Metering Jet—*See Carburetor Section for Carter (B&B) Downdraft Carburetor Jet Specification Table.*

CARB. EQUIPMENT

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment for Stromberg or Carter B&B.

Slow Closing Throttle (Fluid Drive Cars): Stromberg or Carter (B&B) Adjustable Dashpot types.
See Carburetion Equipment Section for complete data.
Setting (Stromberg)—With all slack removed from linkage, set adjusting screw on dash pot lever under float bowl so that piston travel is 5/16-11/32" (measured on dash pot rod on bowl cover). Turn screw out to lengthen stroke, in to shorten.
Setting (Carter B&B)—Adjusting screw on top of bowl cover open five (5) full terms from closed position.

Automatic Choke:—Sisson Type AC-758B.
See Carburetion Equipment Section for complete data.
Setting—The choke can be adjusted by inserting a gauge pin through hole in automatic choke lever shaft and slot in base mounting flange (to position shaft) and adjusting carburetor choke valve lever so that choke valve is tightly closed.

Air Cleaner: AC No. 1542284 Heavy duty oil-bath type.
Filter element AC No. 1544091.
Servicing—Clean and refill to indicated oil level at 1000 mile or 30 day intervals. Use SAE 50 oil (above 32°F.), SAE 20-W (below 32°F.). Oil filler cap filter should be cleaned in kerosene and re-oiled by dipping in SAE 50 engine oil at the same time.

Fuel Pump: AC No. 1539042 or Carter Type M594S. Diaphragm type fuel pump.
Replacement Pump—AC No. 577 (for 1539042).
Pressure—3½-5½ lbs.
See Carburetion Equipment Section for complete data.

Fuel Tank Filter: New Oilite metal filter in tank.
Servicing—If more than 2 pints water in tank, fuel will not pass filter. Remove filler cap and drain plug, draining tank. Disconnect fuel line at some point between pump and tank, blow out line and filter with air, increasing pressure as filter is cleaned. Flush tank with clean gasoline.

Gasoline Gauge: Auto-Lite electric type.
Dash Unit—Auto-Lite No. NG-10884D or NG-11134D.
Tank Unit—Auto-Lite No. NG-10862T.
See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite Type CF-1-15R. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage 4.2 volts.
Dimensions—Length 9". Width 7 1/16". Hgt. 9 5/16".
Grounded Terminal—Positive (+) to engine.
Location—Under hood in left fender shield.

STARTER

Auto-Lite Model MAW-4041. Armature MAW-2030.
Drive—Outboard Barrel Type Bendix No. A2089.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 175 amperes, 6.4 volts.

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4900	5.5	65
.60	"	3300	5.5	100
2.75	"	1480	5.0	200
5.45	"	820	4.5	300
8.50	"	400	4.0	400
11.55	"	110	3.5	500
11.5	"	Lock	3.0	505
18.	"	Lock	4.0	670

Removal: Disconnect wires (tape battery lead), remove mounting bolts, withdraw starter (not necessary to disturb oil filter or oil lines).

Starting Switch: Auto-Lite Model SST-4001. Magnetic type mounted on left front fender shield and controlled by pushbutton on instrument panel.
See Electrical Equipment Section for complete data.

GENERATOR

STANDARD

Auto-Lite Model GDZ-4801A. Armature GDZ-2006F. Two brush (shunt) type with voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—As given in tables below reached at approx. 25 MPH. car speed and above with load or discharged battery (Current Regulator *setting). Actual charging rate controlled by Voltage* Regulator and dependent on battery condition.

Cold Performance Data			Hot Performance Data		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
5	6.65	1060	5	6.65	1150
10	6.85	1200	10	6.85	1290
15	7.05	1340	15	7.05	1430
20	7.3	1480	20	7.3	1590
25	7.55	1620	25	7.55	1750
30	7.8	1760	30	7.8	1980
35①	8.0	1900	35	8.0	2250

①—Current Regulator Setting. See Regulator data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.

GENERAT R

SPECIAL EQUIPMENT

Auto-Lite GEG-4823A or GEG-4823B. Armature No. GEG-2006F (both). Two brush (shunt) types with voltage and current regulation. Ventilated.
SEE CHRYSLER 8 C39 PAGE FOR ALL DATA.

REGULAT R

Std.—VRP-4401A, VRP-4501A, or VRP-4503A (VRP-4001A used on Canadian Cars).

Spec. Equip. (for GEG-4823A, B Gen.)—VRP-4001F, VRP-4401B, or VRP-4501C (VRP-4005E for negative ground). Vibrating type voltage and current regulators.
See Electrical Equipment Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min. **Air Gap**—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A, 4401A)—34-36 amperes ("35").
Setting (VRP-4001F, 4005E, 4401B)—39-41 amperes, marked "40".
Setting (VRP-4501A, 4503A)—35 amperes (42 amperes at 70°F. after 15 minutes run, 33-37 amperes at 70° after additional 15 minutes run). CAUTION—These current regulators are temperature compensated and setting decreases with temperature rise in service.
Setting (VRP-4501C)—40 amperes (46 amperes at 70°F. after 15 minutes run, 38-42 amperes at 70° after additional 15 minutes run). CAUTION—This current regulator is temperature compensated and setting decreases with temperature rise in service.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Corcoran-Brown **"Sealed Beam" type.** *See Electrical Equipment Section for complete data.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on upper edge of panel above speedometer. Lighted with upper beams on.

Direction Signal: Optl. *See Electrical Equipment Section.*
Direction Signal Indicator—On either side of Headlamp Beam Indicator (above speedometer).

Switches

Lighting—Dodge No. 990547.
Beam Selector—Dodge No. 859974.
Instrument—Dodge No. 947065.
Map Light—Dodge No. 947064.
Dome Lamp Pillar—Dodge No. 317180.
Door Switches—Dodge No. 882943.
Stop Light—Dodge No. 920355.
Direction Signal—Dodge No. 1163990, 980793 (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	45-35 watts	Sealed Beam
Parking (no Dir. Signal)	3	63
Front Dir. Sig. & Park	21-3	1158
Instrument	1½	55
Speedometer (after 30653062)	6	81
Map Light	6	81
Beam & Dir. Sig. Ind., Ign. Sw.	1	51
Tail (no Dir. Sig.), License	3	63
Rear Dir. Sig. & Tail	21-3	1158
Stop, Back Up, Hand Brake	21	1129
Dome	10	07

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting—On back of lighting switch. Vibrating type, protects lighting circuits.
Direction Signal—Dodge No. 1161568. On flasher behind instrument panel. 8 ampere, vibrating type.
Windshield Wiper—Dodge No. 898572. On switch. Vibrating type. Starts to operate with 12 ampere
Convertible Top—Mounted near control switch. Thermostatic type. Opens at 80 amperes in 1 minute
Hand Brake Signal—Dodge No. 1161568. 8 ampere, vibrating type. Protects Hand Brake Light circuit.

FUSES: Clock—2 ampere. In clock lead.
Radio—14 ampere. In fuse connector at radio.

HORNS: Auto-Lite Model HT-4007 (Low Pitch), HT-4008 (High Pitch). Dual horns operated by relay.

Horn Relay: Auto-Lite HRL-4101. Connected through ignition switch, operates only with ignition on.
Contacts Close 1.5-3.0 volts (seal to core with 4 V).
Contacts Open— .5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (gap between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: 6 cylinder, "L" hd. type.
Bore—3¼". **Stroke**—4⅝".
Displacement—230.2 cu. ins. **Rated H.P.**—25.35.
Developed Horsepower—102 at 3600 RPM.
Compression Ratio—6.7-1 std. Cast-iron head.
Compression & Vacuum Reading—*See Tune-up data.*

OIL PAN REMOVAL: *See Dodge Special Data.*

ENGINE REMOVAL: *See Dodge Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Dodge Special Data.*

PISTONS: Aluminum alloy, U-slot, cam ground type.
NOTE—Skirt cam ground (.010-.012" smaller diameter across pin bosses) and tapered (.0005-.0015" smaller diameter at top of skirt than at bottom).
Original Bore & Piston Sizes—*See Dodge Special Data.*
Length—3 11/16". **Weight**—16 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0008" on thrust face ¾" from bottom of skirt.

Fitting New Pistons: Measure piston size with micrometer across thrust faces (right angles to pin bosses) ¾" from bottom of skirt. Fit piston in bore using .002" x ½" feeler, insert piston upside down in bore with feeler 90° from pin bosses on side opposite slot. Clearance correct when 5-7 lbs. pull required to withdraw feeler (bore & piston at 70°F). NOTE—Cylinder recondition limits .0005" taper and .0005" out-of-round. Badly scored bores or with taper over .030" or out-of-round over .004" require reboring and honing to limits listed above.

Replacement Pistons: *See Dodge Special Data.*

Installing Pistons: "U" slot away from valves.

PISTON RINGS: Two compression, two slotted oil control, coated rings per piston, all above pin. Oil ring grooves drilled for oil drainage (lower groove slotted).

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	3/32"	.007-.015"	.002-.0035"
Oil Contr. (#3,4)	5/32"	.007-.015"	.001-.0025"

Installing Rings—#1 Compr. with step on inner edge up. #2 Compr. with step on inner edge up or if step on outer edge install with step down.

Replacement Piston Rings: *See Dodge Special Data.*

PISTON PIN: Diameter 55/64". **Length** 2¾". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit (piston at 160°F.).
Pin Fit in Rod Bushing—Tight thumb push fit at normal room temperature.

Replacement Pins: Std., .0006", .003", .008" oversize.

CONNECTING ROD: Weight 1.77 lbs. (with bolts less bearings). **Length** 7 13/16".
NOTE—Pin hole in rod bronze bushed.
Crankpin Journal Diameter—2.0615-2.0625". *See "Original Bearing Sizes" in Dodge Special Data.*
Lower Bearing—Removable, precision type, thin babbitt on steel.
Clearance—.001-.0015". **Sideplay**—.0055-.0115".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. *See "Connecting Rods & Bearings" in Dodge Special Data.*

Replacement Bearings: *See Dodge Special Data.*

Replacement Bearings:—*See Chrysler Shop Notes.*

Installing Rods:—Wide portion of bearing to rear (#1, 3, 5) to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT: 4 bearings, 7 integral counterweights, with vibration dampener on front end.
Journal Diameters—2.4995-2.5005". *See "Original Bearing Sizes" in Dodge Special Data.*
Bearings—Removable, precision type, thin babbitt on steel. No shims.
Clearance—.001-.0015".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See "Crankshaft and Main Bearings" in Dodge Special Data.*

Crankshaft Front & Rear Oil Seals: *See "Crankshaft and Main Bearings" in Dodge Special Data.*

End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT: 4 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width 1". Pitch .500" (½"). Length 24" or 48 links.
Timing Chain Removal—*See Dodge Special Data.*

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	4 25/32"
Exhaust	1 13/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	⅜"	.001-.003"
Exhaust	45°	⅜"	.003-.005"

Exhaust Valve Seat Inserts—*See "Valve System" in Dodge Special Data.*

Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block (use Tool CM-83), then finish ream to .342-.343" Intake, .344-.349" Exhaust.

Valve Springs:—Install with closely coiled end to top.

	Free length 2". Spring Pressure	Length
Valve Closed	40- 45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve guide). Oversizes .001", .008", .030".
Lifter Clearance in Block—.000-.001".

VALVE TIMING

Tappet Clearance:—.008" Intake, .010" Exh. (hot and idling), .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel and lower wheel housing panel for access to valves.

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 12° BTDC. Close 44° ALDC.

Exhaust Valves—Open 50° BLDC. Close 6° ATDC.

Valve Timing Check—With .014" tappet clearance (Cold), #6 intake valve should open with #6 piston 5° to 17° or .011" to .122" BTDC with 5th to 17th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clearance to running clearance .008" Hot.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain. New "Rotor" type oil pump.

Crankcase Capacity—5 quarts (refill).

Normal Oil Pressure—40-45 lbs. above 30 MPH.

Oil Pressure Relief Valve Under plug below starter. Opens at 40-45 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring.

Oil Pump: New "Rotor" type on right side of engine.

Servicing—*See Dodge Special Data.*

Oil Filter: On left side side of engine above starter.

Servicing—Replace element at 8000 mile intervals.

Oil Pressure Gauge: Auto-Lite No. G-10881 (not elec.).

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass thermostat, and water distribution tube in cylinder block behind pump.

Capacity—15 quarts.

Radiator Core Removal: *See "Radiator" in Dodge Special Data.*

Water Distribution Tube Servicing: *See "Cooling System" in Dodge Special Data.*

Water Pump: Packless type with grease fitting.

See Water Pump Section for complete data.

Removal—Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs, lift fan and pump off.

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In cylinder head water outlet.

INSTALLATION NOTE—Install thermostat with 2 ports facing front, and 2 ports facing rear.

Setting—Starts to open 157-162°F. Fully open 183°F.

Temperature Gauge: Auto-Lite H-10883 or H-11133. Not electric.

CLUTCH

Borg & Beck Model 10A7 (Std.), 9A7 (with Fluid Drive), 11A6 (7 Passenger). Single plate, dry disc type with "Borglite" driven member.

NOTE—Cover No. 952 (9A7), 928 (10A7), 931 (11A6). *See Clutch Section for complete data.*

Facings—Woven type, 2 required.

	Inside Diameter	Outside Diam.	Thickness
9A7	6"	9¼"	.125" (⅛")
10A7	7"	10"	.125" (⅛")
11A6	6½"	11"	.125" (⅛")

Pedal Adjustment: Should just clear toeboard (adjust stopscrew on lower end of pedal) & have 1" free travel (adjusting nut on connector link at fork).

Clutch Over-Center Spring—*See "Clutch Notes" in Dodge Special Data.*

Removal:—Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE

OPTIONAL EQUIPMENT

Dodge—Fluid coupling at rear of engine. Optl.

See Transmission Section for complete data.

Slippage Test: *See "Fluid Drive" in Transmission Section for complete data.*

Oil Level: Keep to level of filler hole. Check at first 1000 miles and every 10,000 miles. Manufacturer recommends MOPAR Fluid Drive Fluid.

Removal: Remove transmission and clutch (see TRANSMISSION and CLUTCH), take off driver flange stud nuts (Tool C-589), lower fluid drive assembly out.

TRANSMISSION

Own Make. All helical gear, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). *See Transmission Section for complete data.*

►*HARD SHIFTING CORRECTION—See "Chrysler, DeSoto, Dodge & Plymouth Synchro-Mesh" in Transmission Section for complete data.*

Transmission Control: Manual steering col. shift Std.

See Transmission Section for complete data.

Removal:—Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Dodge Special Data for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to clutch housing capscrews and nuts. Pull unit to rear, down and out of car. NOTE—Use pilot studs when installing assembly.

UNIVERSALS

All exc. 7 Pass.—Detroit Universal Series 4200.

7 Pass. Models—Detroit Universal Series 7200.

Ball-and-Trunnion Type (4200), cross type (7200).

Propeller Shaft Center Bearing: Used on 7 pass. sedan.

See "Propeller Shaft" in Dodge Special Data.

REAR AXLE

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive. *See Rear Axle Section for data.*

Ratio	Car Used On:
3.73-1	All 3 Passenger Coupe
3.9-1	Fluid Drive (exc. 3 & 7 Pass.)
4.1-1	No Fluid Drive (exc. 3 & 7 Pass.)
4.3-1	All 7 Passenger Sedan
4.56-1	Export (incl. 7 Passenger)
4.78-1	Export (except 7 Passenger)
4.89-1	Export (7 Passenger only)

Backlash—.006-.010". Screw adjustment.

Removal:—Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws.

Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-675), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller). NOTE—Use Puller C-293-E to remove bearing from shaft, puller C-748 or C-358 for inner oil seal, drift C-201 to install.

Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

Axle Shaft Outer Seal: New leather type mounted on brake support (backing plate).

Oil Seal Servicing—*See "Rear Axle" in Dodge Special Data.*

SHOCK ABS RBERS

Delco—Model 1030-C (Front), 1031-T (Rear).

Monroe—Model K-11148 (Front), K-11149 (Rear).

Export—Delco Model 942D (front), 940W (rear). Direct acting, hydraulic types.

Hydraulic Transverse Sway Absorber: Rear sway bar with built-in shock absorber used on 7 Pass. Sedan and Convertible Coupe.

FRONT SUSPENSION

Front Suspension:—Independent, linked parallelogram type with coil springs.

See Front Suspension Section for complete data.

Kingpin Inclination—4¾° to 6°.

Camber—Positive ¼°. Limits 0° to Pos. ¾°.

Caster—Negative 1° to Positive 1°. Not adjustable.

Toe In—0-1/16". Turn both tie rods equally.

Steering Geometry—Inner wheel 22½°, Outer 20°.

STEERING EAR

Own Make. (Gemmer design) Model 305 (5 pass.), 335 "3-tooth" type (7 passenger).

NOTE—See Gemmer 305 & 335 articles for data.

See Steering Gear Section for complete data.

BRAKES

Service: Dodge "Safe-guard" Lockheed Hydraulic **Front Wheels**—Two-cylinder type (front shoe anchored at bottom and actuated by upper cylinder, rear shoe anchored at top and actuated by lower cylinder).

Rear Wheels—Double anchor type with single double-acting wheel cylinder.

See Brake Section for complete data.

►*BRAKE SQUEAK OR SQUEAL CORRECTION: See "Lockheed-ChryslerSafe-guard Hydraulic" Brakes in Brake Section.*

Wheel Cylinders—1⅛" bore. Single acting (front), double acting (rear wheels).

Drums—Cast-iron. Diameter 11" (12" on 7 pass.).

Lining—Molded Asbestos. 2" Wide. 13/64" Thick.

Length per shoe: 11" type—8⅞" (rear wheel rear shoe), 11½" (all others). 12" type—9⅝" (rear wheel rear shoe), 12 9/16". (all other shoes).

Clearance—.006" at each end of all shoes.

Braking Power—60% front wheels, 40% rear.

Hand Brake:—On drum at rear of transmission.

Adjustment—*See "Hand Brake Notes" in Dodge Special Data.*

Drum—Cast-iron. 6" (7" diameter on 7 Passenger).

Lining—Width 2" (2½" on 7" type). Thickness 5/32". Length 16 11/16" (20" on 7" type).

Clearance—.015-.020" around band.

MISC. MECHANICAL

WINDSHIELD WIPER: Auto-Lite Model EWH-5001, EWH-5003 (Conv. Coupe). Electric type with circuit breaker mounted on control switch.

See Miscellaneous Section for complete data.

Circuit Breaker—Dodge No. 898572. On switch. Vibrating type. Starts to operate with 12 amperes.

CONVERTIBLE TOP CONTROL: Electric type.

See Miscellaneous Section for complete data.

Circuit Breaker—Near control switch. Thermostatic type. Opens at 80 amperes in 1 minute or less.

MODEL IDENTIFICATION

SERIAL NUMBER: Located on left front door hinge post.

1949 Numbers	Detroit	San Leandro
D-29	37,000,101 Up	48,000,101 Up
D-30	31,245,001 UP	45,050,001 Up

ENGINE NUMBER: Located on left side of cylinder block between #1 and #2 cylinders.

1949 Numbers—D-30-1001 Up.

TUNE-UP

COMPRESSION PRESSURE: 120-150 lbs. at cranking speed of 150 RPM.

VACUUM READING: Steady 18-21" idling at 6 MPH.

SPARK PLUG GAPS: .035". Limits plus or minus .001". *This setting supersedes previous data.*

Plugs—Auto-Lite Resistor Type AR5. 14 mm.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

DISTRIBUTOR: Breaker Gap—.020".

Cam Angle—34½° to 38° (closed).

Breaker Arm Spring Tension—17-20 ozs.

Automatic & Vacuum Advance—*See Ignition.*

Condenser Capacity—.25-.28 microfarad.

IGNITION TIMING: At Top Dead Center (TDC). *This setting supersedes previous data.*

Timing Procedure—*See Ignition Timing.*

Timing Mark—Fan pulley (Wayfarer), vibration dampener (Others) marked "DC" at top dead center position with 15-1° graduations before and after this point. Set timing with DC mark at pointer on chain case cover, then set manual (octane selector) adjustment.

Octane Selector—Set for slight ping when accelerating with wide open throttle between 10-30 MPH.

CARBURETION:

Idle Setting—With engine warm, set throttle stop-screw. Adjust idle adjusting screw for smooth idle (½-1½ turns open for Carter).
Idle Speed (Std. Trans.)—6 MPH.
Idle Speed (Gyro-Matic Drive)—450-475 RPM.
Float Level (Stromberg)—Fuel level ⅝" below top surface of float chamber.
Float Level (Carter)—Top of float (not soldered seam) 5/64" ± 1/64" below top edge of bowl.
Accelerating Pump—Center hole (medium) Normal. Inner Hole—Summer, Outer Hole—Winter.

Choke Setting: The choke can be adjusted by inserting a gauge pin through hole in automatic choke lever shaft and slot in base mounting flange (to position shaft) and adjusting carburetor choke valve lever so that choke valve is tightly closed.

Fuel Pump Pressure: 3-5 lbs.

MANIFOLD HEAT CONTROL: Thermostatic coil type. See that valve operates freely. When installing coil, wind free end up approx. one turn.

VALVE TAPPET CLEARANCE: .008" Intake, .010" Exh. Hot.

IGNITION

IGNITION SWITCH: Mitchellock. Combination ignition-starter switch. Starter operates when key held fully to the right. Key automatically returns to "on" position. Coil lead protected by armored cable through fire wall.

COIL: Auto-Lite CR-4001 (IG-4809 Early Cars). On ignition cable bracket above distributor.

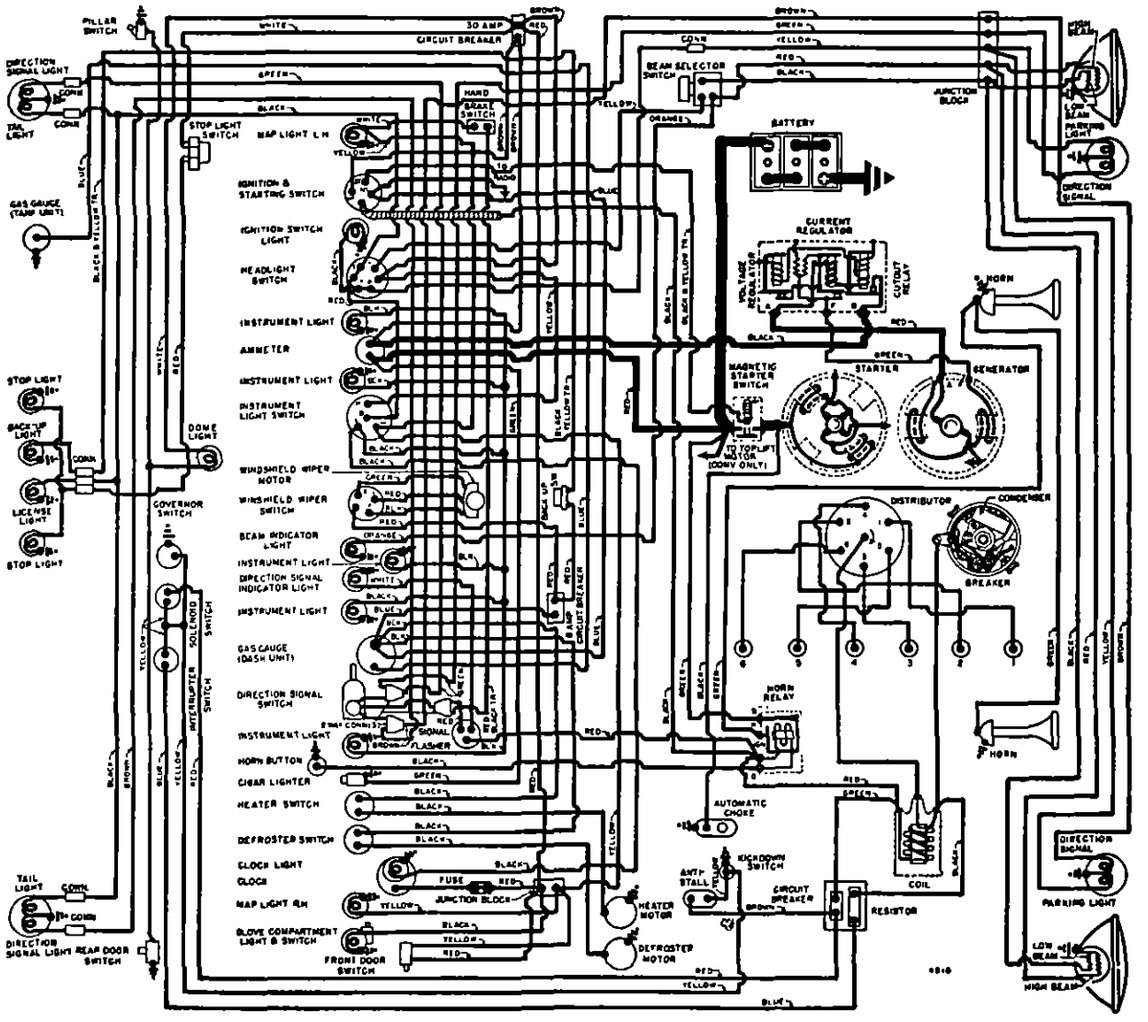
Ignition Current—2¼ amperes idling, 5 stopped.

CONDENSER: Auto-Lite No. IG-3927G.

Capacity—.25-.28 mfd.

DISTRIBUTOR: Auto-Lite—Automatic advance type with Vacuum Spark Control as follows:

D29, D33 (Std.)	IGS-4207B-1
D30, D34 (Std.), D29, D33 (Spec.)	IAP-4103A-1
D30 (Canada)	IAP-4102-1



►*DISTRIBUTOR CAP POPPING OFF CORRECTION (Early IAP Distributors)—See "IAP" Distributors in Electrical Equipment Section.*

Breaker Plate Identification—Maximum vacuum advance limited by a slot in plate. Plate marked #7 (IAP-4201-1). #8 (IAP-4103A-1, IGS-4207B-1).
Breaker Gap—.020".
Cam Angle—34½° to 38° (closed).
Breaker Arm Spring Tension—17-20 ounces.

Rotation—Clockwise viewed from above.

Automatic Advance—IGS-4207B-1 & IAP-4103A-1

Degrees	Distr R.P.M.	Degrees	Eng. R.P.M.
Start	350	0	700
1	450	2	900
5	800	10	1600
9	1300	18	2600
10	1425	20	2850

Automatic Advance—IAP-4102-1

Degrees Start	Distr	R.P.M.	Degrees	Eng.	R.P.M.
		350	0		700
3		400	6		800
6		850	12		1700
9		1300	18		2600
12		1750	24		3500

Vacuum Spark Control. Auto-Lite Units. Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring).

Vacuum Advance—IGS-4207B-1 & IAP-4103A-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4½"
1°	2°	5½"
4°	8°	9⅛"
7°	14°	12¾"
8°	16°	14"

Vacuum Advance—IAP-4102-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6¾"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing.

Distributor Removal: Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position.

IGNITION TIMING

Std. Setting—Initial setting (for regular non-premium fuel) as shown below. See Manual Adjustment (following) for Final Setting.

	Flywheel Degrees	Piston Position
All Engines	At TDC	.000" TDC.

This setting supersedes previous data.

NOTE—Impulse neutralizer marked 'DC' at TDC. with 15 (1°) graduations on either side.

Timing (Using Timing Light)—*Connect timing light* between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see Setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (*mark correct graduation with paint*), idle engine, adjust distributor as directed above until mark aligned with pointer on chain case cover.
Manual Adjustment—Set to give slight ping from 10-30 MPH. accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping), clockwise (if ping too severe), tighten screw.

CARBURETOR

STROMBERG

Stromberg Models BXVD-3 (with Fluid Drive). BXVES-3 (with Gyro-Matic Drive Transmission). Single barrel downdraft type with Sisson Automatic Choke.
NOTE—BXVES-3 type has Kick-down Switch for automatic transmission.
See Carburetor Section for complete data.

►**Carburetor Production Changes**—***Changes made in specifications indicated by carburetor Code No. (see Code Note). See "Stromberg BXVD-3 & BXVES-3" in Carburetor Section.***

►**Carburetor Code Note**—Stamped on carburetor:

Carburetor No.	Code No.①
BXVD-3 380249	3-93, 3-93A, 3-93B
BXVD-3 380253 (Can.)	3-97, 3-97A
BXVES-3 380251	3-95, 3-95A, B, C, D, E

①—See Carburetor Production Change note above.

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***
Metering Jet—***See Carburetor Section for Stromberg Downdraft Carburetor Jet Specification Table.***

Slow-Closing Throttle: Adjustable Dashpot type.
Setting—With all slack removed from linkage, set adjusting screw on dash pot lever under float bowl so that piston travel is 5/16-11/32" (measured on dash pot rod on bowl cover). Turn screw out to lengthen stroke, in to shorten.
See Carburetion Equipment Section for complete data.

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment required.
See Carburetion Equipment Section for complete data.

CARBURETOR

CARTER (B & B)

Carter (B&B) Models D6P1 (with Fluid Drive), D6M1 (with Gyro-Matic Drive). 1½" Single barrel, downdraft type with Sisson Automatic Choke.
NOTE—D6M1 type has Kick-down Switch for automatic transmission.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***
Metering Jet—***See Carburetor Section for Carter (B&B) Downdraft Carburetor Jet Specification Table.***

Slow-Closing Throttle: (D6P1) Adjustable type, (D6M1) Non-adjustable Solenoid type.
Setting (D6P1)—Adjusting screw on top of bowl cover, open five (5) full turns from closed position.
See Carburetion Equipment Section for complete data.

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment required.
See Carburetion Equipment Section for complete data.

Automatic Choke: Sisson Type.
Setting—The choke can be adjusted by inserting a gauge pin through hole in automatic choke lever shaft and slot in base mounting flange (to position shaft) and adjusting carburetor choke valve lever so that choke valve is tightly closed.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: AC No. 1544612 (Early), 1544714 (Late) Heavy duty oil-bath type. Filter element AC No. 21.
Servicing—Wash filter element in kerosene, drain and clean oil reservoir and refill to indicated level mark with 1 pint SAE No. 50 engine oil (SAE No. 20W for temperatures below freezing) at 1000 mile or 30 day intervals, or more often if required.
Oil Filler Cap (crankcase Ventilator) Air Cleaner: Wash filter element in cap in kerosene and re-oil by dipping in SAE No. 50 engine oil at 1000 mile or 30 day intervals or more often if required.

Fuel Pump: AC No. 1539042 or Auto-Lite No. FA-4001. Diaphragm type fuel pump.
Replacement Pump—AC No. 577 or 588 (for 1539042)
Pressure—3-5 lbs.
See Carburetion Equipment Section for complete data.

Fuel Tank Filter: Oilite metal filter in tank.
Servicing—If more than 2 pints water in tank, fuel will not pass filter. Remove filler cap and drain plug, draining tank. Disconnect fuel line at some point between pump and tank, blow out line and filter with air, increasing pressure as filter is cleaned. Flush tank with clean gasoline.

Gasoline Gauge: Auto-Lite electric type.
Dash Unit—Auto-Lite No. 11728A.
Tank Unit—Auto-Lite No. 11538A.
See Carburetion Equipment Section for complete data.

BATTERY

Willard or Auto-Lite Type 1H-105D. 6 Volt, 15 Plate, 105 Ampere Hour Capacity (20 hour rate).
Dimensions—Length 9". Width 7 1/16". Hgt. 9 5/16".
Grounded Terminal—Positive (+) to engine.
Location—Under hood in left fender shield.

STARTER

U. S......**Auto-Lite MCH-6101.** Arm. MCH-2028
Canada.....**Auto-Lite MAW-4041.** Arm. MAW-2128
Drive—Outboard Barrel Type Bendix No. A-2991.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	4900	5.5	65
2.75 "	1480	5.0	200
8.50 "	400	4.0	400
6.0 "	Lock	2.0	335

Removal: Disconnect wires (tape battery lead), remove mounting bolts, withdraw starter (not necessary to disturb oil filter or oil lines).

Starting Switch: Auto-Lite Model SST-4001. Magnetic type mounted on left front fender shield and controlled by turning ignition switch past "on" position.
See Electrical Equipment Section for complete data.

GENERAT R

Auto-Lite. Two-brush with voltage and current regulation.

	Auto-Lite No.	Armature No.
All (Std.)	GGW-6001A	GGW-2006F
D-30 (Early)	GDZ-4801A	GDZ-2006F
D-30 (Early & Can.)	GDZ-4801R	GDZ-2006F
D30, D34 (Spec.)①	GGW-6001D	GGW-2006F
City Police & Taxi	GGJ-6001A	GGJ-2101F
	GGU-6001A	GGU-2006F
State Police	GGJ-6001B	GGJ-2101F
	GGU-6001E	GGU-2006F

①—Station Wagon & Long W.B. (7 Pass.) Cars.
Two brush type current-voltage regulators.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Maximum Charging Rate—See table below.

Charging Rate Adjustment—None. See Regulator.

Performance Data (GGW-6001A, D)

Amperes	Volts	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
40	8.0	1800-2000	2150-2350

Performance Data (GDZ-4801A, R)

0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Performance Data (GGJ-6001A, B)

0	6.4	600-700	650-750
50	8.0	1400-1600	1550-1750

Performance Data (GGU-6001A, E)

0	6.4	750-850	800-900
45	8.0	1450-1650	1650-1850

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—(GGW, GDZ, GGU) 35-53 ozs. (new brushes); (GGJ) 30-37 ozs. (new brushes).
Field Current—(GGW, GDZ) 1.6-1.8 amperes, (GGJ) 1.7-1.9 amperes, (GGU) 1.7-1.8 amperes, all at 6.0 volts.
Motoring Current—(GGW) 4.6-5.2 amps., (GDZ) 4.2-4.6 amps., (GGU) 5.5-6.5 amps., (GGJ) 4.3-4.8 amps., all at 6.0 volts.

Removal: Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment: Loosen pivot and clamp bolts, pull out on generator until belt is snug (40-50 lbs. tension secured on scale attached to field frame) or ¼" belt deflection between generator and pump.

REGULATOR

Auto-Lite. Voltage and current type.

Auto-Lite Regulator	Generator No.
VRP-4503A	GDZ-4801R
VRP-4503B	GGW-6001A, B, D
VBA-4101A, VBA-4104A①	GGJ-6001A, B
VBA-4101A, VBA-4104A①	GGJ-6001A, B
VAV-4404B	GGU-6001A, E
VBA-4101B, VBA-4104B①	GGU-6001A, E

①—For Negative Ground.

See Electrical Equipment Section for complete data.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—(VRP & VBA) 6.3-6.8 volts, (VAV) 6.4-6.9 volts. Set all models to 6.4 volts.
Cuts Out (All)—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap (All)—.015" minimum.
Air Gap (All)—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—(VRP & VAV) 7.2-7.5 volts, (VBA) 7.0-7.2 volts at 70°F. while charging at 10 amperes (VRP & VBA), ½-maximum rate (VAV).
Checking (without breaking seals) & Adjustment—***See Electrical Equipment Section.***
Air Gap (All)—.048-.052" with contacts just opening.

Current Regulator

▷*CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.*

	Test A—Operating Amperes—Test B	
VRP-4503A	42	33-37
VRP-4503B	46	38-42
VAV-4404A, 5A	55	48-52
VAV-4404B	50	43-47
VBA-4101A, 4A	56	48-52
VBA-4101B, 4B	51	43-47

Test A—After 15 minutes operation charging at 10 amperes(VRP & VBA), ½-maximum rate (VAV).
Test B—After additional 15 minutes operation with current regulator operating (load applied to hold voltage to 6.7-7.0 volts (VRP), 6.7-6.9 volts (VAV), 6.7 volts (VBA).
Checking (without breaking seals) & Adjustment—***See Electrical Equipment Section.***
Air Gap (All)—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type with new "Bull's-eye lens."
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Lighted when Country (upper beams in use. Located on lower face of speedometer.

Direction Signal: ***See Electrical Equipment Section.***
Direction Signal Indicator—Located on lower face of speedometer.

Switches

Lighting—Dodge No. 1300600.
Beam Selector—Dodge No. 1253460.
Instrument—Dodge No. 1308226.
Map Light—Dodge No. 1244600.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting—30 ampere. Vibrating type, protects lighting circuits.
Aux. Circuit Breaker—8 ampere. Protects Windshield Wipers and Back-Up Light.
Direction Signal—On flasher behind instrument panel. Vibrating type. Protects dir. signal circuit.
Transmission Solenoid—Vibrating type mounted as an assembly with resistor unit.
Convertible Top—Mounted near control switch. Thermostatic type. Opens at 80 amperes in 1 minute or less.

FUSES: Clock—3 ampere. In clock lead.
Radio—14 ampere. In fuse connector at radio.

HORNS: Auto-Lite Model HW-4201 (Low Pitch), HW-4202 (High Pitch). Dual horns operated by relay.

Horn Relay: Auto-Lite HRL-4103 or 4104. Connected through ignition switch, operates only with ignition on.
Contacts Close—1.5-3.0 volts (seal to core with 4 V.).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.018-.020" (armature air gap with contacts closed but not sealed, .015-.018" (gap between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: 6 cylinder, "L" hd. type.
Bore—3¼". **Stroke**—4⅝".
Displacement—230.2 cu. ins. **Rated H.P.**—25.35.
Developed Horsepower—103 at 3600 RPM.
Compression Ratio—7.0-1 Std. Cast-iron Head.
Compression & Vacuum Reading—***See Tune-up data.***

OIL PAN REMOVAL: ***See Dodge Special Data.***
ENGINE REMOVAL: ***See Dodge Special Data.***
CYLINDER HEAD & TIGHTENING TORQUES: ***See Dodge Special Data.***

PISTONS: Aluminum alloy, "U" slot, cam ground type.
NOTE—Piston skirt is elliptical (.010-.012" smaller diameter across pin bosses than across thrust faces), and tapered (.0005-.0015" smaller diameter at top of skirt than at bottom).
Length—3 11/16". **Weight**—16.0 ozs. (stripped).
Original Bore & Piston Sizes—***See Dodge Special Data.***
Removal—Pistons and rods removed from above.
Clearance—.0008" on thrust face ¾" from bottom of skirt.

Fitting New Pistons: Measure piston size with micrometer across thrust faces (right angles to pin bosses ¾" from bottom of skirt. Fit piston in bore using .002" x ½" feeler, insert piston upside down in bore with feeler 90° from pin bosses on side opposite slot. Clearance correct when 5-7 lbs. pull required to withdraw feeler (bore & piston at 70°F.).
NOTE—Cylinder recondition limits .0005" taper and .0005" out-of-round. Badly scored bores or with taper over .030" or out-of-round over .004" require reboring and honing to limits listed above.

Replacement Pistons: .005", .020", .030", .040", .060" OS. ***See "Pistons" in Dodge Special Data.***

Installing Pistons: "U" slot away from valves.

PISTON RINGS: Two compression (top ring chrome-plated), two slotted oil control, coated rings per piston, all above pin. Oil ring grooves drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	3/32"	.007-.015"	.002-.0035"
Oil Contr. (#3,4)	.5/32"	.007-.015"	.001-.0025"

Installing Rings—#1 Compr. with step on inner edge up. #2 Compr. with step on inner edge up or if step on outer edge, install with step down.

Replacement Rings: .005" .020" .030" .040" .050" .060" OS. ***See "Piston Rings" in Dodge Special Data.***

PISTON PIN: Diameter—55/64". Length—2 3/4". Pin floats in piston and rod, held by lock rings.
Pin Fit in Piston—.0000" to +.0005". Thumb push fit with piston at 70°F.
Pin Fit in Rod Bushing—+.0001" to +.0002". Thumb push fit at 70°F.

Replacement Pins: Std., .0006", .003", .008" Oversize.

CONNECTING ROD: Length—7 13/16". **Weight**—27.90 ozs. (with bolts less bearings).
NOTE—Pin hole in rod bronze bushed.
Crankpin Journal Diameter—2.0615-2.0625".

Original Bearing Sizes: ***Dodge Special Data.***
Lower Bearing—Removable, precision type, steel-backed, thin babbitt-lined. No shims.
Clearance—.0005-.0015". **Sideplay**—.006-.011".

Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps. ***See "Connecting Rods & Bearings" in Dodge Special Data.***

Replacement Bearings: .001", .002", .010", .012" U.S. ***See "Connecting Rods & Bearings" in Dodge Special Data.***

Installing Rods: Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT: 4 bearings, 7 integral counterweights, with vibration dampener on front end.

ENGINE

CONTINUED FROM PRECEDING PAGE

Journal Diameters—2.4995-2.5005".
Original Bearing Sizes: *See Chrysler Special Data.*
Bearings—Removable, precision type, steel-backed, thin babbitt-lined. No shims.
Clearance—.0005-.0015".
Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See "Crankshaft and Main Bearings" in Dodge Special Data.*
Replacement Bearings: .001", .002", .010", .012" U.S. *See "Crankshaft & Main Bearings" in Dodge Special Data.*
End Thrust: Taken by flanged faces of #4 (rear) main bearing. **Endplay**—.003-.007".
Crankshaft Front & Rear Oil Seals: *See "Crankshaft and Main Bearings" in Dodge Special Data.*
CAMSHAFT: 4 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 1/4".
Bearings—Removable, steel-backed, babbitt-lined bushings (except #4—machined in crankcase).
Clearance—.001-.003".
Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*
End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain: Width 1". Pitch .500" (½"). Length 24" or 48 links.
Timing Chain Removal—*See Dodge Special Data.*
Camshaft Setting: Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	4 25/32"
Exhaust	1 13/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.001-.003"
Exhaust	45°	23/64"	.002-.004"

Exhaust Valve Seat Inserts—*See "Valve System" in Dodge Special Data.*
Valve Guides: Remove from above. Press new guides in with stepped end down and upper end ⅞" below top of block, ream guides to inside diameter of .342-.343" (Intake), .343-.344" (Exhaust).
Valve Springs: Install with close-coil end to top.

Free Length 2".	Spring Pressure	Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters: Mushroom type (remove from below with camshaft out of engine). Stem diameter ⅝". Service by reaming lifter holes (work from above piloting reamer in valve guide) and installing oversize lifters furnished .001", .008", .030" Oversize.
Lifter Clearance in Block—.000-.001".

VALVE TIMING

Tappet Clearance: .008" Intake, .010" Exhaust, Hot.
NOTE—Tappet screws self-locking type.
Valve Timing: See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 36° ALDC.
Exhaust Valves—Open 37° BLDC. Close 7° ATDC.
Valve Timing Check—With .014" tappet clearance (Cold), #6 intake valve should open with #6 piston 8° before top dead center with 8th graduation before "DC" mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clearance to .008" Hot running clearance.

LUBRICATI N

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain. "Rotor" type oil pump.
Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—40-50 lbs. at 20 MPH.
Oil Pressure Relief Valve—Under plug below starter. Opens at 40-45 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring.
Oil Pump: "Rotor" type on right side of engine.
Servicing—*See Dodge Special Data.*
Oil Filter: On left side of engine above starter.
Servicing—Replace filter at 8000 mile intervals.
Oil Pressure Gauge: Auto-Lite No. 11727A (not elec.).

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass thermostat, and water distribution tube in cylinder block behind pump.
Capacity—15 quarts.
Radiator Core Removal: *See "Radiator" in Dodge Special Data.*
Water Distribution Tube Servicing: *See "Cooling System" in Dodge Special Data.*
Water Pump: Packless type with grease fitting.
See Water Pump Section for complete data.
Removal—Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs, lift fan and pump off.
Belt Adjustment—*See Generator Belt Adjustment.*
Thermostat: In cylinder head water outlet.
INSTALLATION NOTE—Install thermostat with 2 ports facing front and 2 ports facing rear.
Setting—Starts to open 157-162°F. Fully open 183-187°F.
Temperature Gauge: Auto-Lite 11729A. Not electric.

CLUTCH

Borg & Beck Model 9A7, 11A6 (Taxicab). Single plate, dry disc types.
BORG & BECK NOTE—Cover Assy. marked 952 (9A7), 931 (11A6).
See Clutch Section for complete data.
Facings (Borg & Beck)—Molded woven asbestos.

	Inside Diam.	Outside Diam.	Thickness
9A7	6"	9¼"	.125" (⅛")
11A6	6½"	11"	.125" (⅛")

Pedal Adjustment: Set pedal to just clear toeboard (stopscrew on lower end of pedal) and set for 1" free travel (adjust nut on connector link at fork). NOTE—Do not disturb turnbuckle on pedal link.
Clutch Over-Center Spring—*See "Clutch Notes" in Dodge Special Data.*
Removal: Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE

Fluid Coupling. Std. on all engines (with or without Gyromatic automatic transmission).
See Transmission Section for complete data.
Oil Level: Keep to level of filler hole. Check at first 1000 miles and every 10,000 miles. Manufacturer recommends MOPAR Fluid Drive Fluid.
Slippage Test: *See "Fluid Drive" in Transmission Section for complete data.*
Removal: Remove transmission and clutch (see TRANSMISSION and CLUTCH), take off driver flange stud nuts (Tool C-589), lower fluid drive assembly out.

TRANSMISSI N
STANDARD

Own Make—All helical gear, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). *See Transmission Section for complete data.*
►*HARD SHIFTING CORRECTION*—*See "Chrysler, DeSoto, Dodge & Plymouth Synchro-Mesh" in Transmission Section for complete data.*
Transmission Control: Manual steering col. shift Std.
See Transmission Section for complete data.
Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Chrysler Special Data for Propeller Shaft Center Bearing Removal on 7 Pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to-clutch housing capscrews and nuts. Pull unit to rear, down and out of car.
NOTE—Use pilot studs when installing assembly.

TRANSMISSI N
AUTOMATIC

Gyromatic—4-speed hydraulically operated type. New design semi-automatic, four-speed transmission with hydraulic actuation and electrical control.
See Transmission Section for complete data including Testing & Trouble Shooting.
►**Kick-down Switch Change to Improve Transmission Operation**—*See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.*
Transmission Control: See Transmission article for adjustment directions.
See Transmission Section for complete data.
Kick-down Solenoid—Auto-Lite No. SSS-4003.
Governor—Auto-Lite No. TG-4205R.
Kick-down Switch—Part of carburetor assembly.
See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.
Ignition Interrupter Switch—On right side of transmission above Governor.
Transmission Oil—3 pints, 10-W engine oil.
Removal: Remove access cover on right rear side of floorboard under front floor mat, disconnect speedometer cable, and governor, solenoid, and interrupter switch wires at transmission. Remove governor and solenoid. Disconnect hand brake cable at brake band, remove cable and cable anchor bracket. Remove brake support, band, adjusting bolt bracket and lever as an assembly. Disconnect front universal (push yoke back), and gearshift rods at transmission. Drain transmission, **replace drain plug.** Disconnect transmission mounting bolts and lower assembly out of car.
INSTALLATION CAUTION—Rear face of clutch housing and lower pan must be in correct alignment. Misalignment can cause hard shifting when transmission installed.

UNIVERSALS

All exc. 7 Pass.—Detroit Universal Series 4200.
7 Pass. Models—Detroit Universal Series 7200.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Ball-and-Trunnion Type (4200), cross type (7200).

Propeller Shaft Center Bearing: Used on 7 pass. sedan. *See "Propeller Shaft" in Dodge Special Data.*

REAR AXLE

Own Make—Semi-floating, hypoid gear type with Hotchkiss drive. *See Rear Axle Section for data.*

Axle Ratio—	Std.	Gyromatic Trans.
D29, Coupe & Rdstr	3.73-1	
D29, Sedans	3.9-1	
D30	3.9-1	3.9-1
Sta. Wgn & Long W.B.	4.3-1	4.1-1

Backlash—.008-.010". Screw adjustment.

Removal: Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws. **Axle Shaft Removal**—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-675), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller). NOTE—Use Puller C-293-E to remove bearing from shaft, puller C-748 or C-358 to remove inner oil seal, drift C-201 to install seal.

Axle Shaft Oil Seal: New leather type mounted on brake support (backing plate). **Oil Seal Servicing**—*See "Rear Axle" in Dodge Special Data.*

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS

Hydraulic, direct acting, non-adjustable.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and direct acting shock absorbers.

See Front Suspension Section for complete data.

Kingpin Inclination—4¾° to 6° crosswise.

Camber—Pos. ¼°. Limits 0° to Pos. ¾° (¼-½° higher on left).

Caster—0° preferred. Limits Neg. 1° to Pos. 1°. No adjustment.

Toe In—0" (0-1/16"). Adjust by turning both tie rods equally.

Steering Geometry—Inner wheel 22½°. Outer 20°.

STEERING GEAR

Own Make—(Gemmer design) Model 305 (exc. 7 pass.), 335 "3-tooth" type (7 passenger).

NOTE—See Gemmer 305 & 335 articles for data.

See Steering Gear Section for complete data.

BRAKES

Service: Dodge "Safe-guard" Lockheed Hydraulic. *See Brake Section for complete data.*

►*BRAKE SQUEAK OR SQUEAL CORRECTION: See "Lockheed-ChryslerSafe-guard Hydraulic" Brakes in Brake Section.*

Wheel Cylinders—Single acting type (front), double acting type with straight (1⅛") bore (rear).

Drums—Cast iron. Diameter 10" (D29), 11" (D30), 12" (Station Wagons & Long W.B. cars).

Lining—Molded asbestos.

	Width	Thickness	Length per Wheel
D29	2"	13/64"	21" Frt., 18½" Rear
D30	2"	13/64"	23" Frt., 20⅜" Rear
Sta. Wgn. & Long W.B.	2"	13/64"	25⅛" Frt. & Rear

Clearance—.006" at each end of all shoes.

Braking Power—60% front wheels, 40% rear.

Hand Brake: On drum at rear of transmission.

Adjustment—*See "Hand Brake Notes" in Dodge Special Data.*

Drum—Cast iron. Diameter 6" (except Long W.B. cars), 7" (Long W.B. cars).

Lining—	Width	Thickness	Length
6" Type	2"	5/32"	15 3/8"
7" Type	2 1/2"	5/32"	20"

Clearance—.015-.020" around band.

MISC. MECHANICAL

WINDSHIELD WIPER: Auto-Lite Model EWJ-4001. EWJ-4003 (Conv. Coupe). Electric type with circuit breaker mounted on control switch.

See Miscellaneous Section for complete data.

CONVERTIBLE TOP CONTROL: Auto-Lite Model EWM-4001. Electric type.

See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

SERIAL NUMBER: Located on left front door hinge post.

1950 Numbers

Plant	D33	D34
Detroit	37,060,001	31,420,001
Los Angeles	48,502,001	45,505,001
San Leandro	48,004,001	45,064,001

1951 Numbers

Plant	D41	D42
Detroit	37,135,001	31,663,001
Los Angeles	48,506,001	45,518,001
San Leandro	48,008,001	45,079,001

ENGINE NUMBER: Located on left side of cylinder block between #1 & #2 cylinders.
1950 Numbers—D34-1001 Up.
1951 Numbers—D42-1001 Up.

TUNE-UP

COMPRESSION PRESSURE: 120-150 lbs. at cranking speed of 150 RPM.

VACUUM READING: Steady 18-21" idling at 6 MPH.

SPARK PLUG GAPS: .035". Limits plus or minus .001"
Plugs—Auto-Lite Resistor Type (1950) AR5, (1951) AR8. 14 mm.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

DISTRIBUTOR: Breaker Gap—.020"
Cam Angle—34½° to 48° (closed).
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.25-.28 microfarad.

IGNITION TIMING: At Top Dead Center (TDC).
This setting supersedes previous data.
Timing Procedure—*See Ignition Timing.*
Timing Mark—Fan Pulley (Wayfarer), vibration dampener (Others) marked "DC" at top dead center position with 15-1° graduations before and after this point. Set timing with DC mark at pointer on chain case cover, then set manual (octane selector) adjustment.
Octane Selector—Set for slight ping when accelerating with wide open throttle between 10-30 MPH.

CARBURETION:
Idle Setting—With engine warm, set throttle stop-screw. Adjust idle adjusting screw for smooth idle (½-1½ turns open for Carter).
Idle Speed (Std. Trans.)—6 MPH.
Idle Speed (Gyro-Matic Drive)—450-475 RPM.
Float Level (Stromberg)—Fuel level ⅝" below top surface of float chamber.
Float Level (Carter)—Top of float (not soldered seam) *5/64"±1/64" below top edge of bowl.*
Accelerating Pump—Center hole (medium) Normal. Inner Hole—Summer, Outer Hole—Winter.

Choke Setting: The choke can be adjusted by inserting a gauge pin through hole in automatic choke lever shaft and slot in base mounting flange (to position shaft) and adjusting carburetor choke valve lever so that choke valve is tightly closed.

Fuel Pump Pressure: 3-5 lbs.

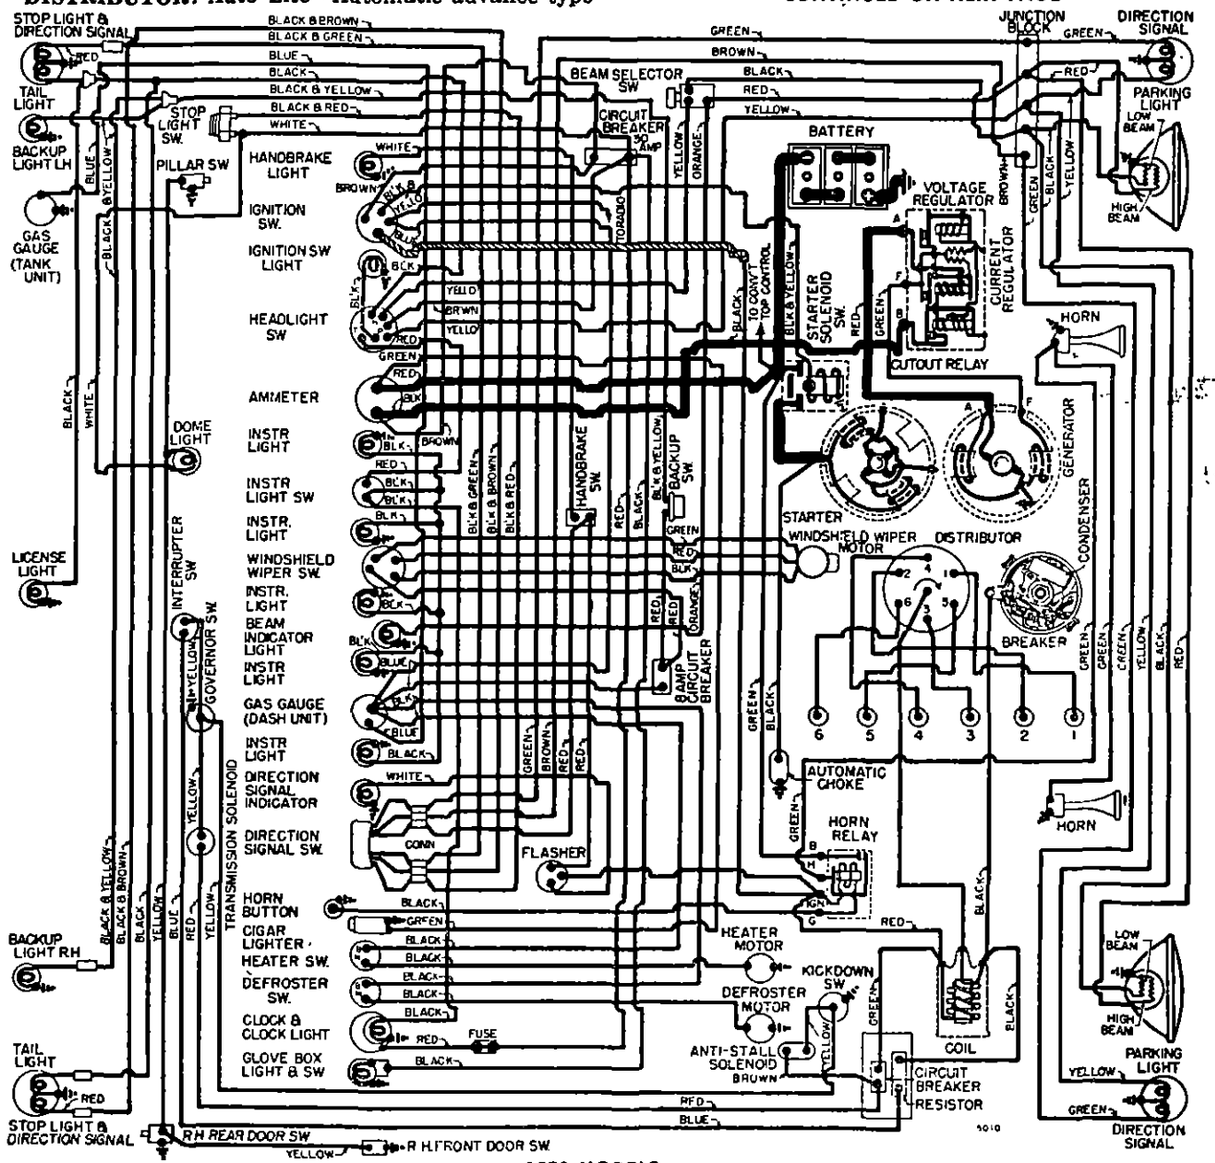
MANIFOLD HEAT CONTROL: Thermostatic coil type. See that valve operates freely. When installing coil, wind free end up **approx. one turn.**

VALVE TAPPET CLEARANCE: .008" Intake, .010" Exh. Hot.
Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: Mitchellock. Combination ignition-starter switch. Starter operates when key held fully to the right. Key automatically returns to "on" position.

COIL: Auto-Lite CR-4001 (IG-4809 Early Cars). On ignition cable bracket above distributor.
Ignition Current—2¼ amperes idling, 5 stopped.



CONDENSER: Auto-Lite No. IG-3927G.
Capacity—.25-.28 mfd.

DISTRIBUTOR: Auto-Lite—Automatic advance type with Vacuum Spark Control as follows:

	Early	Late
D33 ('50) Std.	IGS-4207B-1	IAT-4003
D33 ('50) Spec.		IAP-4103A-1
D34 ('50) Std.	IAP-4103A-1	IAT-4003
D34 ('50) Canada	IAP-4102-1	IAT-4004A
D42 ('51) Canada	IAT-4012A	
D41, D42 ('51)	IAT-4011	

►***DISTRIBUTOR CAP POPPING OFF CORRECTION Early "IAP" Distributors): See "Auto-Lite IAP Distributors" in Electrical Equipment Section.***

CONTINUED ON NEXT PAGE

1950 MODELS

CONTINUED FROM PRECEDING PAGE

Breaker Gap—.020".
Cam Angle—34½° to 38° (closed).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Automatic Advance—IGS-4207B-1, IAP-4103A-1 IAT-4011, IAT-4003

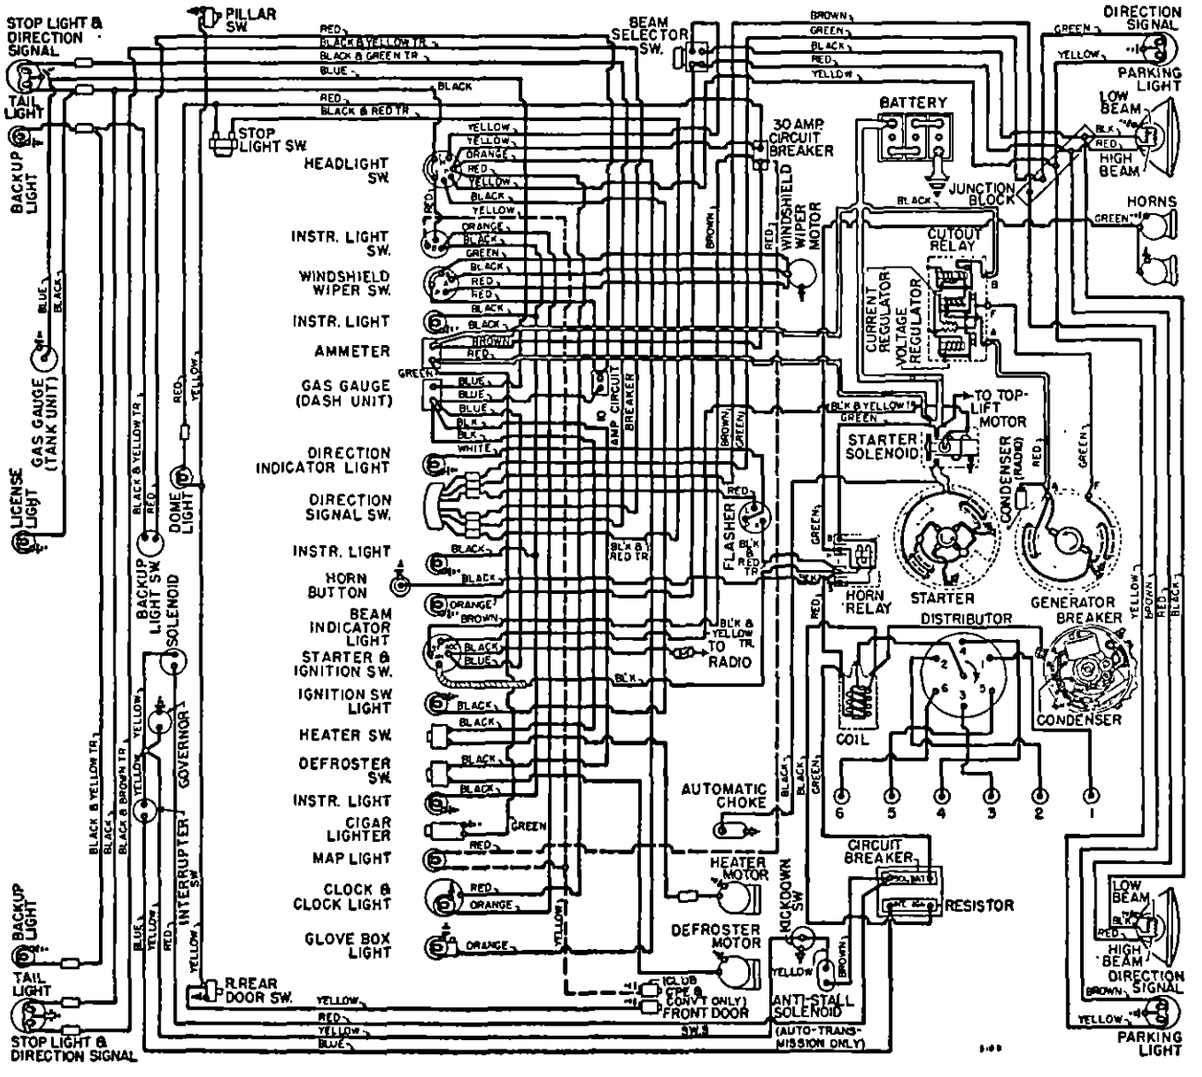
Degrees	Distr. R.P.M.	Degrees Eng. R.P.M.
Start	350	0 — 700
1	450	2 — 900
5	800	10 — 1600
9	1300	18 — 2600
10	1425	20 — 2850

Automatic Advance—IAP-4102-1, IAT-4004A, IAT-4012A

Degrees	Distr. R.P.M.	Degrees Eng. R.P.M.
Start	350	0 — 700
3	400	6 — 800
6	850	12 — 1700
9	1300	18 — 2600
12	1750	24 — 3500

Vacuum Spark Control. Auto-Lite Units. Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring).

Vacuum Advance—IGS-4207B-1, IAP-4103A-1, IAT-4011, IAT-4003



Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4½"
1°	2°	5½"
4°	8°	9⅞"
7°	14°	12¾"
8°	16°	14"

Vacuum Advance—IAP-4102-1, IAT-4004A, IAT-4012A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6¾"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing.

Distributor Removal: Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position.

1951 MODELS

IGNITION TIMING

Std. Setting—Initial setting (for regular non-premium fuel) as shown below. See Manual Adjustment (following) for Final Setting.

	Flywheel Degrees	Piston Position
All Engines	At TDC	.000" TDC.

This setting supersedes previous data.

NOTE—Impulse neutralizer marked 'DC' at TDC. with 15 (1°) graduations on either side.

Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see Setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following)

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine, adjust distributor as directed above until mark aligned with pointer on chain case cover.

Manual Adjustment—Set to give slight ping from 10-30 MPH. accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping), clockwise (if ping too severe), tighten screw.

CARBURETOR

STROMBERG

Stromberg Models BXVD-3 (with Fluid Drive). BXVES-3 (with Gyro-Matic Drive Transmission). 1½" Single barrel downdraft type with Sisson Automatic Choke.

▷*NOTE*—BXVES-3 type has Kick-down Switch for automatic transmission.

See Carburetor Section for complete data.

▷**Carburetor Production Changes**—*Changes made in specifications indicated by carburetor Code No. (see Code Note). See "Stromberg BXVD-3 & BXVES-3" in Carburetor Section.*

►**Carburetor Code Note**—Stamped on carburetor:

Carburetor No.	Code No.①
BXVD-3 380249	3-93, A, etc.
BXVD-3 380253 (Can.)	3-97, A, etc.
BXVES-3 380251	3-95, A, etc.
BXVES-3 380268 (Can.)	3-103, A, etc.

①—See Carburetor Production Change note above.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jet—*See Carburetor Section for Stromberg Downdraft Carburetor Jet Specification Table.*

Slow-Closing Throttle: Adjustable Dashpot type.
Setting—With all slack removed from linkage, set adjusting screw on dash pot lever under float bowl so that piston travel is 5/16-11/32" (BXVD3), 13/32-7/16" (BXVES3) measured on dashpot rod on bowl cover. Turn screw out to LENGTHEN stroke.
See Carburetion Equipment Section for complete data.

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment required.
See Carburetion Equipment Section for complete data.

Automatic Choke: See Carter (B&B) data below.

CARTER (B&B)

Carter (B&B) Models D6P1 (with Fluid Drive), D6M1 (with Gyro-Matic Drive). 1½" Single barrel, downdraft type with Sisson Automatic Choke.
NOTE—D6M1 type has Kick-down Switch for automatic transmission.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jet—*See Carburetor Section for Carter (B&B) Downdraft Carburetor Jet Specification Table.*

Slow-Closing Throttle: (D6P1) Adjustable type, (D6M1) Non-adjustable Solenoid type.
Setting (D6P1)—Adjusting screw on top of bowl cover, open five (5) full turns from closed position.
See Carburetion Equipment Section for complete data.

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment required.
See Carburetion Equipment Section for complete data.

Automatic Choke: Sisson Type.
Setting—The choke can be adjusted by inserting a gauge pin through hole in automatic choke lever shaft and slot in base mounting flange (to position shaft) and adjusting carburetor choke valve lever so that choke valve is tightly closed.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: AC No. 1544714 Heavy duty oil-bath type. Filter element AC No. 21.
Servicing—Wash filter element in kerosene, drain and clean oil reservoir and refill to indicated level mark with 1 pint SAE No. 50 engine oil (SAE No. 20W for temperatures below freezing) at 1000 mile or 30 day intervals, or more often if required.

Fuel Pump: AC No. 1539208 or Auto-Lite No. FA-4001 (1950). Auto-Lite No. FA-4001A (1951). Diaphragm type fuel pump.
Replacement Pump—AC No. 588 (for 1539208).
Pressure—3-5 lbs.
See Carburetion Equipment Section for complete data.

Fuel Tank Filter: Oilite metal filter in tank.
Servicing—If more than 2 pints water in tank, fuel will not pass filter. Remove filler cap and drain plug, draining tank. Disconnect fuel line at some point between pump and tank, blow out line and filter with air, increasing pressure as filter is cleaned. Flush tank with clean gasoline.

Gasoline Gauge: Auto-Lite electric type.
Dash Unit—Auto-Lite No. 12103A ('50), No. 12335A ('51).
Tank Unit—Auto-Lite No. 11538A (1950-51).
See Carburetion Equipment Section for complete data.

BATTERY

Willard HW-1-105C or Auto-Lite IH-105-D. 6 volt, 15 plate, 105 Ampere Hour Capacity (20 Hour rate).
Dimensions—Length 9". Width 7 1/16". Hgt. 9 5/16".
Grounded Terminal—Positive (+) to engine.
Location—Under hood in left fender shield.

STARTER

U.S.—**Auto-Lite MCH-6101.** Arm. MCH-2028
Canada—**Auto-Lite MAW-4041.** Arm. MAW-2128
Drive—Outboard Barrel Type Bendix No. A-2991.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 "	Lock	2.0	335

Removal: Disconnect wires (tape battery lead), remove mounting bolts, withdraw starter (not necessary to disturb oil filter or oil lines).

Starting Switch: Auto-Lite Model SST-4001 ('50), SST-4006 ('51). Magnetic type mounted on left front fender shield and controlled by turning ignition switch past "On" position.
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite. Two-brush with voltage and current regulation.

	Auto-Lite No.	Armature No.
D33, D34 (Std.)	GGW-6001A (Early)	GGW-2006F
	①GGW-6001J (Late)	GGW-2006F
D33, D34 (Spec.)	GGW-6001B (Early)	GGW-2006F
	①GGW-6001K (Late)	GGW-2006F
D41 (Std.)	①GGW-6001L	GGW-2006F
D42 (Std.)	①GGW-6001K	GGW-2006F
City Police	GGU-6001A (Early)	GGU-2006F
	①GGU-6001G (Late)	GGU-2006F
	GGJ-6001A (Early)	GGJ-2101F
	①GGJ-6001F (Late)	GGJ-2101F
State Police	GGU-6001E (Early)	GGU-2006F
	①GGU-6001H (Late)	GGU-2006F
	GGJ-6001B (Early)	GGJ-2101F
	①GGJ-6001G (Late)	GGJ-2101F
Sta. Wg. & 7 Pass.	GGW-6001D (Early)	GGW-2006F
	①GGW-6001L (Late)	GGW-2006F

①—New Type Narrow Belt.

Maximum Charging Rate—See table below.
Charging Rate Adjustment—None. See Regulator.

Performance Data (GGW-6001A, B, D, J, K, L)

Amperes	Volts	Cold—R.P.M.	Hot
0	6.4	870-970	950-1050
40	8.0	1800-2000	2150-2350

Performance Data (GGJ-6001A, B, F, G)

0	6.4	600-700	650-750
50	8.0	1400-1600	1550-1750

Performance Data (GGU-6001A, E, G, H)

0	6.4	750-850	800-900
45	8.0	1450-1650	1650-1850

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—(GGW, GGU) 35-53 ozs. (new brushes); (GGJ) 30-37 ozs. (new brushes).
Field Current—(GGW) 1.6-1.8 amperes, (GGJ) 1.7-1.9 amperes; (GGU) 1.7-1.8 amperes. All at 6.0 volts.
Motoring Current—(GGW) 4.6-5.2 amps., (GGU) 5.5-6.5 amps., (GGJ) 4.3-4.8 amps., all at 6.0 volts.
Removal: Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment: Loosen pivot and clamp bolts, pull out on generator until belt is snug (40-50 lbs. tension secured on scale attached to field frame) or ¼" belt deflection between generator and pump.

REGULAT R

Auto-Lite. Voltage and current type.

Auto-Lite Regulator No.	for Auto-Lite Generator
VRP-6004A	GGW-6001A, B, D, J, K, L
VBA-4202A, VBA-4204A①	GGJ-6001A, B, F, G
VAV-6001A, VAV-6002A①	GGU-6001A, E, G, H
VBE-6001A	GGW-6001L, K

①—VBA-4204A & VAV-6002A for negative ground.
See Electrical Equipment Section for complete data.

►*NOTE*—Regulator case cover is sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In (All)—6.3-6.8 volts. Set to 6.4-6.6 volts.
Cuts Out (All)—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap (All)—.015" minimum.
Air Gap (All)—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting (All)—7.1-7.4 volts at 70°F. while charging at 10 amperes (VRP & VBA), ½-maximum rate (VAV & VBE).
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*
Air Gap (All)—.048-.052" with contacts just opening.

Current Regulator

►*CAUTION*—*"Temperature Compensated" type. Set to following specifications at 70°F.*

	Test A—Operating Amperes	Test B
VRP-6004A	46	38-42
VAV-6001A, 2A	50	43-47
VBA-4202A, 4A	56	48-52
VBE-6001A	52	43-47

Test A—After 15 minutes operation charging at 10 amperes (VRP & VBA), ½-maximum rate (VAV & VBE).
Test B—After additional 15 minutes operation with voltage regulator operating (load applied to hold voltage to 6.7-7.0 volts (VRP), 6.7-6.9 volts (VAV & VBE), 6.7 volts (VBA).
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section.*
Air Gap (All)—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Corcoran-Brown "Sealed Beam" type with new "Bull's-eye lens."
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Lighted when Country (upper) beams in use. Located on lower face of speedometer.

Direction Signal: *See Electrical Equipment Section.*
Direction Signal Indicator—Located on lower face of speedometer.

Switches

Lighting—Dodge No. (1950) 1300600, (1951) 1370138.
Beam Selector—Dodge No. (1950) 1253460, (1951) 1253003.
Instrument—Dodge No. (1950) 1244997, (1951) 1370011.
Map Light—Dodge No. 1244600.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting—30 ampere. Vibrating type, protects lighting circuits.
Aux. Circuit Breaker—8 ampere. Protects Windshield Wipers and Back-Up Light.
Direction Signal—On flasher behind instrument panel. Vibrating type. Protects dir. signal circuit.
Transmission Solenoid—Vibrating type mounted as an assembly with resistor unit.
Convertible Top—Mounted near control switch. Thermostatic type. Opens at 80 amperes in 1 minute or less.

FUSES: Clock—3 ampere. In clock lead.
Radio—14 ampere. In fuse connector at radio.

HORNS: Auto-Lite.
1950—HW-4201 (Low Pitch) & HW-4202 (High Pitch).
1951—HW-4108 (Low Pitch) & HW-4108 (High Pitch). Dual horns operated by relay.
Horn Current—15 amperes.

Horn Relay: Auto-Lite HRL-4104. Connected through ignition switch, operates only with ignition on.
Contacts Close—1.5-3.0 volts (seal to core with 4 V.).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (gap between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: 6 cylinder, "L" hd. type.
Bore—3¼". **Stroke**—4⅝".
Displacement—230.2 cu. ins. **Rated HP.**—25.35.
Developed Horsepower—103 at 3600 RPM.
Compression Ratio—7.0-1 Std. Cast-iron Head.
Compression & Vacuum Reading—*See Tune-up data.*

OIL PAN REMOVAL: *See Dodge Special Data.*

ENGINE REMOVAL: *See Dodge Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Dodge Special Data.*

PISTONS: Aluminum alloy, "U" slot, cam ground type.
NOTE—Piston skirt is elliptical (.010-.012" smaller diameter across pin bosses than across thrust faces), and tapered (.0005-.0015" smaller diameter at top of skirt than at bottom).
Original Bore & Piston Sizes—*See Dodge Special Data.*
Length—3 11/16". **Weight**—16.0 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0008" on thrust face ¾" from bottom of skirt. Ring land diameter .0305" larger than skirt.

Fitting New Pistons: Measure piston size with micrometer across thrust faces (right angles to pin bosses) ¾" from bottom of skirt. Fit piston in bore using .002" x ½" feeler, insert piston upside down in bore with feeler 90° from pin bosses on side opposite slot. Clearance correct when 5-7 lbs. pull required to withdraw feeler (bore & piston at 70°F.).
NOTE—Cylinder recondition limits .0005" taper and .0005" out-of-round. Badly scored bores or with taper over .030" or out-of-round over .004" require reboring and honing to limits listed above.

Replacement Pistons: .005", .020", .030", .040", .060" OS. *See "Pistons" in Dodge Special Data.*

Installing Pistons: "U" slot away from valves.

PISTON RINGS: Two compression (top ring chrome-plated), two slotted oil control, coated rings per piston, all above pin. Oil ring grooves drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	3/32"	.007-.015"	.002-.0035"
Oil Contr. (#3,4)	5/32"	.007-.015"	.001-.0025"

Installing Rings—#1 Compr. with step on inner edge up. #2 Compr. with step on inner edge up or if step on outer edge, install with step down. NOTE—Ring expanders used with top oil ring.

Replacement Rings: .005" .020" .030" .040" .050" .060" OS. *See "Piston Rings" in Dodge Special Data.*

Piston Pin: Diameter—55/64". **Length**—2 3/4". Pin floats in piston and rod, held by lock rings.
Pin Fit in Piston—.0000" to +.0005". Thumb push fit with piston at 70°F.
Pin Fit in Rod Bushing—+.0001" to +.0002". Thumb push fit at 70°F.

Replacement Pins: Std., .0006", .003", .008" Oversize.

CONNECTING ROD: Length—7 13/16". **Weight**—27.90 ozs. (with bolts less bearings).
NOTE—Pin hole in rod bronze bushed.
Crankpin Journal Diameter—2.0615-2.0625". *See "Original Bearing Sizes" in Dodge Special Data.*
Lower Bearing—Removable, precision type, steel-backed, thin babbitt-lined. No shims.
Clearance—.0005-.0015". **Sideplay**—.006-.011".

Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps. *See "Connecting Rods & Bearings" in Dodge Special Data.*

Replacement Bearings: .001", .002", .010", .012" U.S. *See "Connecting Rods & Bearings" in Dodge Special Data.*

Installing Rods: Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT: 4 bearings, 7 integral counterweights, with vibration dampener on front end.
Journal Diameters—2.4995-2.5005". *See "Original Bearing Sizes" in Dodge Special Data.*
Bearings—Removable, precision type, steel-backed, thin babbitt-lined. No shims.
Clearance—.0005-.0015".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See "Crankshaft and Bearing Sizes" in Dodge Special Data.*

Replacement Bearings: .001", .002", .010", .012" U.S. *See "Crankshaft & Main Bearings" in Dodge Special Data.*

End Thrust: Taken by flanged faces of #4 (rear) main bearing. **Endplay**—.003-.007".

Crankshaft Front & Rear Oil Seals: *See "Crankshaft and Main Bearings" in Dodge Special Data.*

CAMSHAFT: 4 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 1/4".
Bearings—Removable, steel-backed, babbitt-lined bushings (except #4—machined in crankcase).
Clearance—.001-.003".

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width 1". Pitch .500" (½"). Length 24" or 48 links.
Timing Chain Removal—*See Dodge Special Data.*

Camshaft Setting: Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	4 25/32"
Exhaust	1 13/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.001-.003"
Exhaust	45°	23/64"	.002-.004"

Exhaust Valve Seat Inserts—*See "Valve System" in Dodge Special Data.*

Valve Guides: Remove from above. Install new guides with the counterbore end UP for EXHAUST valves and with the counterbore end DOWN for INTAKE valves. Press new guides in with upper end 7/8" below top of block, ream guides to inside diameter of .342-.343" (Intake), .343-.344" (Exhaust).

Valve Springs: Install with close-coil end to top. Free Length 2".

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	110-120 lbs.	1⅜"

Valve Lifters: Mushroom type (remove from below with camshaft out of engine). Stem diameter ⅝". Service by reaming lifter holes (work from above piloting reamer in valve guide) and installing oversize lifters furnished .001", .008", .030" Oversize.
Lifter Clearance in Block—.000-.001".

VALVE TIMING

Tappet Clearance: .008" Intake, .010" Exhaust, Hot.
NOTE—Tappet screws self-locking type.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 36° ALDC.
Exhaust Valves—Open 37° BLDC. Close 7° ATDC.
Valve Timing Check—With .014" tappet clearance (Cold), #6 intake valve should open with #6 piston 8° before top dead center (8th graduation before "DC" mark on vibration dampener or crankshaft fan pulley aligned with pointer on chain case cover). Reset tappet clearance to .008" HOT running clearance.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, and timing chain. "Rotor" type oil pump.
Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—40-50 lbs. at 20 MPH.
Oil Pressure Relief Valve—Under plug below starter. Opens at 40-45 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring.

Oil Pump: "Rotor" type on right side of engine.
Servicing—*See Dodge Special Data.*

Oil Filter: On left side of engine above starter.
Servicing—Replace filter at 8000 mile intervals.

Oil Pressure Gauge: Auto-Lite No. (1950) 12105A, (1951) 12332A. (Not electric).

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass thermostat, and water distribution tube in cylinder block behind pump.
Capacity—15 quarts.

Radiator Core Removal: *See "Radiator" in Dodge Special Data.*

Water Distribution Tube Servicing: *See "Cooling System" in Dodge Special Data.*

Water Pump: Packless type with grease fitting.
See Water Pump Section for complete data.
Removal—Drain cooling system, remove fan belt,

disconnect hoses at pump, remove pump mounting studs, lift fan and pump off.
Belt Adjustment—*See Generator Belt Adjustment.*
Thermostat: In cylinder head water outlet.
INSTALLATION NOTE—Install thermostat with 2 ports facing front, and 2 ports facing rear.
Setting—Starts to open 157-162°F. Fully open 183-187°F.
Temperature Gauge: Auto-Lite No. (1950) 12104A, (1951) 12333A. (Not electric).

CLUTCH

Borg & Beck Model No. 9A7, Auburn Model No. 9251-12 (Std.). Borg & Beck Model No. 10A7 (Heavy Duty), 11A6 (Taxicab). Single plate dry disc clutch.
BORG & BECK NOTE—Cover Assembly marked 952 (9A7), 931 (11A6).
See Clutch Section for complete data.
Facings (Borg & Beck)—Molded woven asbestos.

	Inside Diam.	Outside Diam.	Thickness
9A7	6"	9¼"	.125" (⅛")
11A7	6½"	11"	.125" (⅛")

Facings (Auburn)—Molded woven asbestos. I.D. 6⅛", O.D. 9⅛", Thickness .125".
Pedal Adjustment: Set pedal to just clear toeboard (stopscrew on lower end of pedal) and set for 1" free travel (adjust nut on connector link at fork). NOTE—Do not disturb turnbuckle on pedal link.
Clutch Over-Center Spring—*See "Clutch Notes" in Dodge Special Data.*
Removal: Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE

Fluid Coupling. Std. on all engines (with or without Gyromatic automatic transmission).
See Transmission Section for complete data.
Oil Level: Keep to level of filler hole. Check at first 1000 miles and every 10,000 miles. Manufacturer recommends MOPAR Fluid Drive Fluid.
Slippage Test: *See "Fluid Drive" in Transmission Section for complete data.*
Removal: Remove transmission and clutch (see TRANSMISSION and CLUTCH), take off driver flange stud nuts (Tool C-589), lower fluid drive assembly out.

TRANSMISSION

STANDARD

Own Make—All helical gear, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). *See Transmission Section for complete data.*
►*HARD SHIFTING CORRECTION—See "Chrysler, DeSoto, Dodge & Plymouth Synchro-Mesh" in Transmission Section for complete data.*
Transmission Control: Manual steering col. shift Std.
See Transmission Section for complete data.
Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if disabling transmission—see Dodge Special Data for for Propeller Shaft Center Bearing Removal on 7 Pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to-clutch housing capscrews and nuts. Pull unit to rear, down and out of car.
NOTE—Use pilot studs when installing assembly.

AUTOMATIC TRANSMISSION

Gyromatic—4-speed hydraulically operated type. New design semi-automatic, four-speed transmission with hydraulic actuation and electrical control.
See Transmission Section for complete data including Testing & Trouble Shooting.
►*SYNCHRONIZER PRODUCTION CHANGE NOTE*—New "Pin Type" synchronizer unit replaced former type during 1950 production.
►**Kick-down Switch Change to improve Transmission Operation**—*See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.*
Transmission Control: See Transmission article for adjustment directions.
See Transmission Section for complete data.
Kick-down Solenoid—Auto-Lite No. SSS-4003.
Governor—Auto-Lite No. TG-4205R ('50), No. TGG-4001 ('51).
Kick-down Switch—Part of carburetor assembly.
See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.
Ignition Interrupter Switch—On right side of transmission above Governor.
Transmission Oil—3 pints, 10-W engine oil.
Removal: Remove access cover on right rear side of floorboard under front floor mat, disconnect speedometer cable, and governor, solenoid, and interrupter switch wires at transmission. Remove governor and solenoid. Disconnect hand brake cable at brake band, remove cable and cable anchor bracket. Remove brake support, band, adjusting bolt bracket and lever as an assembly. Disconnect front universal (push yoke back), and gearshift rods at transmission. Drain transmission, **replace drain plug.** Disconnect transmission mounting bolts and lower assembly out of car.
INSTALLATION CAUTION—Rear face of clutch housing and lower pan must be in correct alignment. Misalignment can cause hard shifting when transmission installed.

UNIVERSALS

All exc. 8 Pass.—Detroit Universal Series 4200.
8 Pass. Models—Detroit Universal Series 7200.
Ball-and-Trunnion Type (4200), cross type (7200).

Propeller Shaft Center Bearing: Used on 8 pass. sedan.
See "Propeller Shaft" in Dodge Special Data.

REAR AXLE

Own Make—Semi-floating, hypoid gear type with Hotchkiss drive. *See Rear Axle Section for data.*

Axle Ratio—	Std.	Gyro-Matic
D33, D41 Coupe & Rdstr.	3.73-1	
All Others	3.9-1	3.9-1

Removal: Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-675), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller). NOTE—Use Puller C-293-E to remove bearing from shaft, puller C-748 or C-358 to remove inner oil seal, drift C-201 to install seal.
Axle Shaft Oil Seal: New leather type mounted on brake support (backing plate).
Oil Seal Servicing—*See "Rear Axle" in Dodge Special Data.*
Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay—.003-.008".**

SHOCK ABS RBERS

Hydraulic, direct acting, non-adjustable.
1951, New "Oriflow" type used.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram. Coil Springs and direct acting shock absorbers.
See Front Suspension Section for complete data.
Kingpin Inclination—(1950) 4¾° to 6° crosswise, (1951) 5° to 6½° crosswise.
Camber—(1950) Pos. ¼°. Limits 0° to Pos. ¾° (¼-½° higher on left). (1951) Pos. ⅜° to Neg. ⅜° (0° preferred).
Caster—0° preferred. Limits Neg. 1° to Pos. 1°.
Toe-In—0" (0-1/16"). Adjust by turning both tie rods equally.
Toe-out on Turns—Inner wheel 22½°. Outer 20°.

STEERING GEAR

Own Make—(Gemmer design) Model 305 (exc. 8 pass.), 335 "3-tooth" type (8 passenger).
See Steering Gear Section for complete data.

BRAKES

Service: Dodge "Safe-guard" Lockheed Hydraulic.
See Brake Section for complete data.
►*BRAKE SQUEAK OR SQUEAL CORRECTION—See "Lockheed-Chrysler Safe-guard Hydraulic" Brake in Brake Section.*
Wheel Cylinders—Single acting type (front), double acting type with straight (1⅛") bore (rear).
Drum—Cast Iron. Diameter 10" (D33, D41), 11" (D34, D42), 12" (Station Wgns. & Long W.B. Cars).
Lining—Molded asbestos.

	Width	Thickness	Length
D33, D41	2"	13/64"	21" Frt., 18 1/2" Rear
D34, D42	2"	13/64"	23" Frt., 20 3/8" Rear
Sta. Wgn. & Long W.B.	2"	13/64"	25 1/8" Frt. & Rear

Clearance—.006" at each end of all shoes.
Braking Power—60% front wheels, 40% rear.
Hand Brake: On shaft at rear of transmission. External contracting type (Synchro-mesh Trans.). Internal expanding type (Gyro-Matic Trans.).
Adjustment—*See "Hand Brake Notes" in Dodge Special Data.*
Drum—Cast Iron. Diam. 7" (8 Pass.), 6" (others).
Lining—Molded asbestos. **Width 2", Thick. 5/32".**
Clearance—.015-.020" around drum.

MISC. MECHANICAL

WINDSHIELD WIPER:
Auto-Lite Model—Electric type with circuit breaker mounted on control switch.
EWJ-4001—D34 exc. Convt. ('50), D42 L.W.B. ('51).
EWJ-4003—Convt. ('50-51), D42 Coronet ('51).
EWR-5001C—D41 Sedan & Coupe (1951).
EWR-5001D—D42 Meadowbrook (1951).
EWR-5001E—D41 Roadster (1951).
Trico Vacuum Type: Model SSM-118, D33 (1950).
See Miscellaneous Section for complete data.
CONVERTIBLE TOP CONTROL: Auto-Lite Model EWM-4001. Electric Type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

SERIAL NUMBER: On plate on left front door hinge post. First Serial Numbers:

1952 Serial Nos.	Detroit	Los Angeles	San Leandro
D-41	31,663,001	48,507,601	48,009,901
D-42	31,867,801	45,527,501	45,090,601
1953 Serial Nos.			
D-46	32,042,001	45,536,001	45,102,001
D-47	37,213,001	48,511,001	48,013,001

ENGINE NUMBER: Stamped on boss on left side of cylinder block between #1 & #2 cylinders.

ENGINE NUMBER LETTERS: (Following Engine Number)—Identified as follows:

"A"—ALL Cylinders .020" oversize.

"B"—ALL Crankshaft Journals .010" undersize.

"AB"—BOTH above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 120-150 lbs. at cranking speed of 150 RPM.

VACUUM READING: Steady 18-20" at idling speed.

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAPS: .035".

Plugs—Auto-Lite AR8. 14 mm. Resistor type.

DISTRIBUTORS: Auto-Lite. (1952 U.S. Cars), IAT-4011, (1953 U.S. Cars) IAT-4101, (1952-53 Canada) IAT-4012. Automatic and vacuum advance type with "pivoted breaker plate."

Breaker Gap—.020" (.018-.022").

Cam Angle—39°±3°. DO NOT exceed breaker gap limits to obtain this dwell.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Automatic & Vacuum Advance—*See Ignition.*

COIL: Auto-Lite No. CR-4001. Above distributor.

Ignition Current—2.25 amperes idling, 5 stopped.

CONDENSER: Auto-Lite No. IAT-3076RA.

Capacity—.25-.28 microfarad.

IGNITION TIMING: (1952) At TDC. (1953) 2° BTDC.

Timing Mark—Crankshaft pulley or vibration dampener marked "DC" at top dead center point with 15 1°-graduations before and after this point. Set timing with correct graduation in line with pointer on chain case cover.

Timing Procedure—*See Ignition Timing.*

CARBURETION (1953—CARTER): (B&B) No. D6H2 (Std. Trans. no Fluid Drive), D6P1 & D6P2 (Std. Trans. & Fluid Drive), D6U1 (Overdrive Trans., no Fluid Drive), D6V1 (Overdrive Trans. & Fluid Drive), D6M1 (Automatic Trans. & Fluid Drive). Single barrel downdraft types with separate Sisson Automatic Choke.

Idle Setting—½-1½ turns open. Adjust for smooth idle, (if vacuum gauge used, set for highest steady vacuum). Turn screw out for richer mixture.

Idle Speed—(Synchro-mesh Trans.) 450-500 RPM. **(Automatic Trans.)**—450-475 RPM.

Float Level—Top of float (not soldered seam) 5/64" plus or minus 1/64" below top edge of bowl.

Accelerating Pump—Center hole normal setting. Outer hole (max.) Winter, Inner hole (min.) Summer.

Fast Idle Setting: No adjustment required.

Choke Setting: Insert gauge pin through hole in automatic choke shaft and hole in base flange to position shaft, loosen choke valve screw and position choke so that valve is tightly closed.

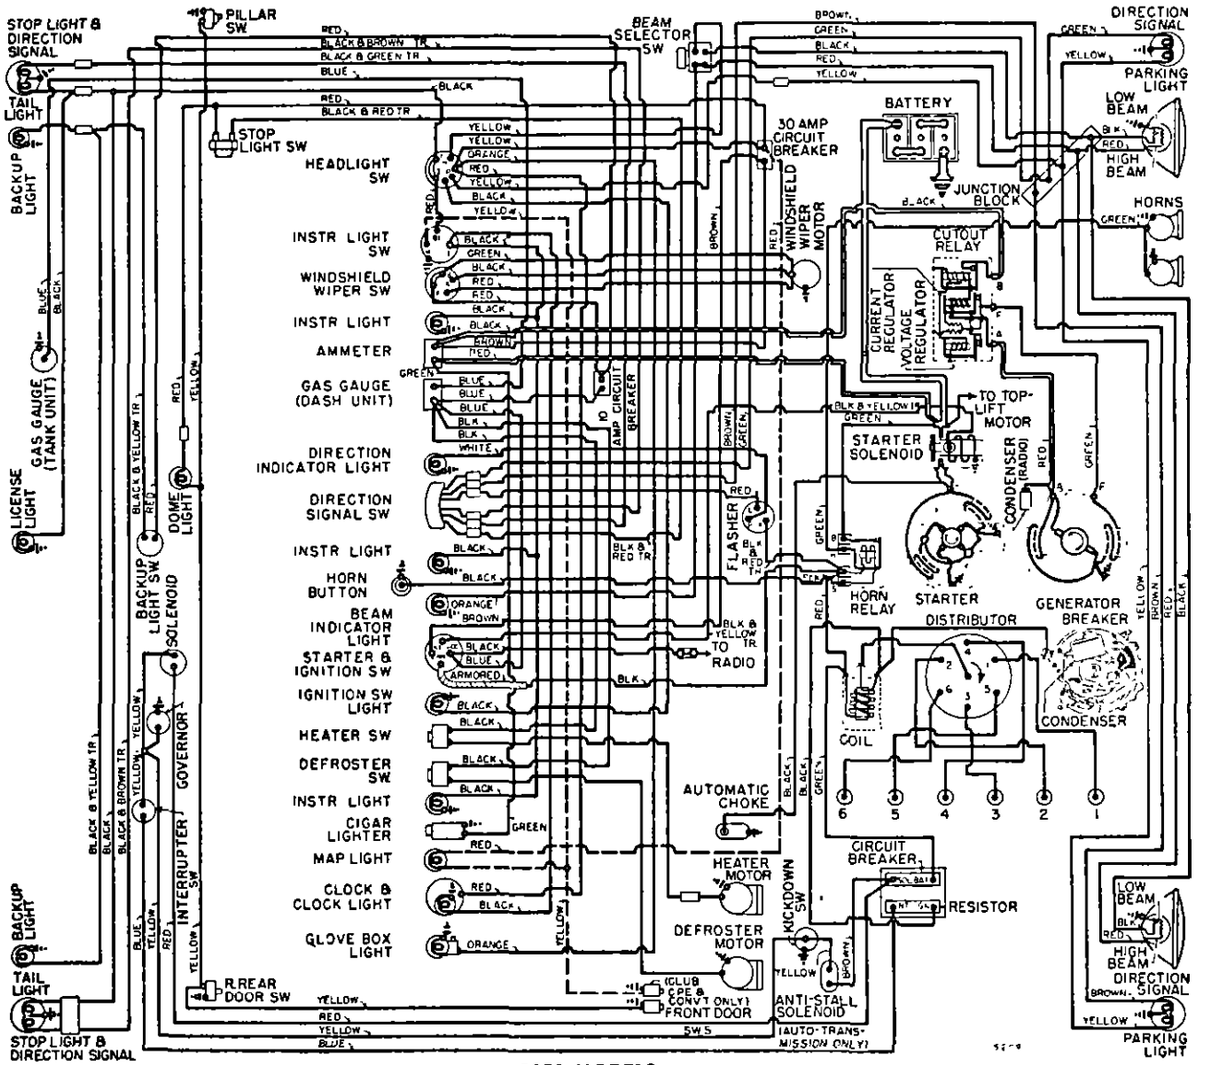
Slow-Closing Throttle: Open adjusting screw **5 full turns** (D6P1), **4½ turns** (D6P2), **2½ turns** (D6V1), from closed position.

CARBURETION (1952-53 — STROMBERG): Model BXVD-3 (1952 Synchro-mesh Cars), BXVES-3 (1952 Synchro-mesh Cars), BXVES-3 (1952-53 Gyromatic Trans.). Single barrel downdraft with separate Sisson Automatic Choke.

Idle Setting—Adjust for smooth idle (if vacuum gauge used, set for highest steady reading). Turn screw out for richer mixture.

Idle Speed (Synchro-mesh Trans.) 450-500 RPM. **(Automatic Trans.)** 450-475 RPM.

Float Level—Fuel level in bowl 5/8" below top edge of bowl with needle valve seated.



Accelerating Pump—Center Hole (medium stroke) Normal, Inner Hole (min. stroke) Summer, Outer Hole (max. stroke) Winter.

Fast Idle Setting: No adjustment required.

Choke Setting: See Carter (B&B) carburetor above.

Slow-closing Throttle Setting: Remove all slack from linkage, set adjusting screw on lever under float so that piston travel (measured on dashpot rod on bowl cover is 5/16-11/32" (BXVD-3), 13/32-7/16" (BXVES-3). Turn screw out to lengthen stroke.

Fuel Pump Pressure: 4 to 5½ lbs.

1952 MODELS

MANIFOLD HEAT CONTROL: Thermostatic coil type. See that valve operates freely. When installing coil, free end should have approx. ¾ turn wind-up (counter-clockwise) to hook over stop stud.

VALVE TAPPET CLEARANCE: With engine HOT:
(1952) .008" Intake, .010" Exhaust.
(1953) .010" Intake and Exhaust.
NOTE—Adjusting screws are self-locking type.

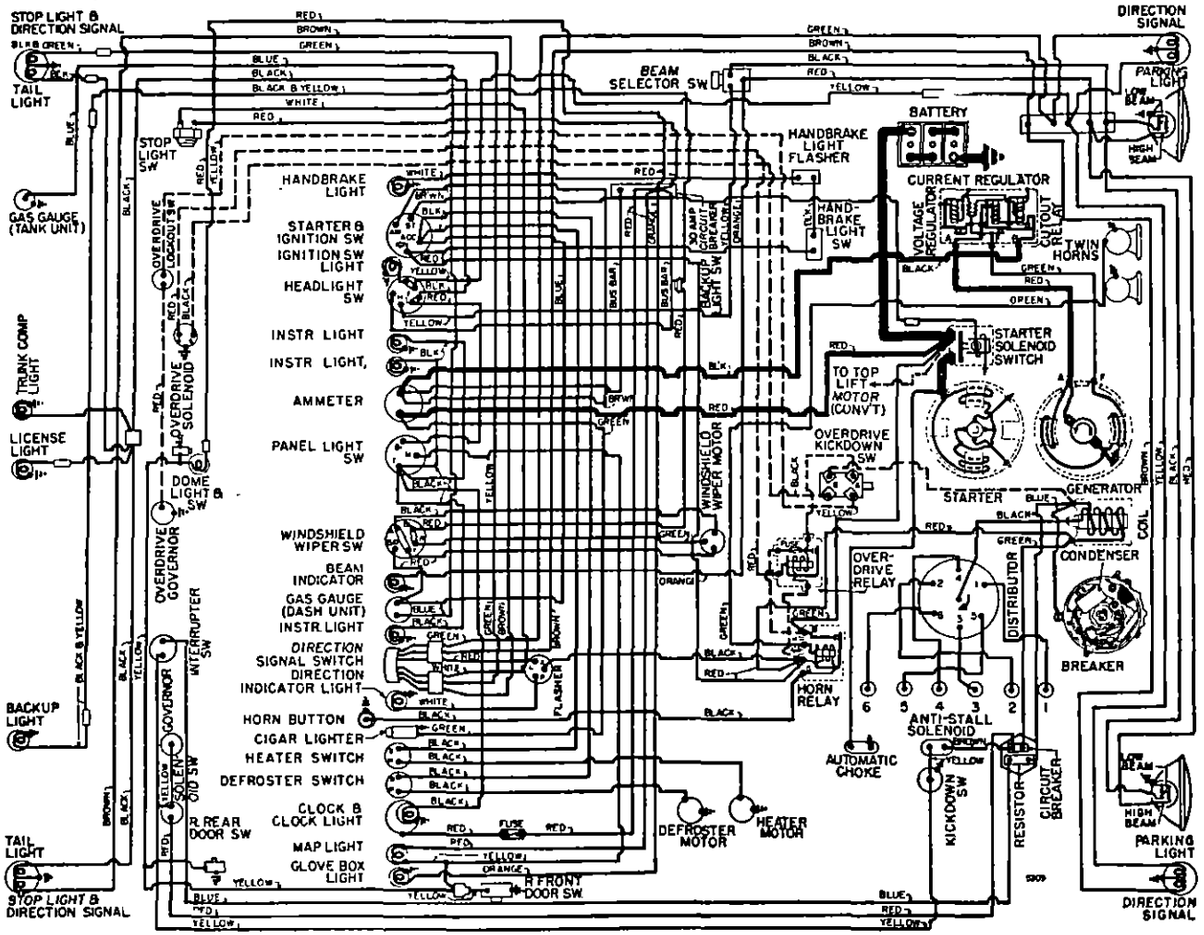
IGNITION

IGNITION SWITCH: Mitchellock. Combination ignition-starter switch. Starter operates when key held fully to the right. Key automatically returns to "on" position.

COIL: Auto-Lite CR-4001. On ignition cable bracket above distributor.
Ignition Current—2.25 amperes idling, 5 stopped.

CONDENSER: Auto-Lite No. IAT-3076RA.
Capacity—.25-.28 microfarad.

DISTRIBUTORS: Auto-Lite. (1952 U.S. Cars), IAT-4011, (1953 U.S. Cars) IAT-4101, (1952-53 Canada) IAT-4012. Automatic and vacuum advance type with "pivoted breaker plate."
Canada). Automatic and vacuum advance.
Breaker Gap—.020", (.018-.022").
Cam Angle—39°±3° closed. DO NOT exceed breaker gap limits to obtain this dwell.
Rotation—Clockwise viewed from above.



Automatic Advance—IAT-4011, 4012, 4101

Degrees Dist.	RPM	Degrees Eng.	RPM
Start	350	0	700
1	450	2	900
5	800	10	1600
9	1300	18	2600
10	1425	20	2850

Vacuum Spark Control: Auto-Lite. Integral type.

Vacuum Advance—IAT-4011, 4101

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4¼"
1°	2°	5½"
4°	8°	9⅛"
7°	14°	12¾"
8°	16°	14"

1953 MODELS

Vacuum Advance——IAT-4012

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5
2	4	7¼
4	8	9⅜
6	12	11⅝
9	18	15

Distributor Installation Note: Install distributor with #1 piston in firing position.

IGNITION TIMING

Model	Std. Setting
1952 D-41 & D-42	AT TDC.
1953 D-46 & D-47	2° BTDC

See Manual Adjustment below for Final Setting.

Timing Mark—Impulse neutralizer marked 'DC' at TDC with 15—1° graduations before and after this point.

Timing (Using Synchroscope)—Loosen distributor lockplate hold-down screw, center pointer on scale, tighten screw. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine, loosen lock-plate clamp bolt, rotate distributor until mark is aligned with pointer on chain case, tighten clamp bolt.

Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° before or after initial setting) counter-clockwise (if no ping), clockwise (if ping too severe). Tighten screw.

CARBURETOR

CARTER (B & B)

Carter (B&B)—1½" single barrel downdraft type with separate Sisson Automatic Choke.

Carter Carburetor No.	Application
D6H2	Std. Trans., no Fluid Drive
D6P1 & D6P2①	Std. Trans. & Fluid Drive
D6U1②	Overdrive Trans., no Fluid Drive
D6V1 ①②	Overdrive Trans. & Fluid Drive
D6M1 ①②	Automatic Trans. & Fluid Drive

①—With Slow-Closing Throttle.
②—With Kick-Down Switch.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Jets—*See Carburetor Section for Carter Carburetor Jet Specification Table.*

Slow Closing Throttle: Adjustable dash-pot type.
Setting—Open adjusting screw in top of bowl cover 5 full turns (D6P1), 4½ turns (D6P2), 2½ turns (D6V1) from closed position.
See Carburetion Equipment Section for complete data.

Overdrive Kick-down Switch: With throttle valve in wide open position, adjust hex nuts on switch to have 1/64" to 3/64" clearance between kick-down lever and switch stem guide.

Fast Idle: No adjustment required.

Automatic Choke: Sisson type.
Setting—Insert gauge pin in automatic choke shaft and hole in base flange to position shaft, loosen choke valve lever screw and position choke so that valve is tightly closed.
See Carburetion Equipment Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STROMBERG

Stromberg Model BXVD-3 (1952 Synchro-mesh), BXVES-3 (1952-53 Gyromatic Trans.). 1½" Single barrel downdraft type with Sisson Automatic Choke.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Jet—*See Carburetor Section for Stromberg Downdraft Carburetor Jet Specification Table.*

Slow-Closing Throttle: Adjustable dashpot type.

Setting—With all slack removed from linkage, set adjusting screw on dashpot lever under float bowl so that piston travel is 5/16-11/32" (BXVD-3), 13/32-7/16" (BXVES-3). Turn screw out to lengthen stroke.

See Carburetion Equipment Section for complete data.

Fast Idle: Throttle opened to fast idle position when choke valve closed. No adjustment required.

Automatic Choke: Sisson type.

Setting—See Carter (B&B) carburetor above.

See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: Heavy duty oil-bath type.

Fuel Pump: Auto-Lite (1952) FA-4001, (1953) FA-4003. Diaphragm type fuel pump.

Pressure—3½-5½ lbs.

See Carburetion Equipment Section for complete data.

Fuel Tank Filter: Oillite metal filter in tank.

Servicing—If more than 2 pints water in tank, fuel will not pass filter. Remove filler cap and drain plug, draining tank. Disconnect fuel line at some point between pump and tank. Blow out line and filter with air, increasing pressure as filter is cleaned. Flush tank with gasoline.

Gasoline Gauge: Auto-Lite electric type.

Dash Unit

Auto-Lite No.	1952	1953
All exc. Estate Wgn.	12821A	12964A
Estate Wgn.	12822A	13193A

Tank Unit

All exc. Estate Wgn.	11538A	12617A
Estate Wgn.	12195A	12904A

See Carburetion Equipment Section for complete data.

BATTERY

Willard HW-1-105C or Auto-Lite IH-105-D. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).

Grounded Terminal—Positive (+) to engine.

Location—Under hood in left fender shield.

STARTER

Auto-Lite. (Early 1952 U.S. Cars) MCH-6201, (Late 1952 & 1953 U.S. Cars) MCH-6205, (Canada) MCH-6202 & MCH-6206. Armature No. MCH-2088.

Drive—Bendix "Folo-Thru" type.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ounces (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6 "	Lock	2.0	335

Starting Switch: Auto-Lite (1952) SST-4006, (1953) SST-4006A. Magnetic type controlled by ignition switch (by turning key past "on" position).

See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite. 2-brush with voltage-current regulation.

Model	Auto-Lite Generator
Std. Equip.	GGW-6001J, K, L, Q
Special	GGU-6001G, V, R GGJ-6001F, G

Maximum Charging Rate—See Table below.

Charging Rate Adjustment—None. See Regulator.

Performance Data—"GGJ" Gen.

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	600-700 — 650-750
50	8.0	1400-1600 — 1550-1750
55	8.0	1500-1700 — 1650-1850

Performance Data—"GGW" Gen.

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 — 950-1050
40	8.0	1800-2000 — 2150-2350
45	8.0	1925-2125 — 2350-2550

Performance Data—"GGU" Gen.

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	750-850 — 800-900
45	8.0	1450-1650 — 1650-1850
50	8.0	1550-1750 — 1750-1950

Rotation—Counterclockwise at commutator end.

Brush Spring Tension—(GGW & GGU) 35-53 ozs. (GGJ) 30-37 ozs. with new brushes.

Field Current—(GGW) 1.4-1.5 amperes, (GGJ & GGU) 1.4-1.6 amperes, all at 5.0 volts.

Motoring Current—(GGW) 4.8-5.3 amperes, (GGJ) 4.1-4.6 amperes, (GGU) 5.0-6.0 amperes, all at 5.0 volts.

Belt Adjustment: ¼" belt deflection or 40-50 lbs. tension with scale attached to field frame.

REGULATOR

Auto-Lite. Voltage & Current type. "Temperature Compensated" Current Regulator.

Auto-Lite Regulator No.	for Auto-Lite Generator
VBE-6001A	All "GGW" Gen.
VBF-6001A or VBF-6002A①	All "GGJ" Gen.
VAV-600-B or VAV-6002B①	All "GGU" Gen.

①—For Negative battery ground.

Checking & Adjusting & Detailed Data—*See Electrical Equipment Section.*

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.3-6.8 volts.

Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).

Contact Gap—.015" minimum.

Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.1-7.4 volts (VAV & VBE), 7.15-7.45 volts (VBF) after 15 minutes operation charging at 10 amperes (VBF), ½ maximum rate (VAV & VBE).

Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

▷*SETTING CAUTION—"Temperature Compensated" type. Set to following specifications at 70°F.:*

Test A—**Operating Amperes**—Test B

All "VAV" Reg. ... 50 ... 45 (43-47)

All "VBE" Reg. ... 52 ... 45 (43-47)

All "VBF" Reg. ... 66 ... 55 (53-57)

Test A—After 15 minutes operation charging at 10 amperes (VBF), ½ maximum rate (VAV & VBE).

Test B—After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 6.7-6.9 volts (VAV & VBE), 6.7-7.0 volts (VBF).

Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Sealed Beam. *See Electrical Equip. Section.*

Direction Signal: *See Electrical Equipment Section.*

Direction Signal Indicator—Located on lower face of speedometer.

Switches

Lighting—Dodge No. 1370138.

Beam Selector—Dodge No. 1253003.

Instrument—Dodge No. 1370011.

Direction Signal—Dodge No. 1440080.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting. 30 amperes, mounted on instrument panel between ammeter and headlamp switch.

Aux. Circuit Breaker—10 ampere. Protects Windshield Wiper and Back-Up Light.

FUSES: Clock—3 ampere. In clock lead.

Overdrive—20 ampere. On overdrive relay.

HORNS: Auto-Lite. Twin horns with relay.

Auto-Lite No.	Low Note	High Note
1952 (U.S. Cars)	HW-4203	HW-4204
1952 (Canada)	HW-4107	HW-4108
1953 (U.S. Early)	HAB-4619	HAB-4620
1953 (U.S. Later)	HAB-4655	HAB-4656
1953 (Canada Early)	HAB-4619	HAB-4620
1953 (Canada Later)	HAB-4659	HAB-4660

Horn Relay: Auto-Lite HRL-4104. Connected through ignition switch, operates only with ignition on.

Contacts Close—1.5-3.0 volts (seal to core with 4 V.).

Contacts Open—.5 volt min. (open from seal).

Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (gap between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: 6 cylinder, "L" hd. type.

Bore—3¼". **Stroke**—4⅝".

Displacement—230.2 cu. ins. **Rated HP**—25.35.

Developed Horsepower—103 at 3600 RPM.

Compression Ratio—7.0-1 Std. Cast-iron Head.

Compression & Vacuum Reading—*See Tune-up data.*

ENGINE REMOVAL: *See Dodge Special Data.*

OIL PAN REMOVAL: *See Dodge Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Dodge Special Data.*

PISTONS: Aluminum alloy, "U" slot, cam ground type.

▷*CYLINDER BORE OVERSIZE CAUTION—Engines with "A" following engine no. have .020" oversize bore.*

NOTE—Piston skirt is elliptical (.010-.012" smaller diameter across pin bosses than across thrust faces), and tapered (.0005-.0015" smaller diameter at top of skirt than at bottom).

Length—3 11/16". **Weight**—16 ozs. (stripped).

Removal—Pistons and rods removed from above.

Clearance—.0008" on thrust face ¾" from bottom of skirt.

Fitting New Pistons: Measure piston size with micrometer across thrust faces (right angles to pin bosses) ¾" from bottom of skirt. Fit piston in bore using .002" x ½" feeler, insert piston upside down in

ENGINE

CONTINUED FROM PRECEDING PAGE

bore with feeler 90° from pin bosses on side opposite slot. Pull required to withdraw feeler should be 6-10 lbs. with piston and cylinder bore at 70°F.

Replacement Pistons: .005", .020", .030", .040", .060" O.S. *See "Pistons" in Dodge Special Data.*

Installing Pistons: "U" slot away from valves.

PISTON RINGS: Two compression (tin-plated), two slotted oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	3/32"	.007-.015"	.002-.0035"
Oil Contr. (#3,4)	5/32"	.007-.015"	.001-.0025"

Installing Rings—#1 Compr. with step on inner edge up. #2 Compr. with step on inner edge up or if step on outer edge, install with step down. NOTE—Ring expanders used with top oil rings.

Replacement Rings: .005" .020" .030" .040" .050" .060" OS. *See "Piston Rings" in Dodge Special Data.*

Piston Pin: Diameter—55/64". **Length**—2 3/4". Pin floats in piston and rod, held by lock rings.
Pin Fit in Piston—.0000" to +.0005". Thumb push fit with piston at 70°F.
Pin Fit in Rod Bushing—.0001-.0002" clearance or Tight thumb press fit at 70°F.

Replacement Pins: Std., .003", .008" Oversize.

CONNECTING ROD: Length—7 13/16". **Weight**—27.90 ozs. (with bolts less bearings).
Crankpin Journal Diameter—2.0615-2.0625".

►*JOURNAL DIAMETER CAUTION—(ONE OR MORE journals machined UNDERSIZE). See Crankshaft data.*
Lower Bearing—Removable, precision type, steel-backed, thin babbitt-lined. No shims.
Clearance—.0005-.0015". **Sideplay**—.006-.011".

Bearing Adjustment: None (no shims). Replace bearings. *See "Connecting Rod & Bearings" in Dodge Special Data.*

Replacement Bearings: .001", .002", .010", .012", U.S. *See "Connecting Rod & Bearings" in Dodge Special Data.*

Installing Rods: Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT: 4 bearings, 7 integral counterweights, with vibration dampener on front end.
Journal Diameters—2.4995-2.5005".

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Engines with undersize journals identified as follows:* .010" **UNDERSIZE (ALL Main & Connecting Rod Journals)**—Letter "B" stamped with engine serial number indicates ALL Main & Connecting Rod Journals are .010" undersize.
Bearings—Removable, precision type, steel-backed, thin babbitt lined. No shims.
Clearance—.0005-.0015".

Bearing Adjustment: None (no shims). Replace bearings. *See "Crankshaft & Main Bearings" in Dodge Special Data.*

Replacement Bearings: .001", .002", .010", .012" U.S. *See "Crankshaft & Main Bearings" in Dodge Special Data.*

End Thrust: Taken by flanged faces of #4 (rear) main bearings. **Endplay**—.003-.007".

Crankshaft Front & Rear Oil Seals: *See "Crankshaft and Main Bearings" in Dodge Special Data.*

CAMSHAFT: 4 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 1/4".
Bearings—Removable, steel-backed, babbitt-lined bushings (except #4—machined in crankcase).
Clearance—.001-.003".
Camshaft Removal: *See Dodge Special Data.*

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width 1". Pitch .500" (1/2"). Length 24" or 48 links.
Timing Chain Removal: *See Dodge Special Data.*

Camshaft Setting: Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	4 27/32"
Exhaust	1 13/32"	.340-.341"	4 27/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.001-.003"
Exhaust	45°	23/64"	.003-.005"

Exhaust Valve Seat Inserts—*See Dodge Special Data.*

Valve Guides: Remove from above. Install new guides with the counterbore end UP for EXHAUST valves and with the counterbore end DOWN for INTAKE valves. Press new guides in with upper end 7/8" below top of block, ream guides to inside diameter of .342-.343" (Intake), .343-.345" (Exhaust).

Valve Springs: Install with close-coil end to top. Free Length 2".

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1 3/4"
Valve Open	110-120 lbs.	1 3/8"

Valve Lifters: Mushroom type (remove from below with camshaft out of engine). Stem diameter 5/8". Service by reaming lifter holes (work from above piloting reamer in valve guide) and installing oversize lifters furnished .001", .008", .030" Oversize.
Lifter Clearance—.0002-.001".

VALVE TIMING

Tappet Clearance: With engine HOT:
(1952) .008" Intake, .010" Exhaust.
(1953) .010" Intake and Exhaust.
NOTE—Tappet screws are self-locking type.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 8° BTDC. Close 36° ALDC.
Exhaust Valves—Open 37° BLDC. Close 7° ATDC.
Valve Timing Check—With .014" tappet clearance (Cold), #6 intake valve should open with #6 piston 8° before top dead center (8th graduation before "DC" mark on vibration dampener or crankshaft fan pulley aligned with pointer on chain case cover). Reset tappet clearance at .008" (1952), .010" (1953) with engine HOT for running clearance.

LUBRICATION

Engine Oiling System: Pressure to main and connecting rod bearings, camshaft bearings, timing chain.
Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—40-50 lbs. at 30 MPH.
Oil Pressure Relief Valve—Under plug below starter. Opens at 45-55 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring.

Oil Pan Removal: *See Dodge Special Data.*

Oil Pump: "Rotor" type on right side of engine.
Servicing—*See "Oil Pump" in Dodge Special Data.*

Oil Filter: On left side of engine above starter.
Servicing—Replace filter at 8000 mile intervals.
Replacement Filter Element—Mopar No. 1121694.

Oil Pressure Gauge: Auto-Lite. (1952 Early) No. 12682A, (1952 Late) No. 12820A, (1953) No. 12960A.

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass thermostat, and water distribution tube in cylinder block behind pump. Pressure type with pressure valve in filler cap.
Capacity—13 1/2 qts.
Pressure Valve—(1952) Dodge No. 1346849 (4 lb. type, stamped "4"), (1952-53) Dodge No. 1373136 (7 lb. type, stamped "7").

Radiator Removal: *See Dodge Special Data.*

Water Distribution Tube Servicing: *See "Cooling System" in Dodge Special Data.*

Water Pump: Packless type with grease fitting.
See Water Pump Section for complete data.
Removal—Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs, lift fan and pump off.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In cylinder head water outlet.
INSTALLATION NOTE—Install thermostat with 2 ports facing front and two ports facing rear.
Setting—Starts to open 157-162°F. Fully open 183-187°F.

Temperature Gauge: Auto-Lite. (Early 1952) No. 12716A, (Late 1952) No. 12818A, (1953) No. 12963A.

CLUTCH

Borg & Beck or Auburn (As Listed Below). Single plate dry disc type.

Borg & Beck Clutches

1952 Std.	9A7 (Assy. No. 952)
1953 Std.	10A7 (Assy. No. 957)
1952-53 Heavy Duty	11A6 (Assy. No. 931)

Auburn Clutch

1952-53	No. 9251-12

See Clutch Section for complete data.
Facings—Molded woven asbestos (all models).
Borg & Beck 9A7—I.D. 6", O.D. 9 1/4", Thickness .125".
Borg & Beck 10A7—I.D. 7", O.D. 10", Thickness .125".
Borg & Beck 11A6—I.D. 6 1/2", O.D. 11", Thickness .125".
Auburn 9251-12—I.D. 6", O.D. 9 1/4", Thickness .115".

Pedal Adjustment: Set pedal to just clear toeboard (stopscrew on lower end of pedal) and set for 1" free travel (adjust nut on connector link at fork). *NOTE*—Do not disturb turnbuckle at pedal spring.
Over-center Spring Adjustment—See "Clutch Notes" in Dodge Special Data.

Removal: Remove release fork pull-back spring, transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or Driving Plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE

Fluid Coupling Optl. on all models with Std. and overdrive transmission, Std. with Automatic Trans.
See Transmission Section for complete data.

Slippage Test: *See "Fluid Drive" in Transmission Section for complete data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Remove transmission and clutch (see TRANSMISSION and CLUTCH), take off driver flange stud nuts (Tool C-589), lower fluid drive assembly out.

SYNCHRO-MESH TRANSMISSION

Own Make. All helical gear, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). *See Transmission Section for complete data.*

Transmission Control: Manual steering col. shift Std. *See Transmission Section for complete data.*

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—See Chrysler Special Data for Propeller Shaft Center Bearing Removal on 7 Pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (If Power Shift used). Remove trans.-to-clutch housing capscrews and nuts. Pull unit to rear, down and out of car. *NOTE*—Use pilot studs for installation.

OVERDRIVE

Warner Type R10. Optional with Synchro-mesh Transmission. Planetary gear type with solenoid operation and accelerator pedal kick-down. *See Transmission Section for complete data.*

Control Relay—Auto-Lite (1952) No. HRT-4001, (1952-53) No. HRT-4001A.

Governor—Auto-Lite No. TGE-4008.

Solenoid—Delco-Remy No. 1118155.

Overdrive Control Fuse—20 ampere. In holder on control relay.

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

AUTOMATIC TRANSMISSION

Gyromatic—4 speed hydraulically operated type. Semi-automatic, four-speed transmission with hydraulic actuation and electrical control.

▷*TESTING, TROUBLE SHOOTING & OVERHAUL: See "Chrysler, DeSoto, Dodge Automatic Transmission" in Transmission Section.*

Kick-down Solenoid—Auto-Lite No. SSS-4003.

Governor—Auto-Lite No. TGG-4001.

Kick-down Switch—Part of carburetor assembly.

Removal: Remove access cover on right rear side of floorboard under front floor mat, disconnect speedometer cable, and governor, solenoid and interrupter switch wires at transmission. Remove governor and solenoid. Disconnect hand brake cable at brake band, remove cable and cable anchor bracket. Remove brake support, band, adjusting bolt bracket and lever as an assembly. Disconnect front universal (push yoke back), and gear-shift rods at transmission. Drain transmission, **replace drain plug.** Disconnect transmission mounting bolts and lower assembly out of car.

INSTALLATION CAUTION—Rear face of clutch housing and lower pan must be in correct alignment. Misalignment can cause hard shifting when transmission installed.

UNIVERSALS

Detroit Universal Series 4200. Ball & Trunnion type.

Propeller Shaft Center Bearing: Used on 8 Pass. Cars. *See "Propeller Shaft" in Dodge Special Data.*

REAR AXLE

Own Make—Semi-floating, hypoid gear type with Hotchkiss drive. *See Rear Axle Section for data.*

Ratios:	1952 Models
Coupe Models (Synchro-mesh)	3.73-1
Sedan Models exc. 8 Pass. (All Trans.)	3.9-1
8 Pass. Models	4.1-1
1953 Models	
All (Synchro-mesh Trans.)	3.9-1
All (Overdrive)	4.3-1
All (Gyromatic Trans.)	3.9-1

Removal: Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws.

Axle Shaft Removal—Remove wheel, hub and drum assembly (use screw type hub puller—Tool C-675), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller). *NOTE—Use puller C-293-E to remove* bearing from shaft, puller C-748 or C-358 to remove inner oil seal, drift C-201 to install seal.

Axle Shaft Oil Seal: Leather type mounted on brake support (backing plate).

Oil Seal Servicing—*See "Rear Axle" in Dodge Special Data.*

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008"

SHOCK ABSORBERS

"Oriflow." Direct-acting, hydraulic. Non-adjustable. Serviced by replacement.

Dodge Part Nos.	Front	Rear
1952 Early (Std)	1321127	1321128
1952 Later & 1953 (Std.)	1326164	1326165
1952 (Heavy Duty)	1540041	1450039
1953 (Heavy Duty)	1450041	1450075

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram. Coil springs and direct acting shock absorbers. *See Front Suspension Section for complete data*

Kingpin Inclination—5° to 6½° crosswise.

Camber—Pos. ⅜° to Neg. ⅜° (0° preferred).

Caster—0° preferred. Limits Pos. 1° to Neg. 1°.

Toe-In—0" (0-1/16") Adjust by turning both tie rods equally.

Toe-out on Turns—Inner wheel 21½° plus or minus 1° with outer wheel at 20°.

STEERING GEAR

Own Make—(Gemmer design) Model 305.

See "Gemmer Model 305 & 335" in Steering Gear Section for complete data.

BRAKES

Service: Dodge "Safe-Guard" Lockheed hydraulic.

▷*BRAKE SQUEAK OR SQUEAL CORRECTION—See "Lockheed-Chrysler Safe-guard Hydraulic Brake" in Brake Section.*

Drum Diameter—10" (D41, D47), 11" (D42, D46).

Lining—Molded asbestos bonded to shoe.

Length— Model	Front Wheel Primary	Front Wheel Secondary	Rear Wheel Primary	Rear Wheel Secondary
D42, 46	11.5"	11.5"	11.5"	8.8"
D41, 47	10.5"	10.5"	10.5"	8.0"

Width—2". Thickness—.200".

Clearance—.006" at each end of all shoes.

Braking Power—60% front wheels, 40% rear.

Hand Brake: On shaft at rear of transmission. External contracting type (Synchro-Mesh Trans.), Internal expanding type (Gyro-Matic Trans.).

Drum—6" (External Type), 7" (Internal Type).

Lining Molded asbestos. **Width 2", Thick. 5/32".**

Clearance (External Type)—.015-.020" between lining and drum.

Clearance (Internal Type)—Approximately .010" between lining and drum.

Adjustment—*See "Hand Brake Notes" in Dodge Special Data.*

Brake Power Unit: Chrysler Vacu-ease Vacuum Power unit.

See Brake Section for complete data.

MISC. MECHANICAL

CONVERTIBLE TOP CONTROL: Hydro-Lectric type *See Miscellaneous Section for complete data.*

WINDSHIELD WIPER: Auto-Lite or Redmond. Electric type with circuit breaker to protect wiper motor.

▷*1952-53 AUTO-LITE WIPER IMPROVED LINKAGE & MOTOR DRIVE PARTS: See "Auto-Lite Windshield Wiper" in Miscellaneous Section for complete data.*

▷*1952 REDMOND WIPER IMPROVED LINKAGE ASSEMBLIES: See "Redmond Electric Windshield Wiper" in Miscellaneous Section for complete data.*

Auto-Lite Wipers

1952 D41—Auto-Lite No. EWR-5001D & EWY-5001D.

1952 D42—Auto-Lite No. EWR-5001D or EWJ-4001 (Early), EWY-5001D or EWJ-4007 (Later).

1953 D46—Auto-Lite No. EMD-4001A.

1953 D47—Auto-Lite No. EMD-4001.

►*1954 AIR-CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

1953 MODELS

Series	Model
Coronet	D-44
Coronet Diplomat	D-48

1954 MODELS

Series	Model
Meadowbrook	D50-1, D50-1A
Coronet	D50-2
Royal	D50-3, D53-3
Sierra	D53-2

SERIAL NUMBER: On left front door hinge post.

1953 Starting Serial Numbers

Model	Detroit	Los Angeles	San Leandro
D-44	34500001	41500001	42500001
D-48	38500001	46500001	47001001

1954 Starting Serial Numbers

Model	Detroit	San Leandro
D-50-1A	32,152,901	45,105,801
D-50-1	34,642,001	42,510,001

D-53-3	38,525,001	47,003,001

ENGINE NUMBER: Stamped on boss on top front side of block just back of water pump
Starting Engine Number–D50-1001.

►*ENGINE NUMBER LETTERS: (Following Engine Number)–Identified as follows:*
"A"–All cylinders .020" Oversize.
"B"–All crankshaft journals .010" Undersize.
"AB"–BOTH above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 135-165 lbs., at cranking speed of 150 RPM.

VACUUM READING: Steady 18-21" idling.

VALVE TAPPET CLEARANCE: No adjustment required, except when valves are reconditioned (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic coil type, located in exhaust manifold of right cylinder block. Valve must operate freely. When installing coil, position shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer (tongue) end of spring in upper left hand position. Press inner end of coil into slot and seat firmly. Now move outer end (tongue) of spring down, around, up and over stud. *See Dodge Special Data.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2. See diagram.
SPARK PLUG GAP: .035".
Spark Plug–Auto-Lite 4S-140. Resistor type. 14mm.
COIL: Auto-Lite CR-6015.
Ignition Current–2.25 amperes idling, 5.0 amperes stopped.
DISTRIBUTOR: Auto-Lite IAZ-4003 (Early 1953); IAZ-4003A (Late 1953 & Early 1954); IAZ-4003B (Late 1954).
Condenser–Auto-Lite IBB-2015R. **Capacity**–.25-.285 microfarad.
Contact Point Set–IGP-3028ZS.
Breaker Gap–.015-.018". Set max. gap to .017".
Cam Angle–34° ± 3°. Total dwell both points. *Do not exceed breaker gap limits to obtain dwell.*
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Clockwise viewed from above.

IGNITION TIMING

Setting–4° BTDC. See Manual Adjustment.
Timing Mark–On fan drive pulley. Marks are 2° apart.
Manual Adjustment–Timing may be advanced to 8° BTDC with some premium fuels. Range of timing should not exceed plus or minus 4° from recommended factory setting.

►*IGNITION TIMING CAUTION: For accurate reading, be sure engine is at operating temperature and carburetor is at slow idle.*

CARBURETOR

►*CARBURETOR APPLICATION: Stromberg 2-Barrel is standard on all models.*

STROMBERG

Stromberg WW. Dual downdraft type with automatic choke.

Model	Stromberg No.
1953 Synchro-mesh (Exc. Fl. Dr.)	3-108
1953 Synchro-mesh (Fluid Drive) ①	3-105
1953 Gyro-Matic & Gyro-Torque ① ②	3-105
1953 Overdrive ②	3-109
1954 Synchro-mesh	3-108A
1954 Overdrive ②	3-109A
1954 PowerFlite ①	3-105A

①–Slow closing throttle dashpot.
②–Kick-down Switch.

Idle Setting–Initial Setting 3/4–1-1/4 turns open, final setting midway between missing and rolling points. Adjust both screws alike, turn screws out for richer mixture.

Idle Speed–450-500 RPM.

Float Level–3/16" from top of main body to top of float measured at center of float with float lip held firmly against needle valve. Use depth gauge or Tool T-25569 to measure float level. To reset float level, bend float lever next to float (use Tool T-24733).

Accelerating Pump–Normal setting, center hole; for less fuel install rod in inner hole; for more fuel install rod in outer hole.

Fast Idle: To make fast idle adjustment, insert gauge T-25570 (1st Step) between short side of choke valve and air horn. Hold choke valve lightly against gauge and slowly close throttle. Top end of fast idle lever should just enter first step on fast idle cam. To adjust, place thumb on counterweight and bend fast idle cam lever ear as required.

Automatic Choke Setting: Centered (arrow on edge of cover aligned with boss on air cleaner end of housing).

Kickdown Switch Adjustment (3-106, 3-109, 3-109A): Adjust switch position on bracket by backing off one locknut on mounting stem and tightening opposite nut until "B" contacts (terminals on opposite end from plunger) are closed with throttle valves wide open (use test lamp connected to switch terminals to check operation).

Slow Closing Throttle (Dashpot) Adjustment (3-105, 3-105A, 3-106): For maximum action, turn screw out until overtravel of plunger (possible inward movement) is 1/32-1/16" with throttle valves closed.

PowerFlite Throttle Linkage Adjustment: *See "PowerFlite" in Transmission Section.*

►*OTHER DATA: See Stromberg "WW" in Carburetor Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fuel Pump Pressure: 3-1/2–5-1/2 lbs.

CARTER 4-BARREL

Carter WCFB 2191S. Four-barrel downdraft type with automatic choke.
Idle Setting–1–2 turns open. For richer mixture, turn screws out.
Idle Speed–475–500 RPM.

►*OTHER DATA: See "Carter WCFB" Carburetor in Carburetor Section.*

PowerFlite Throttle Linkage Adjustment (1954 Models): *See "PowerFlite Transmission" in Transmission Section.*

Fuel Pump Pressure: 3-1/2–5-1/2 lbs.

CARB. EQUIPMENT

Fuel Pump: Auto-Lite FB-4002. Diaphragm type.
Pressure–3-1/2–5-1/2 lbs.
See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: Auto-Lite. "One Wire" and "Two Wire (Thermostatic)" types used. Nos. 13529A and 13586A (Dash Units), 13514A (Tank Unit) comprise "Two Wire (Thermostatic)" type, others are "One Wire".

Dash Unit (1953)–Auto-Lite No. 12964A (Exc. Suburban); No. 13193A (Suburban).
Dash Unit (1954)–(Exc. Suburban) Auto-Lite No. 13454A (Early), 13584A (Later). (Suburban) 13457A & 13529A (Early), 13586A (Later).
Tank Unit–(Exc. Suburban) Auto-Lite 12617A. (Suburban) 12904A (Early), 13514A (Later).
See "Fuel Gauges" in Electrical Equip. Section.

BATTERY

Auto-Lite 1H-105-D or Willard HW-1-105-C. 6 volt, 15 plate, 105 ampere hour rate.
Grounded Terminal–Positive.
Engine Ground–Left front of engine.

STARTER

Auto-Lite MCH-6206. Armature–MCH-2088.
Drive–Bendix "Folo-thru" type.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–42-53 ozs. (with new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6 ft. lbs.	Lock	2.0	335

Starting Switch: Auto-Lite SST-4006A. Magnetic type switch controlled by ignition switch. Neutral Safety Switch mounted on Transmission on Automatic Transmission equipped cars. *See "Starter Controls" in Electrical Equip. Section.*

GENERATOR

Early 1953 Models

Auto-Lite Generator No.	Armature No.
GGW-6009 (Standard)	GGW-2006F
GGJ-6001F (City Pol. & Taxi)	GGJ-2101F
GGJ-6001G (State Police)	GGJ-2101F
GGW-6009A (Special)	GGW-2006F

Late 1953 & 1954 Models

Auto-Lite Generator No.	Armature No.
GGW-6012A, B (Standard)	GGW-2006F
GGW-6014A, B (Power Steering)	GGW-2045F
GGU-6008A, B (Special)	GGU-2063F
GGU-6006A, C (Special Power Steering)	GGU-2042F
GGU-6010B (Special Power Steering)	GGU-2042F
GGJ-6005A (Special)	GGJ-2101AF

Performance Data–GGJ

Amperes	Volts	Cold – R.P.M. – Hot

45	8.0	1925-2125 – 2350-2550

Brush Spring Tension–(GGJ) 30-37 ozs. (GGU, GGW) 35-53 ozs., with new brushes.

CONTINUED ON NEXT PAGE

1953 MODELS

CONTINUED FROM PRECEDING PAGE

Field Current—(GGJ, GGU) 1.4—1.6 amperes, (GGW) 1.4—1.5 amperes, all at 5.0 volts.

Motoring Current—(GGJ) 4.1—4.6 amperes, (GGU) 5.0—6.0 amperes, (GGW) 4.8—5.3 amperes, all at 5.0 volts.

Rotation—Counter-clockwise at commutator end.

Belt Adjustment: Approximately 1/2" slack (when pushed from a straight line midway between pulleys.

REGULATOR

Auto-Lite Regulator No.	Generator
VBF-6001A	GGJ
VBF-6002A (Neg. Gd.)	GGJ
VAV-6001B	GGU
VAV-6002B (Neg. Gd.)	GGU
VBE-6001A	GGW

Cutout Relay

Cuts In—6.3—6.8 volts.

Cuts Out—4.1—4.8 volts.

Contact Gap—.015" minimum.

Air Gap—.031—.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting (VAV, VBF)—7.1-7.4 volts (at 70°), *after 15 minutes operation charging at ½ maximum rate.*

Setting (VBE)—7.1-7.4 volts (at 70°). *Test with regulator in operation at 10 amperes output.*

Air Gap—.048—.052" with contacts just opening.

Checking & Adjusting—See *Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A—Operating Amperes	Test B
VBE-6001A	52	45 (43-47)
VBF-6001A, 2A	55	55 (53-57)
VAV-6001B, 2B	50	50 (48-52)

Test A—After 15 minutes operation charging at 1/2 maximum rate.

Test B—After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 6.7—6.9 volts (VAV, VBE). 6.7—7.0 volts (VBF).

Air Gap—.048—.052" with contacts just opening.

Checking & Adjusting—See *Electrical Equip. Section.*

1954 MODELS

MISC. ELECTRICAL

Headlamps: Sealed Beam. See *Electrical Equip. Section.*

Direction Signal: See *Electrical Equip. Section.*

►*IGNITION-STARTER SWITCH CAUTION: When installing accessories, use accessory terminal only on ignition-starter switch and not the ammeter terminal post.*

Lighting Switch Removal: Remove knob (use small screwdriver to raise up special slip in knob, or remove small cross-head screw, depending on method used to hold knob). Remove hex nut and collar that holds assembly in place. Pry out switch (switch has threaded sleeve with two flat sides. Sleeve fits snugly in switch hole in panel).

Stop Light Switch Location: In brake line fitting on frame left side rail.

FUSES: Clock—3 ampere. In clock lead wire.

Radio—14 amperes. At ignition terminal feed.

Overdrive—20 ampere. On overdrive relay.

CIRCUIT BREAKERS: Lighting—30 ampere circuit breaker, located to right of ammeter, protects lighting circuits

Windshield Wiper—10 ampere circuit breaker, located on wiper switch, protects windshield wiper and back-up lights.

HORNS: Auto-Lite. Twin horns with relay.

	High Pitch	Low Pitch
1953 U.S. (Early)	HAB-4620	HAB-4619
1953 U.S. (Late)	HAB-4156	HAB-4155
1953 Canada D-46 (Early)	HA-4042	
1953 Canada (Early)	HAB-4620	HAB-4619
1953 Canada (Late)	HAB-4660	HAB-4659
1954 U.S.	HAB-4656	HAB-4655
1954 Canada	HAB-4660	HAB-4659

Horn Relay: Auto-Lite HRL-4104.

Contacts Close—1.5—3.0 volts (seal to core with 4.0 volts maximum).

Contacts Open—.5 volt *minimum (open from seal).*

Contact Gap—.026". **Air Gap**—.016—.020" (armature air gap with contacts closed but not sealed), .015—.018" (gap between armature leg and yoke with armature sealed to core).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE

►*AIR-CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning system. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8 (All Models).

Model	Bore	Stroke	Displacement
1953-54	3 7/16"	3 1/4"	241.3 cu. ins.

Model	Comp. Ratio	Rated HP	Dev. HP ①
1953 Coronet	7.1-1	37.8	140
1954 Meadowbrook	7.1-1	37.8	140
1954 Coronet, Royal	7.5-1	37.8	150

①—All at 4400 RPM.

Compression & Vacuum Reading—See *TUNE-UP.*

ENGINE REMOVAL: See *Dodge Special Data.*

OIL PAN REMOVAL: Remove oil level indicator, drain oil, disconnect steering linkage at idler arm support bracket, and allow linkage to drop. Remove bolts that hold oil pan to cylinder block and slide pan out, down, and away from engine.

CYLINDER HEAD & TIGHTENING TORQUES: See *Dodge Special Data.*

PISTONS

Aluminum alloy, T-slot, cam ground, with skirts relieved below piston pins, and tin coated.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" Oversize.*

Weight—16.4 ozs. (stripped).

Removal—Pistons and rods removed from above.

Fitting New Pistons: Clearance .00075—.00175" between thrust face of piston and cylinder wall. Coat bore with light engine oil (SAE 10W). Insert piston in bore upside down with feeler stock .0015" x 1/2" between thrust face of piston and cylinder wall. Pull to withdraw feeler should be 5—10 lbs. at 70° F.

Replacement Pistons: Std., .010", .020", .030", .040", .060" Oversize.

Installing Pistons: Arrow stamped on top of piston must point toward front of engine. NOTE—Assemble pistons to the rod on right hand cylinder bank with the "V" slot in connecting rod aligned with the "T" slot in piston. On left hand cylinder bank "V" slot in rod must be opposite "T" slot in piston.

PISTON PINS

Floating type with lock ring at each end.

Diameter—.8591—.8593". **Length**—2.880—2.890".

Pin Fit in Piston—.0000—.0005". Tight thumb press fit at 70° F.

Pin Fit in Rod Bushing—.0001—.0004". Tight thumb press fit at 70° F. Selective fit.

Replacement Pins: Std., .003", .008" Oversize.

NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0775—.0780"	.007—.015"	.0015—.0030"
Compr. (#2)	.0775—.0780"	.007—.015"	.0010—.0025"
Oil (#3)	.1860—.1865"	.007—.015"	.001—.003"

Replacement Rings: Furnished in sets Standard, .010", .020", .030", .040", .060" Oversize.

Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length (Center to Center)—5.9335—5.9375". **Weight**—21.14 ozs. (600 grams).

Crankpin Journal Diameter—1.9365—1.9375".

Maximum out-of-round and taper limits—.001".

Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)*—See *"CRANKSHAFT" below.*

Clearance—.0005—.0015". Maximum—.0025".

Endplay—.006—.014".

Bearing Adjustment—None. Replace bearings.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize.

Installing Rods: See *"Pistons (Installation)" above.* Rods are chamfered on one side at bearing insert and must be installed with chamfer toward crankshaft fillet. "V" slot across one bolt hole of each bearing cap is an oil passage for lubricating the opposite cylinder wall and piston. When installing bearing cap make certain "V" slot oil passage is toward top of engine.

►*CAUTION:* Rods are **interchangeable.** However, when rods are assembled to piston, the assemblies of one engine bank **are not interchangeable** with the other bank.

CRANKSHAFT

Journal Diameter—2.3745—2.3755".

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*

.010" UNDERSIZE (Main & Connecting Rod Journals)—Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" Undersize.

Bearings—Removable, precision type, steel-backed, babbitt lined. No shims.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize. Halves of Nos. 1, 2, and 4 bearings are interchangeable with one another (caps are not interchangeable); upper and lower halves of No. 3 bearing are interchangeable; No. 5 halves are NOT INTERCHANGEABLE.

End Thrust: Taken by center (#3) main Bearing.

Endplay—.002—.007". Maximum—.010".

Crankshaft Oil Seals: *See "Crankshaft & Main Bearings" in Dodge Special Data.*

CAMSHAFT

Journal Diameters—(1) 1.998—1.999", (2) 1.982—1.983", (3) 1.967—1.968", (4) 1.951—1.952", (5) 1.4355—1.4365".

Bearings—Removable, steel-backed, babbitt lined bushings.

Clearance—.001—.003". Maximum—.005".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay—.002—.006". Maximum—.010".

Timing Chain: Width—1-1/8". **Pitch**—.375". **Length**—68 links.

Camshaft Setting: Place crankshaft "Zero" mark exactly in line with center of camshaft. Temporarily install camshaft sprocket less chain, line up dowel pin holes in hub and gear, while at the same time positioning camshaft gear "Zero" mark exactly in line with center of crankshaft. (A straightedge should be used to check accuracy of this alignment). Remove camshaft gear and engage with timing chain. Place timing chain over crankshaft gear and at the same time, slide the camshaft gear over end of camshaft, keeping timing mark in position. With timing marks aligned, push gear on camshaft, install fuel pump eccentric. Install nut and tighten to 120-130 ft. lbs. torque.

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

►*TIMING CASE COVER REMOVAL CAUTION: Remove water pump before removing timing case cover. (Cover attaching bolt is behind water pump).*

VALVES

Tappet Clearance: None in service (hydraulic).

Valves	Head Diameter	Stem Diameter	Length
Intake	1-21/32"	.372-.373"	4-13/16"
Exhaust	1-13/32"	.371-.372"	4-3/4"

Valves	Seat Angle	Lift	Stem Clearance
Intake	45°	.360"	.001-.003"
Exhaust	45°	.364"	.002-.004"

Valve Seat Width—.060-.085" (Intake), .040-.060" Exhaust).

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Dodge Special Data.*

Intake Valve Stem Oil Seal—Seal ring installed in bore of spring seat on all intake valves (install rings after assembling springs and seat but before installing valve locks).

►*VALVE GRINDING CAUTION:* If the position of the valve in the head has been changed (due to valve or valve seat grinding) so as to shorten the operating length by 1/32" or more from its factory installed position, the dimension from valve spring seat in the

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

head to valve tip should be checked with gauge C-3061. If the valve tip exceeds the maximum allowable on the gauge, grind the tip as necessary (do not go below the minimum allowable on the gauge). Improper valve clearance at high speed will result if this condition is not corrected.

Valve Springs: Two springs used for each valve. Install with closed coil toward cylinder head.
Free Length—(Outer) 2-1/32", (Inner) 2-1/64".

Valve Spring Specifications

	Inner Spring		Outer Spring	
Valve	Lbs. Press.	Length	Lbs. Press.	Length
Closed	20-23	1-9/16"	38-43	1-11/16"
Open	40-45	1-3/16"	100-110	1-5/16"

►*CAUTION: Spring ends must be square within 1/16". (Use steel square on surface plate—revolve spring against square noting alignment of top coil).*

►*VALVE SPRING HEIGHT CAUTION:* If valves or seats are reground, check **installed** height of spring. If height of spring is 1-11/16" or greater, install a 1/16" spacer (Part No. 1400482) in the head counterbore to bring spring height back to nominal 1-5/8—1-11/16".

►*VALVE SPRING LOAD CAUTION: Hydraulic lifter "pump-up" will restrict engine speed and cause valves to burn if spring loads are not maintained.*

Valve Guides: Remove old guides by driving them out through top of head using tool C-3159. Install new guides by driving them up through valve port opening. To install INTAKE valve guide, place a steel scale across combustion chamber and drive valve guide in until punch mark on tool C-3159 is flush with face of cylinder head. To install EXHAUST valve guide, drive it in until it is flush with the machined face of the hole. Ream guide to .374-.375" with tool C-741.

►*CAUTION: Oil hole in top of exhaust guide must face up.*

NOTE—If Valve Guide Tool C-3159 is not available, drive guide in, measuring from top of valve seat as follows: **Intake**—15/16". **Exhaust**—1-3/32".

Hydraulic Valve Lifters: Diameter—.9040-.9045". **Clearance**—.0005-.0015".
Lifter Overhaul & Testing—*See "Valve System" in Dodge Special Data.*

Rocker Arm Assembly: *See "Valve System" in Dodge Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves—Open 17° BTDC. Close 47° ALDC.
Exhaust Valves—Open 55° BLDC. Close 9° ATDC.
Valve Timing Check—Turn crankshaft until #1 intake valve is closed. Insert a .210" spacer between the rocker arm and stem of #1 intake valve. (This can be done by prying between rocker and valve spring seat with a large screwdriver). Install a dial indicator so that pointer contacts valve spring seat as nearly at a right angle as possible. Wait until seat stops moving. This indicates that oil has bled out of hydraulic tappet and plunger has bottomed, giving in effect a solid tappet. Set dial indicator on zero and then turn crankshaft clockwise (normal running direction) until dial indicator shows that valve has lifted .024". Timing on crankshaft pulley should now read from 5° BTDC to 7° ATDC. (If reading is over specified limits, check gear indexing marks and timing chain wear). After valve timing checked, turn crankshaft counter-clockwise until tappet is back down to valve closed position. Remove .210" spacer.

►*CAUTION: Do not turn crankshaft further than indicated above, as spacer might cause valve spring to bottom and damage valve operating mechanism.*

►*TIMING CASE COVER REMOVAL CAUTION: One cover attaching bolt located in case back of water pump. Remove water pump before attempting to remove timing case cover.*

OILING SYSTEM

Crankcase Capacity (Exc. Gyro-Torque Cars)—5 qts. (refill). Add one quart if filter changed.
Crankcase Capacity (Gyro-Torque Cars)—12 qts. Add one quart if filter changed.

►*OIL CHANGE NOTE (GYRO-TORQUE CARS): Change oil twice each year only. See "Gyro-Torque Drive" in Transmission Section.*

Normal Oil Pressure: 40-65 lbs. with warm oil operating at 40-50 MPH.
Oil Pressure Relief Valve—Mounted in oil pump. Adjustable by replacing springs (3 types). (1) Standard spring painted RED. (2) Lighter than standard spring painted GRAY. (3) Heavier than standard spring painted BROWN.

Oil Pressure Gauge: Auto-Lite No. 12960A (1953); No. 13451A (Early 1954), No. 13587A (Late 1954). Not electric.

Oil Pump: Rotary type. In crankcase at rear end. Mounted on rear bearing cap.
Oil Pump Overhaul—*See "Oil Pump" in Dodge Special Data.*
Priming Oil Pump (After Overhaul): Prime pump before installing oil pump and strainer to rear main bearing cap.

Oil Filter: Shunt type. A portion of oil from oil pump is directed through this filter and the remainder flows directly into engine lubrication system.
Filter Element—Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: 19 quarts (20 with heater).
Pressure Valve: Dodge 1373136. Radiator filler cap. Opens at 7 lbs.
Thermostat: By-pass type in cylinder head water outlet. Starts to open at 159-165° F.

Water Pump: Packless type. Grease fitting for lubrication. *See Water Pump Section for data.*
Pump Removal—Drain cooling system, remove fan, belt, and pulley. Remove four water pump attaching bolts and remove water pump.

Temperature Gauge: Auto-Lite No. 12962A (1953); No. 13455A (Early 1954), No. 13589A (Late 1954).

CLUTCH

Borg & Beck. Single plate dry disc types as follows:

Car Model	Clutch Model	Assy.No.	Disc No.
Synchro-mesh	10A7	1331	382102
Gyro-Matic	9.5E	1214	382005
Gyro-Torque	9.5E	1220	382005
Hvy. Duty	11A6	929	381850

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: Adjust fork rod to secure 1/8—5/32" free movement of clutch release fork at push rod contact point. This will provide 1" free pedal movement at pedal pad.

Over-Center Spring Adjustment: Adjust clutch pedal stop screw and rear mounting of over-center spring so as to locate the center-line of over-center spring at 5/16—11/32" above center-line of clutch pedal shaft when pedal stop screw is in contact with the stop. Adjust over-center spring so as to obtain 12-15 lbs. pedal pressure required to hold clutch in released position after approximately 1" return of the clutch pedal pad from a full clutch release pedal travel position.

Removal: Remove transmission or transmission and overdrive (See Synchro-mesh Transmission). Remove clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

FLUID DRIVE

1953 MODELS

Own Make. Fluid coupling at rear of engine. Optional. *See "Fluid Drive" in Transmission Section.*

Slippage Test: *See "Fluid Drive" in Transmission Section.*

Removal: Remove transmission and clutch (see Transmission Removal), take off drive flange and stud nuts (Tool 589), lower fluid coupling out.

GYRO-TORQUE DRIVE

1953 MODELS

Own Make. Four element single stage torque converter with combined oil system (engine oil circulates through torque converter). *Torque converter unit cannot be disassembled. Replace assembly if repairs are necessary.*

Lubrication: Change engine oil and torque converter oil twice each year and oil filter element every 5000 miles. *See "Fluid Torque Drive (Combined Oil System)" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Capacity—13 quarts (combined engine and torque converter capacity including one quart for filter).
Removal: *See "Fluid Torque Drive (Combined Oil System)" in Transmission Section.*

SYNCHRO-MESH TRANSMISSION

1953-54 MODELS

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*
Transmission Controls: *See "Transmission Controls" in Transmission Section.*
Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission is to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

OVERDRIVE

1953-54 MODELS

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down.
See "Warner R10" Overdrive in Transmission Section.
Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*
Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

AUTOMATIC TRANSMISSION

1953 MODELS

►**Own Make (Used with Fluid-Drive or Gyro-Torque Drive).** Semi-automatic, four speed transmission with hydraulic actuation and electric control.
►*DIFFICULT SHIFTING CORRECTION: Caused by incorrect selector lever adjustment. See "Chrysler, DeSoto, Dodge Automatic Transmission" in Transmission Section.*
►*TESTING, TROUBLE SHOOTING & OVERHAUL: See "Chrysler, DeSoto, Dodge Automatic Transmission" in Transmission Section.*
Transmission Control: *See "Chrysler, DeSoto, Dodge Automatic Transmission" in Transmission Section.*
Kickdown Solenoid—Auto-Lite No. SSS-4003.
Governor—Auto-Lite No. TGG-4001.
Kickdown Switch—Part of carburetor assembly.
Ignition Interrupter Switch—On right side of transmission above governor.
Transmission Oil Capacity—3 pints, 10W engine oil.
Removal: Remove access cover on right side of floor board under floor mat. Disconnect speedometer cable, governor, solenoid, and interrupter switch wires at transmission. Remove governor and solenoid. Disconnect hand brake cable at brake band, remove cable and cable anchor bracket. Remove brake support, band, adjusting bolt bracket and lever as an assembly. Disconnect front universal (push yoke back), and gear shift rods at transmission. Drain Transmission, **then replace drain plug.** Disconnect transmission mounting bolts and lower assembly out of car.
►*INSTALLATION CAUTION:* Rear face of clutch housing and lower pan must be in correct alignment. Misalignment can cause hard shifting when transmission installed.

POWERFLITE TRANSMISSION

1954 MODELS

Torque Converter and hydraulically operated planetary transmission.
See "PowerFlite" Transmission in Transmission Section.
►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*
►*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).
Checking Fluid Level—Apply hand brake, place selector lever in neutral position. Allow engine to idle until normal operating temperature is reached. Shift selector lever through all ranges. Shift selector lever back to neutral and add Automatic Transmission Fluid (Type A) to bring level to full mark on oil level indicator.
Oil Filler Tube (Location)—(4-Dr. & Cl. Coupe) At right rear of engine compartment, (Conv. & Sp. Cl. Cpe.) Under floor mat at right hand side of driving compartment—Remove plug.
►*CAUTION:* To prevent dirt from entering transmission make sure oil level Indicator is properly seated in filler tube.
►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universal. Ball and Trunnion Type.

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE*—"Barrel Type" differential assembly used on cars with Automatic Transmission.
See "Dodge Hypoid" in Rear Axle Section.

Transmission	Rear Axle Ratios
Standard	3.73-1, 3.91-1
Overdrive	4.1-1, 4.3-1
PowerFlite	3.54-1, 3.73-1
Automatic (1953)	3.9-1

Backlash—.006-.010".
Thrust Pad Clearance (Barrel Type)—.006-.008".
Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly.
Axle Shaft Removal: Remove wheel, hub and drum assembly (Use puller C-845). *(CAUTION—Do not strike end of axle shaft to loosen hub; otherwise, possible damage to axle shaft bearings and thrust block might result).* Block brake pedal, disconnect brake line at wheel cylinders, remove axle shaft key, install sleeve C-757 in axle bearing outer oil seal before removing brake support plate from axle housing. Remove shims from each end of axle housing. (Each set should be kept separate so that at reassembly, central location of axle shafts, wheels and thrust block, will be assured). Remove axle shafts and bearings from housing (Use puller C-293-C to remove bearings from axle shafts, puller C-637 to remove inner oil seal, drift C-241 to install seal.
Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel hub removed, check end play with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

Standard Shock Absorbers

Car Model	Dodge Part No. Front	Rear
4-Dr., Club Coupe	1326164	1450633
Others	1450630	
8-Pass. Sed., Est. Wgn.		1450635

Heavy Duty Shock Absorbers

All (Exc. 8-Pass., Est. Wgn.)	1450041	1450635
All (Special)		1450075

FRONT SUSPENSION

Independent. Coil springs and direct-acting shock absorbers.
See "Dodge" in Front Suspension Section.
Kingpin Inclination—5° to 6½° at 0° camber.
Camber—Pos. 3/8° to Neg. 3/8° (Left side 1/4—1/2° greater than right side within these limits).
Caster—Neg. 1° to Pos. 1° (0° preferred).
Toe-In—0" to 1/16" (0" preferred).
Toe-Out on Turns—With outer wheel turned 20°, inner wheel should be 21½°±1°.

STEERING

Manual Steering Gear: Gemmer. Worm and two-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.
Power Steering: Ross "Full-Time". Linkage Type. Used with Standard Steering Gear.
See "Ross Power Steering (Linkage Type)" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BRAKES

Service: Dodge "Safe-Guard" Lockheed hydraulic.
See "Dodge Safe-Guard" in Brake Section.
Drums–Cast Iron. Diameter–11".
Wheel Cylinder Diameter–1-1/8". Single acting (front), double acting (rear wheels).
Replacement Linings & Shoes–Linings or shoes with linings are furnished Standard and .030" Oversize.
Lining–Molded asbestos (bonded to shoe).
Length–(Primary, Front & Rear) 11.5", (Secondary, Front) 11.5", (Secondary, Rear) 8.8".
Width–2". **Thickness**–.200".
Braking Power–60% Front, 40% Rear.
Clearance–.006" at end of all shoes.

Master Cylinder: On frame at base of brake pedal.
Checking Fluid–Access hole at left of front floor pan.
Removal–Remove floor mat and toe board. Disconnect push rod. Remove horse shoe clip and slide brake pedal off shaft. Disconnect brake line tubes at master cylinder fittings. Remove bolts from master cylinder body. Cylinder can then be lifted off frame bracket When reinstalling use new horse shoe clip.
Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans. 7" internal expanding type used with Automatic Transmissions.
Adjustment–*See "Hand Brake Notes" in Dodge Special Data.*

Lining–	Width	Thickness	Length
6" Ext. Type	2"	5/32"	15-3/8"
7" Int. Type	2"	5/32"	13-1/16"

Clearance (External Type)–.015-.020" around band.
Internal Type–Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

MISC. MECHANICAL

Windshield Wipers: (1953)–Auto-Lite EME-4001A (Early), EMG-4001A (Late). **(1954)**–Auto-Lite EMD-4003A (D50), EMD-4003 (D53), EMG-4102A (D50, D53 Two-speed). Electric type.

See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.
Air Conditioning: Dodge "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*
Convertible Top Control: Electrical-Mechanical Type. *See "Dodge & Plymouth" Top Control in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Caution" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model	Model Designation
1954 Meadowbrook	D-51-1
1954 Meadowbrook	D-51-1A
1954 Coronet	D-51-2
1954 Coronet	D-52
1955 Coronet	D-56-1

SERIAL NUMBER: On left front door hinge post.

Starting Serial Nos.	Detroit	San Leandro
D-51-1	32,160,001	45,110,001
D-51-1A	34,635,801	42,508,001
D-51-2	32,160,001	45,110,001
D-52	37,227,001	48,015,001
D-56-1	32,192,001	①48,016,001

①—Los Angeles Assembly plant.

ENGINE NUMBER: Stamped on left side of engine block between No. 2 and 3 cylinders.
Starting Engine Numbers—D51-1001 (1954); D56-1001 (1955).

►*ENGINE NUMBER LETTERS: (Following Engine Number)—Identified as follows:*
"A"—ALL cylinders .020" oversize.
"B"—ALL Main & Connecting Rod Bearings .010" undersize.
"AB"—BOTH above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 120-150 lbs. at cranking speed of 150 RPM.

VACUUM READING: Steady 18-20" at idling speed.

VALVE TAPPET CLEARANCE: .010" Intake. .010" Exhaust. Engine must be hot and idling. NOTE—Tappet screws are self-locking type.

►*CONTINUOUS HIGH SPEED TAPPET CLEARANCE:* An additional .002" clearance for **exhaust** tappets is desirable.

MANIFOLD HEAT CONTROL: Thermostatic coil type. See that valve operates freely. When installing coil, place new coil spring in position over shaft slot, with outer end (tongue) of spring in the upper left hand position (10 o'clock). Press inner end of coil into slot and seat firmly. Move outer end of spring down (counter-clockwise), around and up over stop stud.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .035".

Plugs—Auto-Lite Resistor Type 4S-140 14mm. Torque to 30-32 ft. lbs.

COIL: Auto-Lite CR-6012C.
Ignition Current—2.25 amperes idling, 5.0 stopped.

DISTRIBUTOR: Auto-Lite IAT-4101B (U.S.), IAT-4012A (Can. 1954), IAT-4012 (Can. 1955).
Condenser—IAT-3076RA. **Capacity**—.250-.285 mfd.
Contact Point Set—Auto-Lite IGW-3028BS.
Breaker Gap—.018-.022".
Cam Angle—36-42°. DO NOT exceed breaker gap limits to obtain dwell.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Automatic Advance—IAT-4101B

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	400	0	800
1	525	2	1050
4	875	8	1750
7	1225	14	2450
8	1350	16	2700

Automatic Advance—IAT-4012

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	350	0	700
1	450	2	900
5	800	10	1600
9	1300	18	2600
10	1425	20	2850

Automatic Advance-IAT-4012A

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control: Auto-Lite. Integral type.

Vacuum Advance—IAT-4101B

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4-3/4
1	2	5-7/8
4	8	9-3/8
7	14	12-7/8
8	16	14

Vacuum Advance—IAT-4012

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-1/4
2	4	6-3/4
4	8	8-5/8
6	12	10-3/4
9	18	15

Vacuum Advance-IAT-4012A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5
1	2	6½
3	6	9¼
5	10	12 1/8
7	14	15

►*DISTRIBUTOR INSTALLATION CAUTION: Make sure that No. 1 piston is at TDC on compression stroke and that distributor rotor is in No. 1 firing position.*

IGNITION TIMING

Setting—2° BTDC.
Timing Mark—On crankshaft vibration damper.

Manual Adjustment—Timing may be advanced with some premium fuels. Range of timing should not exceed plus or minus 4° from recommended factory setting.

CARBURETOR

►*CARBURETOR APPLICATION: Carter "B&B" (Single Barrel) used in Early 1954. Carter "BBS" (Single Barrel) Late 1954. Stromberg "WW" (Dual) used in 1955.*

CARTER "B&B" (EARLY 1954)

Transmission	Carter No.
Synchro-mesh	E9T1
Overdrive	E9N1
Gyro-Matic	E9V1
PowerFlite	E9U1

Idle Setting—½-1½ turns open. For richer mixture turn screw out.
Idle Speed—450-500 RPM.
Float Level—**(E9U1)** 1/16", **(Others)** 5/64" from top surface of body casting to top of float.
Accelerating Pump—Long stroke for cold weather, short stroke for hot weather.
Fast Idle: No adjustment required.
Automatic Choke Setting: Insert gauge pin through hole in automatic choke shaft, and hole in base flange to position shaft, loosen choke valve screw and position choke so that valve is tightly closed.
Slow Closing Throttle (Dashpot) (E9U1): Tighten adjustment screw, then turn counter-clockwise 4½ turns. Further adjustment outward will increase action of dashpot and lengthen its retarding effect.
Overdrive Kick-down Switch Adjustment (E9N1): With throttle valve in wide open position, adjust hex nuts on switch to have 1/64-3/64" clearance between kick-down lever and switch stem guide.
Throttle Linkage Adjustment (E9U1): *See "PowerFlite" Transmission in Transmission Section.*
►*OTHER DATA: See "Carter BB" in Carburetor Section.*
Fuel Pump Pressure: 4-5½ lbs.

CARTER "BBS" (LATE 1954)

Transmission	Carter No.
Synchro-mesh	2063S, SA
Overdrive	2062S, SA
PowerFlite	2116S, SA

Idle Setting—½-1½ turns open. For richer mixture turn screw out.
Idle Speed—450-500 RPM.
Float Level—7/32" from top surface of body casting to top of each float.
Accelerating Pump—Center hole. Distance from top of bowl cover to top of plunger shaft should be 54/64". Adjust by bending throttle connector rod at lower angle.

Fast Idle: .022-.026" clearance between throttle valve and bore of carburetor (side opposite idle port), with choke valve held closed and throttle stop screw backed off.
Automatic Choke Setting: Set on index.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Slow Closing Throttle Dashpot (2116S, SA): Maximum dashpot action is obtained by loosening locknut and *adjusting dashpot unit so that dashpot plunger shaft* can be moved inward approximately 3/32" with throttle valve tightly closed.

Overdrive Kickdown Switch Adjustment (2062S, SA): With throttle valve in wide open position, adjust hex nuts on switch to have 1/64-3/64" clearance between kickdown lever and switch stem guide.

Throttle Linkage Adjustment (2116S, SA): *See "PowerFlite" Transmission in Transmission Section.*

►*OTHER DATA: See "Carter BBS" in Carburetor Section.*

Fuel Pump Pressure: 4-5½ lbs.

STROMBERG "WW"
1955 MODELS

Transmission	Stromberg Carb. No.
Standard	WW3-124
Overdrive	WW3-125
PowerFlite	WW3-126

►*MANIFOLD FUEL DISTRIBUTION: Each barrel feeds all cylinders.*

Idle Setting—1 turn open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed—450-500 RPM.

Float Level—3/16" from top of main body to top of float measured at center of float, with float lip held firmly against needle valve. Use depth gauge or Tool T-25569 to measure float level. To reset float level, bend float lever next to float (use Tool T-24733).

Accelerating Pump—Normal setting, center hole; for less fuel install rod in inner hole; for more fuel install rod in outer hole.

Fast Idle: *With throttle valves in fully closed position,* turn throttle stop screw in until it just contacts throttle lever and then turn stop screw in 5-1/8 turns. When properly adjusted a #59 drill gauge should just pass between throttle valve and wall of throttle body. With choke valve closed and throttle lever held against throttle stop screw, a #48 drill gauge should just fit clearance between ear on contact lever and first step of fast idle cam. To adjust, bend cam contact ear.

Automatic Choke Setting: Centered (indicator mark on cover coincides with center mark on housing).

Unloader Adjustment: Apply light closing pressure to choke valve, then open throttle valve to wide open position. Choke valve should open just enough to insert a #19 drill gauge between choke valve and wall of air horn. To adjust, bend ear of cam contact lever with long nose pair of pliers.

Kickdown Switch Adjustment (3-125): With throttle valves in wide open position there should be 1/64-1/32" clearance between ear on throttle lever and threaded section of switch housing. To adjust, loosen adjusting nuts and adjust to correct position.

Slow Closing Throttle (Dashpot) Adjustment (3-126): With throttle stop screw set for normal idle speed, there should be a 1/16-1/32" clearance between end of dashpot plunger and ear of throttle lever when dashpot plunger is pushed into end of its stroke.

Throttle Linkage Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

►*OTHER DATA: See Stromberg "WW" in Carburetor Section.*

Fuel Pump Pressure: 4-6½ lbs.

CARB. EQUIPMENT

Fuel Pump: Auto-Lite FA-4003 (1954), FA-4005 (1955). Vacuum diaphragm type.
Pressure—4½-5½ lbs. (FA-4003), 5-6 lbs. (FA-4005).

Gasoline Gauge: Auto-Lite. Electric type.

►**1954 SUBURBAN GAS GAUGE NOTE:** *"One-Wire" and "Two-Wire" (Thermostatic) types used Dash units No. 13513A, 13529A, 13586A, and Tank unit No. 13514A are "Two-Wire". Others are "One-Wire".*

Dash Unit (1954)—(Except Suburban) Auto-Lite No. 13454A (Early), 13484 (Late). (Suburban) Auto-Lite No. 13457A & 13529A (Early), 13586A (Late).

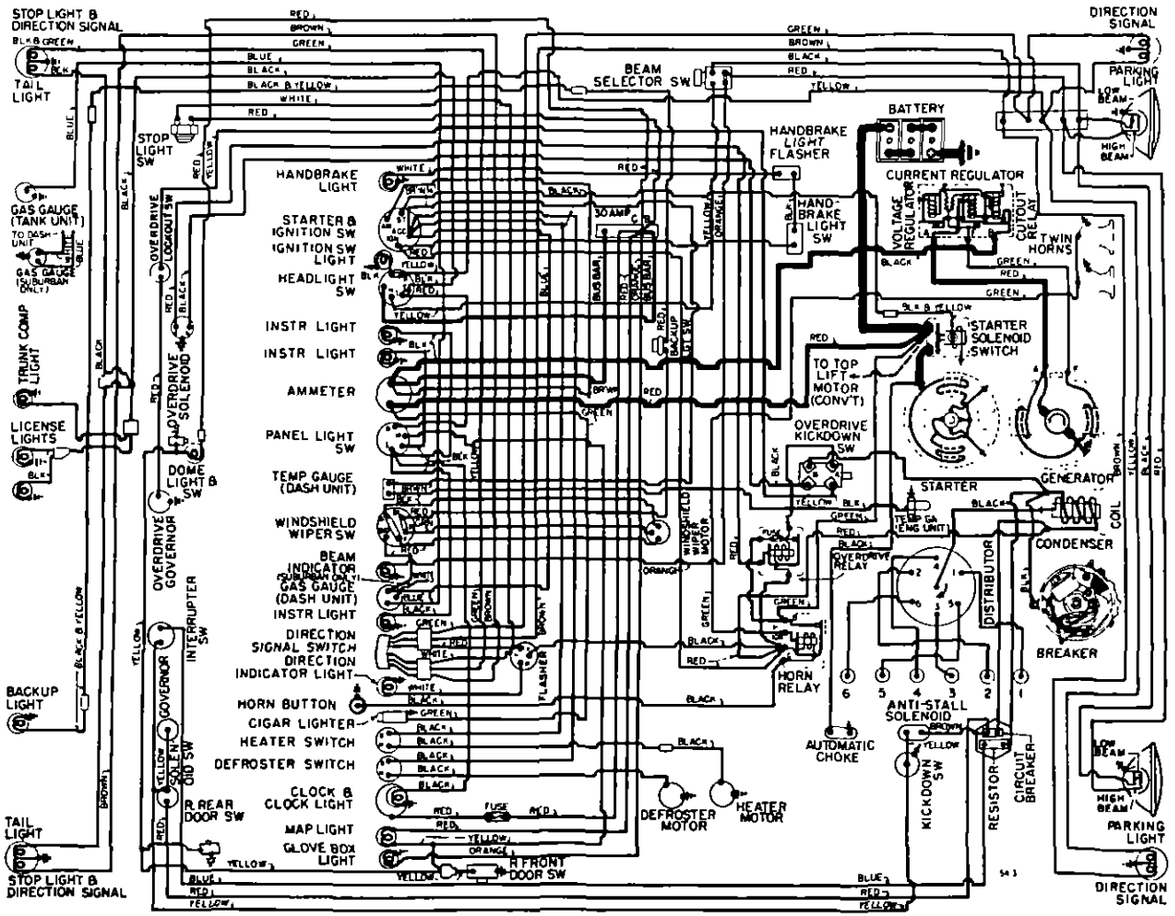
Dash Unit (1955)—Auto-Lite No. 13792A (Exc. Suburban), 13816A (Suburban)

Tank Unit (1954)—(Except Suburban) Auto-Lite No. 12617A. (Suburban—"One-Wire") Auto-Lite No. 12904A. (Suburban—"Two-Wire") Auto-Lite No. 13514.

Tank Unit (1955)—(Except Suburban) Auto-Lite No. 13794A. (Suburban) Auto-Lite No. 13905A.

See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY



Auto-Lite 1H-105-D or Willard HW-1-105-C. 6 Volt, 15 plate, 105 ampere hour capacity.

With PowerFlite—Auto-Lite 2H-120-D. 6 volt, 120 ampere hour capacity

Grounded Terminal—Positive.

Engine Ground—Left front of engine.

1955 MODELS

CONTINUED FROM PRECEDING PAGE

►*SPECIAL GENERATOR NOTE:* GGJ, GGU, and GGW type generators used. Performance specifications below apply equally to all generators, within any one of the three groups specified.

Performance Data–GGJ

Amperes	Volts	Cold –R.P.M.–	Hot
0	6.4	600-700	650-750
50	8.0	1400-1600	1550-1750
55	8.0	1500-1700	1650-1850

Performance Data–GGU

Amperes	Volts	Cold –R.P.M.–	Hot
0	6.4	750-850	800-900
45	8.0	1450-1650	1650-1850
50	8.0	1550-1750	1750-1950

Performance Data–GGW

Amperes	Volts	Cold –R.P.M.–	Hot
0	6.4	870-970	950-1050
40	8.0	1800-2000	2150-2350
45	8.0	1925-2125	2350-2550

Brush Spring Tension–(GGJ) 34-41 ozs., (GGU, GGW) 35-53 ozs., with new brushes.
Field Current–(GGJ) 1.4-1.7 amperes, (GGU) 1.4-1.6 amperes, (GGW) 1.6-1.7 amperes, all at 5.0 volts.
Motoring Current–(GGJ) 4.1-4 6 amperes, (GGU) 5 0-6.0 amperes, (GGW) 5.0-5.5 amperes, all at 5.0 volts.
Rotation–Counter-clockwise at commutator end.

Belt Adjustment: Loosen generator adjusting strap and generator-to-generator bracket mounting bolts. With Tool C-3379 hooked over generator and a torque wrench attached to tool, apply torque of 45 ft. lbs. (new belt), 27 ft. lbs. (old belt), to pull generator outward While holding generator outward at required torque, securely tighten generator mounting bolts and adjusting strap.

REGULATOR

Auto-Lite Regulator No.	Generator
VBF-6001A	GGJ
VBF-6002A (Neg. Gd.)	GGJ
VAV-6001B	GGU
VAV-6002B (Neg. Gd.)	GGU
VBE-6001A	GGW
VBE-6201A (Late 1955)	GGW

Cutout Relay

Cuts In–6.3-6.8 volts.
Cuts Out–4.1-4.8 volts.
Contact Gap–.015" minimum.
Air Gap–.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting (VAV, VBF)–7.1-7.4 volts (set at 70°F), *after 15 minutes operation charging at ½ maximum rate.*
Setting (VBE)–7.1-7.4 volts (at 70°F). Test with regulator in operation at 10 amperes output.
Air Gap–.048-.052" with contacts just opening.
Checking & Adjusting–*See Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F (VAV, VBE, VBF).*

Regulator	Test A-Operating Amperes-Test B
VAV-6001B, 2B	55 . . . 50 (48-52)
VBE-6001A, 6201A	52 . . . 45 (43-47)
VBF-6001A, 2A	66 . . . 55 (53-57)

Test A–After 15 minutes operation charging at 1/2 maximum rate.
Test B–After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 6.7-6.9 volts (VAV, VBE), 6.7-7.0 volts (VBF)).
Air Gap–.048-.052" with contacts just opening.
Checking & Adjusting–*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Direction Signal: *See Electrical Equip. Section.*
►*IGNITION-STARTER SWITCH CAUTION: When installing accessories, use accessory terminal only on ignition-starter switch and not the ammeter terminal post.*
Lighting Switch Removal: Remove knob (use small screwdriver to raise up special clip in knob, or remove small cross-head screw, depending on method used to hold knob). Remove hex nut and collar that holds assembly in place. Pry out switch (switch has threaded sleeve with two flat sides. Sleeve fits snugly in switch hole in panel).
Stop Light Switch Location: On forward end of brake master cylinder.
FUSES: Clock–3 amperes. Located on clock.
Radio–14 amperes. At ignition terminal feed.
Overdrive–20 amperes. On overdrive relay.
CIRCUIT BREAKERS: (1954)–One 30 amp. circuit breaker located to right of ammeter, protects lighting circuits.
CIRCUIT BREAKERS: (1955)–Located in headlight switch assembly. Three in number as follows:

25 Ampere Circuit Breaker–Protects headlights, high beam indicator light, and parking lights.
10 Ampere Circuit Breaker–Protects tail lights, license plate lights, clock light, and instrument panel light.
10 Ampere Circuit Breaker–Protects stop lights, map light, dome light, glove box light, courtesy light, and trunk compartment light.

HORNS: (1954)–Auto-Lite HAB-4656 (High Pitch), HAB-4655 (Low Pitch). **(1955)**–HAB-4708 (High Pitch). HAB-4707 (Low Pitch).
Horn Relay: Auto-Lite HRL-4104 (1954). RAF-4001 (1955).

ENGINE

Model	Bore	Stroke	Displacement
1954-55	3¼".	3 5/8"	230.2 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
1954	7.25-1	25.35	110 at 3600 RPM
1955	7.40-1	25.35	123 at 3600 RPM

Compression & Vacuum Reading–*See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Dodge Special Data.*
►*MANIFOLD INSTALLATION CAUTION:* Two long capscrews extend into cylinder block water passage Before installing, apply sealer to these capscrews. It is important that conical washers at flange ends of exhaust manifold be installed to permit expansion and contraction without loosening.
OIL PAN REMOVAL: Drain engine oil. As soon as oil is drained, install drain plug and tighten securely. Remove clutch housing pan to prevent damaging oil pan gaskets on clutch housing pan dust seal. Remove oil level indicator and drop pan on tie rod. Lift up oil strainer so it clears baffle inside pan. With strainer lifted, slide pan to rear and remove. NOTE–New end gaskets should protrude 1/4" to 1/8" above oil pan. *Ends must not be cut off.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, U-slot, cam ground type.
►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bore .020" oversize.*
Weight–16 ozs. (stripped).
Removal–Pistons and rods removed from above.

Fitting New Pistons: Clearance .0015-.002" between thrust face of piston and cylinder bore. With piston pin and rings removed, cylinder wall and piston dry and clean, insert piston, upside down, into cylinder bore, with feeler stock, .002" x 1/2", inserted between cylinder wall and piston, on high spot of piston contour. Pull to withdraw feeler should be 6-10 lbs.

Replacement Pistons: Std., .005", .020", .030", .040", .060" oversize.
Installing Pistons: "U" slot away from valves.

PISTON PINS

Full floating type.
Diameter–55/64". **Length**–2-3/4".
Pin Fit in Piston–.0000-.0005". DOUBLE THUMB push fit at room temperature (70° F.)
Pin Fit in Rod Bushing–.0001-.0002". Tight thumb push fit at room temperature (70° F.)
Replacement Pins: Std., .003", .008" oversize.
NOTE–Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.010-.020"	.0025-.004"
Compr. (#2)	3/32"	.010-.020"	.002-.0035"
Oil (#3)	5/32"	.010-.020"	.001-.0025"
Oil (#4)	5/32"	.010-.020"	.001-.003"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Replacement Rings: Std., .010", .020", .030", .040", .050", .060" oversize.
Installing Rings: #1 Compression, with step on inner edge up. #2 Compression with step on inner edge up (step down, if step on outer edge).

CONNECTING RODS

Length (Center to Center)–7-13/16". **Weight**–27.9 ozs.
Crankpin Journal Diameter–2.0625".
Maximum out-of-round and taper limits–.001"
Lower Bearings–Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)–See "CRANKSHAFT" below.*
Clearance–.0005-.0015".
Endplay–.006-.011".
Bearing Adjustment: None. Replace bearings.
Replacement Bearings: Std., .001", .002", .010", .012" undersize.
Installing Rods: Oil metering hole toward valve side of engine.

CRANKSHAFT

Journal Diameter–2.4995-2.5005". Four bearing.
Bearing Type–Removable, precision type, thin babbitt on steel. No shims.
►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows: **.010" UNDERSIZE (All Main & Connecting Rod Journals)**–Letter "B" stamped with engine serial number indicates that ALL Main & Connecting Rod Journals are .010" undersize.
Clearance–.0005-.0015" desired.
Replacement Bearings: Std., .001", .002", .010", .012" undersize.
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*
End Thrust: Taken by flanged faces on rear (#4) main bearing. **Endplay**–.003-.007".

CAMSHAFT

Journal Diameters–(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-1/4".
Bearings–Removable, steel-backed babbitt lined bushings (exc. #4–machined in crankcase).
Clearance–.001-.003". NOTE–If clearance exceeds .005" (measure with dial indicator placed against cam lobe and pry toward indicator), install new camshaft for test and if clearance is greater than .0035", replace bearings.
End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**–.002-.006".
Timing Chain: Width–1". **Pitch**–.500". **Length**–24" or 48 links.
Camshaft Setting: Sprockets marked. Mesh chain with sprockets so that "O" marks on sprockets are adjacent and in line with a straightedge across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Dodge Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance: .010" Intake, .010" Exhaust (engine hot and idling). NOTE–.002" additional clearance on exhaust tappets if car driven at continuous high speed.

Valves	Head Diam.	Stem Diam.	Length
Intake	1-17/32"	.340-.341"	4-27/32"
Exhaust	1-13/32"	.340-.341"	4-25/32"

Valves	Seat Angle	Lift	Stem Clearance
Intake	45°	.23/64"	.001-.003"
Exhaust	45°	.23/64"	.003-.005"

Valve Seat Width–1/16-3/32". Runout .0015" maximum.

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Dodge Special Data.*

Valve Guides: Remove from above. Press new guides in with upper end 7/8" below top of block, finish ream to give correct valve stem clearance (See Valve Stem Clearance above). CAUTION–*Guides must be installed with counterbore end UP on exhaust valves and counterbore end DOWN on intake valves.*

Valve Springs: Install with closely coiled end up.
Free Length–2".

Valve Spring Specifications

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1-3/4"
Valve Open	110-120 lbs.	1-3/8"

Valve Lifters: Mushroom type (remove from below).
Stem Diameter–5/8". Ream holes from above (pilot in guide). Oversizes .001", .008", .030".
Lifter Clearance in Block–.000-.001".

VALVE TIMING

See *"Camshaft Setting" under CAMSHAFT above.*
Intake Valves–Open 12° BTDC. Close 44° ALDC.
Exhaust Valves–Open 50° BLDC. Close 6° ATDC.
Valve Timing Check–With .014" (Cold) tappet clearance, No. 6 intake valve should open with No. 6 piston 12-13° BTDC or .0766-.0770" BTDC. Reset tappet clearance to .010" HOT running clearance.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add one additional quart when filter changed.
Normal Oil Pressure: 40-50 lbs. at 25-30 MPH.
Oil Pressure Relief Valve–Oil pressure relief valve opens at 45-55 lbs. Under plug on left side of crankcase below starting motor. Provides additional oil at idling speeds. Adjustable by replacing springs (3 types). (1) Standard spring is not painted. (2) Lighter than standard painted RED. (3) Heavier than standard painted GREEN. When replacing springs, same color springs should be used.
Oil Pressure Gauge–Auto-Lite 13451A (Early 1954), 13587A (Late 1954), 13790A (1955). Not electric.

Oil Pump: Rotor type on right side of crankcase.
Overhaul–*See "Oiling System" in Dodge Special Data.*
Oil Filter: By-pass type. On left side of engine above starter.
Servicing–Install new filter element and cover gasket at 8000 mile intervals (more often in dusty areas). Change oil at same time filter is changed.
Crankcase Ventilation: Filter in oil filler tube and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: 14 qts. (1954), 13 qts. (1955). Add one quart if equipped with heater.
Pressure Valve: Dodge No. 1373136. Radiator filler cap. Opens at 7 lbs.
Thermostat: By-pass type in cylinder head water outlet. Starts to open at 159-165° F.
Water Pump: Packless type. Grease fitting for lubrication. *See Water Pump Section for data.*
Pump Removal–Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs. Remove pump.
Water Distribution Tube: *See "Cooling System" in Dodge Special Data.*
Temperature Gauge–Auto-Lite 13452A & 13588A (Early 1954), 13591A. (Late 1954), 13791A (1955). *NOTE*–Early 1954 types are not electric. Late 1954 & 1955 are electric type.

CLUTCH

►*CLUTCH PEDAL CLICKING SOUND OR CLUTCH SLIPPAGE CORRECTION (When Due to Interference Between Rear End of Clutch Release Fork Rod & Clutch Release Fork):* To correct, rod end should be reworked to eliminate shoulders of rod end forward of attaching eyelet.

1954 Clutch Application

Borg & Beck	Model	Assy. No.	Disc No.
Standard	10A7	957	CD728
Overdrive	10A7	957	382139
Gyro-Matic	9A7	952	CD756
Heavy Duty	11A6	931	381850

1955 Clutch Application

Borg & Beck	Model	Assy. No.	Disc No.
Standard	9A7	361373	382237
Heavy Duty	10A7	361368	381758
Heavy Duty (Spl)	11A6	929	381850

See "Borg & Beck" & "Auburn" Clutches in Clutch Section.

Pedal Free Play Adjustment: Adjust fork rod to secure 1/8-5/32" free movement of clutch fork outer end. This adjustment will provide 1" free pedal movement at pedal pad.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Over-Center Spring Adjustment (1954 Models): Adjust clutch pedal stop screw and rear mounting of over-center spring so as to locate the centerline of the over-center spring at 5/16-11/32" above centerline of clutch pedal shaft when pedal stop screw is in contact with the stop. Adjust over-center spring so as to obtain 12-15 lbs. pedal pressure required to hold clutch in released position after approximately 1" return of the clutch pedal pad from a full clutch release pedal travel position.

Over-Center Spring Adjustment (1955 Models): *(NOTE*—Over-Center spring located above brake pedal and attached to pedal mounting bracket). Disconnect clutch pedal pushrod. Remove over-center eyebolt adjusting nut. Reinstall adjusting nut, tighten finger tight then further tighten four complete turns. This adjustment will require 12-15 lbs. pressure to hold clutch pedal down when it is 1" from fully released position.

Removal: Remove transmission or transmission and overdrive (See Synchro-mesh Transmission). Remove clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*

ransmission Controls: *See "Transmission Controls" in Transmission Section.*

HARD SHIFTING CORRECTION: Check for interference between gear shift lever and transmission cover. If found, replace manual remote gearshift lever shaft screw, Part No. 853877. *(NOTE*—Before installing screw, it should be tested for proper hardness with a standard mill file. Only screws which are **not** file soft should be installed). If interference not found at point indicated above, check for interference between gearshift rod and lower edge of instrument panel. In most cases, condition can be corrected by realignment of steering column jacket. In some cases it may be necessary to provide adequate clearance by filing out lower edge of instrument panel.

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

OVERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down.
See "Warner R10" Overdrive in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

GYROMATIC TRANSMISSION

Own. Semi-automatic, 4-speed transmission with hydraulic actuation and electrical control.
See "Dodge Gyro-Matic" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dodge Gyro-Matic" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Dodge Gyro-Matic" Transmission in Transmission Section.*

Lubrication: Check oil level in transmission every 1000 miles or 30 days, drain and refill every 10,000 miles or once a year, maintain oil level even with bottom of filler plug hole. **Capacity**—3 pints.
Recommended Oil—SAE 10-W.

►*OTHER "DODGE GYRO-MATIC" SERVICE DATA: See "Dodge Gyro-Matic" Transmission in Transmission Section.*

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated planetary transmission.
See "PowerFlite" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).
Checking Fluid Level—Apply hand brake, place selector lever in neutral position. Allow engine to idle until normal operating temperature is reached. Shift selector lever through all ranges. Shift selector lever back to neutral and add Automatic Transmission Fluid (Type A) to bring level to full mark on oil level indicator.
Oil Filler Tube (Location)—At right rear of engine compartment.
CAUTION: To prevent dirt from entering transmission make sure oil level indicator is properly seated in filler tube.

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universal. Ball and Trunnion Type.

►*UNIVERSAL JOINT BOOT NOTE:* A new, larger boot is used on the rear universal joint and can be identified by a daub of white paint on it. In service, larger boot can be used on both front and rear joints, but small boot should **never** be used on rear universal joint as boot failure is very likely to result.

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive.
See "Dodge Hypoid" in Rear Axle Section.

Transmission	Rear Axle Ratios
Standard	3.9-1 (39-10)
Overdrive	4.3-1 (43-10)
PowerFlite	3.73-1 (41-11)
Gyro-Matic	3.9-1 (39-10)

Backlash—.006-.010".

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly.

Axle Shaft Removal: Remove wheel, drum, and hub assembly (use screw type hub puller—Tool C-675), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 Puller). *NOTE*—Use Puller C-293-E to remove bearing from shaft, Puller C-748 or C-358 to remove inner oil seal, Drift C-201 to install seal.

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick (equally at both wheels). **Endplay**—.003-.008".

SHOCK ABSORBERS

"Oriflow". Direct-acting, hydraulic type. Serviced by replacement.

Model	Front	Rear
1954 (Exc. D51-A)	1450630	1450633
1954 (D51-A)	1326164	1326166
1954 (Heavy Duty)	1450041	1450635
1954 (Sp. Hvy. Duty)		1450075
1955 (All Models)	1614404	1450918
1955 (Heavy Duty)	1617004	1450920
1955 (Sp. Hvy. Duty)		1450037

FRONT SUSPENSION

Independent. Coil springs and direct acting shock absorbers.
See "Dodge" in Front Suspension Section.
Kingpin Inclination—5° to 6½° (1954). 5½° (1955), at 0° Camber.
Caster (1954)—Neg. 1° to Pos. 1° (0° preferred).
Caster (1955)—Neg. 2° to 0° (Neg. 2° preferred with Manual Steering, 0° preferred with Power Steering).
NOTE—On Power Steering Cars, left side should be 0° to ¾° more negative than right side.

Camber (1954)—Pos. 3/8° to Neg. 3/8° (Left side ¼° to ½° greater than right side within these limits).
Camber (1955)—Pos. ¼°±3/8° (Left side Pos. ½°, Right side 0° preferred).
Toe-In—0" to 1/16" (0" preferred).
Toe-out on Turns—With outer wheel at 20°, inner wheel should be 21½°±1°.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STEERING

Manual: Gemmer. Worm & Roller.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering (1954): Linkage type, used with standard steering gear.
See "Monroe Power Steering (Linkage Type)" in Steering Section.

Power Steering (1955): "Co-axial" type with combined steering gear and power unit.
See "Dodge Co-Axial Power Steering" in Steering Section.

►*1955 JERKY OPERATION OF POWER STEERING GEAR CORRECTION:* Adjust generator drive belt (see Generator), then adjust fan drive belt so that a maximum of ¼" belt deflection is obtained when applying a 10 lb. pull with spring scale at middle of widest belt span.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

►*LOOSE OR SQUEAKY BRAKE PEDAL OR PAD CORRECTION:* Change location of attachment of brake pedal return spring from right side of pedal bracket to left side (Standard & Overdrive), left side to right side (PowerFlite), and attach in hole provided in bracket. On PowerFlite cars, if excessive movement or squeak is encountered in pedal pad, remove brake pedal and make several prick punch marks on pedal at pedal pad mounting bracket location to improve clamping action, re-install pad, tighten retaining bolt to 20 ft. lbs.

Service: Dodge "Safe-Guard" Lockheed Hydraulic.
See "Dodge Safe-Guard" in Brake Section.

Drums– Cast iron. (1954) Diameter 10"(Exc-D51-2). 11" (D51-2). (1955) 11" (All models).

Wheel Cylinder Diameter–1-1/8". Single acting (front), double acting (rear wheels).
Replacement Linings & Shoes–Lining or shoes with linings are furnished Standard and .030" Oversize.
Lining–Molded asbestos (bonded to shoe).

Lining Length

	Front Wheel		Rear Wheel	
Model	**Pri.**	**Sec.**	**Pri.**	**Sec.**
1954(Exc. D51-2)	10.5"	10.5"	10.5"	8.0"
1954 (D51-2)	11.5"	11.5"	11.5"	8.8"
1955 (All Models)	11.5"	11.5"	11.5"	8.8"

Width–2". Thickness–.200".
Braking Power–60% Front. 40% Rear.
Clearance–.006" at end of all shoes.

Master Cylinder: On frame at base of brake pedal (1954). On engine side of dash panel opposite base of brake pedal (1955).
Checking Fluid–Access hole at left of front floor pan (1954). At top of master cylinder on dash in engine compartment (1955).
Removal (1954)–Remove floor mat and toe board and disconnect pushrod. Remove horseshoe clip and slide brake pedal off shaft. Disconnect brake line tubes at master cylinder fittings. Remove bolts from master cylinder body. Cylinder can then be lifted off frame bracket.

Removal (1955)–Disconnect pushrod. Disconnect brake line tubes at master cylinder fittings. Remove four stud nuts and remove cylinder.

Power Brakes: Combination vacuum power unit and master cylinder. Unit mounted on engine side of firewall and replaces regular master cylinder. *See "Dodge Power Unit" in Brake Section.*

Removal of Power Unit–Same as for standard master cylinder, after hydraulic lines and stop light wires removed.

Parking Brake: On shaft at rear of transmission. 6" external-contracting type used with Synchro-mesh Trans. 7" internal expanding type used with PowerFlite Transmission.

Adjustment–*See "Hand Brake Notes" in Dodge Special Data.*

Lining–	**Width**	**Thickness**	**Length**
6" Ext. Type	2"	5/32"	15-3/8"
7" Int. Type	2"	5/32"	13-1/16"

Clearance (External Type)–.015-.020" around band.
Internal Type–Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

MISC. MECHANICAL

Windshield Wipers: Auto-Lite electric type as follows:

Model	**Auto-Lite No.**
1954 (D51)	①EMD-4003A
1954 (D51)	②EMG-4102A
1954 (D52)	①EMD-4003
1954 (D52)	②EMG-4102A
1955 (Early)	①EMU-4101
1955 (Early)	③EMZ-4001
1955 (Late)	①EMU-4101A
1955 (Late)	③EMZ-4001A

①–Single Speed. ②–Two Speed. ③–Variable Speed.
See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.

Air Conditioning: Dodge "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motors in each window. Controlled by door switch and master switch. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Electric type. *See "Power Seat Adjusters" in Miscellaneous Section.*

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Series-	Model Identification
Coronet	D-55-1
Royal	D-55-2
Custom Royal	D-55-3

SERIAL NUMBER: On left front door hinge post.

Starting Serial Nos.	Detroit	Los Angeles
D-55-1, 2, 3	34740001	42518001

ENGINE NUMBER: Stamped on boss on top front side of block just back of water pump.

Starting Engine Number–(D-55-1, 2) D55-1-1001, (D-55-3) D55-3-1001.

►*ENGINE NUMBER LETTERS: (Following Engine Number)–Identified as follows:*

"A"–ALL cylinders .020" oversize.

"B"–ALL Main & Connecting Rod Bearings .010" undersize.

"AB"–BOTH above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 135-165 lbs. at cranking speed of 150 RPM.

VACUUM READING: Steady 18-21" idling.

VALVE TAPPET CLEARANCE: No adjustment required, except when valves are reconditioned (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic coil type, located in exhaust manifold of right cylinder block. Valve must operate freely. When installing coil, position shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot,. with outer (tongue) end of spring below shaft, horizontal and facing front of engine. Press inner end of coil into slot and seat firmly. Now move outer (tongue) end up, around (counter-clockwise) and hook under left stud (toward rear of engine).

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders–RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Plugs–Auto-Lite Resistor Type 4S-165, 14mm. Torque to 30 ft. lbs.

COIL: Auto-Lite CR-6012C.

Ignition Current–2.25 amperes idling, 5.0 amperes stopped.

DISTRIBUTOR: Auto-Lite (D-55-1, 2) IAZ-4003C, (D-55-3) IAZ-4003D.

Condenser–Auto-Lite IBB-2015R. **Capacity**–.25-.28 microfarad.

Contact Point Set–Auto-Lite IGP-3028ZS.

Breaker Gap–.015-.018". Set maximum gap to .017".

Cam Angle–34° ± 3° with both sets of contacts. Do not adjust contact gap outside limits to obtain specified cam dwell.

Breaker Arm Spring Tension–17-20 ozs.

Rotation–Clockwise viewed from above.

Automatic Advance–IAZ-4003C

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	350	0	700

11	1475	22	2950
12	1625	24	3250

Vacuum Spark Control: Auto-Lite. Integral type.

Vacuum Advance–IAZ-4003C, D

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-1/4
1	2	6
5	10	9-1/4
10	20	14-7/8
11.5	23	17

Distributor Basic Timing & Drive Shaft Bushing: *See "Ignition Notes" in Dodge Special Data.*

IGNITION TIMING

Setting–4° BTDC. See Manual Adjustment below.

Timing Mark–On fan drive pulley. Marks are 2° apart.

Manual Adjustment–Timing may be advanced with some premium fuels. Range of timing should not exceed plus or minus 4° from recommended factory setting.

CARBURETOR

►*CARBURETOR APPLICATION: Stromberg 2-Barrel Carburetor is standard equipment. Carter 4-Barrel Carburetors used as special equipment.*

STROMBERG 2-BARREL WW

►*CARBURETOR PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: Later carburetors ("A", "B", "C" Coding) have different jet calibration and specifications. See "Stromberg WW (Dodge)" in Carburetor Section.*

D-55-1, 2	Stromberg Code No.
Synchro-mesh	WW-3-131, 131A
Overdrive	WW 3-132, 132A
PowerFlite	WW 3-133, 133A, 133B
D-55-3	
Synchro-mesh	WW 3-120, 120A, 120B
Overdrive	WW 3-121, 121A, 121B
PowerFlite	WW 3-122, 122A, 122B, 122C

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting–1 turn open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed–450-500 RPM. (Std. & O.D.) 475-500 RPM (PowerFlite) with selector lever in Neutral.

Float Level–3/16" from top of main body to top of float measured at center of float, with float lip held firmly against needle valve. Use depth gauge or tool T-25569 to measure float level. To reset float level, bend float lever next to float (use Tool T-24733).

Accelerating Pump–Normal setting, center hole, for less fuel install rod in inner hole; for more fuel install rod in outer hole.

Fast Idle: With throttle valves in fully closed position, turn throttle stop screw in until it just contacts throttle lever and then turn stop screw in 4-1/2 turns. When properly adjusted, a #59 drill gauge should just pass between throttle valve and wall of throttle body. With choke valve closed and throttle lever held against throttle stop screw, a #48 drill gauge should just fit clearance between ear on contact lever and first step of fast idle cam. To adjust, bend cam contact ear.

Automatic Choke Setting: 2 Points Lean.

Kickdown Switch Adjustment (3-121, 132): With throttle valves in wide open position, there should be 1/64-1/32" clearance between ear on throttle lever and threaded section of switch housing. To adjust, loosen adjusting nuts and adjust to correct position.

Slow Closing Throttle (Dashpot) Adjustment (3-122, 133): With throttle stop screw set for normal idle speed, clearance between end of dashpot plunger and ear on throttle lever should be 1/16-3/32" with dashpot plunger pushed in to the end of its stroke. Adjust by loosening locknut and turning dashpot assembly in or out of the bracket.

Throttle Linkage Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

►*OTHER DATA: See "Stromberg WW (Dodge)" in Carburetor Section.*

Fuel Pump Pressure: 5-6½ lbs.

CARTER 4-BARREL WCFB NOS. 2181S, 2253S

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting–1/2–1-1/2 turns open. For richer mixture, turn screws out.

Idle Speed–450-500 RPM (Std. & O.D.). 475-500 RPM (PowerFlite) with selector lever in Neutral

Throttle Linkage Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

►*OTHER DATA: See Carter "WCFB 4-Barrel" in Carburetor Section.*

Fuel Pump Pressure: 5-6½ lbs.

CARB. EQUIPMENT

Fuel Pump: AC or Auto-Lite. Diaphragm type. **Replacement Pump**–AC No 4280 or Auto-Lite FB-4006.

Pressure–5-6½ lbs.

See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: Auto-Lite. Electric type.

Dash Unit–Auto-Lite 13792A(U.S.), 13753A (Can.).

Tank Unit–Auto-Lite 13794A.

See "Fuel Gauges" in Electrical Equip. Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BATTERY

Auto-Lite 1H-105-D or Willard HW-1-105-C. 6 volt, 15 plate, 105 ampere hour rate.
Grounded Terminal–Positive.
Engine Ground–Left front of engine.

STARTER

Auto-Lite MCH-6305. Armature MCH-2088.
Drive–Bendix "Folo-thru" type.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–42-53 ozs. (with new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6 ft. lbs.	Lock	2.0	335

Starting Switch: Auto-Lite SST-4006 (Std.), SST-4013 (PowerFlite). Magnetic type switch controlled by ignition switch. Neutral Safety Switch mounted on transmission of automatic transmission cars. *See "Starter Controls" in Electrical Equipment Section.*

Neutral Safety Switch Adjustment: *See "PowerFlite" Transmission in Transmission Section.*

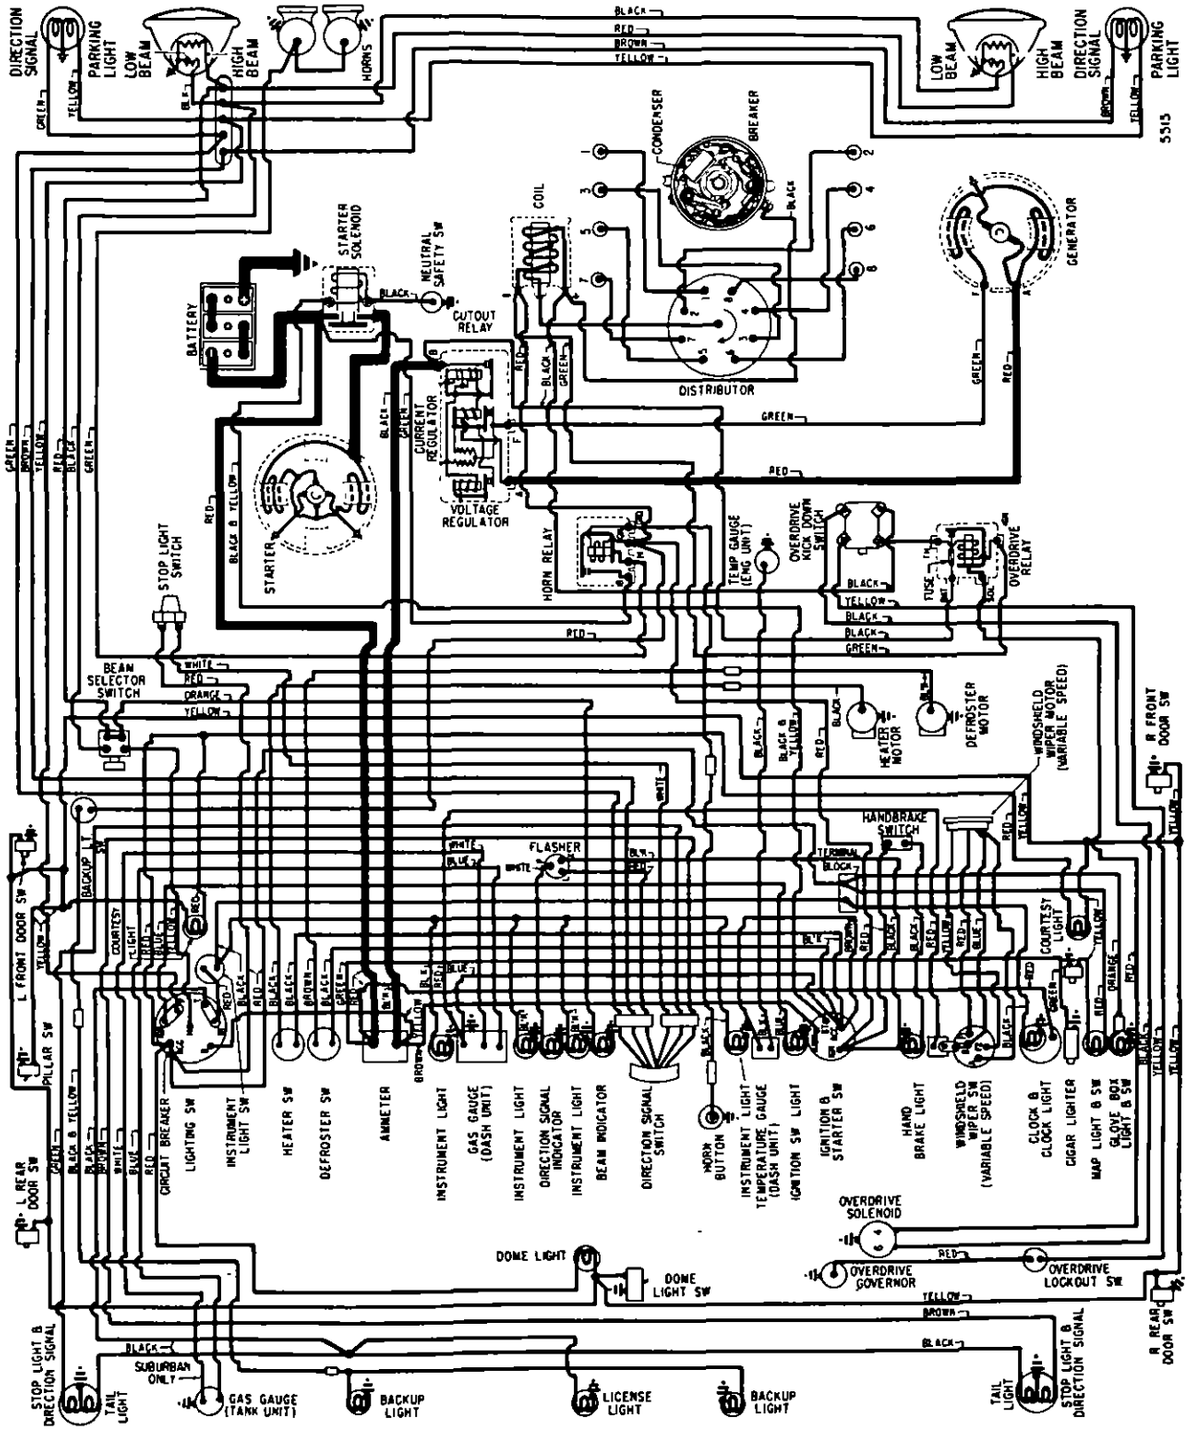
GENERATOR

Auto-Lite Generator No.	Armature No.
GGW-6012-B (D55-1, 2 Std.)	GGW-2006F
GGW-6001-J (D53 Std.)	GGW-2006F
GGJ-6005-A, D (D55-1, 2 Spec. Equip.)	GGJ-2101AF
GGU-6001-G (D53 Spec. Equip.)	GGU-2006F
GGJ-6001-F (D53 Spec. Equip.)	GGJ-2101AF
GGW-6016-A (Pow. St.)	GGW-2090F
GGU-6013-D (Pow. St.)	GGU-2071F
GGW-6016-E (Pow. St. Can.)	GGW-2090F
GGW-6017-A (Air Cond.)	GGW-2098F
GGU-6008-C (Air Cond.)	GGU-2063F
GGJ-6001-K (Air Cond.)	GGJ-2101AF
GGW-6016-C (A.C. & Pow. St.)	GGW-2090F
GGU-6013-C (A.C. & Pow. St.)	GGU-2071F
GGW-6016-F (A.C. & Pow. St. Can.)	GGW-2090F

►*SPECIAL GENERATOR NOTE:* GGJ, GGU, and GGW type generators used. Performance specifications below apply equally to all generators, within any one of these groups.

Performance Data–GGJ

Amperes	Volts	Cold – R.P.M. – Hot
0	6.4	600-700 – 650-750
50	8.0	1400-1600 – 1550-1750
55	8.0	1500-1700 – 1650-1850



Performance Data–GGU

Amperes	Volts	Cold – R.P.M. – Hot
0	6.4	750-850 – 800-900
45	8.0	1450-1650 – 1650-1850
50	8.0	1550-1750 – 1750-1950

Performance Data–GGW

Amperes	Volts	Cold – R.P.M. – Hot
0	6.4	870-970 – 950-1050
40	8.0	1800-2000 – 2150-2350
45	8.0	1925-2125 – 2350-2550

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Brush Spring Tension–(GGJ) 34-41 ozs., (GGU, GGW) 35-53 ozs., with new brushes.
Field Current–(GGJ) 1.4-1.7 amperes, (GGU) 1.4-1.6 amperes, (GGW) 1.6-1.7 amperes, all at 5.0 volts.
Motoring Current–(GGJ) 4.1-4.6 amperes, (GGU) 5.0-6.0 amperes, (GGW) 5.0-5.5 amperes, all at 5.0 volts.
Rotation–Counter-clockwise at commutator end.

Belt Adjustment: Loosen generator adjusting strap and generator-to-generator bracket mounting bolts. With Tool C-3379 hooked over generator and a torque wrench attached to tool, apply torque of 45 ft. lbs. (new belt), 27 ft. lbs. (old belt), to pull generator outward. While holding generator outward at required torque, securely tighten generator mounting bolts and adjusting strap.

REGULATOR

Auto-Lite Regulator No.	Generator
VBF-6001A	GGJ
VBF-6002A (Neg. Gd.)	GGJ
VAV-6001B	GGU
VAV-6002B (Neg. Gd.)	GGU
VBE-6001A	GGW

Cutout Relay

Cuts In–6.3–6.8 volts.
Cuts Out–4.1–4.8 volts.
Contact Gap–.015" minimum.
Air Gap–.031–.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting–7.1–7.4 volts at 70° F. *after 15 minutes operation charging at 1/2 maximum rate.*
Air Gap–.048–.052" with contacts just opening.
Checking & Adjusting–See *Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A–Operating Amperes	Test B
VBE-6001A	52	45 (43-47)
VBF-6001A, 2A	66	55 (53-57)
VAV-6001B, 2B	50	50 (48-52)

Test A–After 15 minutes operation charging at 1/2 maximum rate.
Test B–After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 6.7–6.9 volts (VAV, VBE), 6.7–7.0 volts (VBF).
Air Gap–.048–.052" with contacts just opening.
Checking & Adjusting–See *Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. See *Electrical Equip. Section.*
Direction Signal: See *Electrical Equip. Section.*

►*IGNITION-STARTER SWITCH CAUTION: When installing accessories, use accessory terminal* **only** *on ignition-starter switch and* **not** *the ammeter terminal post.*

Lighting & Panel Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut. Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft. Headlamp knob is held on its shaft by means of a recessed hex screw.

Stop Light Switch Location: On forward end of master cylinder.

FUSES: Clock–3 amperes. Located on clock.
Radio–14 amperes. At ignition terminal feed.
Overdrive–20 amperes. On overdrive relay.

LIGHTING CIRCUIT BREAKERS: Located in headlight switch assembly. Three in number as follows:
25 Ampere Circuit Breaker–Protects headlights, high beam indicator light, and parking lights.
10 Ampere Circuit Breaker–Protects tail lights, license plate lights, clock light, and instrument panel light.
10 Ampere Circuit Breaker–Protects stop lights, map light, dome light, glove box light, courtesy light, and trunk compartment light.

HORNS: Auto-Lite. Twin horns with relay.
High Pitch–HAB-4708.
Low Pitch–HAB-4707.
Horn Relay: Auto-Lite RAF-4001.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*TWO ENGINES USED AS FOLLOWS:* **D-55-1, 2 Red Ram**–Polyspherical combustion chamber with lateral valves (single rocker arm shaft)
D-55-3 Super Red Ram– Hemispherical combustion chamber with laterally inclined valves (double rocker arm shafts).

ENGINE SPECIFICATIONS: 90°V8 (All Models)

Model	Bore	Stroke	Displmnt	Rated HP
All Engines	3.63"	3.256"	270 cu. ins.	42.2

Model	Compr. Ratio	Developed HP
D-55-1, 2 Red Ram	7.6-1	175 at 4400 RPM
D-55-3 Super Red Ram	7.6-1	183 at 4400 RPM
D-55-3 Super Red Ram ①	7.6-1	193 at 4400 RPM

①–Special Power Pkg. (Carter 4-Barrel Carburetor and special Intake Manifold, and Dual Exhaust system).

Compression & Vacuum Reading– See *TUNE-UP.*

►*ENGINE PARTS INTERCHANGEABILITY NOTE:* All engine parts are interchangeable on both engines with exception of Cylinder Heads, Valve Train parts, Water Pump Housing, and Hydraulic Valve Lifters as explained below.

►*D-55-3 EXHAUST MANIFOLD INSTALLATION CAUTION (To Prevent Poor Gas Mileage, Carburetor Flooding or Difficulty in Restarting):* Check to see that the portion of the right bank exhaust manifold gasket that seals off the preheat chamber does NOT extend down below the exhaust manifold at choke heat tube cavity (on engine side of manifold at point opposite heat control valve).

ENGINE REMOVAL: See *"Engine" in Dodge Special Data.*

OIL PAN REMOVAL: Remove oil level indicator, drain oil, disconnect steering linkage at idler arm support bracket, and allow linkage to drop. Remove bolts that hold oil pan to cylinder block and slide pan out, down, and away from engine.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, T-slot, cam ground, with skirts relieved below piston pins, and tin coated.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" Oversize.*

Weight–16.2 ozs. (stripped).
Removal–Pistons and rods removed from above.
Fitting New Pistons: Clearance .001" at top between thrust face of piston and cylinder wall. Coat bore with light engine oil (SAE 10W). Insert piston in bore upside down with feeler stock .0015" x 1/2" between thrust face of piston and cylinder wall. Pull to withdraw feeler should be 5–10 lbs. at 70° F.
Replacement Pistons: Std., .010", .020", .030", .040", .060" Oversize.
Installing Pistons: The notch on top of piston must point toward front of engine. NOTE–Assemble pistons to the rod on right hand cylinder bank with the "V" slot in connecting rod aligned with the "T" slot in piston. On left hand cylinder bank "V" slot in rod must be opposite "T" slot in piston.

PISTON PINS

Floating type with lock ring at each end.
Diameter–.8591–.8593". **Length**–2.880–2.890".
Pin Fit in Piston–.0000–.0005". Tight thumb press fit at 70° F.
Pin Fit in Rod Bushing–.0001–.0004". Tight thumb press fit at 70° F. Selective fit.
Replacement Pins: Std., .003", .008" Oversize.
NOTE–Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0775–.0780"	.007–.015"	.0015–.0030"
Compr. (#2)	.0775–.0780"	.007–.015"	.0010–.0025"
Oil (#3)	.1860–.1865"	.007–.015"	.001–.003"

Replacement Rings: Furnished in sets Standard, .010", .020", .030", .040", .060" Oversize.
Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length (Center to Center)–5.9335–5.9375". **Weight**–21.14 ozs. (600 grams).
Crankpin Journal Diameter–1.9365–1.9375".
Maximum out-of-round and taper limits–.001".
Lower Bearings–Removable, precision type, thin babbitt on steel. No shims.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)–See "CRANKSHAFT" below.*

Clearance–.0005–.0015". Maximum–.0025".

Endplay–.006–.014".

Bearing Adjustment–None. Replace bearings.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize.

Installing Rods: *See "Pistons (Installation)" above.* Rods are chamfered on one side at bearing insert and must be installed with chamfer toward crankshaft fillet. "V" slot across one bolt hole of each bearing cap is an oil passage for lubricating the opposite cylinder wall and piston. When installing bearing cap make certain "V" slot oil passage is toward top of engine.

►*CAUTION:* Rods are **interchangeable.** However, when rods are assembled to piston, the assemblies of one engine bank **are not interchangeable** with the other bank.

CRANKSHAFT

Journal Diameter–2.3745–2.3755".

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*

.010" UNDERSIZE (Main & Connecting Rod Journals)–Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" Undersize.

Bearings–Removable, precision type, steel-backed, babbitt lined. No shims.

Replacement Bearings: Std., .001", .002", .003", .010", .012" Undersize. Halves of Nos. 1, 2, and 4 bearings are interchangeable with one another (caps are not interchangeable); upper and lower halves of No. 3 bearing are interchangeable; No. 5 halves are NOT INTERCHANGEABLE.

End Thrust: Taken by center (#3) main Bearing.

Clearance–.0005-.0015".

Endplay–.002-.007". Maximum .010".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.998–1.999", (2) 1.982–1.983", (3) 1.967–1.968", (4) 1.951–1.952", (5) 1.4355–1.4365".

Bearings–Removable, steel-backed, babbitt lined bushings.

Clearance–.001–.003". Maximum–.005".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay–.002–.006". Maximum–.010".

Timing Chain: Width–1-1/8". **Pitch**–.375". **Length**–68 links.

Camshaft Setting: Place crankshaft "Zero" mark exactly in line with center of camshaft. Temporarily install camshaft sprocket less chain, line up dowel pin holes in hub and gear, while at the same time positioning camshaft gear "Zero" mark exactly in line with center of crankshaft. (A straightedge should be used to check accuracy of this alignment). Remove camshaft gear and engage with timing chain. Place timing chain over crankshaft gear and at the same time, slide the camshaft gear over end of camshaft, keeping timing mark in position. With timing marks aligned, push gear on camshaft, install fuel pump eccentric. Install nut and tighten to 120-130 ft. lbs. torque.

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Dodge Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance: None in service (hydraulic).

►*CAUTION: Different Valves, Valve Seals, Springs, Valve Guides, Pushrods, and Lifters used on each engine.*

D-55-1, 2 Red Ram

Valve	Head Diameter	Stem Diameter	Length
Intake	1.72"	① .371-.372"	4.25"
Exhaust	1.47"	① .372-.373"	4.20"

①–Std. Valve. *See Valve Guides (below).*

D-55-3 Super Red Ram

Valve	Head Diameter	Stem Diameter	Length
Intake	1.75"	.371-.372"	4.83"
Exhaust	1.41"	.372-.373"	4.75"

All Engines

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.360"	.002"
Exhaust	45°	.360"	.003"

Valve Stem Seals–*New type seals used on D-55-1, 2 Red Ram Engine as follows:*

D-551, 2 Intake Valve Seals–"Umbrella" type rubber seal installed on valve stem inside valve spring (install seal with cup side down BEFORE installing spring retainer).

D-55-1, 2 Exhaust Valve Seals–On FIRST Cars (with two-bead locks), lubricate and install the "O" ring seal on valve stem AFTER valve retainer installed but BEFORE installing valve locks (position seal approximately 1/8" below lower valve stem lock groove). On LATER cars (with four-bead locks), seals will not be required.

D-55-3 Valve Seal Note–Seal ring used on Intake Valve stems only (same as 1954 Dodge V8).

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Dodge Special Data.*

►*VALVE GRINDING CAUTION:* If the position of the valve in the head has been changed (due to valve or valve seat grinding) so as to shorten the operating length by 1/32" or more from its factory installed position, the dimension from valve spring seat in the head to valve tip should be checked with gauge C-3061. If the valve tip exceeds the maximum allowable on the gauge, grind the tip as necessary (do not go below the minimum allowable on the gauge). Improper valve clearance at high speed will result if this condition is not corrected.

Valve Springs: *SINGLE spring used on D-55-1, 2 Red Ram, DOUBLE springs used on D-55-3 Super Red Ram.*

Valve Spring Specifications

D-55-1, 2

Valve	Lbs. Press	Length
Closed	53 lbs.	1.69"
Open	140 lbs.	1.31"

D-55-3

	Inner Spring		Outer Spring	
Valve	Lbs. Press.	Length	Lbs. Press.	Length
Closed	20-23	1-9/16"	38-43	1-11/16"
Open	40-45	1-3/16"	100-110	1-5/16"

►*CAUTION: Spring ends must be square within 1/16". (Use steel square on surface plate–revolve spring against square noting alignment of top coil).*

►*VALVE SPRING HEIGHT CAUTION:* If valves or seats are reground, check **installed** height of spring. If height of spring is 1-11/16" or greater, install a 1/16" spacer under valve spring.

►*VALVE SPRING LOAD CAUTION: Hydraulic lifter "pump-up" will restrict engine speed and cause valves to burn if spring loads are not maintained.*

Valve Guides: D-55-1, 2–Guides are integral with head. If valve stem clearance excessive, use tool set to ream hole to NEXT oversize and install valve with OVERSIZE stem. Valves are furnished Std. and .005", .015", .030" oversize.

D-55-3–Guides are separate pressed-in parts and are serviced by installing new guide and reaming to size for standard valve. Remove guides by driving out through top of head using tool C-3159. Install new guides by driving them up through valve port opening. To install INTAKE valve guide, place a steel scale across combustion chamber and drive valve guide in until punch mark on tool C-3159 is flush with face of cylinder head. To install EXHAUST valve guide, drive it in until it is flush with the machined face of the hole. Ream guide to .374-.375" with tool C-741.

►*CAUTION: Oil hole in top of exhaust guide must face up.*

NOTE–If Valve Guide Tool C-3159 is not available, drive guide in, measuring from top of valve seat as follows: **Intake**–15/16". **Exhaust**–1-3/32".

Hydraulic Valve Lifters: *CAUTION–All valve lifters are hydraulic type but are not fully interchangeable on all engines.*

D-55-1, 2 Lifters–Three types used. Lifters identified by groove on body (groove is directly below large "V" groove at upper end of body or in land between this "V" groove and relieved section at upper end of body). *DO NOT use D-55-3 Lifters in this engine.*

D-55-3 Lifters–Two types used. Lifters do not have identifying grooves used on D-55-1, 2 types (above), *however, all D-55-1, 2 lifters can be used in this engine.*

Diameter–.9040-.9045". **Clearance**–.0005-.0015".

Lifter Overhaul & Testing–*See "Valve System" in Dodge Special Data.*

Rocker Arm Assembly: *See "Valve System" in Dodge Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves—Open 14° BTDC. Close 50° ALDC.
Exhaust Valves—Open 52° BLDC. Close 12° ATDC.
Valve Timing Check: *See "Camshaft Setting" under CAMSHAFT above.*

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add one additional quart if filter changed.

Normal Oil Pressure: 50-65 lbs. with warm oil and engine operating at 1500 RPM.

Oil Pressure Relief Valve—Mounted in oil pump. Adjustable by replacing springs (3 types). **(1)** Standard spring painted BLACK. **(2)** Lighter than standarc spring painted RED. **(3)** Heavier than standard spring painted GREEN.

►*OIL PRESSURE RELIEF VALVE NOTE:* Springs identified as follows:

Color	Free Height	Spring Press. & Checking Height
Red (Light)	1 13/16"	12.4-13.8 at 1¼"
Black (Standard)	1 13/16"	14.4-15.8 at 1¼"
Green (Heavy)	1 13/16"	16.2-17.8 at 1¼"

Oil Pressure Gauge: Auto-Lite 13790A. Not Electric.

Oil Pump: Rotary type. In crankcase at rear end. Mounted on rear bearing cap.

Overhaul—*See "Oiling System" in Dodge Special*

Priming Oil Pump (After Overhaul): Prime pump before installing oil pump and strainer to rear main bearing cap.

Oil Filter: Shunt type. A portion of oil from oil pump is directed through this filter and the remainder flows directly into engine lubrication system.

Filter Element—Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: 19 quarts (20 with heater).

Pressure Valve: Dodge 1373136. Radiator filler cap. Opens at 7 lbs.

Thermostat: By-pass type in cylinder head water outlet. Starts to open at 159-165° F.

Water Pump: Packless type. Grease fitting for lubrication on early type only. *See Water Pump Note below. See Water Pump Section for data.*

Pump Removal—Drain cooling system, remove fan, belt, and pulley. Remove four water pump attaching bolts and remove water pump.

►*WATER PUMP NOTE:* Three types used. Early pump was bushing type with lubrication fitting. Two later types are ball-bearing, which are pre-lubricated and require no additional lubrication (have no lubrication fitting).

Temperature Gauge: Auto-Lite 13791A. Electric type.

CLUTCH

Borg & Beck	Model	Assy. No.	Disc No.
Standard	10A7	361368	382346
Heavy Duty	11A6	929	381850

See "Borg & Beck" Clutches in Clutch Section.

►*CLUTCH PEDAL CLICKING SOUND OR CLUTCH SLIPPAGE CORRECTION (When Due to Interference Between Rear End of Clutch Release Fork Rod & Clutch Release Fork):* To correct, rod end should be reworked to eliminate shoulders of rod end forward of attaching eyelet.

Pedal Adjustment: Adjust the fork rod to secure 1/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: (*NOTE*—Over-center spring located above brake pedal and attached to pedal mounting bracket). Disconnect clutch pedal pushrod. Remove overcenter eyebolt adjusting nut. Reinstall adjusting nut, tighten finger tight, then further tighten four complete turns. This adjustment will require 12-15 lbs. pressure to hold clutch pedal down when it is 1" from fully released position.

Removal: Remove transmission or transmission and overdrive (See Synchro-mesh Transmission). Remove clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*

►*HARD SHIFTING CORRECTION:* Check for interference between gearshift lever and transmission cover. If found, replace manual remote gearshift lever shaft screw, Part No. 853877. (*NOTE*—Before installing screw, it should be tested for proper hardness with a standard mill file. Only screws which are **not** file soft should be installed). If interference not found at point indicated above, check for interference between gearshift rod and lower edge of instrument panel. In most cases, condition can be corrected by realignment of steering column jacket. In some cases it may be necessary to provide adequate clearance by filing out lower edge of instrument panel.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission is to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

VERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down. *See "Warner R10" Overdrive in Transmission Section.*

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated planetary transmission.

See "PowerFlite" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).

Checking Fluid Level—Apply hand brake, place selector lever in neutral position. Allow engine to idle until normal operating temperature is reached. Shift selector lever through all ranges. Shift selector lever back to neutral and add Automatic Transmission Fluid (Type A) to bring level to full mark on oil level indicator.

Oil Filler Tube Location: At right rear of engine compartment.

►*CAUTION:* To prevent dirt from entering transmission make sure oil level indicator is properly seated in filler tube.

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universal. Ball and Trunnion Type.

►*UNIVERSAL JOINT BOOT NOTE:* A new, larger boot is used on the rear universal joint and can be identified by a daub of white paint on it. In service, larger boot can be used on both front and rear joints, but small boot should **never** be used on rear universal joint as boot failure is very likely to result.

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE*—"Barrel Type" differential assembly used on cars with Automatic Transmission.

See "Dodge Hypoid" in Rear Axle Section.

Transmission	Rear Axle Ratios
Std., Exc. Suburban	3.73-1
Suburban Std.	3.9-1
Overdrive	4 1-1
PowerFlite	3 54-1

Backlash—.006-.010".
Thrust Pad Clearance (Barrel Type)—.006-.008".

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Axle Shaft Removal: Remove wheel, hub and drum assembly (Use puller C-845). *(CAUTION—Do not strike end of axle shaft to loosen hub; otherwise, possible damage to axle shaft bearings and thrust block might result).* Block brake pedal, disconnect brake line at wheel cylinders, remove axle shaft key, install sleeve C-757 in axle bearing outer oil seal before removing brake support plate from axle housing. Remove shims from each end of axle housing. (Each set should be kept separate so that at reassembly, central location of axle shafts, wheels and thrust block, will be assured). Remove axle shafts and bearings from housing (Use puller C-293-C to remove bearings from axle shafts, puller C-637 to remove inner oil seal, drift C-241 to install seal.

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel hub removed, check end play with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

Type	Dodge Part No. Front	Rear
Standard	1614404	1450918
Heavy Duty	1617004	1450920
Heavy Duty (Spec.)		1450037

FRONT SUSPENSION

Independent. Coil springs and direct-acting shock absorbers.
See "Dodge" in Front Suspension Section.
Kingpin Inclination—5-1/2° at 0° camber.
Caster—Neg. 2° to 0° (Neg. 2° preferred with Manual Steering, 0° preferred with Power Steering). Left side should be between 0° and ¼° more negative than right side.
Camber—Pos. 1/4°±3/8° (Left side Pos. ½°, Right side 0° preferred).
Toe-In—0" to 1/16" (0" preferred).

STEERING

Manual: Gemmer. Worm and three-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.
Power Steering: Coaxial. Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column.
See "Coaxial" Power Steering in Steering Section.
►*JERKY OPERATION OF POWER STEERING GEAR CORRECTION:* Adjust generator drive belt (See Generator), then adjust fan drive belt so that a maximum of ¼" deflection is obtained when applying a 10 lb. pull with spring scale at middle of widest belt span.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: Dodge "Safe-Guard" Lockheed hydraulic.
See "Dodge Safe-Guard" in Brake Section.

►*LOOSE OF SQUEAKY BRAKE PEDAL OR PAD CORRECTION:* Change location of attachment of brake pedal return spring from right side of pedal bracket to left side (Standard & Overdrive), left side to right side (PowerFlite), and attach in hole provided in bracket. On PowerFlite cars, if excessive movement or squeak is encountered in pedal pad, remove brake pedal and make several prick punch marks on pedal at pedal pad mounting bracket location to improve clamping action, re-install pad, tighten retaining bolt to 20 ft. lbs.

Drums—Cast Iron. Diameter—11".
Wheel Cylinder Diameter—1-1/8". Single acting (front), double acting (rear wheels).
Replacement Linings & Shoes—Linings or shoes with linings are furnished Standard and .030" Oversize.
Lining—Molded asbestos (bonded to shoe).
Length—(Primary, Front & Rear) 11.5", (Secondary, Front) 11.5", (Secondary, Rear) 8.8".
Width—2". **Thickness**—.200".
Braking Power—60% Front, 40% Rear.
Clearance—.006" at each end of all shoes.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.
Checking Fluid—Filler plug at top of master cylinder (on dash panel in engine compartment).
Removal—Disconnect brake line tubes at master cylinder fittings. Remove four stud nuts from studs, remove master cylinder.

Power Brakes: Combination vacuum power unit and master cylinder. Unit mounted on engine side of firewall and replaces regular master cylinder. *See "Dodge Power Unit" in Brake Section.*
Removal of Power Unit—Same as for standard master cylinder, after hydraulic lines and stop light wires removed.
Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans. 7" internal expanding type used with Automatic Transmissions.
Adjustment—*See "Hand Brake Notes" in Dodge Special Data.*

Lining—	Width	Thickness	Length
6" Ext. Type	2"	5/32"	15-3/8"
7" Int. Type	2"	5/32"	13-1/16"

Clearance (External Type)—.015-.020" around band.
Internal Type—Adjusting nut on shoe link backed off one notch from point where shoes just drag against drum, approximately .010".

MISC. MECHANICAL

Windshield Wipers: Auto-Lite. Electric.

Car Model	Auto-Lite No.
D-55-1 Std.	EMU-4101
D-55-1 Spec. (2-Speed)	EMZ-4001
D-55-2, 3 Std. (2-Speed)	EMZ-4001

See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.

Air Conditioning: Dodge "Airtemp". *See "Airtemp" Air Conditioning in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Electric Window Regulators" in Misc. Section.*

Power Seat Adjuster: Electric type. *See "Power Seat Adjusters" in Miscellaneous Section.*

Convertible Top Control: Electrical-hydraulic type. *See "Power Top Controls" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

1946-48 MODELS

	Ft. Lbs.
Cyl. Head Nuts (Cast Iron Head)	50-60
Cyl. Head Nuts (Alum. Head)	35-40

Oil Pump Mounting (6 Cyl.)	30-35
Oil Pump Mounting (V8)	12-15
Oil Filter	20-25

①–See Cylinder Head Installation (below) for head tightening procedure. Three different torque applications must be made.

ENGINE

1946-48 PASS. CARS & TRUCKS

ENGINE REMOVAL: For Engine Servicing (& Oil Pan Removal on Six)—Drain cooling system and crankcase. Remove engine as follows:

1. **Disconnect and remove radiator hoses and thermostats, remove radiator.**
2. Disconnect cables and remove battery.
3. Remove engine hood by taking out capscrews in hood hinges and bolts in support arm at each side.
4. Disconnect all electrical wires and cables at engine accessories (remove spark plug wires and conduits, disconnect ground cable at rear of engine).
5. Disconnect hand throttle and choke cables at carburetor (free hand throttle cable clamp at dash and loop cable out of the way by hooking it back of generator regulator, free choke cable clamp at dash and hook cable back of battery box), disconnect fuel line at fuel pump.
6. Remove all engine accessories (except water pumps and starter), remove oil filler pipe.
7. On V8, loosen clamp on exhaust cross-pipe, disconnect both exhaust pipes at exhaust manifold connections, remove cross-pipe (left bank pipe). On 6 Cylinder, disconnect exhaust pipe at manifold.
8. Remove two engine front support bolts.
9. Install sling on engine, attach hoist, take up slack in sling and hoist cables.
10. Remove front floor pan, take out capscrews mounting transmission on flywheel housing.
11. Move engine straight forward to disengage clutch shaft, then lift engine out of chassis.

Cab-over-Engine Model Note—On these models, radiator grille and radiator are removed from the forward end, and special engine cradle should be used to slide engine out toward front.

1949-51 PASSENGER CARS

ENGINE REMOVAL: Remove hood and battery. Drain crankcase and radiator. Disconnect upper radiator hose at engine and lower hose at radiator. Disconnect heater hoses and remove from engine. Disconnect all wires from engine, spread cable clips and fold cable out of the way. Disconnect fuel lines, throttle linkage, and accelerator pedal rod. Push cross shaft back against dash panel. Disconnect windshield wiper hose at engine. Disconnect muffler inlet pipe and clutch retracting spring. Remove the two top transmission to flywheel housing bolts. Remove engine front support nuts. Install engine lift brackets and take up the load with chain hoist. Support transmission and remove two lower transmission to flywheel housing bolts. Rock the engine and pull it away from transmission until the pilot and shaft separate from the clutch, then raise engine carefully. Be sure it clears all parts of engine compartment. Do not let engine strike grille.

Installation: Reverse the above procedure. NOTE—It may be necessary to adjust height of transmission with relation to engine until after pilot enters the clutch. If engine "hangs up" after pilot enters, turn crankshaft slowly until splines seat.

1952-53 PASSENGER CARS

1954 6 CYL. PASS. CARS

ENGINE REMOVAL (PASSENGER CAR): Disconnect driveshaft at rear axle and pull it out of transmission extension. Remove engine rear support-to-transmission extension bolts ***(on Fordomatic disconnect the manual control linkage at the transmission and disconnect the accelerator pedal shaft at the accelerator cross shaft and remove the screws retaining cross shaft to dash panel).*** Disconnect gearshift rods at transmission, disconnect clutch release rod and retracting spring. Remove the equalizer bar support-to-flywheel housing screws, remove support and bushing, and let the equalizer hang from frame. Disconnect speedometer cable. ***(On Overdrive transmission, disconnect manual control cable at overdrive lever, remove cable housing retainer clip and pull cable away from transmission. Disconnect the two wires at solenoid and one wire at governor).*** 1). Drain coolant. Remove hood and radiator and the heater blower motor. Disconnect heater hose at engine. Disconnect generator wires, ignition primary wire, engine temperature sending unit wires, and oil pressure sending unit wire.
2). Remove air cleaner and tape carburetor opening closed. Disconnect choke wire at carburetor and the windshield wiper hose at manifold. Disconnect starter wire at starter. Disconnect accelerator at manifold bellcrank (except Fordomatic). Disconnect fuel pump flexible line. Disconnect muffler inlet pipe at the exhaust manifold and pull pipe away from engine. Remove front support bolts.
3). Install engine lift bracket, using rear notch, and take up the load. Lift the engine and at the same time move it forward over the cross-member.

1954 V8 PASS. CARS

ENGINE REMOVAL: On standard and overdrive transmission cars remove capscrews retaining equalizer bar support to flywheel housing, then remove support and bushing. Remove transmission-to-flywheel housing capscrews. Place jack under transmission, and raise jack until it touches transmission. On Fordomatic Drive cars disconnect throttle linkage and remove it from unit. Remove converter housing lower access cover. Remove idler arm bracket and remove starter. Remove the six converter-to-flywheel assembly bolts, then remove three bolts from converter housing-to-engine block. To gain access to fourth bolt, roll back floor mat and remove floor pan plug. On all cars, drain coolant, remove hood, upper and lower radiator hoses. Drain oil from crankcase, remove battery ground cable, then remove radiator assembly. Remove fan and disconnect flexible fuel line. Remove air cleaner and disconnect wiper vacuum line and manual choke cable. Remove wires from oil pressure and temperature gauge sending units. Disconnect wires from coil and remove wires from generator. Jack up front end of car and position car on jack stands. Adjust transmission jack until it just touches transmission. Remove muffler inlet pipe and gasket from manifold. Remove transmission control linkage splash shield from cylinder block and remove oil filter. Remove front splash aprons from both sides of engine. Install an engine lifting sling on engine and position hoist so there is no slack in sling. Remove engine front support steady rest then remove engine support from left side of engine. Remove capscrews from right side engine support at engine. Raise engine slightly, then carefully pull engine away from transmission. Carefully lift engine out of engine compartment.

1955 PASS. CARS (EXC. THUNDERBIRD)

ENGINE REMOVAL: Disconnect transmission from engine.

1) **Cars with Standard or Overdrive Transmission:** Disconnect clutch release spring. Remove screws retaining equalizer bar support to flywheel housing, then remove support and bushing. Disconnect accelerator linkage at manifold bellcrank. Remove two upper flywheel housing bolts . Remove flywheel housing cover, support transmission with jack, then remove remaining flywheel housing bolts. Then following procedures under 3) below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

2) Cars With Fordomatic Transmission: Disconnect transmission throttle linkage at cross shaft, tie linkage to dash panel. Remove idler arm bracket. Fold back floor mat, remove two rubber plugs, then two top converter housing-to-engine bolts. Jack up front of vehicle and position safety stands. Support transmission with jack, then remove remaining converter housing-to-engine bolts. Remove converter housing lower access cover, then remove six converter-to-flywheel assembly bolts. Remove dipstick tube assembly. Remove transmission control linkage splash shield from cylinder block, then remove oil filter. Then follow procedures under 3) below.

3) Engine Removal: Remove hood, drain cooling system and crankcase. Remove heater hoses. On 8 Cylinder engine, remove heater inlet duct. On 6 Cylinder engine, remove heater blower motor. Remove upper and lower radiator hoses, then remove radiator. Disconnect battery ground cable at cylinder block, and flex fuel line at fuel pump, remove pump. Disconnect windshield wiper vacuum hose, temperature sending unit wire, and oil pressure sending unit wire. Disconnect primary wire at coil. Remove starter cable at starter, then remove starter. Disconnect ground cable from rear of engine. Remove air cleaner, then tape air horn closed. Disconnect choke cable at carburetor and disconnect accelerator linkage. Disconnect muffler inlet pipes at exhaust manifold. Attach engine lift bracket or sling. Remove right and left front splash aprons. Loosen two engine front steady rest-to-frame bolts. Raise vehicle and position safety stands. On 8 Cylinder engine, remove left-hand engine support and capscrews from right-hand engine support at engine. On 6 Cylinder engine, remove left-hand mounting bolts at insulator, at right-hand mounting nuts at engine. Raise engine slightly, then carefully pull engine from transmission. Carefully lift engine out of engine compartment.

1955 THUNDERBIRD

ENGINE REMOVAL: Disconnect transmission from engine, follow steps 1) or 2) under "Engine Removal—All Passenger Cars (Except Thunderbird)" above, then remove engine as follows: Remove hood, drain cooling system and crankcase. Remove fan, then remove radiator and shroud as an assembly. Remove air cleaner. Disconnect engine ground wire at dash. Disconnect battery ground cable at engine and battery-to-starter relay cable at battery, Disconnect vacuum pump line, and fuel inlet line at fuel pump. Disconnect starter cable at starter solenoid, then remove cable clamp at dash panel. Disconnect ignition switch-to-coil wire at coil. Disconnect the two heater hoses. Remove generator wires, and wires from oil pressure and temperature sending units. Remove heater blower assembly. Disconnect tachometer cable. Disconnect accelerator rod, then disconnect link bracket at block (this bracket also serves as ignition cable bracket). Raise vehicle and position safety stands. Disconnect exhaust pipes at exhaust manifold. Remove engine front mount bolt and insulator. Remove engine right and left support bolts at engine, then turn insulator to one side so engine will clear them upon removal. Remove safety stands and lower vehicle. Install engine lifting sling. Raise engine slightly, then carefully pull engine from transmission. Carefully lift engine out of engine compartment.

1949-54 TRUCKS

ENGINE REMOVAL (CONVENTIONAL TRUCKS): 1). Drain engine coolant and remove the hood. Disconnect battery ground cable (at engine), engine temperature sending unit wire, oil pressure sending unit wire, and the ignition primary coil wire. Disconnect cable at starting motor.
2). Disconnect generator wires, windshield wiper hose, choke control cable, hand throttle, and accelerator rod and spring (at carburetor). Remove air cleaner and tape carburetor opening closed. Disconnect radiator upper hose at engine, and lower hose at radiator, and heater hose at engine.
3). Remove fan and bracket assembly, fan shroud and radiator. Disconnect muffler inlet pipe and pull away from manifold. Shut off fuel valve at tank and disconnect flexible hose at fuel pump.
NOTE—If engine and transmission are to be removed as an assembly, disconnect driveshaft at rear end and pull out of transmission extension. Remove transmission extension support bolts.
4). Remove transmission retaining bolts and disconnect clutch return spring. Support transmission with a jack. Remove engine front support bolts, and install engine lift bracket. Remove engine.

ENGINE REMOVAL (PARCEL DELIVERY): Remove engine compartment rear cover and latch open the front cover. (See Engine Removal—Conv. Trucks, and proceed through steps 1, 2, & 3), then install engine lift bracket. Project lift arm of crane through right hand door and take up load of engine. Remove engine front support nuts and remove the bolts securing the transmission to flywheel housing. Support the transmission with a jack. Move engine far enough forward to clear transmission main shaft, then lift engine enough to maneuver it through the door.

ENGINE REMOVAL (CAB-OVER-ENGINE MODELS): 1). Drain crankcase and cooling system. Remove hood, air cleaner and flexible tube, floor pan over the engine, and dash panel. Remove oil filter lines.
2). Remove either front wheel. Remove grille assembly, then disconnect radiator hoses and remove the radiator support assembly with the radiator.
3). Disconnect the generator wires, ignition switch to coil wire, temperature sending unit wire, oil pressure sending unit wire, and the vacuum hose at the intake manifold, starting motor cable at the starter, throttle linkage, choke wire, and heater hoses. Disconnect flexible fuel line, muffler inlet pipe, and clutch release bearing spring. Remove engine front support bolts.
4). **(To remove V8 Engine)**—Remove generator, carburetor, crankcase inlet pipe and fuel pump. Install the engine lift hook assembly and take up the slack in the cable with a portable floor crane. Remove the bolts securing transmission to flywheel housing. Move engine away from the transmission, and lift it high enough to clear chassis, then maneuver it from the engine compartment.
5). **(To remove 6 Cyl. Engines)**—Same as for V8 except that it is not necessary to remove generator, carburetor, crankcase inlet pipe and fuel pump.

ENGINE INSTALLATION: Reverse removal procedure.

1955 CONVENTIONAL TRUCKS

ENGINE REMOVAL: *For trucks equipped with Fordomatic, see Note below.* Drain cooling system and crankcase. Remove hood, fan assembly and fan belt. Disconnect heater hoses at engine. Remove radiator and shroud assembly. Remove air cleaner, then tape carburetor air horn closed. Disconnect windshield wiper hose at manifold. Disconnect hand throttle control, choke cable, accelerator rod, and accelerator retracting spring at carburetor. Disconnect engine temperature and oil pressure sending unit wires, and ignition coil primary wire. Disconnect generator wires. Disconnect flexible fuel line at fuel pump and muffler inlet pipe at exhaust manifold. Disconnect clutch release lever retracting spring, starter cable at starter, and battery ground strap at engine. Remove starter assembly. Install engine lifting sling. Remove flywheel housing-to-engine bolts, then flywheel housing lower cover. Remove bolts from engine front support. Take up weight of engine with hoist. Support transmission with jack, then move engine forward to separate clutch from transmission input shaft. Lift engine carefully from chassis.

►*FORDOMATIC ENGINE REMOVAL NOTE:* On Conventional & Cab Forward Trucks. In addition to procedures given, perform following: Disconnect transmission oil-to-water cooler inlet and outlet tubes. Remove upper and lower screws retaining converter housing to engine. Remove converter housing lower access cover, then using Tool T52L-7950-A, turn flywheel until flywheel drive plate is in position so that three bolts can be removed. Turn flywheel 180°, and remove other three bolts. Install engine lifting sling and remove engine in usual manner.

1955 CAB FORWARD TRUCKS

ENGINE REMOVAL: *For trucks with Fordomatic Transmission, see NOTE at end of "Conventional Truck Engine Removal" immediately above.* Drain cooling system and crankcase. Disconnect throttle return spring. Remove floor mat, then battery cover. Disconnect one of battery cables. Remove floor pan. Disconnect ignition coil primary wire and ground wire at coil mounting bracket. Remove screws securing loom clip, tail light wire clip, and speedometer cable, then move wires and speedometer cable out of way. Remove distributor cap and rotor. Remove fan assembly, belt, and air cleaner. Tape carburetor air horn closed. Disconnect radiator upper and lower hoses, and heater hoses at engine. Remove upper and center grille sheet metal. Remove radiator, shroud assembly, and radiator-to-front fender apron supports. Disconnect hand throttle control and choke control. Disconnect accelerator linkage. Remove windshield wiper hose from intake manifold (or vacuum pump inlet). Remove temperature sending unit wire and generator wires. Remove oil dipstick. Remove engine front support nuts and washers. Disconnect flexible fuel line at fuel pump. Close off main fuel line to prevent loss of fuel. Disconnect muffler inlet pipe, and pull it away from manifold flange. Remove flywheel housing lower cover. Remove flywheel

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

housing-to-engine retaining screws. Disconnect starter cable and battery ground strap, remove starter. Install engine lifting sling. Position floor jack under engine, place wood block between jack and oil pan. Raise engine slightly, and remove engine front support bolts and rubber pad. Raise engine carefully with hoist, move it forward to clear transmission input shaft, and remove it from chassis.

1955 PARCEL DELIVERY TRUCKS

ENGINE REMOVAL: (*NOTE*–Engine & transmission removed as assembly). Remove driver's seat and support. Drain crankcase. Disconnect air cleaner tube and elbow from carburetor, then remove air cleaner from engine cover bracket. Tape carburetor air horn closed. Drain cooling system. Remove clutch pedal plate. Remove brake pedal pad, then remove pedal opening plate and slide it over brake pedal rod. Remove pedal opening rubber mat. Remove two screws retaining dimmer switch, and drop switch through floor board. Disconnect accelerator rod from pedal. Remove left floor plate (the accelerator pedal and engine front cover hoodlock are removed with floor plate). Remove brake master cylinder inspection cover. Remove ten screws from engine cover base plate. Remove nuts and bolts retaining center floor plate to engine cover base plate. Loosen three bolts securing crossmember reinforcing plate to left and right wheel housings (*NOTE*–Drive wedge between reinforcing plate and left and right wheel housings). Remove center floor plate, then remove one reinforcing plate-to-crossmember bolt from end of body crossmember. Remove engine cover and base plate assembly. Disconnect windshield wiper vacuum line at fuel pump, and the fuel flex line at tank fuel line-(*NOTE*–On Fordomatic equipped vehicles disconnect transmission selector rods at transmission). Disconnect radiator upper and lower hoses at radiator. Disconnect radiator-to-cylinder outlet tube and hose at water pump. Disconnect primary wire from coil and ground wire at coil bracket Disconnect heat and oil pressure indicator wires. Disconnect starter cable at solenoid and starter ground strap at starter. Disconnect exhaust inlet pipe at exhaust manifold. Remove emergency brake cable clevis pin, then remove emergency brake holding bracket. Remove emergency brake holding bracket. Remove emergency brake hold down bracket. Pull emergency brake cable out of way. Remove speedometer cable holding bracket, then remove speedometer cable from transmission speedometer gear, and move assembly out of way. Remove fan assembly and belt. Disconnect generator wires. Remove body crossmember. Disconnect choke cable at carburetor. Remove engine front support bolts, rear support mount bolts and lower right and left-hand pads. Remove universal joint "U" bolts and drop rear of drive shaft. Disconnect universal joint knuckle dust cap Remove drive shaft spline from universal joint knuckle and plug assembly. Remove carburetor inlet fitting and fuel line from carburetor. Remove valve rocker arm cover, then install the appropriate engine lifting bracket. Position hoist through right door and attach it to lifting bracket. Lift engine and remove engine and transmission through the front door.

ENGINE MOUNTINGS

1954-55 PASS. CARS & TRUCKS

ENGINE FRONT STEADY REST REMOVAL & INSTALLATION: Remove fan belt and the two clamp bolts at front steady rest bracket. Remove spacer bolt retaining insulators in bracket and remove insulators. Remove crankshaft pulley. Remove capscrews retaining steady rest bracket to cylinder front cover and remove bracket.

Installation—Install steady rest bracket on cylinder front cover and tighten capscrews to 23-28 ft. lbs. torque. Install crankshaft pulley. Install spacer bolt and clamp bolts. Do not tighten spacer bolts or clamp bolts. If necessary, center spacer bolt in frame bracket by shifting engine front mountings in their frame brackets. Tighten spacer bolt to 20-25 ft. lbs. Make sure no engine weight is being transferred to the steady rest insulators, then tighten clamp bolts to 25-30 ft. lbs. Install fan belt and adjust belt tension.

OIL PAN

1946-48 6 CYL. MODELS

OIL PAN REMOVAL: Remove the engine from the chassis (see Engine Removal above). Then remove starter, take out oil pan capscrews and lift pan off.

Oil Pan Installation Note—Use new packing at front and rear ends of pan. CAUTION—Soak new packing in engine oil for 2 hours before using.

1946-48 V8 MODELS

OIL PAN REMOVAL: Remove oil pan drain plug and drain the oil. Disconnect steering drag link at steering gear pitman arm. Loosen clamp on exhaust cross-pipe, disconnect exhaust pipe at left exhaust manifold and remove cross-pipe. Take out capscrews in ball joint at rear end of front radius rods, lower rear end of rods to provide clearance (rods can be held down by wooden block inserted between radius rod ball and frame). Take out engine splash pan mounting screws, move pans to the side and out of the way. Remove starter by disconnecting brace at commutator end and taking out two through bolts on commutator end plate. Disconnect oil filter return line at oil pan connection, remove oil level indicator stick and tube. Take out oil pan capscrews and remove pan from beneath car.

NOTE—Additional clearance can be secured by attaching hoist to front bumper bars (not axle) and raising front end of car slightly.

Oil Pan Installation Note—Use new gaskets and new packing at front end of pan. Soak new packing in engine oil for 2 hours before using.

1949-51 6 CYL. MODELS (EXCEPT "M" 254" ENGINE)

OIL PAN REMOVAL: Remove engine from chassis. Remove screws holding oil pan to engine rear plate, and screws holding pan to engine block and front cover plate. Remove pan from engine.

Installation—Soak new packing 2 hours in SAE 20 engine oil before installation. Install packing in retainer groove and roll it in place with a round bar, making sure the packing meets the pan gasket evenly. Mount pan on engine and install screws holding pan to engine block and front plate. Torque to 15-18 ft. lbs. (*NOTE*—Alignment of pan can be simplified by using two studs in opposite corners of block). Install screws holding oil pan to rear plate. Torque to 10-15 ft. lbs.

1949-53 V8 MODELS

OIL PAN REMOVAL: Drain oil, remove starter motor, clutch spring and the flywheel housing front cover. Remove the road air breather duct and the bolts retaining steering gear idler arm to frame. Remove steering gear arm and drop idler and connecting rod until it hangs from spindle. Remove oil pan retaining screws and drop the oil pan. The two front screws on the pan can be reached through holes in frame front cross member. *NOTE*—On some engines it will be necessary to disconnect the front engine supports and raise front of engine.

Installation—Clean gasket surface of block and file off any burrs around bolt holes. Tie each half of pan gasket to pan through two of the holes to hold gasket while installing. Hold pan in place on block and install two screws finger tight in each side. Remove strings and install remaining screws, tightening them to 15-18 ft. lbs. Install road breather duct and flywheel housing front cover. NOTE—Align flywheel housing front cover by installing the two shoulder bolts in the top holes. Install starter motor, clutch return spring, steering idler arm support bracket and the steering idler arm. Fill crankcase with oil and run engine to check for oil leaks.

1952-53 6 CYL. 215" ENGINE

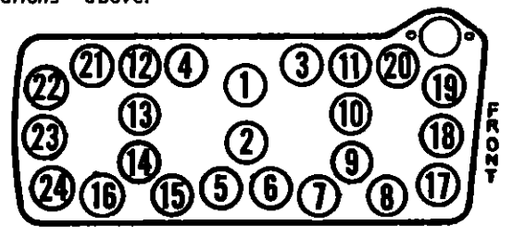
OIL PAN REMOVAL: Drain radiator and crankcase. Disconnect upper and lower radiator hoses from the engine. Remove engine front support to frame attaching bolts, and raise the front of the engine about 2 inches. Remove oil dipstick, and remove the oil pan retaining screws. Remove pan.

Installation—Clean gasket surface of block thoroughly, and file off any burrs around threaded bolt holes. Install new gasket and oil pan, tighten one pan screw at each end of the pan finger-tight, tighten all screws from center outward, to 12-15 ft.lbs. torque, repeat tightening procedure to make certain all screws correctly torqued. Check pan for oil leakage after engine warmed up.

►*OIL PAN SCREW CAUTION*—Slotted head ¼" screws used to retain oil pan on first cars must be installed with lockwashers. Tighten screws securely with a large screwdriver.

1950-53 6 CYL. "M" ENGINE

OIL PAN REMOVAL: Raise and support front of truck. Drain crankcase and remove splash pan. Remove starter and disconnect ventilator pipe bracket. Remove oil pan-to-rear plate screws and oil pan-to-block and front cover screws. Remove oil pan.



Installation–Remove old packing from front and rear of pan. Soak new packing in oil for two hours then install it in retainer grooves, rolling it in place with a round bar. Spread a thin coating of grease on oil pan gasket surface to hold gasket in place and install gasket. Install pan into place and secure with screws. Complete assembly by reversing removal instructions.

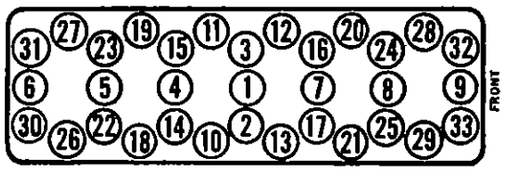
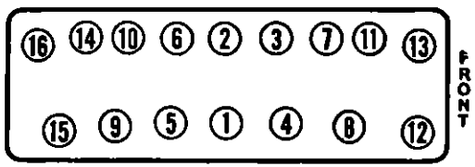
CONTINUED FROM PRECEDING PAGE

CYLINDER HEAD & MANIFOLD



TIGHTENING TORQUES: *See "Tightening Specifications" above.*



L-HEAD V8 ENGINE CYLINDER HEAD

OVERHEAD VALVE V8 CYLINDER HEAD

L-HEAD 6 CYL. ENG. CYLINDER HEAD

OVERHEAD VALVE 6 CYLINDER HEAD

1946-48 V8 MODELS

CYLINDER HEAD INSTALLATION: Right and left bank cylinder heads are interchangeable.

►*CAUTION: Do not use earlier type cylinder head gaskets with these heads.*

1949-53 V8 MODELS

CYLINDER HEAD INSTALLATION: ***CAUTION—Use latest type Cylinder Head gasket (see data below).*** Install guide studs (see note below) in two outer bolt holes in block. Coat NEW cylinder head gasket on both sides with special head gasket sealer No. 8A-19554, install gasket on block. Install cylinder head over guide studs. Coat threads of all cylinder head bolts lightly with water resistant sealer, install one bolt at each end of head and tighten finger-tight to hold head and gasket in position, remove guide studs, install remaining head bolts. Tighten all head bolts evenly to 65-70 ft. lbs. torque in correct sequence (see Cylinder Head Diagram). Recheck cylinder head bolts after engine has reached normal operating temperature (run for at least 10 minutes at fast idle) and again after 1000 miles of operation.

►**Cylinder Head Guide Stud Note**—Guide studs can be made up by cutting head off a 7/16-14 x 3½" bolt, tapering end, and cutting a screwdriver slot so that stud can be turned into cylinder block hole.

►***1949-53 REPLACEMENT CYLINDER HEAD AND GASKET CAUTION***—New heads and gaskets (heads .011" thicker at gasket surface, gaskets .010" thinner when compressed) are furnished to overcome coolant leakage due to loss of head bolt torque. LATER TYPE "THIN" GASKET MUST BE USED ONLY WITH LATER TYPE "THICKER" CYLINDER HEAD. Correct gasket and cylinder head combinations are as follows:

Gasket No.	EARLY TYPE	Cylinder Head No.
EAB-6051B	EAB-6049C, 8RT-6049A, 8BA-6049A	
EAB-6083B	EAB-6050C, 8RT-6050A, 8BA-6050A	

Gasket No.	LATER TYPE	Cylinder Head No.
EAB-6051C	EAB-6049D, 8RT-6049B	
EAB-6083C	EAB-6050D, 8RT-6050B	

1947-51 6 CYL. "H" ENGINES

6 CYLINDER HEAD GASKET: Gasket must be installed with large full flow passages at rear. Late type gaskets have left front corner cut off for identification. If this type gasket with cutoff corner installed backwards, water leaks at the rear corner between head and block will occur.

6 CYLINDER HEAD BOLTS & STUDS: Studs used on engines up to 7HA-61171, bolts used after this number. Both studs and bolts furnished for service but should not be mixed. Use all studs or bolts.

1954-55 V8 MODELS

CYLINDER HEAD: Removal– Drain cooling system. Clean outside of valve chamber cover. Remove cover, exhaust manifold, spark plugs, intake manifold, ignition harness bracket from right hand cylinder head (remove distributor cap when removing right hand head from Thunderbird). On cars, others than Thunderbird, disconnect battery ground cable, and oil dipstick tube bracket from cylinder head. Remove generator bracket-to-cylinder head bolt, remove generator from mounting bolt, and move generator out of way. Release spring tension on rocker arms by loosening adjusting screws, then remove rocker arm assembly and oil baffle plates. Remove valve pushrods in sequence. Identify pushrods so that they can be replaced in original positions. Disconnect wire from temperature sending unit (left-hand head). Remove cylinder head bolts. Install cylinder head holding fixtures. *(NOTE*– Distributor location on Thunderbird will not permit installation of rear holding fixture on right hand head in its normal position. Install fixture one hole forward). Lift cylinder head off block. Do not pry between head and block. Remove head gasket.

Installation: Using new gasket with sealer applied to both sides, position cylinder head on engine. Remove holding fixture brackets. Install cylinder head bolts, and tighten them to 55 ft. lbs. torque (cold) in proper sequence (see diagram). Repeat operation and tighten to 65 ft. lbs. (cold). (See Cylinder Head Torquing following for special tools required). Install pushrods in their proper locations. Position oil baffle plates on head. Place rocker arm assembly on plates, then install bracket retaining screws and nuts. Be sure to install the oil drain tube on same end bracket from which it was removed. The bracket end of the tube must enter locating hole in rocker shaft. *(CAUTION*–Be sure rocker shaft support brackets are not upside down when assembly installed. There is a .020" difference in bracket height when reversed. Tightening the screws with brackets reversed can result in a broken rocker shaft). Tighten bracket retaining screws and nuts to 12-15 ft. lbs. torque. Make a preliminary valve lash adjustment. Connect temperature sending unit (left hand head). After installing right hand head on all vehicles **except Thunderbird,** position generator, install the generator front mounting bolt, then fasten generator bracket to cylinder head. Connect battery ground cable and dipstick bracket. After installing right hand head on Thunderbird, install distributor cap. Install ignition harness bracket on right hand cylinder head. Install intake manifold. Install spark plugs, then install heat shields and exhaust manifold. Fill cooling system, and run engine until it has reached normal operating temperature. Then tighten head bolts to 75 ft. lbs. torque (hot). Check the valve lash and adjust the lash as necessary. Cement new gasket on rocker arm cover if necessary, then install cover. Tighten cover nuts to 2.0-2.5 ft lb. torque.

►*V8 CYLINDER HEAD TIGHTENING NOTE:* Due to position of rocker arm assemblies and exhaust manifolds, special tools are required to properly torque cylinder head. On both right and left hand bolts 1-2-3-4-5-6-7-8-9 use Wrench S-8663-A. On right hand bolt No. 10 use 11/16" socket, 1 5/16" long plus SX-5 Extension. On left hand bolt No. 10 use S-8663-A Wrench. *When using socket and extension on a Fordomatic equipped vehicle, work from the top of the manifold, and force the socket extension past the Fordomatic oil level indicator tube in order to get the socket on the bolt head.*

1952-55 6 CYL. MODELS

CYLINDER HEAD: Removal–Disconnect all lines and wires to distributor and carburetor. Remove coil from engine and let hang from distributor. Disconnect engine temperature unit sending wire. Remove capscrew and clip from No. 6 rocker arm support bracket and pull oil feed line out of bracket, then pull it out of block with with pliers (do not damage the line). Loosen all rocker arm adjusting screws to remove valve spring load from the rocker arms. Slide the rocker arms away from the pushrods and remove the rods. *NOTE–Leave the two end pushrods in place. Rocker arms at each end of*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

engine cannot be moved laterally). Identify the pushrods so they can be reinstalled in their original positions. Remove manifold bolts and pull manifold assembly away from head. Install cylinder head holding fixture Tool No. T52P-6085-DAD. Remove all cylinder head bolts, install guide studs (see notes below) in two diagonally opposite end bolt holes. Lift head up over pushrods and guide studs and remove from engine.

►**Cylinder Head Guide Stud Note:** Guide studs can be made up by cutting head off a 7/16-14x6" bolt, tapering end, and cutting a screwdriver slot so that it can be turned into cylinder block hole.

Installation: Coat NEW cylinder head gasket on both sides with special head gasket sealer No. 8A-19554, install gasket on block. Install the two end pushrods and install guide studs in two diagonally opposite end bolt holes. Lower the cylinder head over the guide studs and pushrods. *(CAUTION*—Slide head down carefully and guide pushrod through head). Coat threads of all cylinder head bolts lightly with water resistant sealer, install two bolts at opposite ends of head to hold head gasket in position, remove guide studs, install remaining head bolts. Tighten all head bolts evenly to 75 ft. lbs. torque in correct sequence (see Cylinder Head Diagram). Install all pushrods and assemble rocker arms (see Rocker Arm Data). Recheck cylinder head bolts after engine has reached normal operating temperature and again after 1000 miles of operation.

1954-55 V8 MODELS (256" ENGINE)

►*1954-55 "256" ENG. MANIFOLD HEAT CONTROL INSTALLATION (For Cold Weather Operation):* If poor engine operation encountered on 256 Eng. Trucks under stop and go conditions, an exhaust thermostat control valve may be installed on 1954-55 models as follows:

Engines Built Through September 2, 1954: Equipped with EBU-5267-B crossover pipe and B5T-5293-A spacer. Remove spacer and install B4A-9685-A exhaust thermostat control valve.

Engines Built From September 2, 1954 to December 1, 1954: Equipped with EBZ-5267-A crossover pipe and four attaching studs (353721-S). Remove pipe and studs, and replace with EBU-5267-B crossover pipe, 88413-S studs, 33816-S nuts. Install B4A-9685-A exhaust thermostat control valve.

Engines Built From December 1, 1954 Through 1955: Equipped with B5C-5267-A crossover pipe, four attaching studs (88448-S), and EBU-9450-B gaskets. Remove pipe, studs, and gaskets. Replace with B5A-5267-B crossover pipe, 88413-S studs, 33816-S nuts, B5A-9450-A gaskets. Install B5A-9685-C exhaust thermostat control valve. *NOTE*–B5A-9685-D exhaust thermostat control valve has been released to minimize engine stalling and improve fuel distribution. See Ford Truck Model pages.

CYLINDER SLEEVES

1946-53 V8 & 6 CYL. L-HEAD ENGINES

CYLINDER SLEEVES: Dry type Steel or Cast Iron cylinder sleeves used in production on some Ford engines. On V8 engines with sleeves, engine may be marked with letters 'HS' stamped on top of block beside inner front corner of left cylinder head.

Cylinder Sleeves

Model	Type	Part No.
6 Cyl. "M" Engine	Cast Iron	8MB-6055-B
6 Cyl. "G" Engine	Cast Iron	1GA-6055-D
6 Cyl. "H" Engine	Cast Iron	7HA-6055-B
8 Cyl. "V8" Engine	Cast Iron	①59A-6055-B
8 Cyl. "V8" Engine	Cast Iron	②59A-6055-C

①—Used with cylinder blocks with milled depression between valve port and cylinder.
②—Used with cylinder blocks without milled depression between valve port and cylinder.

Service Limits: Steel sleeves should be replaced if worn more than .003" or if ridged at top due to wear. Sleeves which have been buckled (visible waves or burned spots) must also be replaced.

Steel Sleeve Installation: Sleeves should be removed and installed with a puller which applies pressure evenly (do not use arbor press). Use Sleeve Replacer tool, No. 6055-A, to install new sleeves, check sleeves after installation for buckling using a plug gauge or new piston. If piston sticks any point, remove sleeve and install another new sleeve.

Cast Iron Sleeve Installation: These sleeves are thicker than steel type and cylinder must be bored out for sleeve installation. Rebore cylinder to size .0012" smaller than outside diameter of sleeve to provide correct press fit, counterbore top of cylinder to fit flange on upper end of sleeve, press sleeve in place. NOTE—These sleeves are furnished with finished cylinder bore to fit a standard size piston. No finishing operations are necessary.

Fitting Pistons on Sleeve Equipped Engines:—Special gauge thicknesses used (not same as for engines without sleeves). See Piston Fitting Instructions on each car model page for complete instructions.

PISTONS

1946-48 MODELS

REPLACEMENT PISTONS: Aluminum 4-Ring piston assemblies (with fitted pin and retainer) furnished for service in Std., .010", .020", .030", .040", .060" oversizes.

1949-53 MODELS

REPLACEMENT PISTONS: Aluminum 4-Ring piston assemblies (with fitted pin and retainer), pistons are either solid or split skirt type, furnished for service replacement in the following oversizes: Std., .0025", .005", .020", .030", .040", .060".

PISTON RINGS

1946-53 MODELS

REPLACEMENT PISTON RINGS: Three types of piston ring sets furnished for service as follows: **Standard** (Snap-type), designed for use in new engines or whenever the engine block is rebored and new pistons installed. **Expander Type,** designed for use after a light honing job and the cylinder taper does not exceed .006". **Steel Section Type,** designed for use in cylinders where taper of bore is between .006" and .015", or whenever excessive oil consumption is encountered, or when cylinder bore is not to be honed. NOTE—"Snap Type" piston rings not furnished for 254 cu. in. "M" engine.

Piston Ring Sets: Furnished Std., .020", .030", .040", .060" Oversize.

CONNECTING R D & BEARINGS

1946-48 V8 MODELS

REPLACEMENT CONNECTING ROD BEARINGS: Bearing floats between connecting rod and crankpin with inner bearing surface on connecting rod and outer bearing surface in connecting rod. Bearings are furnished Standard on outside diameter, and the following undersizes on inside diameter: .002", .010", .020", .030", .040".

1946-48 V8 MODELS

CONNECTING ROD BEARING SERVICING: If connecting rod bore worn more than .0015" over original size of 2.360" (2.3597-2.3603") rod should be replaced.

Connecting Rod Bearing: Measure bearing thickness with micrometer gauge by placing a piece of round stock on inner face of bearing and measuring total thickness of bearing and stock (measure stock separately and subtract from micrometer reading for bearing thickness figure). Replace bearing measuring less than .1085" thick.

Crankshaft Crankpins—Check crankpins for condition, replace crankshaft or re-machine crankpins if scored or grooved, tapered more than .001", or out-of-round more than .0015". Shafts should be re-machined as noted under "Crankshaft & Main Bearing" section below. NOTE—If crankpins worn evenly, and to less than maximum limits given above, crankshaft will be satisfactory for service providing that connecting rod bearings installed which provide bearing clearance of less than .005" (desired bearing clearance .0015-.0035").

1949-53 V8 MODELS

CONNECTING ROD INSTALLATION: Install connecting rods with oil squirt holes as follows—Left bank rods with oil squirt holes to front side and right bank rods with oil squirt holes on rear side. Left bank rod numbers must be towards the left side of engine and right bank rod numbers towards right side of engine.

CRANKSHAFT & MAIN BEARINGS

1946-47 6 CYL. "G" ENGINES

REPLACEMENT MAIN BEARINGS: Upper and lower bearing halves not interchangeable. Crankshaft end thrust taken by No. 4 (rear) bearing. Replacement bearings furnished in Standard and the following undersizes: .005", .010", .020", .030".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1946-48 MODELS

SPECIAL MAIN BEARING NOTE (Some Engines)—Some cylinder blocks have been manufactured with main bearing bore .015" Oversize. These blocks can be identified by mark "ERP" stamped on oil pan gasket flange at left front corner of block. CAUTION—All bearings installed in these engines must be special "O.D. .015"" Oversize type

1946-48 V8 MODELS

REPLACEMENT MAIN BEARINGS: Main bearings furnished in Standard and the following undersizes (See Special Main Bearing Note above): .002", .010", .020", .030".

Rear Main Bearing Oversize (Length): Flanged rear main bearings are furnished .015" oversize (overall length) for adjustment of crankshaft endplay.

1949-55 V8 MODELS

1947-55 6 CYL. MODELS

REPLACEMENT MAIN BEARINGS: Bearings furnished Standard and in the following undersizes: .002", .010", .020", .030".

Selective Fit Standard Bearings: Engine block, crankshaft journals, and bearings marked with red or blue paint for selective fitting of bearings (Thinner wall section—RED; Thicker Wall Section—BLUE). If block and crankshaft journal marked with same color paint, then both bearing halves should be of same color. If block and crankshaft journals of different colors, then bearing halves should be of different colors. NOTE—Either color bearing half can be used optionally in combination with block and crankshaft journal markings for selective bearing fitting.

1954-55 V8 MODELS

CRANKSHAFT THRUST BEARING ALIGNMENT: After No. 1, No. 2, and No. 4 bearing caps and inserts have been installed and properly torqued, install No. 3 bearing cap and insert. Install capscrews snugly, then pry crankshaft toward rear of engine. Reverse this action by prying crankshaft forward (toward front of engine). This will align thrust surfaces of both halves of thrust bearing. RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 80-90 ft. lbs. torque. Check crankshaft endplay which should be .002-.006"

1952-55 6 CYL. MODELS
OVERHEAD VALVE ENGINES

REAR MAIN BEARING OIL SEALS: *NOTE*—Crankshaft seal is installed in groove in block and in seal retainer (directly behind rear main bearing).

Seal Installation: With crankshaft out, install new journal oil seal in cylinder block (Tool T52L-6701-AGD). Cylinder block journal seal and retaining cap journal seal must be cut flush without any frayed edges overlapping. Install a new journal oil seal in oil seal retainer cap (Tool T52L-6701-AGD) Install new retainer cap-to-cylinder block seals. Install main bearing caps and inserts. Lubricate seals with grease to reduce friction, then install retainer in cylinder block.

Testing Seal Installation: Check retainer-to-cylinder block seal for leaks. Squirt a few drops of oil into seal corners on outside of cylinder block. Blow compressed air into seal corners from inside block. If air bubbles appear in oil, remove seal retainer. Be sure all mating surfaces are clean. Install new seals and repeat air test.

1954-55 V8 MODELS

REAR MAIN BEARING OIL SEALS: *NOTE*—Crankshaft seal is installed in groove in block and in seal retainer (directly behind rear main bearing). Retainer is sealed in block by special sealing strips inserted in grooves in sides of retainer after it is installed in the block.

Seal Installation: With crankshaft out, install new journal oil seal in cylinder block (Tool T52L-6701-AGD). Cylinder block journal seal and retaining cap journal seal must be cut flush without any frayed edges overlapping Install a new journal oil seal in oil seal retainer cap (Tool T52L-6701-AGD). Install main bearing caps and inserts, then install rear main bearing oil seal retainer. Dip retainer-to-cylinder block oil seals in light engine oil, then immediately install them in grooves (seals will swell immediately on contact with with engine oil). It may be necessary to tap seals into place for last ½" of travel.

Testing Seal Installation: Same as for 6 Cylinder. See above.

ENGINE FRONT COVER

1954-55 V8 MODELS

FRONT COVER OIL SEAL: Drive out old seal with a pin punch, then clean out recess in cover. Coat new seal with grease, then install seal with Tool T52L-6700-BEE. Drive seal in until it is fully seated in recess. Check seal to be sure spring did not come out during installation.

CAMSHAFT & BEARINGS

1946-53 MODELS

CAMSHAFT BEARING SERVICING: Camshaft bearings should be replaced if scored or worn, or if bearing clearance is greater than indicated below.

Bearing Clearance—.001-.002" (new), .004" (worn).

Bushing Removal & Installation—Use Puller No. 6005-N to remove bearing so that bearing is drawn out evenly. Install new bearing with same tool, making certain that oil holes in bearing line up with oil channels in cylinder block. Replacement bearings are finished type and do not require reaming.

1947-51 6 CYL. "H" ENGINES

CAMSHAFT & TAPPET CLEARANCE CHANGES: Three different camshafts have been used on this engine. *NOTE—Tappet Clearances are different. See Tappet Clearance below..*

Early 1950 & Previous Engines—Camshaft No. *7HA-6350-C (stamped "C" or "CWC" on forward end)* used with Camshaft Gear 8HA-6256-A, B, C with 15° chamfer on inner diameter of hub. Later type gear 0HA-6256-A, B, C can also be used. *See Tappet Clearance Setting below.*

Late 1950 Engine—Camshaft No. OHA-6250-A (stamped "0" on forward end, and engine block stamped "0H" directly above #3 Intake valve port). Does not have undercut at gear post and is used with Camshaft Gear 0HA-6256-A, B, C. CAUTION—Previous type 8HA-6256-A, B, C can be used but chamfer on inner diameter must be increased from 15° to 45°. *See Tappet Clearance below.*

►*ENGINE MARKING CAUTION*—Engine marking (see above) must be added when "0H" camshaft installed in unmarked block, or removed if first type installed in marked block.

1951 Engines—Camshaft No. 0HA-6250-B (Stamped "B" on forward end), replaces previous type 0HA-6250-A. This camshaft is interchangeable with 0HA-6250-A. *See Tappet Clearance below.*

6 CYL. "H" ENGINE TAPPET CLEARANCE

(With 7HA-6250-C Camshaft—Marked "C" or "CWC") Intake—.009"-.011". Exhaust—.013"-.015".

(With 0HA-6250-A, 0HA-6250-B Camshaft) (Shaft Marked "0" or "B." Engine Marked "0H") Intake—.013"-.015". Exhaust—.017"-.019".

1950-53 6 CYL. "M" ENGINE

CAMSHAFT CHANGE: Two different camshafts used as follows:

Early 1950 & Previous Engines—Camshaft No. 7HT-6250-A, B, C same as used on Early 1950 "H" Engines. See "H" Engine Camshaft Change data above.

Late 1950 & 1951-53—Camshaft No. MTH-6250 (stamped "M" on forward end). This camshaft does not have undercut at gear post and is used with Camshaft Gear 7HT-6256-A, B, C (with 45° chamfer on inner diameter).

►*CAUTION*—Previous type gear 8HA-6256-A, B, C can be used but chamfer on inner diameter must be increased from 15° to 45°. Valve tappet clearance same for both. **Intake** .009"-.011", **Exhaust** .014"-.016".

1952-55 6 CYL. MODELS
OVERHEAD VALVE ENGINES

CAMSHAFT BEARING REMOVAL & INSTALLATION: Remove camshaft, drill a ½" hole in plug at rear camshaft bearing bore, remove plug with Tool 7600-E. Remove bearings from block with Tool T52L-6261-CEE. To install, position bearing at bearing bore and press it into place with Tool T52L-6261-CEE. No. 1 cam bearing must be pressed in .005-.025" below front face of bearing bore. Press remaining bearings in sufficiently to align oil supply holes. Clean out plug recess in camshaft rear bore. Coat outer rim of new plug lightly with Sealer 8A-19554-A, and install plug with Tool T52L-6266-BGD. Install camshaft. *NOTE*—No. 3 Bearing not interchangeable with other bearings.

1954-55 V8 MODELS

CAMSHAFT BEARING REMOVAL & INSTALLATION: Remove camshaft. Drill ½" hole through plug at camshaft rear bearing bore, then remove plug with Tool 7600-E. Pull bearings out of block with Tool T52L-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6261-CEE. To install bearings use Tool T52L-6261-CEE (A bearing adapter with larger flange is used to install bearings in cylinder block). (*NOTE*—No. 1 camshaft bearing has *one oil hole, other four camshaft* bearings have five holes and are interchangeable) *Be sure to align holes in camshaft bearings with oil holes in cylinder block when bearings are installed.* Particular care should be taken with No. 3 cam bearing since it supplies oil to rocker arms. After all bearings are installed, coat a new camshaft rear bearing bore plug with oil resistant sealer and install plug with Tool T53L-200-A (Handle), T54L-6266-A (Adapter).

TIMING GEARS

1946-53 V8 ENGINES

1946-EARLY 1949 6 CYL. ENGINES

TIMING GEARS: Bolted on type camshaft used (fibre or aluminum) which can be replaced without removing camshaft from engine.

Replacement Gears: Crankshaft gears are Cast Alloy Steel and are furnished in one size only. Camshaft Gears are furnished in Standard size, and the following oversizes: .006", .010".

Camshaft Gear Removal and Installation:—Gear is bolted on camshaft hub flange by 4 offset capscrews. To remove gear, remove crankshaft pulley (and dampener on 6 Cyl. Engine)—use Puller 6312-A, and timing gear cover. Bend back lock plate tangs, take out four camshaft gear mounting capscrews, remove gear. When replacing gear, make certain that marks on camshaft and crankshaft gears are lined up and see that lockplate tangs are bent up against flats on mounting screws. NOTE—Camshaft gear mounting screw holes offset so gear can only be installed in correct position. Use 6312-B Pulley Replacer to install crankshaft pulley.

LATE 1949-51 6 CYL. "H" ENGINES

TIMING GEARS: Pressed on type camshaft gear used (fibre or aluminum) which can be replaced without removing camshaft from engine.

►*TIMING GEAR REPLACEMENT NOTE*—Later "Press-on" type timing gear can be used to replace earlier "Bolted-on" type by removing separate timing gear hub, then installing gear as indicated below.

Camshaft Gear Removal & Installation: *(NOTE—Three different camshafts used, and it is necessary that correct timing gear be used. See "Camshaft & Tappet Clearance Changes" above.* To remove timing gear, remove radiator, vibration dampener, and engine front cover. If gear has tapped holes in gear hub, use puller which fits the two 7/16-14 tapped holes in gear hub and pull gear off. If there are no tapped holes in hub, drill hub with Special Tool No. 6256-AA to relieve the press fit, then remove gear with puller No. 6256-AB. To install gear position thrust plate on camshaft with oil groove toward journal. Align gear with keyway in shaft, and marks on gear with marks on crankshaft gear. Press gear on camshaft with tool No. 6256-BB. Check backlash which should be .001-.002".

VALVE SYSTEM

1946-48 V8 MODELS

VALVE ASSEMBLY INTERCHANGEABILITY: 8BA type (1949-50) valve assembly (valve & guide) can be used in 1946-48 engines providing 8BA-6510-B Guide, 8BA-6514 Retainer and 7HA-6518 Valve Lock are also used. 8BA-6510 Valve Lifter must also be used with the later type assembly. Earlier type lifter will collapse if used with later type valve assembly.

OVERHEAD VALVE ENGINES

►*ALL 6 CYL. & V8 OVERHEAD VALVE ENGINE EXHAUST VALVE STEM GUIDE CLEARANCE CHANGE:* Stem diameter of Production & Service Exhaust Valves decreased .0005" for greater stem clearance. NEW stem diameters are:

Size	Stem Diameter
Std. (Marked Red)	.3400-.3405"
Std. (Marked Green)	.3405-.3410"
.003" Oversize	.3430-.3440"
.015" Oversize	.3550-.3560"
.030" Oversize	.3700-.3710"

1948-50 MODELS

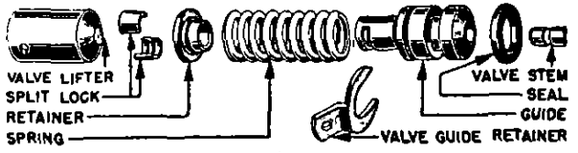
ROTATABLE VALVES: Rotatable valves and parts can be installed in 1948-50 "R" Engines, 1949-50 Pass. Car Engines and 1948-50 "H" Engines by changing *the retainer valve spring, exhaust and intake valves.*

1950-53 6 CYL. "M" ENGINE

FREE TYPE VALVES: 6 Cyl. "M" Series Truck Engine **Exhaust Valves**—Consists of Valve Cap, Spring Retainer, Valve Lock and Valve. Free Type exhaust valve assemblies can be installed on 1948-51 6 Cyl. "H" engines by replacing the above parts.

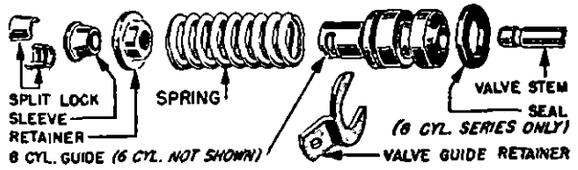
VALVE TAPPET ADJUSTMENT

1946-53 V8 ENGINES



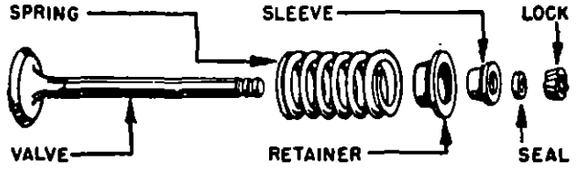
1946-47 6 CYL. "G" ENGINES

Valve Grinding and Tappet Clearance Note (for all V8 Models):—To perform these operations with minimum amount of hand cranking, note which valves are fully open (first column in table below), grind or check valves listed on same line of table—then turn shaft 'til next 'valve open' point reached.

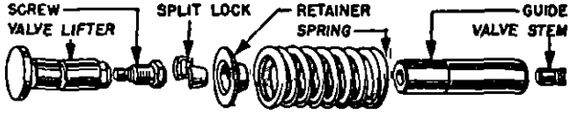


Valves Open	Valves to Grind
1. 4X & 1N	3X, 8N, 6N, 7X, 3N, 2X
2. 3X & 8N	1X, 7N, 5X, 2N, 4X, 1N
3. 1X & 7N	8X, 5N, 6X, 4N
OR	
1. 8X & 5N	1X, 7N, 6N, 7X, 3N, 2X
2. 6N & 7X	5X, 2N, 4X, 1N, 8X, 5N
3. 5X & 2N	6X, 4N, 3X, 8N

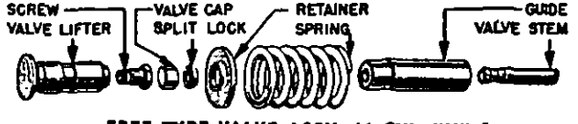
NOTE—'X' Exhaust Valve. 'N' Intake Valve.



Tappet Clearance Checking (V-8 Engines & 6 Cyl. "G" Engines): Check tappet clearance when re-installing valves. Turn camshaft until lifter is on heel of cam, make certain that valve assembly is seated in engine block ("C" washer engaging valve guide), then check the tappet clearance between end of valve stem and top of lifter with a feeler gauge. If clearance less than minimum (see Car or Truck Model pages), install a shorter valve or grind off end of valve stem. If clearance greater than maximum, install longer valve, or reface valve seat to lower the valve in block.



CONVENTIONAL TYPE V8 VALVE ASSEMBLY



1946-53 V8 ROTATABLE VALVE ASSY.

TYPICAL 1952-55 ROTATABLE VALVE ASSY.
6 CYL. & V8 OVERHEAD VALVE ENGINES

CONVENTIONAL TYPE 6 CYL. "H" & "M" VALVE ASSEMBLY

FREE TYPE VALVE ASSY. (6 CYL. "H" & "M" ENGINE TYPE SHOWN)

1952-53 6 CYL. "215" ENGINES

Preliminary Valve Adjustment: Rotate crankshaft until No. 1 piston is at TDC on compression stroke. Adjust #1 Int. & Exh. valves to correct clearance. Make two chalk marks on damper 120° each way from timing mark (120° is equal to 1/3 turn of crankshaft). Turn crankshaft 1/3 turn in direction of rotation and adjust valve lash for No. 5 cylinder valves. Repeat this operation for No. 3, 6, 2, and 4 in that order (rotate crankshaft 1/3 turn for each set of valves).

Final Valve Adjustment: Run engine until it reaches normal operating temperature, then reset all valves to following tappet clearance:

Pass. Cars, All Valves	.015"
Truck Engine, Intake Valves	.013-.015"
Exhaust Valves	.015-.017"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1949-51 SIX CYL. "H" ENGINE

VALVE TAPPET NOISE: Valve Tappet Clearance Springs, Ford Part No. 8HA-6550 can be used when valve tappets are noisy after they have been adjusted correctly. To install springs turn engine over to close valve and insert small end (bottom) of spring between tappet and tappet adjusting screw.

1946-47 6 CYL. "G" ENGINES
1946-53 V8 ENGINES

VALVE ASSEMBLY SERVICING: The complete valve assembly (valve, spring, and guide) should be removed and installed as a unit. Service these assemblies as follows:

Valve Assembly Removal: Compress valve spring down against valve locks and remove valve guide retainer. Pry up on tappet end of valve spring to remove assembly.

Valve Assembly Installation: Slide valve and spring assembly into valve chamber. Compress the valve spring and insert guide retainer in the groove provided in valve guide. Be sure retainer seats properly when spring is released.

►***INTAKE VALVE GUIDE RUBBER SEAL CAUTION—Be sure rubber seal around guide starts evenly in valve guide opening.***

6 CYL. "M" & "H" ENGINE

VALVE ASSEMBLY SERVICING: Valve assemblies are not removed and installed as a unit. Service as follows:

Removal—Compress valve springs using Tool J-6513-R and remove valve spring retainer locks. Remove valve spring using Tool 6513-S. *NOTE*—For "Free Type" exhaust valves use Tool 6518 to remove special thin valve locks.

Installation (Conventional Valves)—Install spring retainer and valve spring (with tightly wound coils in the up position against the block) using Tool 6513-S. Compress the spring using Tool 6513-R and install the valve spring locks.

Clearance (Free Type Valves)—.0002" to .004" between end of valve stem and inside of cap. This clearance can be measured after assembly in the engine by rotating crankshaft until valve is off the seat and free to rotate by hand. Locate a dial indicator on the head and note the reading when valve is moved vertically. If vertical movement exceeds .004", polish open end of cap on fine emery cloth until clearance is within limits. If clearance is less than .0002", grind off end of valve for proper clearance.

1952-55 6 CYL. & V8 MODELS
OVERHEAD VALVE ENGINES

VALVE SERVICING: Valves are "Rotatable" type operating directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal—Use Tool 6513-EE to compress valve springs, remove valve spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.

Valve Assembly Installation—Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

VALVE SEAT INSERTS
1946-53 V8 & 6 CYL. L-HEAD ENGINES

VALVE SEAT REMOVAL & INSTALLATION: (Removal)—Drill two small holes into insert approximately 180° apart. *(CAUTION*—Do not drill all the way through insert). Crack insert at drilled holes and pry the pieces out.

Installation—Counterbore recess to 1.6505"-1.6515" for oversize insert. Cut slightly below the old counterbore depth (.001-.002") to clean up this face. Remove all chips from recess. Chill the oversize insert and the installation tool in dry ice for ½ hour. Position insert on tool with the small radius on the outer edge facing outward. Pilot the driving tool in the valve guide, then drive insert into counterbore until it is fully seated. *DO NOT PEEN THE AREA AROUND INSERT.* Reface the new valve seat insert. *CAUTION—Installation of insert must be performed immediately after removal from dry ice.*

1954-55 V8 MODELS (256" ENGINE)

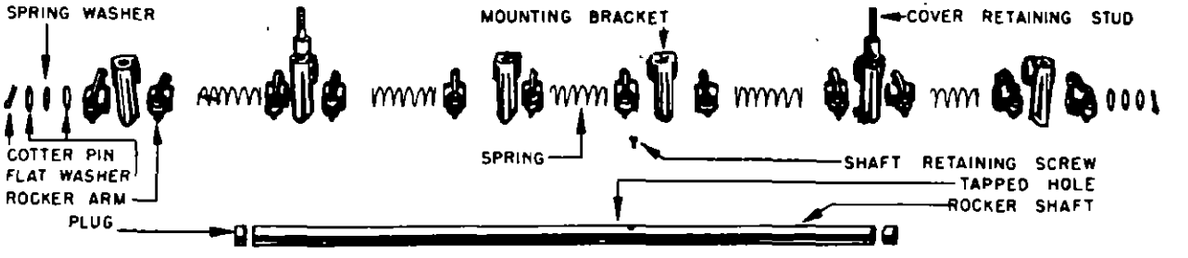
"256" ENGINE VALVE SEAT INSERT: Removal—Invert head and insert drift through valve port, drive seat out.

Installation: Counterbore insert recess to engine specifications. Cut slightly (.001-.002") below old counterbore depth to clean up this face Clean out chips and all oil from recess. Chill oversize insert and installation tool in dry ice for ½ hour. Position insert on tool with small radius on outer edge facing outward. Pilot the driving tool in valve guide, then drive the insert into counterbore until it is fully seated. Do not peen area around insert. Reface new valve seat insert. CAUTION-Installation of insert must be performed immediately on removal of tool and insert from dry ice.

VALVE GUIDES
1952-55 6 CYL. & V8 MODELS
OVERHEAD VALVE ENGINES

VALVE GUIDES (Oversize Valve Stem Installation): Use Tool T52L-6085-AEE Piloted Reamer to ream cylinder head valve guides for oversize stems. Reamers are furnished in .003", .015", .030' oversizes Pilots are furnished Standard, .003", .015".Use reamers with correct pilots in sequence when reaming from standard to oversize holes. Regrind valve seats AFTER reaming guides.

ROCKER ARMS
1952-55 6 CYL. & V8 MODELS
OVERHEAD VALVE ENGINES



ROCKER ARMS: Disassembly—On 6 Cylinder Engines, remove capscrew and clip from No. 6 rocker arm support bracket. Pull oil feed line out of bracket (be careful not to damage line). Loosen all rocker arm adjusting screws to remove valve spring load from rocker arms, then remove rocker arm assembly. **On 8 Cylinder Engines,** release spring tension on rocker arms by loosening adjusting screws, then remove rocker arm assembly. **On all engines,** remove cotter pins at each end of rocker arm shaft, then remove flat washers, spring washers, and plugs. Slide rocker arms, springs, and brackets off shaft. Be sure to identify parts so they can be installed in their original positions.

Reassembly: Oil moving parts with engine oil. Install a plug at each end of shaft. **Do not peen plugs to make them tight.** Assemble rocker arm shaft parts in order shown in illustration. Install oil outlet tube in end rocker arm support and make certain end of tube enters hole in shaft. Tighten rocker arm shaft support-to-cylinder head bolts and tighten to 45-55 ft. lbs. torque. Install rocker arm covers and tighten hold down bolts finger tight after making a preliminary valve adjustment. Make final adjustment after engine warmed up to normal operating temperature. Install new gasket (cement to cover only), install cover and tighten hold down bolts to 8-10 ft. lbs. torque.

►*CAUTION:* Be sure rocker shaft support brackets are not upside down when assembly installed. There is .020" difference in bracket height when reversed, and tightening of screws with brackets reversed can result in a broken rocker shaft.

►*1954-55 ROCKER ARM COVER & GASKET PRODUCTION CHANGE & INSTALLATION CAUTION:* New rocker arm cover (B5A-6582-A) and cover gasket (B5A-6584-A) are now available for service. New gasket has greater resistance to shrinkage than those previously used. New cover does not have inner retaining flange for gasket New type rocker arm cover to be used on 1954 "239" and "256" Engines. Gasket can be used on 1954-55 "239" and "256" Engines. To install new gaskets (.040" thicker than old type) on 1954 "239" and "256" Engines with old type gasket, replace studs with new longer studs (ED-354052-S) to compensate for increased gasket thickness. If new studs not available, old studs (354052-S) should be backed out approximately two turns to allow for thread engagement of nuts. New type nuts (354526 °8) which are threaded completely through should be u: d to prevent bottoming of stud in nut and provide adequate pressure on gasket. Cement gasket to cover. Apply Sealing Compound (8A-19554-B) to gasket, and allow compound to become tacky before positioning gasket to cover.

1952-55 6 CYL. OVERHEAD VALVE ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

OILING SYSTEM

1952-53 6 CYL. 215" ENGINE

►*OIL LEAKAGE AT CAMSHAFT BEARING BORE HOLES IN CYLINDER BLOCK:* These holes located on outside right face of cylinder block and are sealed at inner end by camshaft bearings when installed. IF OIL LEAKAGE NOTED AT THESE HOLES, install tapered drive plugs (No. EAF-66025-A) in these holes. Coat outer surface of plug with Permatex No. 2, drive plugs in until outer end approximately ⅛" below outer surface of block.

OIL PUMP

1946-48 V8 MODELS

OIL PUMP: Removal & Disassembly—To remove pump from engine, remove locking wire and take out mounting screw in pump mounting flange, pull pump down and out (NOTE—Pump body fits in recess in cylinder block and it may be necessary to jar it slightly to loosen it). To dismantle pump, remove strainer screen retainer spring, remove screen, take out screen cover mounting screws, remove screen cover and gasket. Take out four capscrews in pump cover, remove cover, lift out pump driven gear. If pump shaft and driving gear are to be removed, drive out pin in drive gear, place pump in arbor press with support under drive gear, press shaft and driving gear out through lower end of pump housing.

Oil Pump Relief Valve (Pressure Regulator) Note—On pumps with relief valve located on side of pump housing, remove locking wire, take out relief valve nut, spring, and valve plunger.

Servicing—Clean out all oil passages in pump housing with compressed air. Replace all worn parts when clearances exceed following limits:

Pump Shaft & Bushings—Shaft clearance in bushings should be .001-.003" and bushings should be replaced if clearance exceeds .005". Replace shaft if pump gear worn or if bearing surface worn to diameter of less than .497". Replace bushings if worn to inside diameter greater than .502". Remove old bushings with driver, press new bushings in place, line ream bushings to inside diameter of .500".

Pump Driven Gear & Shaft—Clearance between driven gear and stub shaft in pump housing should be .002-.0035". Replace shaft if clearance exceeds .005". To replace shaft, drive old shaft out of housing, press new shaft in place making certain that end of shaft will clear pump cover when it is installed.

Oil Pressure Regulator (Relief Valve)—Check relief valve spring tension and replace spring if tension is less than 78 ozs. or more than 87 ozs. when compressed to length of 1.380".

Pump Assembly—Insert pump shaft in housing, press drive gear on shaft until clearance between gear hub and end of housing (endplay) is .017", drill new 5/32" hole hrough shaft in line with hole in gear, install 5/32" pin and peen both ends of the pin to prevent loosening in service. Complete assembly by reversing disassembly directions above.

CAUTION—Make certain that relief valve nut and pump mounting screw are locked with wire and that lockwashers used under screw heads on pump cover and oil screen cover.

1946-48 V8 MODELS

OIL PUMP DRIVE (Camshaft Gear): Pump drive gear is pressed on rear end of camshaft. Remove old gear with gear puller, No. 6254-A, drive new gear on shaft with a fibre block (support shaft in vise with brass jaws). NOTE—Late design camshafts have flat on oil pump drive gear hub and gears have a similar flat to prevent the gear turning in service. These gears and camshaft must be used together and flats must be lined up when installing gear. Drive gear on shaft until it is firmly seated against the shoulder on the shaft.

Oil Pump Idler Gear: This gear located in rear end of cylinder block between camshaft gear and oil pump drive gear on pump shaft.

Removal & Disassembly—Take out capscrews in cover on rear face of cylinder block, lift off cover and gear assembly, and gasket.

Servicing—Replace all worn parts when clearances exceed following limits:

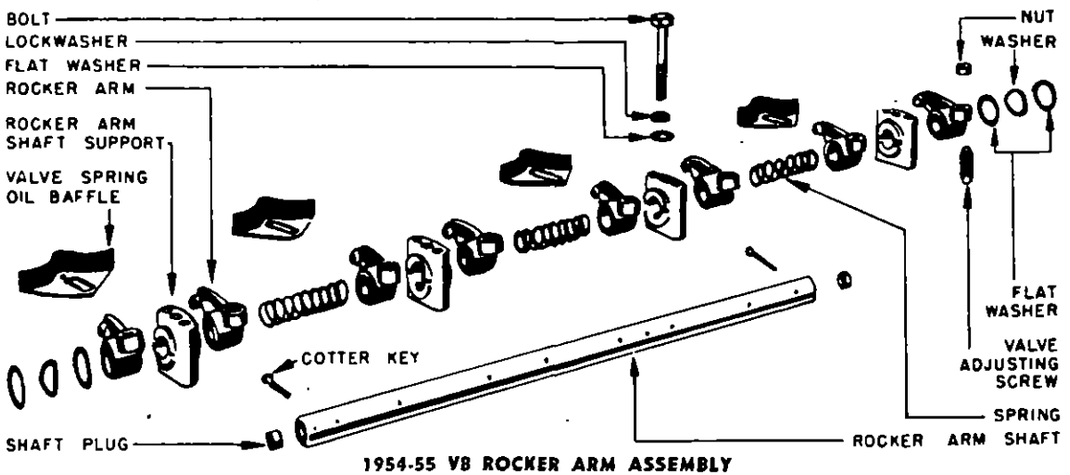
Idler Gear & Bushing—Clearance on shaft should be .001-.003". Replace bushing if worn to inside diameter greater than .752" or if clearance exceeds .005". To replace bushing, drive old bushing out, press new bushing in gear, ream bushing to provide shaft clearance of .001-.003".

Idler Gear Shaft—Replace shaft if scored or worn to diameter less than .747". To replace shaft, press old shaft out, press new shaft in cover until end of shaft is flush with face of cover.

1946-48 V8 MODELS

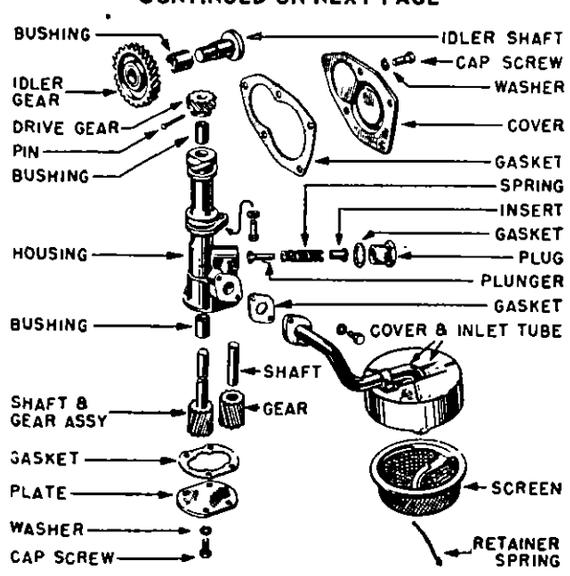
OIL PRESSURE REGULATOR (Relief Valve): Relief valve located on side of pump housing. Check relief valve spring tension and replace springs which are not within limit of 78 ozs. to 87 ozs. when compressed to length of 1.380".

1946-48 V8 MODELS



LOW OIL PRESSURE NOTE: Low oil pressure may be caused by fuel pump push rod bushing being worn through, permitting oil to escape from main oil channel. Replace bushing by driving old bushing out of cylinder block and driving new bushing in until top of bushing is flush with face of casting. New bushings need not be reamed.

1949-53 V8 MODELS



OIL PUMP: Gear type pump mounted on cylinder block inside oil pan at rear of engine. Pressure relief valve mounted in pump housing. NOTE—Early 1949 pumps have spur gear, and later type pumps have helical gears.

Removal: Drain oil, remove oil pan. Remove oil pump retaining screw and remove pump and strainer assembly.

CONTINUED ON NEXT PAGE

1954-55 V8 ROCKER ARM ASSEMBLY

1946-53 V8 OIL PUMP

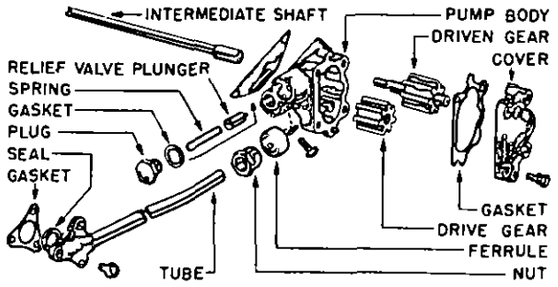
CONTINUED FROM PRECEDING PAGE

Disassembly: Remove strainer assembly retaining screw, strainer and gasket. Remove cover plate and pump driven gear. Remove lock wire and pressure relief valve (plug, gasket, spring, and valve). Drive out pin and remove upper driven gear. Slide shaft and drive gear assembly out of housing. Wash all parts in solvent and dry thoroughly, making sure that no dirt or metal particles remain in housing.

Inspection: Check pump housing for cracks or excessive wear. Pump shaft should have a free running fit without excessive endplay in bushings (.0005" to .0025" clearance). Check pump gear teeth for scratches and wear. Measure clearance between pump gears and pump body, which should be no greater than .005". Check compression relief valve spring which should be 12 lbs. ± 2 ozs., when compressed to 1.14". Clearance between oil pump driven gear and shaft should be .005" maximum.

Reassembly: Apply a thin coating of engine oil to all moving parts. Slide shaft and drive gear assembly into housing. Install upper drive gear, insert retaining pin, and rivet end of pin. ***(NOTE—When installing a new shaft and drive gear assembly, it will be necessary to drill a retaining pin hole in the shaft. Set the end clearance to .016" and use a No. 30 (.1285") drill for the retaining pin hole).*** Install pump driven gear, cover plate gasket and cover plate. Tighten cover plate screws to 7-10 ft. lbs. torque. Install pressure relief valve, spring, gasket, and plug. Insert a piece of lockwire through hole in plug and twist wire around extension housing. Install strainer and gasket and tighten screws securely.

Installation: Slide pump into cylinder block, making sure upper driven gear meshes properly, and install pump retaining screw with a lock washer. Tighten screw to 12-15 ft. lbs. Install oil pan and fill crankcase with engine oil.



1954-55 V8 MODELS

OIL PUMP: Gear type pump mounted on left hand side of crankcase and driven by intermediate shaft from distributor shaft. Pressure relief valve in oil pump housing

Removal: Remove oil pump inlet pipe (NOTE—Early type inlet pipes were connected to oil pan with a flange connector. Later type pipes are one-piece, and are part of oil pump screen cover assembly and should be disconnected at oil pump). Remove capscrews and lockwashers securing pump to engine block. Remove pump and gasket, and the intermediate shaft (if shaft comes out with pump).

Disassembly: Remove capscrews retaining pump cover to body and remove cover plate and gasket. Do not tap pump drive shaft to drive cover off pump. Remove oil pump gear and shaft assembly and oil pump idler gear. Remove oil pressure relief valve plug, gasket, spring and plunger.

Inspection: Check oil pump housing for cracks or excessive wear. Pump shaft should have free running fit without excessive play in pump housing (clearance is .0001-.0024"). Check pump gear teeth for scratches and wear. Check compression of relief valve spring which should be 10.82-10.90 lbs. at 1.40". Replace any worn or defective parts.

1954-55 V8 OIL PUMP

Reassembly: Oil all parts thoroughly. Install oil pressure relief valve plunger, spring, cover plug, and gasket. Install idler gear and oil pump gear and shaft assembly. Install cover plate with new gasket, and tighten cover plate screws to 12-15 ft. lbs. torque. Check pump shaft endplay with a dial indicator which should be .0015-.0055".

Installation: Reverse removal procedure using a new gasket between pump mounting flange and engine.

1946-47 6 CYL. "G" ENGINES

OIL PUMP: Removal & Disassembly. To remove pump from engine, take off Oil Pump Screen Cover assembly by removing lock wire and capscrew at rear intermediate main bearing cap and lock wire and three capscrews in cover on front main bearing cap. Remove front main bearing cap with oil pump body. To disassemble pump, lift out driven (idler) gear from stub shaft in body, press drive gear and shaft out of driving gear and body, using an arbor press.

Servicing—Clean out all oil passages in pump body with compressed air. Replace all worn parts when clearances exceed following limits:

Pump Shaft and Bushings—Replace shaft if fibre drive gear worn or if bearing surface worn to diameter of less than .560". Replace bushing in pump body if worn to inside diameter greater than .566". Remove old bushing with driver, press new bushing in place until inner edge flush with pump body, line ream bushings to inside diameter of .5625".

Pump Driven (Idler) Gear & Shaft—Clearance between driven (idler) gear and stub shaft in pump body should be .002-.0035". Replace shaft if clearance exceeds .005". To replace shaft, press old shaft out of body, press new shaft in place until outer end flush with body (inner end of shaft must clear cover when it is installed).

Pump Assembly—Insert pump shaft in body, press driving gear on shaft. Install driven (idler) gear on stub shaft in pump body.

1947-51 6 CYL. "H" ENGINE

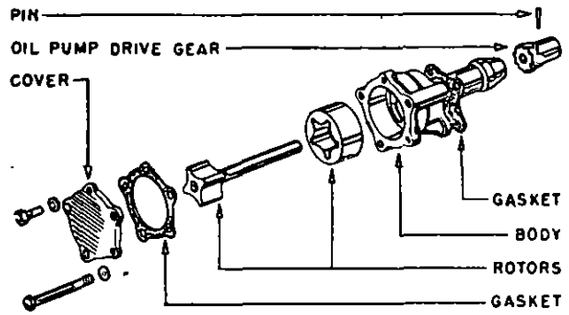
1950-53 6 CYL. "M" ENGINE

6 CYLINDER ROTOR TYPE OIL PUMP: Removal from Passenger Car. Remove the distributor cap turn engine over until #1 cylinder at firing position (rotor will point to oil hole in distributor), allow crankshaft to remain in this position while pump off engine. Remove front engine mounts-to-frame bolts. Loosen rear engine mounting. **Raise front of engine 2" and move ½" to left.** Remove distributor. Take out 3 pump mounting capscrews in pump cover, pull pump out.

Pump Disassembly—Remove cover and outer rotor (rotate drive gear to free rotor from pump body). Drive out pin in drive gear and press gear off shaft. Remove shaft and inner rotor. Clean all parts and check to specifications listed below.

Pump Specifications and Clearances—As follows:

Outer Rotor. Outside Diameter 2.249" (wear limit 2.245"). Clearance in Body .005-.010" (wear limit .012").



Pump Body. Inside Diameter 2.258" (wear limit 2.260").

Inner Rotor. Clearance in Outer Rotor .008" (wear limit .010").

Shaft. Outside Diameter .5175" (wear limit .5170"). Shaft Endplay .004-.008" (wear limit .010").

Pump Assembly—If new shaft installed, assemble shaft with inner rotor in pump. Press drive gear on end of shaft to obtain .004" clearance between gear and upper end of pump body. Drill pin hole in shaft. Install pin and peen both ends. Place outer rotor in body, install cover being sure to use new cover gasket.

Pump Installation—Reverse removal instructions listed above making certain distributor correctly positioned for proper ignition timing.

6 CYL. L-HEAD ENGINE OIL PUMP

1949-50 SIX CYL. "H" ENGINE

(before Pass. Car 8HA-107555, Truck 7H-219349)

OIL PUMP DRIVEN GEAR: After above nos. cast-iron gear (7HA-6652) used together with new flame-hardened camshaft (7HA-6250-C—this no. cast between second and fourth cam lobes from rear end of camshaft).

Replacement of Oil Pump Driven Gear on Engines before Pass. Car No. 8HA-107555 and Truck No. 7H-219349. Bronze gear used on these engines. If pump replaced or if gear failure encountered, manufacturer recommends installation of cast-iron gear no. 7HA-6652. If this cast-iron gear fails prematurely, new flame-hardened camshaft no. 7HA-6250-C and new cast-iron gear should be installed. ***CAUTION***—If oil pump being replaced, 8HA-6600 pump will require re-working by installation of cast-iron driven gear 7HA-6652.

Gear Installation Note. Must be .004-.008" shaft endplay. See Oil Pump Installation above.

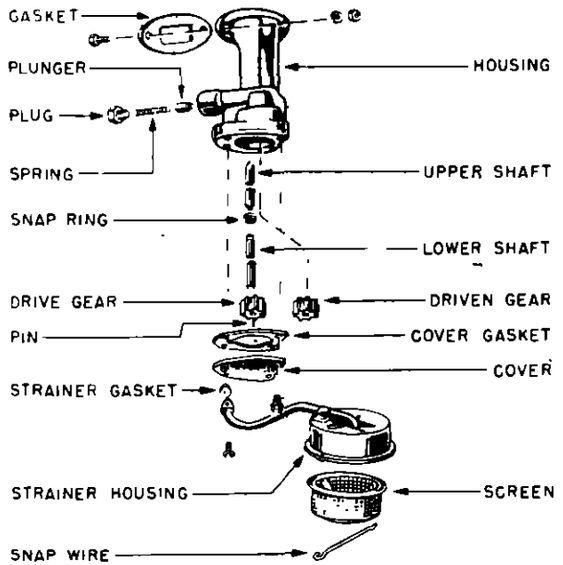
CONTINUED FROM PRECEDING PAGE

1952-55 6 CYL. MODELS
OVERHEAD VALVE ENGINES

►*OIL PUMP PRODUCTION CHANGE & PARTS INSTALLATION CAUTION (223 Eng.):* New oil pump assembly, oil pump body, intermediate shaft and body plate released for service. Intermediate shaft has been case hardened, body plate is now phosphate-coated, gear side and endplay have been increased to prevent binding. New oil pump assembly identified by a daub of green paint on pump body, body plate identified by the color black in addition to daub of green paint, intermediate shaft identified by daub of green paint (shaft should be tested to see that it is file-hard before installation). *Parts not interchangeable with those of previous type pump.*

Part	New Part No.	Old Part No.
Oil Pump Assembly	B5A-6621-B	B5A-6621-A
Intermediate Shaft	B5A-6609-B	B5A-6609-A
Oil Pump Body	B5A-6603-A	B4A-6603-A
Oil Pump Body Plate	B5A-6616-A	E4A-6616-A

OIL PUMP: Gear type oil pump mounted in crankcase in line with distributor. Pump driven by means of a hex drive shaft. Shaft is pinned in end of distributor drive shaft by a roll pin, and other end seats in end of oil pump drive shaft. Pressure relief valve is incorporated in oil pump housing.



Removal: Drain oil and remove oil pan. Remove two nuts and lockwashers retaining pump to cylinder block. Remove pump and gasket.

Disassembly: Remove screen assembly retaining screws, screen assembly, and gaskets. Remove cover retaining screws, cover, and gasket. Push pump drive shaft and drive gear assembly from pump housing. Remove driven gear. Remove oil pressure relief valve plug, spring, and and plunger. Remove snap wire retaining pump screen, and remove screen from housing.

Inspection: Wash all parts in a solvent and dry them thoroughly. Use a brush to clean inside of pump housing and pressure relief valve bore. Be sure all dirt and chips are removed. Remove all old gasket material from pump body and cover. Check pump housing for damage or excessive wear. Check pump gear teeth for damage or wear. Check compression of relief valve spring (9.76-9.84 lbs. at 1.56"). Check relief valve clearance in relief valve bore. Check driven shaft clearance (.001-.002" maximum). Pump shaft should be free running fit without excessive play in pump housing. (.0015-.0029"). Replace any worn or defective parts.

Reassembly: Place snap ring on groove on upper end of lower drive shaft. Slide drive gear and shaft assembly into housing. Position gasket on housing, then lay a piece of Plastigage over face of gear and install cover. Remove cover and note reading on Plastigage. Gear endplay may be .0015-.0055" (Clearance of .0015-.003" preferred). An alternate method of checking gear endplay is as follows: Position gasket on housing, and lay a straightedge across gasket directly over gear. Check gear endplay by placing tip of dial indicator on gear and moving gear back and forth, between housing and straightedge. Subtract .005" from reading to allow for compression of gasket. Install pump drive gear, cover plate gasket, cover plate, and retaining screws. Tighten screws to 12-15 ft. lbs. Install pressure relief valve plunger, spring, and plug. Tighten plug to 33-38 ft. lbs. Install screen in screen cover and secure it with snap wire. Install gasket, screen and cover assembly, and retaining screws. Tighten screws to 10-12 ft. lbs. Rotate pump shaft by hand to make sure it turns freely.

Installation: Place new gasket on retaining bolts, slide pump mounting flange over retaining bolts, install lockwashers and nuts. Install oil pan, fill crankcase. Run engine, check pressure.

6 CYL. OVERHEAD VALVE ENGINE OIL PUMP

OIL FILTER
ALL OVERHEAD VALVE ENGINES

►*OIL FILTER LEAKAGE CORRECTION:* If leakage noted around filter sealing surfaces, first check center bolt tightness with a torque wrench and tighten this bolt to 20-25 ft. lbs. *(CAUTION*—DO NOT overtighten this bolt—will distort cover and cause leakage). If leakage continues, disassemble filter (see servicing data below), check cover for evidence of crushing or distortion and warping of center bolt-to-cover gasket surface, inspect flanged sealing surface on open end of cover for warping or distortion and mounting gasket surface on block for dirt or chips, clean all parts and reassemble filter.

OIL FILTER: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions).

►*REPLACEMENT CAUTION: Use Replacement Kit, Part No. B2A-6731-A, which includes correct filter element and NEW GASKETS WHICH MUST BE USED. CAUTION—Use of by-pass filter element would restrict oil flow and might cause failure of engine.*

Filter Installation: Wash all parts in a solvent and dry them thoroughly. Make sure all openings in center bolt are clean. Install new fibre gasket on center bolt, then place bolt through filter housing. Install spring and spring assembly on bolt, making sure seat tangs are engaged in spring. Install a new neoprene gasket and new filter element over center bolt. *(NOTE*—Be sure two elongated holes in oil filter diaphragm are at top when positioned on block). Install new neoprene gasket in filter housing recess. Place filter assembly in position, and thread center bolt into adapter, finger tight. Rotate filter assembly slightly, in each direction, to make sure gasket is seated evenly. Tighten center bolt ¾-1 complete turn (20-25 ft. lbs.). With engine at normal operating temperature and operating at fast idle, check for oil leaks past housing gasket or around center bolt gasket. If oil leaks past housing gasket, check housing for proper seating. If oil leaks past center bolt gasket; check center bolt for proper torque or replace gasket. *NOTE*—Pressed paper type element does not use neoprene gasket.

FUEL SYSTEM

1952-53 6 CYL. 215" ENGINE

CAMSHAFT ECCENTRIC WEAR CHECK (6 CYL. "215" ENGINE): If fuel pump pressure below specifications with NEW pump, check for eccentric wear as follows: Remove pump, measure down 27/64" from center-line of two mounting bolt holes on pump mounting pad, scribe a line across the mounting pad at this point. Turn crankshaft until highest lift point of fuel pump eccentric on camshaft is directly opposite scribed line on pump pad. Use depth micrometer to measure from highest lift point on eccentric to face of machined surface of mounting pad. If this distance greater than 1.197", eccentric is worn and camshaft should be replaced.

1949-52 V8 ENGINES

FUEL PUMP PUSHROD WEAR (V8 "239" ENG.): On engines with combination fuel-and-vacuum pumps, if loss of power or engine cutting out at high speeds or during heavy operation complaints are encountered, check fuel pump pushrod for wear (resulting in lessened fuel pump stroke) and install LATEST type pushrod as follows:

Checking Pushrod Wear: First check fuel and vacuum pressures at inlet and outlet sides of fuel pump to make certain trouble not caused by clogged fuel lines, ignition trouble, etc. If pressure and vacuum are low, remove pump and pump mounting adapter and check pushrod stroke as follows: Remove pushrod and measure overall length, replace rod if length not 10 3/64-10 5/64" or if foot end of rod is scored or galled (check camshaft eccentric for scores or ridges if this condition noted). Install special master testing rod (see Note below), mount dial indicator on adapter mounting boss with indicating button contacting end of pushrod (CAUTION —Indicator must have range of .300"). Turn engine over until pushrod on highest point of eccentric. Set dial indicator at ZERO. Turn engine over until pushrod on lowest point of eccentric. Dial indicator reading should be within .185-.200". If reading less than .185", camshaft should be replaced.

Master Testing Pushrod Note—Use a pushrod which measures between 10 3/64" and 10 5/64" in length and modify lower end of the rod by reducing diameter to 7/32" for a length of ⅜".

►**ENGINE PRODUCTION CHANGE: New "H" Series Engine starting September 1947. New ignition system, valve system, oil pump, and cooling system.**

►***"H" SERIES ENGINE INFORMATION—For Tune-Up, Ignition, Ignition Timing, and Engine data, see 1949 FORD SIX car pages.***

OIL PAN REMOVAL: ***See Ford Shop Notes for Engine Removal Instructions (recommended for oil pan removal).***

M DEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on top of clutch housing (visible through opening in floor) and on left frame side member near front engine support.

TUNE-UP

COMPRESSION: Pressure—105-125 lbs. at cranking speed of 100 RPM. (Std. 6.7-1 Cast Iron Head).

VACUUM READING: Approx. 18-20" at idling speed.

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUGS: Champion H-10 (Pass. Cars), H-9 Comm'l (Trucks). 14 mm. Metric type.
Gaps—.025"

IGNITION: See Coil, Condenser, and Distributor.
Breaker Gap—.014-.016". **Cam Angle 40° closed.**
Breaker Arm Spring Tension—20-24 ozs.
Automatic Advance—*See Distributor.*

IGNITION TIMING: See Ignition Timing.
Std. Setting—1° BTDC.
Timing Marks—None. See Ignition Timing for directions on setting of distributor for correct timing when installed on engine.
Vacuum Brake Setting—Set to just eliminate pinging when engine operated under load (back off adjusting screw until engine pings, then turn screw in just enough to eliminate ping).

CARBURETION: See Carburetor & Carb. Equipment.
Idle Setting—Adjust idle screw for smooth idling and highest steady reading of vacuum gauge (when used). Idle speed 500 Engine RPM. (can be judged by marking fan belt and setting engine for 25 revolutions of the belt in 10 seconds).
Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (Gauge 9550-A). Fuel level 11/16" plus or minus 1/32" below top edge of bowl.
Accelerating Pump—Center (#2) hole Normal. Inner (#1) hole—Summer, Outer (#3) hole—Winter for temperature extremes.

Fuel Pump Pressure: 3½ lbs. (2-3¼ lbs.).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Valve should be closed (counterweight arm against stop pin) with engine cold and should operate freely.

VALVES: See Valve Timing.
Tappet Clearance—.013-.015" Intake & Exhaust, Cold. No adjustment provided.

STARTING: See Battery, Starter, Generator, and Regulator.

I NITION

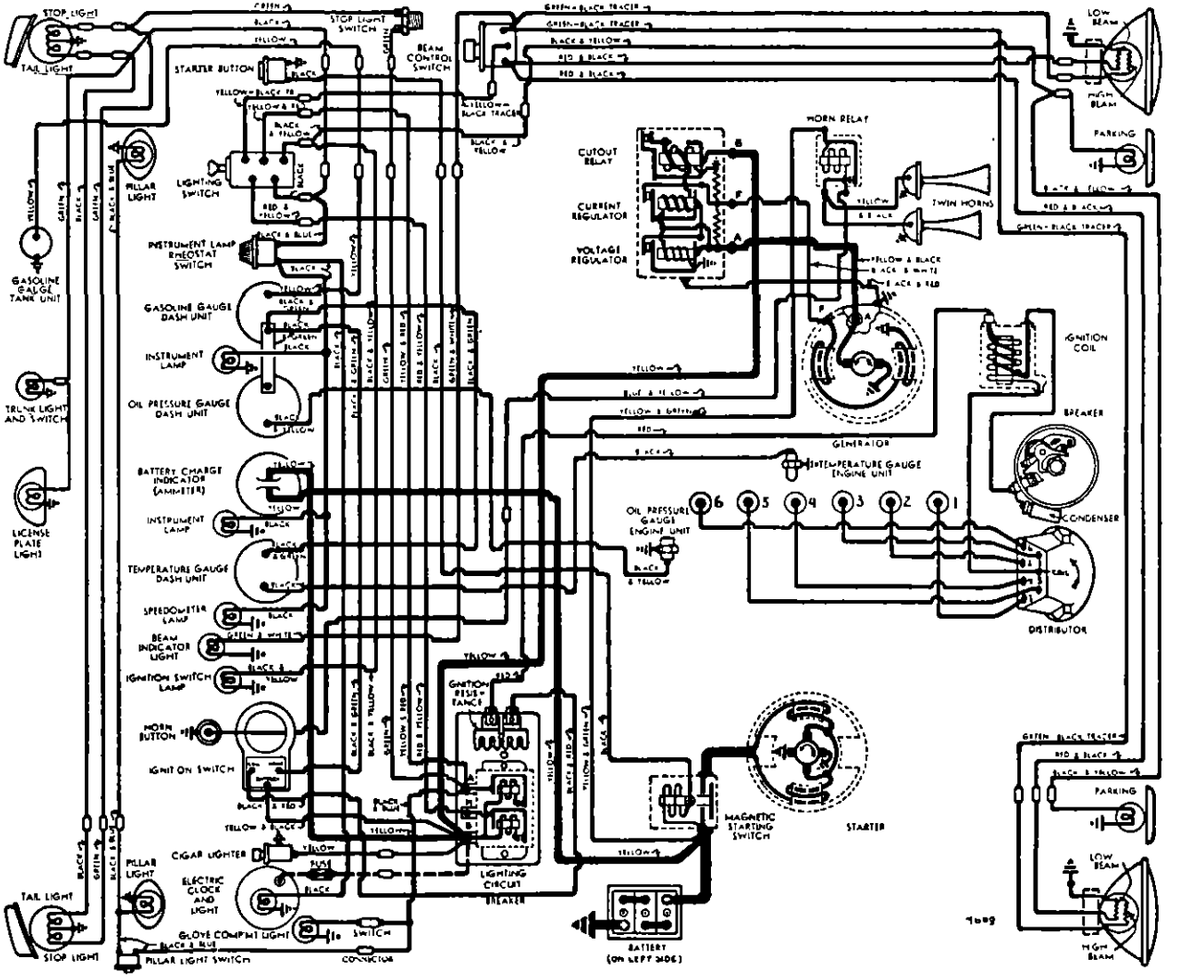
IGNITION SWITCH: Oakes Steering Column & Ignition Lock Assembly No. 302848, Ford No. 51A-3676-A (Deluxe Models), Oakes No. 302850, Ford No. 51A-3676-B (Super Deluxe Models). Ignition Switch Assembly Oakes No. 302494, Ford No. 11A-3680 (All).
Ignition Lock—Hurd or Briggs & Stratton No. 80935, Ford No. 91A-3686A (with key).
Key Series—FK000 to FK999. **Groove**—No. 17.

COIL: Ford No. 1GA-12024. Mounted on engine.
Resistor Unit—Connected in coil primary circuit (part of Lighting Circuit Breaker Assembly).
Ignition Current—4½-6 amperes with engine stopped (primary resistance 1-1⅓ ohms).

CONDENSER: Ford Part No. 1GA-12300-B.
Capacity—.29-.32 microfarad.

DISTRIBUTOR: Ford No. 5GA-12127 (less Terminal Housing & Rotor). New "Sealed-dry" type. Single breaker, 6 lobe cam, full automatic advance type with Vacuum Brake adjustment.
Breaker Gap—.014-.016"
Cam Angle or Dwell—40° closed, 20° open (distr.).
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewing driving end of unit.

Distributor Degrees	Automatic Advance R.P.M.	Engine Degrees	Engine R.P.M.
Start	200	0	400
9	600	18	1200



Vacuum Brake: Consists of a spring-loaded vacuum controlled brake piston which bears on edge of retard disc of breaker advance mechanism and acts as a "drag" to retard normal advance when engine is accelerated or operated under load. Piston is normally held out of engagement by manifold vacuum.

Distributor Removal: Disconnect coil lead, unsnap two clips holding distributor cap in place, take out mounting capscrews. NOTE—Vacuum connection (for Vacuum Brake operation) is through hole in face of mounting flange.

IGNITION TIMING

Std. Setting	Flywheel Degrees
All Engines	1° BTDC

See Vacuum Brake Setting for service corrections.

Ignition Timing (Basic Setting)—Distributor can be timed for correct ignition timing when off engine as follows: Place small straightedge or scale against tang on drive end of distributor shaft (scale must be on wide side of shaft), rotate shaft in direction of rotation (clockwise) until leading edge of scale is exactly ⅝" before nearest edge of distributor mounting hole on vacuum piston side of mounting flange. If contacts do not begin to open at this point, loosen adjusting screw on side of distributor, move screw down (to advance spark), or up (to retard spark) in the slot until contacts begin to open, tighten adjusting screw. This will provide correct 1° BTDC ignition timing when distributor installed on engine.

Ignition Timing (On Engine)—No flywheel marks or other means provided to check timing on engine. If basic setting of distributor correct (above), all necessary adjustments for operating conditions and octane rating of fuel being used can be made through the Vacuum Brake adjustment.

Vacuum Brake Adjustment—Road test car. Back off vacuum brake adjusting screw until engine pings when operating under load, then turn adjusting screw in just enough to eliminate ping, tighten locknut.

CARBURETOR

Holley (Chandler-Groves) Ford No. 5GA-9510-A. Single barrel, downdraft type with manual choke control.

See Carburetor Section for complete data.

Idle Adjustment—With engine warm and choke valve wide open, set throttle stopscrew for idle speed of 500 engine RPM. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in just enough so that engine idles smoothly. Recheck idle speed. NOTE—Idle speed can be noted by marking spot on fan belt and setting speed for 25 revolutions of the belt in 10 seconds.

Accelerating Pump Setting—Three holes in throttle lever for pump connection. Set as follows:

#1 (Inner)—Extremely Hot Weather.
#2 (Center)—Normal weather and fuel.
#3 (Outer)—Extremely Cold Weather.

Float Level—Use Ford No. 9550-A Gauge to check float. Invert air horn and float assembly, place gauge on face of bowl cover. Bottom of float should be 1.322-1.353" from face of cover (1.353" portion of gauge "GO", 1.322" portion "NO GO"). Adjust by bending lip on float lever. Fuel level in bowl 11/16" plus or minus 1/32" below top edge.

Metering Jets—*See Chandler-Groves (Ford) Jet Specification Table in Carburetor Section.*

Fast Idle: Consists of a "kicker" lever which opens throttle valve to fast idle position when choke valve closed for cold starting. Should not require adjustment.

CARB. EQUIPMENT

Air Cleaner: Ford No. 1GA-9600-C. Oil-bath type.

Servicing—Clean and refill (to level mark on case) with same grade engine oil used in crankcase at 3500 mile intervals (when draining crankcase), or more often if required.

NOTE—Clean and re-oil filter element in oil filler cap every 1000 miles.

Gasoline Gauge: King-Seeley Electric. Ford Nos.

Dash Unit—No. 51A-9280-A (1946 Deluxe & Sedan Del.), 51A-9280-B ('46 Sup. Del.), 6A-9280 (1947).

Tank Unit—No. 99A-9275-B (Deluxe & Super Deluxe Models), 21A-9275-A (Sedan Delivery).

See Carburetion Equipment Section for data.

Fuel Pump: AC. Type R, Ford No. 1GA-9350. Diaphragm type. **Pressure**—3½ lbs. max. (2-3¼ lbs.).

See Carburetion Equipment Section for data.

BATTERY

Ford Type No. 01A-10655-A. 6 volt, 17 Plate, 120 Ampere Hour Capacity (20 hour rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) terminal grounded to dash. **Engine Ground**—Separate ground strap from rear of cylinder head to dash.

Location—On left side in engine compartment.

Dimensions—Length 10.56". Width 7.28". Height 8.25".

STARTER

Ford Model No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix No. A1472. Ford No. B-11350.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on dash and controlled by pushbutton switch on instrument panel, Ford No. 19A-11500 (Pass. Cars).

Removal: Starter mounted on right front face of flywheel housing. To remove, disconnect cable, take out capscrews in right hand engine side pan and move pan to one side, loosen two through-bolts on commutator end plate and disconnect brace on commutator end of starter.

GENERATOR

Ford Model No. 2GA-10000A. Armature No. 2GA-10005. Two brush (shunt) type with voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—None (see Regulator).

Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, check output at 2 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine RPM
Start	565
32	1160
30	2500

Rotation—Counter-clockwise at commutator end.

Field Current—2.1 amperes at 6.0 volts (field resistance 2.88 ohms at 70°F).

Brush Spring Tension—Approximately 28 ozs.

Removal: Generator mounted on adjustable bracket at left front of engine. To remove, take out bolt in mounting bracket, slip off drive belt and water pump belt, lift generator out.

Belt Adjustment: ½" deflection midway between generator and crankshaft pulley (generator belt), generator and pump pulley (pump belt). Adjust both belts by loosening two capscrews in mounting bracket beneath generator, move generator up and out (bolt holes slotted at this angle).

REGULATOR

Ford Model No. 01A-10505-C. Three-unit type Voltage & Current Regulator. In case with Cutout Relay on dash.

See Electrical Equipment Section for complete data.

NOTE—Regulator case grounded through 'pigtail' to dash or separate ground wire to generator. This ground connection must be in place when regulator being operated or tested (disturbed by cover removal).

Cutout Relay

Cuts In—5.8-6.3 volts at operating temperature.

Cuts Out—8 amperes discharge current (maximum).

Voltage Regulator

Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Elec. Equip. Section for other temps.

Checking & Adjusting—*See Electrical Equipment Index for article on 'Ford Regulator—3 Unit Type' for complete instructions.*

Current Regulator

Setting—30-33 amperes Hot (after engine run for 5 minutes).

Checking & Adjusting—See Voltage Regulator.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Adjustment—Aim upper beam straight ahead (hot spot centers 3" below lamp center height at 25 ft.).

Beam Indicator—Red jewel on lower edge of speedometer dial. Lighted when upper beams in use.

Switches

Lighting—Ford No. 11A-11652 (Switch & Wiring—All Models), 51A-11661A (Knob & Insert—Deluxe Models), 51A-11661B (Knob & Insert—Super Deluxe with Blue-Gray Trim), 51A-11661C (Knob & Insert—Super Deluxe with Brown Trim).

Beam Selector—Ford No. 11A-13532 (Switch only), 5GA-11653 (Switch & Wiring).

Instrument—Ford No. 19A-13740.

Stop Light—Ford No. 11A-13480.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Ford No. 11A-12250A Combined with the Ignition Resister on block on dash under cowl. Consists of two separate circuit breaker units (one unit protects headlamp circuits, second unit protects other lighting circuits). Breakers are thermostatic and wound-coil type. Contacts open with current of 50 ampere and vibrate rapidly to control current.

HORNS: Ford No. 91A-13832 (High Note), 91A-13833 (Low Note). Air electric type dual horns operated by horn relay.
Horn Current—24-28 amperes (total).

Horn Relay: Ford No. 11A-13842D (Horns on Left Side), 5GA-13842 (Horns on Right Side).
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE

►**ENGINE PRODUCTION CHANGE:** New "H" Series Engine starting September 1947. New ignition system, valve system, oil pump, and cooling system.

►*"H" SERIES ENGINE INFORMATION—For Tune-Up, Ignition, Ignition Timing, and Engine data, see 1949 FORD SIX car pages.*

ENGINE SPECIFICATIONS: 6GA 90 HP. Six cylinder, "L" head type.
Bore—3.30" **Stroke**—4.40"
Displacement—226 cu. ins. **Rated H.P.** 26.13
Developed Horsepower—90 at 3300 RPM.
Compression Ratio—6.7-1. Cast Iron Head.
Compression & Vacuum Reading—*See Tune-up data.*

ENGINE REMOVAL (For Oil Pan Removal & General Engine Service): *See Ford Shop Notes.*

OIL PAN REMOVAL: *See Ford Shop Notes.*

TIGHTENING TORQUES: *See Ford Shop Notes.*

CYLINDER HEAD: Tightening Torque—*See Ford Shop Notes.*

CYLINDER SLEEVES: Hardened, dry type cylinder sleeves used on some engines.
Sleeve Installation—*See Ford Shop Notes.*

PISTONS: New aluminum alloy, four-ring, Cam-ground, Dome Head type. Pistons have additional oil ring below piston pin.
Weight—414 grams (stripped), 576 grams (complete).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Fitting New Pistons: Use .50" wide feeler stock of correct thickness (as listed below) inserted between piston and cylinder wall at right angles to pin to check clearance. Pull required to withdraw feeler should be 5-8 lbs. (all types).
Feeler Thickness—.002" New Piston in New Plain Bore, .004" New Piston in Worn Plain Bore, .005" Worn Piston in Worn Plain Bore.

Replacement Pistons: *See Ford Shop Notes.*

PISTON RINGS: Two compression, one oil ring above pin, additional oil ring on piston skirt below pin. Upper oil ring groove slotted, lower oil ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.092-.0925"	.012-.017"	.0015-.003"
Compr. (#2)	.092-.0925"	.012-.017"	.001-.0025"
Oil (#3, 4)	.186-.1865"	.012-.017"	.001-.0025"

Replacement Rings: *See Ford Shop Notes.*

PISTON PIN: Diameter .8501-.8504". Length 2.91" Pin floats in piston and rod with locking ring at each end.
Pin Fit in Piston—.000-.0005" clearance or light hand push fit with piston at 70°F.
Pin Fit in Rod Bushing—.0002-.0005" clearance (pin should fall through bushing slowly of own weight).

Replacement Pins: Furnished Standard size and .001", .002" Oversize.

CONNECTING ROD: Length 7.800" Weight 732 grams.
Crankpin Journal Diameter—2.235".
Lower Bearing—Removable, steel-backed, special alloy lined type. No shims.
Clearance—.0013-.0035". **Sideplay**—.003-.007".
NOTE—Replace bearing inserts worn .005" or more (.005" or more thinner than original insert).

Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps. NOTE—Make certain that small tangs on bearing halves engage grooves in rod and cap.

Replacement Bearings: *See Ford Shop Notes.*

CRANKSHAFT: Four Bearings, Cast alloy steel with integral counterweights and Vibration Dampener on front end.
Journal Diameters—2.499" (all main bearings).
Bearing Type—Removable precision type, steel-backed, special alloy lined type. No shims.
Clearance—.001-.003".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.

Replacement Bearings: *See Ford Shop Notes.*

End Thrust: Taken by rear main bearings. Adjust by replacing bearing (use bearing with thicker flange to reduce endplay).
Endplay—.002-.006"

CAMSHAFT: Four bearing with helical gear drive.
Bearing Diameters—1.797" all bearings. Replace the camshaft if worn to less than 1.7955" diameter. Replace bearings if inside diameter more than 1.802".
Bearing Type—Steel-backed, babbitt-lined bushings.
Clearance—.001-.002".

Timing Gears: Crankshaft Gear—cast alloy steel, Camshaft Gear—aluminum alloy, bolted-on type.
Timing Gear Replacement—*See Ford Shop Notes.*

Camshaft Setting: Mesh marked tooth of crankshaft gear in marked space between teeth of camshaft gear.

VALVES:	Head Diameter	Stem Diameter
Intake	1.620"	.3095-.3105"
Exhaust	1.484"	.3095-.3105"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.292"	.0015-.0035"
Exhaust	45°	.292"	.0015-.0045"

NOTE—Service limit for valve stem diameter .3065".

Valve Seat Inserts—*See "Valve System" in Ford Special Data.*

Valve Assembly Removal & Servicing—*See Ford Shop Notes.*

Valve Guides: Split type retained by 'C' washer and valve spring. NOTE—Replace both halves of all guides measuring less than .6665" (thickness of guide half and valve stem at top of guide with valve of .311" stem diameter in place in guide).

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.85"

NOTE—Replace spring if the pressure is less than 30 lbs. when compressed to 2.125".

Valve Lifters: Barrel type in reamed holes in block. **Diameter**—.9995". Replace if worn to less than .998" in diameter or length less than 1.710" after any necessary resurfacing of ends (cast type can be resurfaced on both ends, pressed steel type on bottom end only).
Clearance—.0005-.0015". Lifter should slip into hole in block of own weight.

VALVE TIMING

Tappet Clearance: .013-.015" All Valves Cold. No adjustment.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 3° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
Valve Timing Check—No flywheel marks or other means provided to check timing. If top dead center position located on flywheel, intake valve for this cylinder should open approx. 1 tooth on flywheel before this top dead center point.

LUBRICATION

Engine Oiling System: Pressure to main, connecting rod, and camshaft bearings, and to valve lifters and timing gears. Oil pump mounted on #1 main bearing cap in crankcase (oil intake pipe extends to oil screen in sump at rear end of oil pan).

Oil Pan Removal: *See Ford Shop Notes.*
Crankcase Capacity—5 quarts.
Normal Oil Pressure—35 lbs. at 2000 RPM of engine.
Oil Pressure Regulator—Located under plug on right side of crankcase at front end. Not adjustable. NOTE—Replace oil relief valve spring if not within limits of 44-46 ounces with spring compressed to 1.40".

Oil Pump: Gear type. Mounted on front main bearing and driven from crankshaft timing gear (pump housing integral with main bearing cap).
Oil Pump Servicing—*See Ford Shop Notes.*

Oil Screen & Drain Plug: Screen mounted on inner end of drain plug and removed with plug when crankcase drained. Clean oil screen each time removed.

Oil Filter: Replace filter cartridge at 5000 mile intervals (Ford No. 01A-18662-A Unit).

Oil Pressure Gauge: King-Seeley Electric. Ford Nos.
Dash Unit—No. 51A-9273-A (1946 Deluxe), No. 51A-9273-B (1946 Super Deluxe), No. 6A-9273 (All 1947).
Engine Unit—No. 41A-9278 (80 lb.) All Models.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Positive circulation with water distributing tube in block to direct cooling water on exhaust valve seats and ports. Re-circulation of water in engine with thermostat closed provided by by-pass channel in front end of head and block leading to pump inlet.
Capacity—14.5 quarts (Pass. Cars).
Pressure Valve—In radiator filler cap. Opens at 3½-4½ lbs.

Water Pump: Packless, centrifugal type with sealed ball bearing shaft.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In cylinder head water outlet below. By-pass (dual valve) type. Starts to open at 150-155°F. Fully open at 175-180°F.

Temperature Gauge: King-Seeley Electric. Ford Nos. **Dash Unit**—No. 51A-10883-A (1946 Deluxe), No. 51A-10883-B (1946 Super Deluxe), No. 6A-10883 (All '47). **Engine Unit**—No. 99A-10884 (All models).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-TI, Ford No. 19A-7563. Single plate, semi-centrifugal, dry disc type.
See Clutch Section for complete data.
Facings—Woven asbestos composition. I.D. 6¾". O.D. 10". Thickness ⅛".

Pedal Adjustment: Pedal free travel 1-1¼". To adjust, disconnect clevis at equalizer (throw-out) shaft end of pedal connector rod, turn clevis on rod.

Removal: Remove Transmission (see Transmission Removal below), install wooden wedges between each release lever and cover to hold the clutch in released position, take out six capscrews mounting cover assembly on flywheel, lift out cover assembly and driven member.

TRANSMISSION

Own Make. Three-speed, all-helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever on steering column.
See Transmission Section for complete data.

Removal: Remove Rear Axle (see Rear Axle Removal below), remove capscrews mounting front seat track on floor, move front seat back for necessary room. Take out mounting screws in front floor pan spacer, remove spacer. Disconnect gearshift connecting rods at transmission case, disconnect and remove equalizer (clutch release) shaft. Remove capscrew and washer on end of transmission shaft (in universal joint), remove universal joint. Remove nuts and washers on engine rear support bolts. Support engine by placing jack (use wood block on jack) under rear end and raise engine sufficiently so that rear support clears mounting bolts (NOTE—remove nuts holding lower half of engine rear support assembly and remove the assembly). Take out eight capscrews mounting transmission case on flywheel housing, pull transmission straight back and lift out.

UNIVERSALS

Spicer Model 202-6X, Ford No. B-7090. Steel bushing type. Single joint in torque ball at rear of transmission case.

REAR AXLE

Own Make. ¾ Floating, Spiral Bevel Gear type with Torque Tube Drive.
See Rear Axle Section for complete data.

Ratio—3.78-1 Std., 4.11-1 Optl.

Backlash—.012" maximum.

Removal: Raise rear end of car. Disconnect track bar. Disconnect rear spring (use spring spreader if available) by placing block under each rear spring eye and lowering car so that weight keeps spring extended and then removing spring shackle bolts and bars. Take out pin in hand brake equalizer and disconnect hand brake cable. Disconnect hydraulic brake line at torque tube and rear shock absorber links at each wheel. Disconnect accelerator pedal, remove pedal pads, floor mat, beam control switch (take out two mounting screws), and floor pan. Disconnect speedometer cable at torque tube. Remove nuts on four universal joint ball housing bolts and two bolts holding ball cap halves together, remove ball cap. Pull rear axle back to disconnect torque tube from transmission and remove from beneath car.

NOTE—Bleed brake line after rear axle re-installed and line connected.

SHOCK ABSORBERS

Houde (Houdaille). Double Acting, adjustable, hydraulic types (Front & Rear).
See Shock Absorber Section for complete data.

	Houde Model	Right — Ford No.	— Left
Front	BBCN-3	51A-18045	51A-18046
Rear①	BBCZ-3	51A-18080A	51A-18081A
Rear②	BBCZ-3	51A-18080B	51A-18081B

①—Except Sedan Delivery and Station Wagon.
②—Sedan Delivery & Station Wagon only.

Adjustment: Standard setting marked by line on face of lever hub (pointer should be aligned with this mark). Adjustment can be varied by turning pointer clockwise (for more control) or counter-clockwise (for less control) not more than 1 or 2 serrations at a time. NOTE—Stops are provided to limit adjustment in either direction.

Refilling: Check every 5000 miles, fill to level of filler plug hole. Use Ford No. M-4633-B fluid only (Houde L-1404) required for these new shock absorbers which may be identified by round top filler plug.

FRONT SUSPENSION

Front Axle: Conventional "I" beam section type with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods.

Kingpin Inclination—8° crosswise.

Caster—3°. Axle may be bent cold for minor corrections providing correct tools used to prevent crushing of axle flange.

Camber—¾°. Adjust as for Caster (above).

Toe In—1/16". Adjust in usual manner by changing length of tie rod.

STEERING GEAR

Gemmer design (Model 305), Ford Make. Worm-&-Roller type with push-pull adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Lockheed Hydraulic, self-centering, double anchor type. Hand lever applies rear wheel brakes.

►**These brakes do not have anchor pin adjustment.**
See Brake Section for complete data.

Drums—Composite cast iron and steel type. Diameter 12".

Clearance—Least possible amount without drag.

Lining—Width 1.75". Thickness .187". Length per shoe 13.12" (forward shoes), 10.08" (rear shoes).

Hand Brakes: See Service Brakes (above).

MISC. MECHANICAL

Power Operated Convertible Top: Two types as follows:
1—Convertible—Auto-lite electric type.
2—Sportsman Convertible—Hydro-Lectric type.
See Miscellaneous Section for complete data.

Power Window Regulators (Sportsman Convertible): Hydro-Lectric type.
See Miscellaneous Section for complete data.

HOOD LOCK: Hood is Alligator type hinged at cowl. To raise hood (Pass. Cars), pull out release knob under instrument panel, release safety catch under front edge of hood.

OIL PAN REMOVAL: *See Ford Shop Notes.*

M DEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on top of clutch housing (visible through hole in floor) and on left frame side member near front eng. support.

TUNE-UP

COMPRESSION: Pressure—105-125 lbs. at cranking speed of 100 RPM. (Std. 6.75-1 Cast iron Head).

VACUUM READING: Steady 18-20" idling at 5-7 MPH.

FIRING ORDER: 1-5-4-8-6-3-7-2 (Cyl. Nos. 1-2-3-4 Right Bank, 5-6-7-8 Left Bank, front-to-rear).

SPARK PLUGS: Champion Type H-10. 14 mm. Metric. Gaps—.025".

IGNITION: See Coil, Condenser, and Distributor.

Breaker Gap—.014-.016" (both sets).

Cam Angle—36° (both sets operating together).

Breaker Arm Spring Tension—20-24 ozs.

Automatic Advance—Starts at 200 RPM. Maximum 11° at 600 RPM (Distr. degrees & RPM).

IGNITION TIMING: See Ignition Timing.
Std. Setting—4° BTDC.

Timing Marks—None. See Ignition Timing for directions on setting of distributor for correct timing when installed on engine.

Vacuum Brake Setting—Set to just eliminate pinging when engine operated under load (back off screw until engine pings, then turn screw in until ping is eliminated).

CARBURETION: See Carburetor & Carb. Equipment.
Idle Setting—Both idle screws ⅜-¾ turn open and set for smooth idle and highest steady reading of vacuum gauge (when used). Idle speed 500 RPM or 5-7 MPH.

Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (Gauge 9550-A). Fuel level 11/16" plus or minus 1/32" below top edge of bowl.

Accelerating Pump—Center (#2) hole Normal. Inner (#1) hole—Summer, Outer (#3) hole—Winter for temperature extremes.

Fuel Pump Pressure: 3½ lbs. maximum.

MANIFOLD HEAT CONTROL: Automatic thermostatic control type (located in exhaust manifold outlet of left cylinder bank). See that valve operates freely.

VALVES: See Valve Timing.

Tappet Clearance—.010-.012" Intake, .014-.016" Exhaust. No adjustment provided.

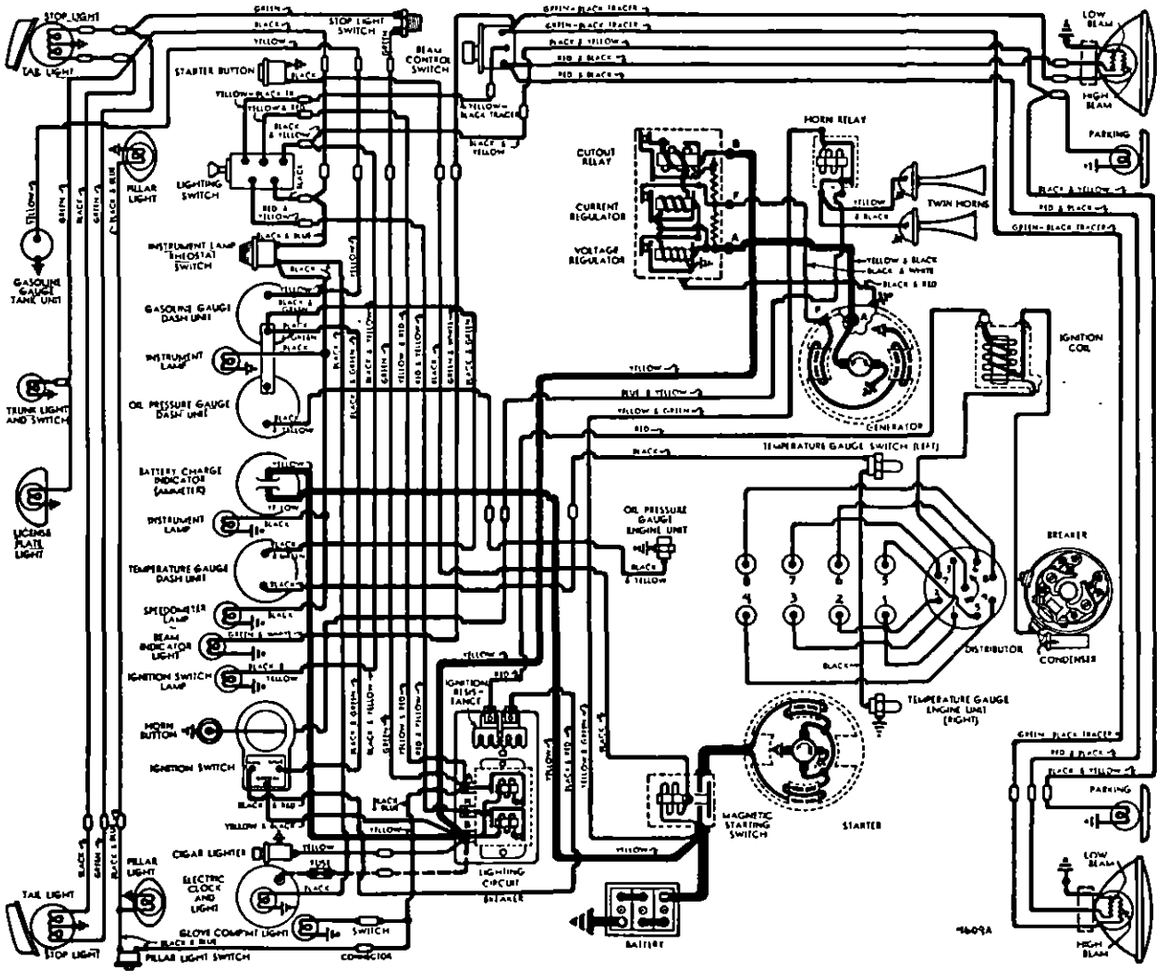
STARTING: See Battery, Starter, Generator and Regulator.

I NITION

IGNITION SWITCH: Oakes Steering Column & Ignition Lock Assembly No. 302848, Ford No. 51A-3676-A (Deluxe Models), Oakes No. 302850, Ford No. 51A-3676-B (Super Deluxe Models). Ignition Switch Assembly Oakes No. 302494, Ford No. 11A-3680 (All Models).
Lock Cylinder—Hurd or Briggs & Stratton #80935 Ford No. 91A-3686-A (with Keys).
Key Series—FK000 to FK999. **Groove**—No. 17.

COIL: Ford No. 1GA-12024. Mounted separately on left front corner of cylinder block.
Ignition Current—4½-6 amperes with engine stopped (primary resistance 1-1⅓ ohm).
Resistor Unit—Connected in coil primary circuit (part of Circuit Breaker Assembly 11A-12250A).

CONDENSER: Ford Part No. 1GA-12300-B.
Capacity—.29-.32 microfarad.



DISTRIBUTOR: Ford No. 59A-12127 (less Terminal Housing, Cap & Rotor). New "Single Cap" sealed-dry "V" outlet type. Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake adjustment. Breaker "loading" and "timing" contacts operate in same manner as on previous V8 models.
Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step 'go', .016" 'no go'.
Cam Angle or Dwell—Approx. 36° closed, 9° open. **Set dwell at 80% (78-80% at 2000 RPM) on Ford Test Set for both sets operating together with correct coil loading lead.**
NOTE—Cam Angle for each set operating singly approximately 22½° closed, 22½° open (50%).
Breaker Arm Spring Tension—20-24 ounces.
Rotation—Clockwise viewed from drive end (counter-clockwise viewed from front of car).

Automatic Advance
(Vacuum Brake Disconnected)

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
11	600	22	1200

NOTE—Limits are 10½-11½° (distributor degrees).

Vacuum Brake: Consists of a spring-loaded vacuum controlled brake piston which bears on edge of retard disc of breaker advance mechanism and acts as a "drag" to retard normal advance when engine is accelerated or operated under load. Piston is normally held out of engagement by manifold vacuum.

Removal:—Distributor mounted on front of engine. To remove, disconnect primary lead, remove distributor cap, take out mounting screws in distributor flange, lift unit out.

IGNITION TIMING

Std. Setting—See Vacuum Brake Setting for service correction for operating conditions.

	Flywheel Degrees	Piston Position
All V8 Engines	4° BTDC	.0058" BTDC.

Ignition Timing (Basic Setting)—Distributor can be timed for correct ignition timing when off engine as follows: Place a small straight edge or scale against tang on drive end of distributor shaft (scale must be on wide side of shaft), rotate distributor in direction of rotation (clockwise) until trailing edge of scale is exactly ⅜" past the nearest edge of the small mounting hole (left hand hole—nearest vacuum brake) on the mounting flange. If left hand (timing) contacts do not begin to open at this point, loosen adjusting screw on side of distributor housing, move screw down (to advance spark), up (to retard spark), in slot until contacts begin to open, tighten adjusting screw. This setting will provide correct 4° BTDC. ignition timing when distributor installed on engine.

NOTE—Timing is controlled by opening of **left hand breaker contacts** only (right hand contacts "load" coil and open and close earlier than the left hand contacts).

Timing (On the Car)—No flywheel marks provided. With distributor adjusted as described above, this will give correct 4° BTDC. timing when installed on the engine and all necessary adjustments for operating conditions and octane rating of fuel being used can be made by means of the Vacuum Brake adjustment as follows:

Vacuum Brake Setting—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, then turn screw in just enough to eliminate ping, tighten locknut.

CARBURETOR

Holley (Chandler-Groves) Ford No. 59A-9510-A. Dual (double barrel), downdraft type with manual choke control.

See Carburetor Section for complete data.

Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 500 RPM. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-¾ turn of screw from inner seated position. Readjust stopscrew for correct idling speed. NOTE—Idling speed can be estimated by marking spot on fan belt and setting speed for 25 revolutions of the belt in 10 seconds.

Accelerating Pump Setting—Three holes provided in the throttle lever for pump rod link connection. Adjust for seasonal requirements as follows:
#1 (Inner) Hole—Summer or Hot weather.
#2 (Center) Hole—Average fuel and weather.
#3 (Outer) Hole—Extremely Cold weather.

Float Level—Use 9550-A gauge to set the float level (1.353" end 'Go', 1.332" end 'No Go') measuring from underside of bowl cover to bottom of float (with cover and float assembly inverted). Fuel level in bowl should be 11/16" plus or minus 1/32".

Metering Jets—*See Chandler-Groves (Ford) Jet Table in Carburetor Section for complete data.*

Fast Idle:—Integral with carburetor. Operated by choke valve lever. No adjustment required.

CARB. EQUIPMENT

Air Cleaner: Ford No. 91A-9600-A. Oil-bath type.
Servicing—Clean and refill (to level mark on case) with same grade engine oil used in crankcase at 3500 mile intervals (when crankcase drained) or more often if required. Clean filter element by washing in cleaning fluid.
NOTE—Clean and re-oil filter element in oil filler cap (crankcase breather) every 1000 miles.

Fuel Pump: AC. Type R. Ford No. 11A-9350. Diaphragm type. Exchange Pump AC No. 541 ('46), 571 ('47).

See Carburetion Equipment Section for data.

Pressure—3½ lbs. max. (2-3¼ lbs.).

Gasoline Gauge: King-Seeley Electric. Ford Nos.
Dash Unit—No. 51A-9280-A (1946 Deluxe & Sedan Del.), 51A-9280-B ('46 Sup. Del.), 6A-9280 (1947).
Tank Unit—No. 99A-9275B (Deluxe & Super Deluxe Models), 21A-9275A (Sedan Delivery).

See Carburetion Equipment Section for data.

BATTERY

Ford Type No. 01A-10655-A. 6 volt, 17 plate, 120 Ampere Hour Capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes.
Grounded Terminal—Positive (+) grounded to dash.
Engine Ground—Strap connector between right rear cylinder head and dash.
Dimensions—Length 10.56". Width 7.28". Hgt. 8.25".
Location—On right side in engine compartment.

STARTER

Ford Model No. 18-11002. Armature No. 18-11005.
Drive—Inboard Bendix Drive No. A1472, Ford No. B-11350.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on dash and controlled by pushbutton switch on instrument panel, Ford No. 19A-11500 (Pass. Cars).

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR

Ford Model No. 21A-10000. Armature No. 01A-10005A. Two brush (shunt) type with vibrating voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine, check output at 2 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine RPM.
Start	520
30	1060
30	2500

Rotation—Counter-clockwise at commutator end.
Field Current—2.1 amperes at 6.0 volts (field resistance 2.88 ohms at 70°F).
Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment: ½" deflection midway between generator and water pump pulleys. NOTE—Generator mounting bracket also includes the fan mounting (fan driven by a separate belt). Both belts adjusted in same manner by loosening mounting bolt and raising mounting brackets.

REGULAT R

Ford Model No. 01A-10505-C. Three Unit Type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash.

See Electrical Equipment Section for complete data.

NOTE—Regulator case is grounded through separate ground wire extending from regulator to generator frame. This ground connection must be in place when regulator being operated or tested.

Cutout Relay
Cuts In—6.3-6.3 volts at operating temperature.
Cuts Out—8 ampere discharge current maximum.

Voltage Regulator
Setting—6.9-7.2 volts at 70-80° F.
Checking & Adjusting—*Refer to Electrical Equipment Index for article on 'Ford Regulator—3-unit Type' for complete instructions.*

Current Regulator
Setting—30-33 amperes (after 5 minutes run).
Checking & Adjusting See Voltage Regulator above.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—On lower edge of speedometer dial Lighted whenever upper beams in use.

Switches
Lighting—Ford No. 11A-11652 (Switch & Wiring—All Models), 51A-11661A (Knob & Insert—Deluxe Models), 51A-11661B (Knob & Insert—Super Deluxe Models with Blue-Grey Trim), 51A-11661C (Knob & Insert—Super Deluxe Models with Brown Trim).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Beam Selector—Ford No. 11A-13532 (Switch only), 21A-11653 (Switch & Wiring).
Instrument—Ford No. 19A-13740.
Stop Light—Ford No. 11A-13480.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking	3	63
Beam Indicator, Ign. Lock	1	51
Instrument, Clock	1½	55
Stop & Tail	21-3	1154
Dome (Pillar), Luggage Compt.	3	63
Rear License	3	63

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Ford 11A-12250A Combined with Ignition Resistor on block on dash under cowl. Consists of two separate circuit breaker units (one unit protects headlight circuits, second unit protects other lighting circuits) of the thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

HORNS: Ford No. 91A-13832 (High Note), 91A-13833 (Low Note). Air electric type dual horns operated by horn relay.

Horn Current—24-28 amperes total.

Horn Relay: Ford No. 11A-13842D.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE

ENGINE SPECIFICATIONS: Own "100". Eight Cylinder, 90° Vee, "L" Head type. Cylinder banks and crankcase cast Enbloc.

Bore—3.187". **Stroke**—3.75".
Displacement—239 cu. ins. **Rated H.P.**—32.5.
Developed Horsepower—100 at 3800 RPM.
Compression Ratio—6.75-1 Cast Iron Heads.
Compression & Vacuum Readings—*See Tune-up data*

►**1946-47 ENGINE SERVICE NOTES: Cylinder Head.** 1946 Head, Part No. 59A-6050-B, is interchangeable right-and-left. May be identified by figures "59A" or "59A-B" on top. Heads have greater valve clearance for new cylinder block (below) and larger water holes for improved cooling (¾" hole at top center and ⅝" hole at center between #2 and #3 cylinders).

►**Cylinder Head Gasket**—New type, Part No. 59A-6051, may be identified by 5/16" round hole instead of blunt coneshaped opening at lower edge between #2 and #3 cylinder bores. ***This gasket must be used with new 1946 type Cylinder Head (above).***

►**Cylinder Block**—New type, Part No. 59A-6010-C with valve ports located .09" farther from center line of block. May be identified by number or by oblong water passages just above valves (round on previous types).

►***CAUTION—If the earlier type Cylinder Heads (81A-81T-, 99T-, 29A-) used with this block, heads must be machined out for valve clearance, and water passages in head should be enlarged for improved cooling.***

OIL PAN REMOVAL: *See Ford Shop Notes.*

ENGINE REMOVAL: *See Ford Shop Notes.*

TIGHTENING TORQUES: *See Ford Shop Notes.*

CYLINDER HEAD: Tightening—*See Ford Shop Notes.*

CYLINDER SLEEVE: Cast iron, dry type cylinder sleeves may be used (engine may have mark "HS" on block beside inner front corner of left cyl. head).
Servicing—*See Ford Shop Notes.*

PISTONS: Steel Alloy, light weight, cam ground type or Aluminum Alloy, T slot type. Recondition engine to take finished replacement pistons (if sleeves used, replace sleeves, use new Std. size pistons).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Replacement Pistons: *See Ford Shop Notes.*

Fitting New Pistons: Use .50" wide feeler stock of correct thickness (see table below) inserted between piston and cylinder wall at right angles to pin to check clearance. Pull required to withdraw feeler should be 6-10 lbs. (all types).

Engines with Steel Sleeves	Steel Piston	Aluminum Piston
New Piston & Sleeve	.003"	.003"
New Piston—Worn Sleeve	.004"	.004"
Worn Piston & Sleeve	.005"	.005"
Engines without Sleeves		
New Piston & Bore	.0025"	.002"
New Piston—Worn Bore	.004"	.004"
Worn Piston & Bore	.005"	.005"

PISTON RINGS: Two compression, two slotted oil rings per piston (lower oil ring below pin). Oil ring grooves have oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0015-.003"
Compr. #2	.0915-.0920"	.012-.017"	.001-.0025"
Oil Contr.	.1545-.1550"	.012-.017"	.001-.0025"

Replacement Rings: *See Ford Shop Notes.*

PISTON PIN: Diameter .7501-.7504". Length 2.975" (with steel pistons), 2.850" (with aluminum pistons). Floating type with locking ring in piston at each end. Pin hole in connecting rod bronze bushed.
Pin Fit in Piston—.0001-.0002" (aluminum pistons), .0003-.0009" (steel pistons) or light hand push fit with piston at 70°F.
Pin Fit in Rod Bushing—.0002-.0005" (pin should pass through bushing slowly of own weight).

Replacement Pins: Furnished Standard size and .001", .002" Oversize.

CONNECTING ROD: Length 7.000". Weight 492 grams. Crankpin Journal Diameter—2.1390" Connecting rod diameter on crankpin 2.360" (2.3597-2.3603").
Bearing Type—Steel-backed, special alloy lined with bearing surface on both inner and outer face. Bearing floats in both rods (side-by-side mounting)
Bearing Dimensions—Length 1.747". Thick .1095".
Clearance—.0015-.0035" (see Bearing Adjustment).
Sideplay—.003-.007" (bearing endplay), .006-.014" (side clearance for both rods).

Bearing Adjustment: None (no shims). Do not file bearing caps. Replace bearings if less than .1085" in thickness, replace or hone rod for oversize bearing if worn more than .0015" over original size (2.3597-2.3603"). CAUTION—Both rods must be same size.

Replacement Bearings: *See Ford Shop Notes.*

Installing Rods: Marks on rods and bearing caps (R1, L1 etc.) must be together and installed in same numbered cylinder with marks pointing down toward pan.

CRANKSHAFT: Three bearing type with integral counterweights. NOTE—New type crankshaft used with new wide land (four ring) pistons.
Journal Diameters—2.4990" (all bearings).
Bearing Type—Steel-backed, special alloy-lined.
Clearance—.001-.003".

Bearing Adjustment: None (no shims). Do not file bearing caps.

Replacement Bearings: *See Ford Shop Notes.*

End Thrust: Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".

CAMSHAFT: Three bearing type. Helical gear drive.
Bearing Diameters—1.797" all bearings. Replace camshaft if worn to less than 1.7955" diameter.
Bearing Type—Steel-backed, babbitt-lined bushings.
Clearance—.001-.002".

End Thrust: Taken by gear hub and thrust surface on inner face of cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".

Timing Gears: Cast alloy iron (crankshaft), Aluminum or malleable iron bolted-on type (camshaft).
Backlash—.004" maximum.
Replacement Gears—*See Ford Shop Notes for Gear Oversizes and installation instructions.*

Camshaft Setting: Mesh marked tooth of crankshaft gear in similarly marked space between teeth on camshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
All Valves	1.510"	.3105"	4.577"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.292"	.0015-.0035"
Exhaust	45°	.292"	.0025-.0045"

NOTE—Service limit for valve stem diameter is .309" Intake, .3065" Exhaust. Valves interchangeable.

►*INSTALLATION OF LATER TYPE VALVE ASSEMBLIES See "Valve Assembly Interchangeability" under VALVE SYSTEM in Ford Special Data.*

Valve Seat Inserts—*See "Valve System" in Ford Special Data.*

Valve Assembly Removal & Installation—*See "Valve System" in Ford Special Data.*

Valve Guides: Split type retained by "C" washer and valve spring. NOTE—Replace both halves of all guides measuring less than .6665" (thickness of guide half and valve stem at top of guide with valve of .311" stem diameter in place in guide).

Valve Lifters: Barrel type in reamed holes in block.
Diameter—.9995". Replace if worn to less than .998" in diameter or length less than 1.710" after any necessary resurfacing of ends (cast type can be resurfaced on both ends, pressed steel type on bottom end only).
Clearance—.0005-.0015". Lifter should slip into hole in block of own weight.

Valve Springs: Replace if pressure less than 30 lbs. when compressed to 2.125".

	Spring Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

VALVE TIMING

Tappet Clearance: .010-.012" Intake, .014-.016" Exhaust, Cold. No adjustment.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

Valve Timing Check—No flywheel marks or other means provided to check timing. No. 1 intake valve should open with No. 1 piston on top dead center entering intake stroke.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, and timing gears. Oil pump mounted in crankcase at rear of engine.

Oil Pan Removal: *See Ford Shop Notes.*
Crankcase Capacity—5 quarts.
Normal Oil Pressure—50 lbs. at 2000 RPM.

Oil Pressure Regulator—Located under plug above front camshaft bearing (under manifold) and on oil pump housing (some models). Not adjustable.

NOTE—Check relief valve tension spring whenever engine overhauled. Replace the cylinder block relief valve spring if tension not within limits of 43-50 ozs. at 1.380" (engines without oil pump relief valve), or 78-80 ozs. at 1.380" (engines with oil pump relief valve). Replace oil pump relief valve spring if tension not within limits of 78-87 ozs. at 1.380".

Oil Pump: Gear type. In crankcase at rear of engine. NOTE—This new type pump, No. 41A-6600-A (for engines without oil pan baffles), has oil pressure regulator (relief valve) in pump body.

Oil Pump Servicing—*See Ford Shop Notes.*

Oil Pressure Gauge: King-Seeley Electric. Ford Nos. **Dash Unit**—No. 51A-9273-A (1946 Deluxe), No. 51A-9273-B (1946 Super Deluxe), No. 6A-9273 (All 1947).
Engine Unit—No. 41A-9278 (80 lb.) All Models.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Positive circulation with two water pumps at front of engine (pump for each bank). Capacity—22 quarts.

Pressure Valve—In radiator filler cap. Opens at 3½-4½ lbs.

Water Pump: Packless, centrifugal type (2 used). Mounted on front of engine (pump housing integral with front engine mounting).
See Water Pump Section for complete data.

Removal—Drain cooling system, place support jack under engine (use wood block on jack to avoid damaging pan), remove bolt from front engine support, raise engine until no weight rests on front support. Loosen generator mounting bolt, remove drive belt. Disconnect and remove hose at pump. Remove four capscrews mounting pump on engine, lift pump out. CAUTION—One mounting screw located within water pump inlet connection (accessible with hose removed).
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In each cylinder head water outlet (two used). Start to open at 150-155°F. Fully open at 175-180°F.

Temperature Gauge: King-Seeley Electric. Ford Nos. **Dash Unit**—No. 51A-10883-A (1946 Deluxe), No. 51A-10883-B (1946 Super Deluxe), No. 6A-10883 (All '47).
Engine Unit—No. 01A-10990 (Temperature Gauge Switch—in left hand cylinder head), No. 99A-10884 (regular Engine Unit—in right cylinder head).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-TI, Ford No. 19A-7563. Single plate, semi-centrifugal, dry disc type.
See Clutch Section for complete data.

Facings—Woven asbestos composition. I.D. 6¾". O.D. 10". Thickness ⅛".

Pedal Adjustment: Pedal free travel 1-1¼". To adjust, disconnect clevis at equalizer (throw-out) shaft end of pedal connector rod, turn clevis on rod.

Removal: Remove Transmission (see Transmission Removal below), install wooden wedges between each release lever and cover to hold the clutch in released position, take out six capscrews mounting cover assembly on flywheel, lift out cover assembly and driven member.

TRANSMISSION

Own Make. Three-speed, all-helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever on steering column.
See Transmission Section for complete data.

Removal: Remove Rear Axle (see Rear Axle Removal below), remove capscrews mounting front seat track on floor, move front seat back for necessary room. Take out mounting screws in front floor pan spacer, remove spacer. Disconnect gearshift connecting rods at transmission case, disconnect and remove equalizer (clutch release) shaft. Remove capscrew and washer on end of transmission shaft (in universal joint), remove universal joint. Remove nuts and washers on engine rear support bolts. Support engine by placing jack (use wood block on jack) under rear end and raise engine sufficiently so that rear support clears mounting bolts (NOTE—remove nuts holding lower half of engine rear support assembly and remove the assembly). Take out eight capscrews mounting transmission case on flywheel housing, pull transmission straight back and lift out.

UNIVERSALS

Spicer Model 202-6X, Ford No. B-7090. Steel bushing type. Single joint in torque ball at transmission.

REAR AXLE

Own Make. ¾ Floating, Spiral Bevel Gear type with Torque Tube Drive.
See Rear Axle Section for complete data.

Ratio—3.54-1 Std., 3.78-1 & 4.11-1 Optl.

Backlash—.012" maximum.

Removal: Raise rear end of car. Disconnect track bar. Disconnect rear spring (use spring spreader if available) by placing block under each rear spring eye and lowering car so that weight keeps spring extended and then removing spring shackle bolts and bars. Take out pin in hand brake equalizer and disconnect hand brake cable. Disconnect hydraulic brake line at torque tube and rear shock absorber links at each wheel. Disconnect accelerator pedal, remove pedal pads, floor mat, beam control switch (take out two mounting screws), and floor pan. Disconnect speedometer cable at torque tube. Remove nuts on four universal joint ball housing bolts and two bolts holding ball cap halves together, remove ball cap. Pull rear axle back to disconnect torque tube from transmission.

SHOCK ABSORBERS

Houde (Houdaille). Double Acting, adjustable, hydraulic types (Front & Rear).

	Houde Model	Right — Ford No.	Left
Front	BBCN-3	51A-18045	51A-18046
Rear①	BBCZ-3	51A-18080A	51A-18081A
Rear②	BBCZ-3	51A-18080B	51A-18081B

①—Except Sedan Delivery and Station Wagon.
②—Sedan Delivery & Station Wagon only.

Adjustment: Standard setting marked by line on face of lever hub (pointer should be aligned with this mark). Adjustment can be varied by turning pointer clockwise (for more control) or counter-clockwise (for less control) not more than 1 or 2 serrations at a time. NOTE—Stops are provided to limit adjustment in either direction.

Refilling: Check every 5000 miles, fill to level of filler plug hole. Use Ford No. M-4633-B fluid only (Houde L-1404) required for these new shock absorbers (identified by round top filler plug).

FRONT SUSPENSION

Front Axle: Conventional "I" beam section type with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods.

Kingpin Inclination—8° crosswise.

Caster—3°. Axle may be bent cold for minor corrections providing correct tools used to prevent crushing of axle flange.

Camber—¾°. Adjust as for Caster (above).

Toe In—1/16". Adjust in usual manner by changing length of tie rod.

STEERING GEAR

Gemmer design (Model 305), Ford Make. Worm-&-Roller type with push-pull adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Lockheed Hydraulic, self-centering, double anchor type. Hand lever applies rear wheel service brakes. NOTE—These brakes do not have anchor pin adjustment.
See Brake Section for complete data.

Drums—Composite iron and steel. Diameter 12".

Clearance—Least possible amount without drag.

Lining—Width 1.75". Thickness .187". Length per shoe 13.12" (forward shoes), 10.08" (rear shoes).

Hand Brakes: See Service Brakes (above).

MISC. MECHANICAL

Power Operated Convertible Top: Two types as follows:
1—Convertible—Auto-lite electric type.
2—Sportsman Convertible—Hydro-Lectric type.
See Miscellaneous Section for complete data.

Power Window Regulators (Sportsman Convertible): Hydro-Lectric type.
See Miscellaneous Section for complete data.

1950 (Late) V8 Engine	②8BA- or OBA-12127

①—Less Terminal Block or Cap and Rotor.
②—**8BA**—with cast iron front cover, **OBA**—with aluminum front cover.

Distr.	Breaker Gap	Cam-Angle
5GA-12127	.014-.016"	40°
7HA-12127, 8MTH-12127	.024-.026"	36°
59A-12127	.014-.016"	①36°
7RA-12127C	.014-.016"	27°
8BA- & OBA-12127	.014-.016"	27°

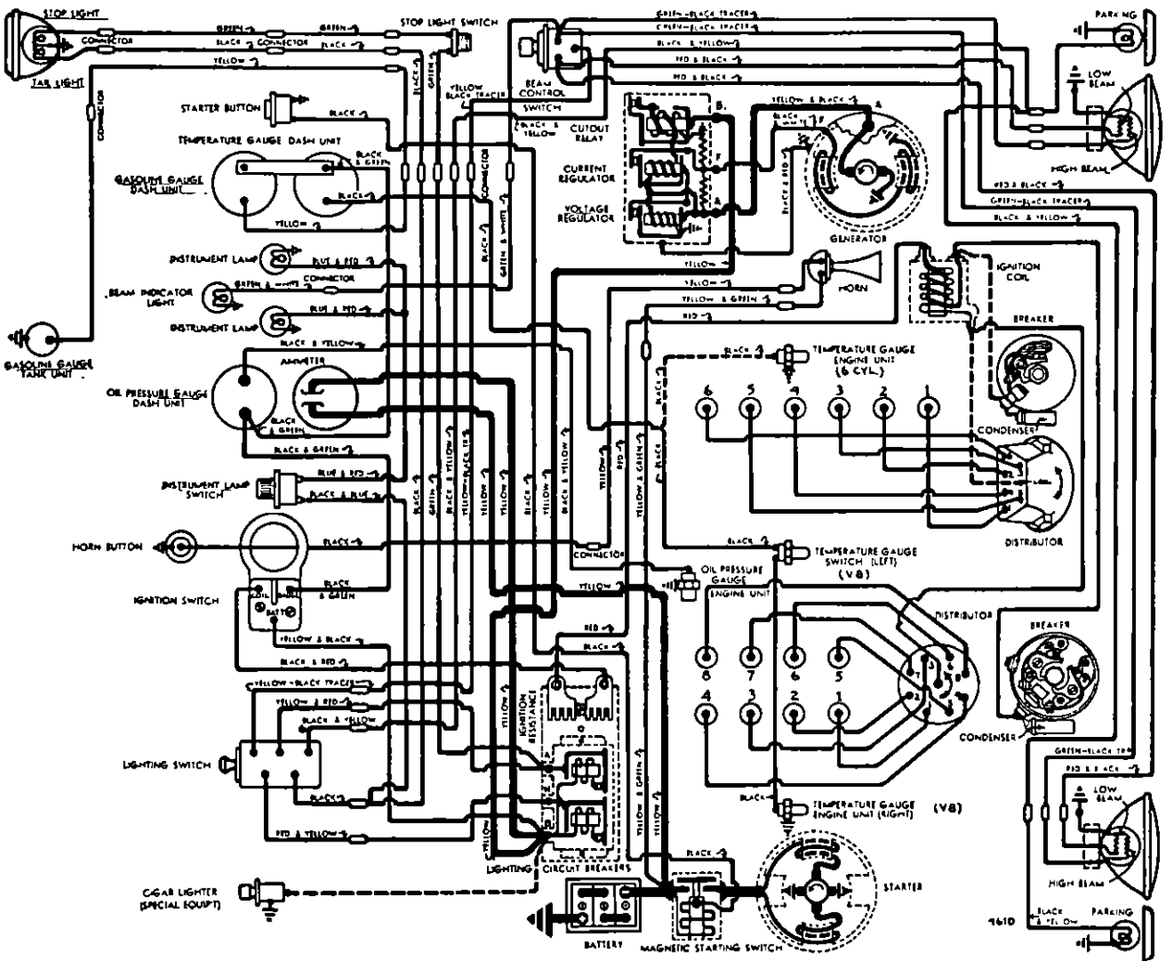
①—Both sets of points operating together (80% dwell), or 22½° (50% dwell) each set singly.

Breaker Arm Spring Tension—20-24 ozs. (5GA-12127 & 59A-12127), 17-20 ozs. (all others).

Rotation—*See wiring diagram.*
Automatic Advance—*See Ignition.*

IGNITION TIMING: **Std. Setting**

6 Cyl. "G" Engine	1° BTDC.
6 Cyl. "H" & "M" Engine	At TDC.
V8 1946-47 Engines	4° BTDC.
V8 1948-50 Engines	2° BTDC.



Timing Mark (6 Cyl. "G" & 1946-47 V8 Engines) No timing mark provided. See Ignition Timing for final ignition setting and Vacuum Brake setting.

Timing Mark (6 Cyl. "H" Engine)—Circular boss or groove in dampener (two types used) and two pointers on engine front cover. Use pointer nearest to outer circumference of dampener.

Timing Mark (6 Cyl. "M" Engine)—Groove on dampener and pointer on engine front cover.

Timing Mark (V8 1948-50 Engine)—Circular boss on crankshaft pulley and pointer on right side of engine front cover.

Timing Procedure—*See Ignition Timing.*

1946-47 6 CYL. & V8 TRUCKS

COIL: (6 Cyl. "G" & 1946-47 V8) Ford No. 1GA-12024, (6 Cyl. "H" & "M", 1948-50 V8) No. 8BA-12029.

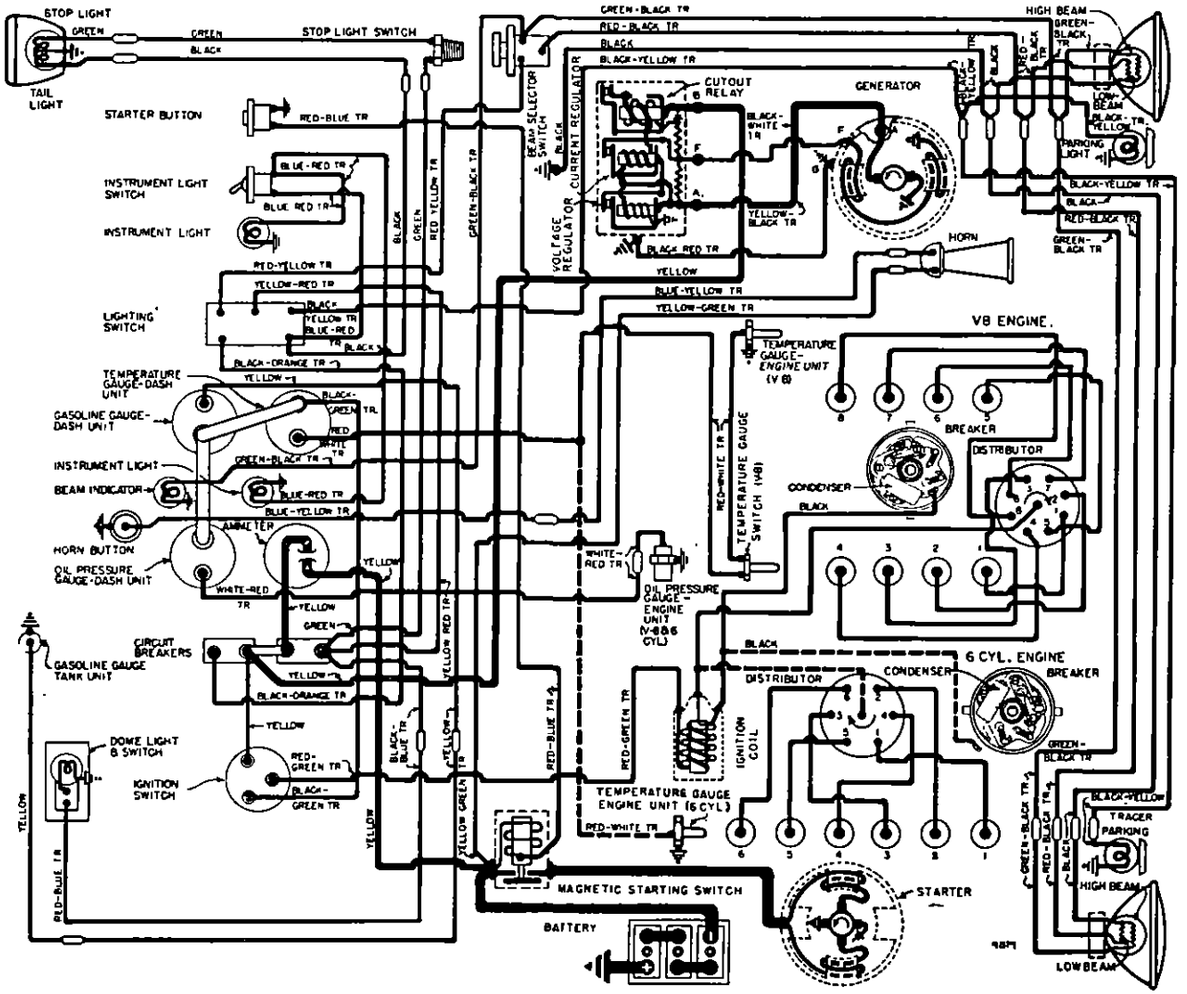
Ignition Current—(1GA-12024 Coil) 4½-6 amperes with engine stopped (ignition primary resistance 1-1⅓ ohms—resistor mounted on circuit breaker and connected in series with coil primary).

(8BA-12029 Coil)—2.75-3 amperes at 6 volts idling, 5-5.5 amperes stopped (coil primary resistance 1.05-1.15 ohms at 75°F).

CONDENSER: (6 Cyl. "G" & 1946-47 V8) Ford No. 1GA-12300B, (6 Cyl. "H" & "M", 1948-50 V8) No. 7RA-12300C.

Capacity—.29-.32 mfd. (1GA-12300B), .21-.25 mfd. (7RA-12300C).

CARBURETION: Holly-Ford Downdraft (except C-O-E 6 Cyl. Engine Updraft). Single barrel (6 Cyl.), Dual (V8) types with manual choke control.



Engine	Ford Carburetor No.
6 Cyl. "G" Engine	5GA-9510A
6 Cyl. "H" Engine	7HT-9510A or ①7HW-9510A
6 Cyl. "M" Engine	8MTH-9510A or ①8MWH-9510A
V8 1946-47 Engine	59A-9510A
V8 1948-50 Engine	7RT-9510A

①—Updraft type carburetor.

Idle Setting—Approx. 1 turn open. 2 screws used on V8—turning screws out gives richer mixture.

Idle Speed—Approximately 500 RPM.

Float Level (6 Cyl. "G" & "H", All V8 Engines): 1.322-1.353" from bottom of float to machined surface of bowl cover with assembly inverted so that needle valve seated (use Gauge No. 9550-A).

1948-49 6 CYL. & V8 TRUCKS
►FOR 1950 TRUCKS, SEE 1951 TRUCK WIRING DIAGRAM

Float Level (6 Cyl. "M" Engine)—1.283" to 1.315" from bottom of float to machined surface of air horn with assembly held in inverted position.

Float Level (C-O-E 6 Cyl. "M" & "H" Engine)—1.180" to 1.200" from top of float to surface of bowl casting.

Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Fuel Pump Pressure: (V8) 3½-4½ lbs., (6) 4-5 lbs.

MANIFOLD HEAT CONTROL: Automatic thermostatic type used on all engines. No adjustment.

V8 Engine—Valve located between right end of exhaust pipe cross over and right exhaust manifold.

6 Cylinder—At center of exhaust manifold just under intake manifold.

VALVE TAPPET CLEARANCE: ***CAUTION—SEVERAL CAMSHAFTS used on some engines require DIFFERENT TAPPET CLEARANCE as listed below.***

6 CYLINDER "G" ENGINE

Intake & Exhaust—.013-.015" COLD. *See "Tappet Clearance Adjustment" in Ford Special Data.*

V8 1946-47 ENGINE

Intake—.010-.012". **Exhaust**—.014-.016" COLD. *See "Tappet Clearance Adjustment" in Ford Special Data.*

6 CYLINDER "H" ENGINE

►First Type Camshaft No. 7HA-6250-C.
(Camshaft stamped "CWC" on forward end)

Intake—.009-.011", **Exhaust**—.013-.015", COLD. Self-locking adjusting screws located in lifters.

Later Type Camshaft No. 0HA-6250-A
(Engine marked "0H" above #3 Intake Port)
(Camshaft stamped "0" on forward end)

Intake—.013-.015". **Exhaust**—.017-.019" COLD. Self-locking adjusting screws located in lifter.

6 CYLINDER "M" ENGINE

Intake—.009-.011", **Exhaust**—.014-.016" COLD. Self-locking adjusting screws located in lifters. ***TWO CAMSHAFTS USED (Tappet Clearance same for both).***

NOTE—.002" additional exhaust valve clearance recommended for high speed operation.

V8 1948-50 ENGINE

►First Type Camshaft No. 8BA-6250-A
(No markings on Engine or Camshaft)

Intake—.010-.012", **Exhaust**—.014-.016" COLD. *See "Tappet Clearance Adjustment" in Ford Special Data.*

►Later Type Camshaft No. 8BA-6250-B
(Engine Marked—"*GAP, in- .014", ex- .018*")①
(Camshaft Marked—"*B*" *on front end*)

Intake Valves .....014" (.013-.015") COLD
Exhaust Valves .....018" (.017-.019") COLD

①—On top of block at center under valve cover.

See "Tappet Clearance Adjustment" in Ford Special Data.

IGNITION

IGNITION SWITCH: (1946-47) Oakes Steering Column & Ignition Lock Assembly. (1948-50) Ford No. 6A-11572B Ignition Lock & Switch assembly on instrument panel.

COIL: (6 Cyl. "G" & 1946-47 V8) Ford No. 1GA-12024, (6 Cyl. "H" & "M", 1948-50 V8) No. 8BA-12029.

Ignition Current—(1GA-12024 Coil) 4½-6 amperes with engine stopped (ignition primary resistance 1-1⅓ ohms—resistor mounted on circuit breaker and connected in series with coil primary).

(8BA-12029 Coil)—2.75-3 amperes at 6 volts idling,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

5-5.5 amperes stopped (coil primary resistance 1.05-1.15 ohms at 75°F).

CONDENSER: (6 Cyl. "G" & 1946-47 V8) Ford No. 1GA-12300B, (6 Cyl. "H" & "M", 1948-50 V8) No. 7RA-12300C.

Capacity—.29-.32 mfd. (1GA-12300B), .21-.25 mfd. (7RA-12300C).

DISTRIBUTOR (1946-47 6 CYL. "G" & V8 ENGINE): Ford No. (6 Cyl.) 5GA-12127, (V8) 59A-12127 (Less Terminal Housing & Rotor). Single cap "sealed dry" type with automatic advance and Vacuum Brake Adjustment.

V8 DISTRIBUTOR NOTE—Two sets of breaker contacts used (one set for coil loading, one set for timing). No adjustment required other than breaker gap setting.

Breaker Gap—.014-.016" (all models).
Cam Angle (6 Cyl.)—40° closed.

Cam Angle (V8)—36° closed or 80% Dwell for both sets operating together. Each set operating singly should be 22½° closed or 50% Dwell (approximately).
Breaker Arm Spring Tension—20-24 ozs. (all).

Rotation—Clockwise viewed from **drive end** of unit.

Automatic Advance
▷With Vacuum Brake Disconnected

6 Cyl. Engine—No. 5GA-12127

Degrees	Distr.	RPM.	Degrees	Eng.	RPM.
Start		200	0		400
9		600	18		1200

V8 Engine—No. 59A-12127

Degrees	Distr.	RPM.	Degrees	Eng.	RPM.
Start		200	0		400
11		600	22		1200

Vacuum Brake: Consists of a spring-loaded, vacuum controlled, brake piston which bears on edge of retard disc of breaker advance mechanism and acts as a "drag" to retard normal advance when engine is accelerated or operated under load. Piston is normally held out of engagement by manifold vacuum.

DISTRIBUTOR (1948-50 6 CYL. "H" & "M", & V8 ENGINES): "Pressure" distributor with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two breaker plate springs. Operating vacuum taken from 1 carburetor connection (2 passages inside carburetor, 1 at venturi, 1 at throttle valve). Full spark advance obtained at 18-35 MPH. with normal road load or for part throttle operation at any speed.

Car Model	①Distributor No.
1946-47 6 Cyl. "G" Engine	5GA-12127
1947-50 6 Cyl. "H" Engine	7HA-12127
1948-50 6 Cyl. "M" Engine	8MTH-12127
1946-47 V8 Engine	59A-12127
1948-50 V8 Engine	7RA-12127C
1950 (Late) V8 Engine	②8BA- or OBA-12127

①—Less Terminal Block or Cap and Rotor.
②—**8BA**—with cast iron front cover, **OBA**—with aluminum front cover.

See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.

Breaker Gap—(6 Cyl.) .024-.026" (V8) .014-.016".
Cam Angle—(6 Cyl.) 36° closed, (V8) 27° closed.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

IGNITION TIMING

IGNITION TIMING:	Std. Setting
6 Cyl. "G" Engine	1° BTDC.
6 Cyl. "H" & "M" Engine	At TDC.
V8 1946-47 Engines	4° BTDC.
V8 1948-50 Engines	2° BTDC.

Timing Mark (6 Cyl. "G" & 1946-47 V8 Engines) No timing mark provided. See Ignition Timing for final ignition setting and Vacuum Brake setting.

Timing Mark (6 Cyl. "H" Engine)—Circular boss or groove in dampener (two types used) and two pointers on engine front cover. Use pointer nearest to outer circumference of dampener.

Timing Mark (6 Cyl. "M" Engine)—Groove on dampener and pointer on engine front cover.

Timing Mark (V8 1948-50 Engine)—Circular boss on crankshaft pulley and pointer on right side of engine front cover.

1946-47 TIMING PROCEDURE

Basic Timing (Distributor off Engine): Place a small straightedge or scale against tang on drive end of distributor shaft with scale on **widest side** of shaft, rotate distributor shaft in direction of rotation (clockwise) to the following position: **6 Cyl.—Leading** edge of scale exactly ⅝" **before** nearest edge of distributor mounting hole on vacuum piston mounting flange. **8 Cyl.—Trailing** edge of scale exactly ⅜" **past** nearest edge of small mounting hole (left hand hole—nearest vacuum brake) on mounting flange. If contacts do not begin to open at this point (left hand timing contacts on V8), loosen adjusting screw on side of distributor housing, move screw down to advance spark, or up to retard spark, until contacts begin to open, tighten adjusting screw. This setting will provide correct timing when distributor installed on engine.

Ignition Timing (On Engine)—No flywheel marks or other means provided to check timing on engine. If basic setting of distributor is correct (above), all necessary adjustments for operating conditions and octane rating of fuel being used can be made by means of the Vacuum Brake adjustment as follows: **Vacuum Brake Setting**—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, then turn screw in just enough to eliminate ping, tighten locknut. When adjusted on the stroboscope, vacuum brake should retard spark to peep sight with peep sight set at 2° when distributor is driven at 650 RPM with no vacuum to release brake.

1948-50 TIMING PROCEDURE

Timing—With #1 piston at firing position and timing mark aligned with pointer on front of engine, loosen distributor clamp screw, rotate distributor until contacts begin to open, tighten clamp screw. Check spark plug connections (see diagram), see that rotor opposite #1 terminal in cap.

Timing (with Neon Timing Light)—***CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.*** Mark timing mark and pointer with white chalk (6 cylinder equipped with two pointers use pointer nearest to outer circumference of dampener). Connect timing light to #1 spark plug, idle engine, adjust distributor by loosening clamp screw and rotating distributor until mark and pointer are aligned, tighten clamp screw, connect vacuum line.

CARBURETOR

CARBURETION: Holly-Ford Downdraft (except C-O-E 6 Cyl. Engine Updraft). Single barrel (6 Cyl.), Dual (V8) types with manual choke control.

Engine	Ford Carburetor No.
6 Cyl. "G" Engine	5GA-9510A
6 Cyl. "H" Engine	7HT-9510A or ①7HW-9510A
6 Cyl. "M" Engine	8MTH-9510A or ①8MWH-9510A
V8 1946-47 Engine	59A-9510A
V8 1948-50 Engine	7RT-9510A

①—Updraft type carburetor.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***
Metering Jets—***See Holley-Ford Jet Specification Table in Carburetor Section.***

Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.

CARB. EQUIPMENT

Air Cleaner: Oil-bath type air cleaner used on all models.

Fuel Pump: Diaphragm type fuel pump or combination fuel-and-vacuum pumps used as follows:
6 Cyl. "G" Engine—Ford No. 1GA-9350.
6 Cyl. "H" & "M" Engines—Ford No. 7HA-9350B (first), replaced by 1HA-9350A (later).
V8 Engine—(Fuel Pump) Ford No. 59A-9350 (1946-47), No. 7RA-9350C (1948-50). (Combination fuel-and-vacuum Pump) No. 7RA-9350E (replaced by 1BA-9350H) or No. 8CM-9350A (replaced by 8CM-9350C).
Pressure—4-5 lbs. (6 Cyl.), 3½-4½ lbs. (V8).

See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley electric type.
Dash Unit—(1946-47) Ford No. 11C-9280A, (1948-50) No. 7RC-9280.

Tank Unit—	1946-47	1948-50
Comm'l	99A-9275B	①7RC-9275
Clsd. Cabs	21C-9275A	7RC-9275
Panels	21C-9275B	②
C-O-E	01W-9275.	7RC-9275
School Bus	594T-9275	7RT-9275

①—Or No. 21C-9275B.
②—(F1, 2, 3) 21C-9275B, (F4, 5, 6) 7RT-9275.

See Carburetion Equipment Section for complete data.

BATTERY

Std.—Ford 81A-10655-A. 6 Volt, 17 Plate, 100 Amp. Hr.
Grounded Terminal—Positive (+) terminal.
Dimensions—L. 10½". W. 7⅛". H. 7¼".

Location—At rear of engine on right side (V8), left side (6 Cyl.). On right running board under separate cover on Cab-Over-Engine trucks.

School Bus (Spec. Equip. Other Models): Ford No. 01A-10655-A. 6 Volt, 17 Plate, 120 Ampere Hour Grounded Terminal & Location—As given above.

STARTER

Ford. Four-pole, two-coil type with Bendix Drive.

Engine Type	Ford Starter No.
6 Cyl. "G" & V8 (1946-47)	18-11002
6 Cyl. "G" (1946-47)	7HA-11002
V8 (1946-47)	7RA-11002
6 Cyl. "H" & "M", V8 (1948-50)	①FAD-11002A

①—See Drive Data below for two types of Drive.

Armature No.—Ford No. 18-11005.

Drive—10 Tooth Pinion Type (All V8, Early 6 Cyl.) Ford No. B-11350 (Bendix No. A1472) for use with 112 tooth flywheel ring gear.

Drive—9 Tooth Pinion Type (Late 6 Cyl.) Ford Part No. 8HA-11350 (with 114 tooth flywheel ring gear).

►***6 CYL. STARTER DRIVE CAUTION—Use proper type drive. Both 9 and 10 tooth pinions used as listed above.***

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—48-56 ozs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on front of dash next to battery (left side on 6 Cyl. Conventional Truck, right side all others) controlled by pushbutton, Ford No. 11C-11500.

Removal: On right front face of flywheel housing cover. To remove, take off right engine splash pan (if used), free starter-to-oil pan bracket, take out 2 starter through bolts.

GENERATOR

Ford 2 brush type with voltage & current regulation.

Engine Type	Generator No.	Amps. Capacity
6 Cyl. "G" (1946-47)	5GA-10000	30
6 Cyl. "H" (1947)	7HA-10001B	30
V8 (1946-47)	21A-10000	30
All (1948-50)	①8BA-10002A, D	30
All (1948-50)	①8BA-10002B	40

①—Replaced by No. FAA-10002A or FAA-10002B.

Armature No.	Generator No.
8BA-10005A	5GA- & 21A-10000
8BA-10005A	7HA-10001B
0A-10005A	8BA-10002A & D
8EH-10005	8BA-10002B

Charging Rate Adjustment—None. See Regulator.

Maximum Charging Rate—Controlled by regulator dependent on load and battery condition.

Performance Data

	Maximum Rate Amperes	Eng. RPM
5GA-10000	30	1650
7HA-10001B	30	1650
21A-10000	35	935
8BA-10002-A	35	935
8BA-10002-B	40	1060
8BA-10002-D	35	900

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. each.

Removal (V8): On support secured to valve chamber cover by stud and nut, driven by belt in tandem with water pumps. To remove, loosen stud nut and disengage generator belt, take out capscrew in mounting strap, lift generator off support.

Removal (6 Cyl.): Separate generator mounting bracket mounted on engine bracket on left side of engine at front. To remove, slack off belt by loosening mounting bracket bolts, take out mounting strap bolt, lift generator off mounting bracket.

Belt Adjustment (V8): Loosen 2 bolts on fan mounting bracket, loosen generator support mounting stud nut, raise generator up until side movement on belt midway between generator and water pump pulleys is ½" (thumb and finger pressure), tighten stud nut. Adjust fan belt in similar manner, tighten 2 fan bracket bolts.

Belt Adjustment (6 Cyl.): ½" deflection midway between generator and pump pulleys. To adjust, loosen 2 mounting bracket bolts under generator and capscrew in bracket slot behind generator.

REGULATOR

Ford. 3-unit, vibrating voltage and current regulators.

Ford Regulator No.	Rating & Application
51A-10505A①	(30-33) All 30 Amp. Gen.
51A-10505H①	(34-38) All 35 Amp. Gen.
5EH-10505C②	(38-42) All 40 Amp. Gen.
8L-10505②	(40-42) All 35 & 40 Amp. Gen.

①—Replaced by No. FAC-10505A.

②—Replaced by No. FAD-10505A.

See Electrical Equipment Section for complete data.

NOTE—Ground wire between generator and regulator must be in place.

Cutout Relay

Regulator	Cuts In
51A-10505-A,H, 5EH-10505-C	6.6-7.0 Volts
8M-10505-A, 8L-10505	6.0-6.6 Volts

Cuts Out (Discharge—0-8 Amperes.

Contact Gap—.010" (armature against upper stop).

Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Regulator	Voltage Setting COLD①
All	7.2-7.6 Volts

①—Voltage settings will increase approx. .2 volts after 20 minutes running.

Checking & Adjustment—*See Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

►***CAUTION—Make certain gauge contacts armature and not brass rivet on underside of voltage armature.***

Contact Spring Tension—5 ounces minimum with contacts just opening.

Current Regulator

Regulator	Current Setting COLD Amperes
51A-10505-A	30-34
51A-10505-H, 8M-10505-A	34-38
5EH-10505-C, 8L-10505	38-42

Checking & Adjustment—*see Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

Contact Spring Tension—5 ounces minimum with contacts just opening.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).

Beam Indicator—Bulb between Fuel and Oil Gauges on panel. Lighted when Upper Beam in use.

Switches

Lighting—Ford. (1946-47 exc. "H" Eng.) 11A-11652, (1947 "H" & All 1948-50) No. 7RA-11654.

Beam Selector—Ford. (1946) No. 11A-13532, (1947-50) No. 8A-13532.

Instrument—Ford No. 21C-13740 (All Models).

Stop Light—Ford. (1946-47) No. 11A-13480, (1948-50) No. 0A-13480 (this switch has waterproof coating).

MISC. ELECTRICAL

CIRCUIT BREAKERS (1946-47): Ford No. 11A-12250C. Combined with ignition resistor on block on dash under cowl. Two separate circuit breakers (one protects Head Light circuits, second unit protects other units). Contacts open with current of 50 amperes and vibrate to limit current (thermostatic, wound-coil type).

CIRCUIT BREAKERS (1948-50): Ford No. 8C-12258B. Consists of two circuit breakers on block behind instrument panel (one 15-ampere unit, one 30-ampere unit). One unit protects Head Light circuit, other unit protects other circuits.

HORNS: Single horn Std., Dual Horns with relay optl.

ENGINE

►*VARIOUS ENGINES USED AS FOLLOWS:*

1946-47 6 CYL. "G" ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. "L" Head type.
Bore—3.30". **Stroke**—4.40".
Displacement 226 cu. ins. **Rated H.P.**—26.13.
Developed Horsepower—90 at 3300 RPM.
Compression Ratio—6.7-1 Cast Iron head.

►*FOR ALL ENGINE DATA, see Ford 1946-48 Six Cylinder Passenger Car data.*

1946-47 V8 "100" ENGINE

ENGINE SPECIFICATIONS: V8 "L" Head type.
Bore—3.187" **Stroke**—3.75".
Displacement—239 cu. ins. **Rated H.P.**—32.5.
Developed Horsepower—100 at 3800 RPM.
Compression Ratio—6.75-1 Cast Iron heads.

►*FOR ALL ENGINE DATA, See Ford 1946-48 V8 Passenger Car data.*

1947-50 6 CYL. "H" ENGINE

ENGINE SPECIFICATIONS: "H" 6 Cyl. "L" Head.
Bore—3.30" **Stroke**—4.40"
Displacement—226 cu.ins. **Rated H.P.** 26.1.
Developed Horsepower—95 at 3300 RPM.
Compression Ratio—6.8-1. Cast Iron head.

►*FOR ALL ENGINE DATA, see Ford Six Cylinder "H" Engine Passenger Car data and note also:*

►*"H" ENGINE CAMSHAFT PRODUCTION CHANGE & TAPPET CLEARANCE ADJUSTING CAUTION:* TWO different camshafts used with different Valve Timing and special Tappet Clearance settings. *See "Camshaft & Bearings" in Ford Special Data for Camshaft data, see Valve Timing (below) for Tappet Clearance & Valve Timing.*

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

1948-50 V8 "R" ENGINE

ENGINE SPECIFICATIONS: "R" V8 "L" Head type.
Bore—3.187" **Stroke**—3.75"
Displacement—239 cu.in. **Rated H.P.** 32.5
Developed Horsepower—100 at 3800 RPM.
Compression Ratio—6.8-1. Cast Iron head.

▷*FOR ALL ENGINE DATA, see Ford V8 Passenger Car Data and note also:*

▷*"R" ENGINE CAMSHAFT PRODUCTION CHANGE & TAPPET CLEARANCE ADJUSTING CAUTION:* TWO different camshafts used with different Valve Timing and special Tappet Clearance settings. *See Valve Timing (below) for Tappet Clearance and Valve Timing*

1950 6 CYL. "M" ENGINE

ENGINE SPECIFICATIONS: "M" 6 Cyl. "L" Head.
Bore—3.5" **Stroke**—4.40"
Displacement—254 cu.in. **Rated H.P.** 29.4
Developed Horsepower—110 at 3400 RPM.
Compression Ratio—6.8-1. Cast Iron head.

▷*"M" ENGINE DATA—Same as for Ford "H" Engine except as noted below. See Ford 6 Cyl. "H" Engine Passenger Car data and note the following:*

▷*PISTON PRODUCTION CHANGE: Split-skirt pistons used in early 1950 production, solid-skirt pistons in later 1950. Fit pistons as follows:*
Fitting Pistons—Use ½" wide feeler inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows: New piston in new bore .0015". New piston in used bore .002". Used piston in used bore .003". Pounds pull to withdraw: 5-10 lbs.

Piston Rings: Two compression, one oil ring.

Ring	End Gap	Side Clearance
Compr. (#1)	.007-.047"	.002-.0035"
Compr. (#2)	.007-.047"	.0015-.003"
Oil (#3)	.007-.047"	.0015-.003"

Connecting Rod: Special type marked "8MTH-D".
Weight—32 ozs.

▷*CAMSHAFT PRODUCTION CHANGE & REPLACEMENT CAUTION: TWO types used with special gears as indicated below. See "Camshaft & Bearings" in Ford Special Data for Camshaft data.*

Timing Gears: *CAUTION*—7HA-6256-A Camshaft gear used with early unmarked camshaft. 7HT-6256-A Camshaft gear used with marked camshaft in either "H" or "M" engines.

▷*NOTE*—7HA-6256-A Camshaft gear can be used with the unmarked camshaft by increasing the chamfer from 15° to 45°. 7HT-6256-A Camshaft gear can be used with either the marked or unmarked camshaft without interference. Same tappet clearance used for both camshafts.

Valves: Intake Valves are "Free Type", Exhaust Valves are "Rotatable Type." *See "Valve System" in Ford Special Data.*

▷*"M" ENGINE VALVE STICKING CORRECTION:* Correct complaints of sticking valves by modifying cylinder block and valve chamber oil baffles as follows:
Cylinder Block Modification—Drain crankcase and remove oil pan. Position crankshaft to provide access to bottom of valve chamber floor. Remove valve chamber covers and oil baffles. Locate centers for holes to be drilled in **front** and **rear** valve chamber (center chamber not affected) as follows: In line with EACH end (exhaust) cam in front and rear chamber, center-punch hole location exactly 1⅛" out toward crankcase wall from center-line of camshaft *(NOTE*—some engines may have cored hole at rear of rear valve chamber, if not, this hole must be drilled). Install a shield to keep chips and metal particles off crankshaft and camshaft, drill a ¼" pilot hole at each center-punched location (two in each end chamber), then drill vent holes out with a ⅝" drill. Carefully brush out all chips from valve chamber and flush valve chamber with solvent. Wash camshaft, crankshaft, and underside of valve chamber floor with solvent to remove all metal particles, wipe solvent off as completely as possible.
Valve Chamber Oil Baffle Modification—Install NEW TYPE BAFFLE No. 8MTH-6524-A in front and rear valve chambers, re-install original baffle in center valve chamber.

VALVE TIMING

VALVE TAPPET CLEARANCE: *CAUTION—SEVERAL CAMSHAFTS used on some engines require DIFFERENT TAPPET CLEARANCE as listed below.*

6 CYLINDER "G" ENGINE

Intake & Exhaust—.013-.015" COLD. *See "Tappet Clearance Adjustment" in Ford Special Data.*

6 CYLINDER "H" ENGINE

▷First Type Camshaft No. 7HA-6250-C.
(Camshaft stamped "CWC" on forward end)
Intake .009-.011", **Exhaust** .013-.015" COLD. Self-locking adjusting screws located in lifters.

Later Type Camshaft No. 0HA-6250-A
(Camshaft stamped "0" on forward end)
(Engine marked "0H" above #3 Intake Port)
Intake .013-.015", **Exhaust** .017-.019" COLD. Self-locking adjusting screws located in lifters.

6 CYLINDER "M" ENGINE

Intake .009-.011", **Exhaust** .014-.016" COLD. Self-locking adjusting screws located in lifters. *TWO CAMSHAFTS USED (Tappet clearance same for both). NOTE*—.002" additional exhaust valve clearance recommended for high speed operation.

V8 1946-47 ENGINE

Intake—.010-.012". **Exhaust**—.014-.016" COLD. *See "Tappet Clearance Adjustment" in Ford Special Data.*

V8 1948-50 ENGINE

First Type Camshaft No. 8BA-6250-A
(No markings on Engine or Camshaft)
Intake .010-.012", **Exhaust** .014-.016" COLD. *See Tappet Clearance Adjustment in Ford Special Data.*

Later Type Camshaft No. 8BA-6250-B
(Engine marked "GAP, in-.014", ex-.018")①
(Camshaft marked "B" on front end)

Intake Valves	.014" (.013-.015") COLD
Exhaust Valves	.018" (.017-.019") COLD

①—On top of block at center under valve cover.

▷*CAUTION—"R" V8 Engines—Loss of Power will result if correct tappet clearance is not used with "B" (late type) camshaft. See Tune-Up for Camshaft Identification data.*

VALVE TIMING: *For Camshaft Settings, see Ford Passenger Car data pages.*

▷*VALVE TIMING CAUTION: Valve Timing is different for each type camshaft on some engines only as listed below:*

6 Cyl. "G" Engine
Intake Valves—Open 3° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

1946-47 V8 "100" Engine
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

6 Cyl. "H" & "M" Engines
Intake Valves—Open 11° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.
NOTE—Valve Timing same for BOTH Camshafts.

V8 "R" Engine (First Type Camshaft)
(No markings on Engine or Camshaft)
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

V8 "R" Engine (2nd. Type Camshaft)
(Camshaft marked "B" on front end)
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 3° ATDC.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings. Timing gears and distributor drive gear lubricated through drilled hole in front end of camshaft on V8. Timing gears lubricated by spray past camshaft thrust plate on 6 cylinder engine.

▷***OIL PAN CLEAN-OUT PLATE—On underside of oil pan, attached by 7 nuts. Remove to clean oil pump intake and screen, and oil pan.***
Crankcase Capacity—5 qts. (All exc. "M" Eng.), 6 qts. ("M" Engine only).
Normal Oil Pressure—(6 Cyl. "G") 35 lbs. at 2000 RPM. (All Others) 50 lbs. at 2000 RPM.

Oil Pressure Relief Valve (6 Cyl.): In cylinder block just to rear of oil filter mounting. Not adjustable. Regulator Spring Tension—("G" Eng.) 44-56 ozs. compressed to 1.40", ("H" & "M" Eng.) 12.76 lbs. plus or minus 2 ozs. compressed to 1.14".

Oil Pressure Relief Valve (V8 Eng.): Located in oil pump body. *NOTE*—Some 1946-47 engines may also have relief valve located under plug above front camshaft bearing in cylinder block under manifold. **Regulator Spring Tension**—(1946-47) 78-87 ozs. compressed to 1.380", (1948-50) 12 lbs. plus or minus 2 ozs. compressed to 1.14". *NOTE*—If relief valve in cylinder block is used (with pump relief valve), spring tension should be 78-87 ozs. compressed to 1.380".

Oil Pump (6 Cyl. "G" Engine): Gear type. Mounted in crankcase on front main bearing cap and driven from crankshaft timing gear (pump body integral with bearing cap).
Oil Pump Servicing—*See Ford Special Data.*

Oil Pump (6 Cyl. "H" & "M" Engines): Rotor type. Mounted externally on right side of crankcase.

▷Oil Pump Driven Gear Replacement before 6 Cylinder Engine No. 7H-219349—*See Ford Shop Notes.*
Oil Pump Servicing—*See Ford Special Data.*

Oil Pump (V8 Engine): Gear type (two types: one equipped with spur gears, second helical gears). In crankcase at rear of engine.
Oil Pump Servicing—*See Ford Special Data.*

Oil Filter: On 6 cylinder, mounted directly on block (no external oil lines) on left side at rear. On V8, mounted on left cylinder head. Replace cartridge every 5000 miles or more often if required.

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. (1946-47) 41C-9273, (1948-50) 7RC-9273.
Engine Unit—Ford No. 41A-9278 (All Models).
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler cap (inlet) with outlet pipe in rear valve chamber extending down on right side of 6 cylinder engine, or from top of engine down behind fan and out along left side of V8 engine.
V8 NOTE—Outlet pipe may be equipped with filter element just below upper elbow.

C OLING

Cooling System: Pressure type with relief valve in filler cap, by-pass in block, and belt-driven water pump (two pumps used on V8 engines).
Capacity—(1946-47 6 Cyl. "G" & 1948-50 F1, F2, F3 with "H" Engine) 17 quarts, (Other 6 Cyl. "H" & "M" Engine models) 18 quarts, (All V8 Engine Models) 23 quarts.
Pressure Valve—In radiator filler cap. Ford Nos. 41A-8100-B (with knurled edge) or 41A-8100-A (flange type grip—use with 51A-8138 radiator cap gasket). Opens at 3½-4½ lbs.

Water Pump (6 Cylinder): Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing. No lubrication required.
See Water Pump Section for complete data.
Removal—Drain cooling system, disconnect hose connection at pump, remove fan blade assembly by taking out capscrews in shaft hub. Remove pump mounting capscrews and lift pump out.

Water Pumps (V8 Engine): Two used. Centrifugal, belt-driven, packless type. Shaft mounted on pre-packed ball-bearing at front, and a bushing next to seal. Oil cup provided for bushing lubrication.
See Water Pump Section for complete data.

►*8 1948-50 PUMP LUBRICATION CAUTION: Fill oil cup in pump with SAE #20 engine oil every 1000 miles. When oiling new pump insert piece of wire down alongside wick in oiler to permit air to escape from cavity.*
Removal—Drain cooling system. Place support jack under engine (use wood block to avoid damaging oil pan), remove engine front support bolts, raise engine just enough to remove weight from supports. Disconnect and remove water pump hose. Remove all water pump mounting capscrews. *(CAUTION*—one screw located within hose connector fitting—accessible with hose removed), lift pump out.

Thermostat: In cylinder head water outlet (2 on V8).

Model	Thermostat No.	Opening Temp.
1946-47 6 Cyl. "G"	1GA-8575A	158°F
1946-47 V8①	11A-8575B	148-153°F
1946-47 V8②	11A-8575C	158-162°F
1947 6 Cyl. "H"③	7HA-8575B3	148-153°F
1947 6 Cyl. "H"④	7HA-8575A3	157-162°F
1947 6 Cyl. "H"⑤	7HA-8575C	177-182°F
1948-50 6 "H" & "M"	7HT-8575B	157-162°F
1948-50 6 "H" & "M"	8HT-8575B	157-162°F
1950 6 Cyl. "M"	8HT-8575A	148-153°F
1948-50 V8	8RT-8575B	148-153°F

①—Use with Radiator Pressure Cap only.
②—DO NOT use with Radiator Pressure Cap.
③—Dole type (replaces 7HA-8575B1 Bellows type).
④—Dole type for use with Radiator Pressure Cap and Permanent Anti-freeze only.
⑤—Use with Permanent Anti-freeze only.

Temperature Gauge: King-Seeley electric. NOTE—V8 engines have regular sender (Engine Unit) in Right Hand cylinder head, additional Temperature Switch in Left Hand cylinder head (causes dash unit to read "hot" if this bank overheated).
Dash Unit—Ford No. (1946-47) 11C-10883A, (1948-50) 7R-10883.
Engine Unit ("Sender" located in R.H. cylinder head on V8 Engines)—Ford No. (1946-47) 99A-10884, (1948-50) 8A-10884.
Temperature Switch (V8 only—located in L.H. cylinder head)—Ford No. (1946-47) 01A-10990, (1948-50) 8A-10990.
See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-TI (Com'l.), 11CF-CI (All others). *Semi-centrifugal, single plate, dry disc types.*
See Clutch Section for complete data.
Facings (10CF)—Moulded. 10" O.D. .125" thick.
Facings (11CF)—Woven (School Bus), Moulded (Others). Outside Diameter 11". Thickness .137".
Pedal Adjustment: 1-1¼" (F-1 with 3 spd. Trans.), 1½-1¾" (All Others) pedal free travel. Adjusting clevis provided at forward end of connector rod between pedal shaft and equalizer shaft.
Removal: Remove transmission (see TRANSMISSION Removal below). Install wooden wedges between each release lever and cover to hold clutch in released position, take out 6 cover capscrews, lift assembly out. NOTE—Flywheel housing may have to be removed on some models.

TRANSMISSION

3-SPEED TYPE

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.
NOTE—Heavy Duty 3-Speed or 4-Speed Transmission optl. on models where this transmission used.
Removal: Remove propeller shaft by disconnecting rear universal and sliding shaft out of transmission. Disconnect clutch linkage and speedometer cable. Remove front floor plate. Remove nuts and washers from two engine rear support bolts. Raise rear end of engine (use block of wood on jack under engine) until rear support clears mounting bolts. Remove transmission mounting capscrews, pull transmission straight back until main drive gear shaft clears clutch, lift transmission out through floor opening.

HEAVY DUTY 3-SPEED TYPE

Own Make. Heavy duty, 3-speed, Helical gear, constant-mesh, synchro-mesh (Second & High). Sliding spur gear (Low & Reverse).
See Transmission Section for complete data.
Removal: Same as for 4-Speed type following.

4-SPEED

Own Make. 4-speed, sliding spur gear type.
See Transmission Section for complete data.
Removal: Remove seat cushion, floor mat, and transmission cover on floor. Support engine with jack under flywheel housing (use wood block on jack), raise jack until engine weight is off rear mounting. Free coupling shaft support bearing from crossmember by removing nuts on two bolts, disconnect front universal joint by taking out four bolts mounting universal joint flange at hand brake drum and disconnect intermediate universal joint at support bearing by removing nuts on "U" bolts (tape bearing caps in place to prevent losing needle bearings), remove front shaft. Remove clutch equalizer shaft by taking out pin in clutch shaft and clevis pin at lever and pulling equalizer shaft off the bracket (CAUTION—Do not lose spring and bushing halves). Remove two bolts in engine rear support. Disconnect speedometer shaft at transmission. Remove transmission capscrews from flywheel housing, pull transmission straight back until clutch (main drive gear) shaft clears, then lift transmission out through floor opening.

4-SPEED SYNCHR -MESH

Own Make. 4-speed constant-mesh type, Synchro-mesh (Second, Third & High). Helical gears used for second, third and fourth speed. Spur gears used low and reverse. *See Trans. Sect. for complete data.*
Removal: Same as for 4-Speed spur gear type (above).

UNIVERSALS

Spicer. Needle bearing type. Two used (114" WB. Light Duty and C-O-E 101" & 110" Trucks), Three used with slip joint at forward end of rear shaft behind coupling shaft support bearing at intermediate universal joint (Other Trucks).

	Spicer Model Nos.		
Wheelbase	Front	Center	Rear
114"①	1278-102X	None	1278-102X
114"②	1311-102X	None	1318-105X
122"	1318-103X	1311-102X	1318-103X
134" & 158"	1358-54X	1351-5107X	1358-5104X
101" & 110"	1351-517X	None	1358-5104X
194"	1358-514X	1351-5107X	1358-5107X

①—3-Speed Transmission. ②—4-Speed Trans.

Coupling Shaft Center Bearing: Consists of cushion mounted ball bearing bolted to underside of frame intermediate cross-member.

REAR AXLE

1946-47 ¾-FLOATING TYPE

Own Make. ¾ Floating, Spiral Bevel Gear type with straddle-mounted pinion and Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratio (6 Cyl.)—3.78-1 Std., 3.54-1, 4.11-1 Optl.
Ratio (V8)—3.54-1 Std., 3.78-1, 4.11-1 Optl.
Backlash—.012" Maximum.
Removal: Raise rear end of frame, disconnect propeller shaft by removing two "U" bolts and nuts in rear universal joint, lower propeller shaft. Disconnect hand brake cables and brake lines at rear axle (bleed brakes when line re-connected). Disconnect rear shock absorber links, disconnect rear springs, withdraw axle assembly from underneath.
Axle Shaft Removal—Axle assembly must be dismantled and axle shaft removed at inner end through differential housing. *See Ford Rear Axle article (in Rear Axle Section) for complete data.*

1948-50 SEMI-FLOATING HYPOID

Own Make. Semi-floating, Hypoid Gear type with Hotchkiss drive (separate carrier not used). Axle ends flanged (no separate hub).
►*NOTE—AXLE NOT SAME AS USED ON FORD CAR.*
See Rear Axle Section for complete data.
Ratio—3.73-1 Std., 4.27-1 Optl.
Backlash—.003-.006". Shim adjustment.
Removal: Raise rear of truck. Disconnect rear universal. Remove axle shafts (see instructions below). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Remove nuts on rear spring "U" bolts, drive bolts up free of housing, lower axle assembly and remove from underneath
Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer nuts (work through opening in axle shaft flange). Use Puller No. 4235 and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal).
Wheel Bearing Adjustment: None. Pre-lubricated sealed ball-bearings.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FULL-FLOATING TYPE

Own Make. Full-floating, Spiral Bevel Gear type with Hotchkiss drive. *See Rear Axle Sect. for data.*

Ratios:	Standard	Optional
¾ Ton	4.86-1 (34-7)	4.11-1 (37-9)
1 Ton	5.14-1 (36-7)	5.83-1 (35-6)
Others	6.66-1 (33-5)	5.83-1 (35-6) 5.14-1 (36-7)

Backlash—.004-.018".

Removal: Raise rear end of frame, remove axle shafts (see below), wheel and drum assemblies. Disconnect hydraulic brake line at each wheel and hose at bracket (bleed brake lines when re-connected). Remove backing plate assemblies. Disconnect rear universal. Remove nuts on rear spring "U" bolts, drive bolts up free of housing, lower axle assembly and remove from underneath truck.

Axle Shaft Removal: Remove hub cap, remove nuts on 8 hub studs holding axle shaft flange in place, turn 2 special screws (in tapped holes in flange) up evenly to break flange loose from hub, back these screws out, strike axle shaft flange at center to loosen centering cones on studs, remove cones, pull axle shaft out (wheel not disturbed).

Wheel Bearing Adjustment: Remove axle shaft (see above), use special bearing adjustment wrench and remove bearing locknut (outer nut), and lockwasher. Adjust bearings by turning bearing adjusting nut (inner nut) up until tight and then backing nut off ⅛ turn. Install bearing lockwasher making certain that it fits over dowel pin on adjusting nut, install bearing locknut and turn this nut up tight. NOTE—When installing axle shaft make certain that gasket in place under shaft flange, cones in place on studs and that two loosening screws backed off sufficiently so that stud nuts can be tightened securely. Turn two loosening screws in just enough to prevent loosening in service.

TWO-SPEED TYPE

Own Make. Vacuum Operated Shift, Two-speed, Full-floating, Spiral Bevel Gear (final drive), spur gear planetary unit (reduction gearing) with Hotchkiss drive. *See Rear Axle Section for data.*

Ratio—Std. 5.83-1 (Direct Spd.), 8.11-1 (2nd Spd.); **Optl.** 6.33-1 (Direct Spd.), 8.81-1 (2nd Spd.).

Backlash—.004-.018".

Removal: Same as for standard axle (above) after disconnecting vacuum line at hose connection.

SHOCK ABSORBERS

1946-47 MODELS

Houde (Houdaille). Double acting, hydraulic, adjustable type. Used at Front and Rear end (114" Light Duty Truck and 194" School Bus), Front end only (122" One Ton Truck).

Houde Model	Right—Ford No.—	Left
114", 122" Frt.	BBCN-3	51A-18045A 51A-18046A
114" Rear	BBCZ-3	51C-18080 51C-18081
194" Front	BBCHMS	
194" Rear	BBCLT	

Adjustment: Standard setting marked by line on face of lever hub (pointer should be aligned with this mark). Adjustment can be varied by turning pointer clockwise (for more control) or counter-clockwise (for less control) not more than 1 or 2 serrations at a time. NOTE—Stops limit adjustment.

Refilling: Check at 5000 mile intervals and fill to level of filler plug hole. Use Ford No. M-4633-B fluid only (Houde L-1404). Shock absorbers are identified by round top filler plug.

1948-50 MODELS

Houde (Houdaille). Direct acting, hydraulic type.

▷***Shocks are sealed (cannot be refilled or repaired).***

F-1, F-2, F-3—Ford No. 7RC-18045-B, Houde No. H-160 (Front). 7RC-18080-B, Houde H-170 (Rear). F-4, F-5, F-6 NOTE—Houde rotary type shocks optional equipment for front end only (Ford No. 8T-18045 Right, No. 8T-18046 Left). These shocks are adjustable and can be refilled. *See 1946-47 Shock Absorber data above.*

FRONT SUSPENSION

Front Axle—Conventional "I" beam section with Reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination—(Comm'l., ¾ & 1 Ton incl. Par. Del., School Bus) 8° ± ¼°, (Others) 8¼° ± ¼° crosswise.

Caster—(1946-47 All Models) Pos. 1° to Pos. 3½°, (1948-50 Comm'l., ¾, 1 Ton exc. Par. Del.) Pos. 2½° to Pos. 4½°, (1948-50 Par. Del. & School Bus) Pos. 1° to Pos. 3°, (1948-50 Other Trucks) Pos. 1° to Pos. 3°. Maximum variation between wheels ½°.

NOTE—Caster angle controlled by wedge shims inserted between axle pads and springs. To increase caster, insert taper shims equally at both sides.

Camber—(All Models) Pos. ¼° to Pos. 1°.

NOTE—Maximum variation between wheels ¼°. Right wheel should not exceed left wheel.

Toe-In—(1946-47) 1/16" and set at 1-10 ratio to camber. (1948-50) 0-1/16" with truck empty.

STEERING GEAR

Ford (Gemmer design). Worm & Roller types with push-pull adjustments. *See "Gemmer 305, 335" in Steering Gear Section for complete data.*

Ford Part Nos.	1946-47	1948-50
Comm'l. ¾, 1 Ton	21C-3504A①	7RC-3504
Others (exc. C-O-E)	01T-3504	7RT-3504
C-O-E	01W-3504	7RW-3504B

①—No. 21C-3504B with steering column gearshift.

BRAKES

1946-47 MODELS

Service—Lockheed Hydraulic, double anchor type. *See Brake Section for complete data.*

Drums—Composite (Cast iron and steel).

	Front — Drum Diameter — Rear
Light Duty (114")	12" 12"
1 Ton (122")	12" 14"
Other Trucks	14" 15"

Lining—Molded type (all shoes).

	Width	Thickness	Length per Shoe①
Light Duty (114")	1.75"	.20"	13.5"—10.28"
1 Ton (Front)	1.75"	.20"	13.5"—10.28"
1 Ton (Rear)	2.00"	.27"	15.53"—10.78"
Others (Front)	2.00"	.27"	15.53"—10.78"
Others (Rear)	3.50"	.335"	16.67"—11.57"

①—Forward Shoe—Rear (reverse) Shoe.

Clearance—Least possible amount without drag.

Hand Brake (Light Duty & 1 Ton Truck): Hand lever applies rear wheel service brakes.

Hand Brake (Other Trucks): Independent external contracting band on drum at rear of transmission.

Adjustment—*See 1948-50 Brake data below.*

1948-50 F-1 SERIES

Service—F-1: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinders—Diameter: Front wheel 1.0655" (hone limit 1.0675"), **Rear 1.003"** (hone limit 1.005").

Drums—11" composite (cast iron and steel).

NOTE—Drum boring limit 11.060" max. diameter.

Lining—Molded or woven type. **Width**—2" (Frt. Whls.), 1¾" (Rear Whls.), **Thickness** 3/16".

Length per Shoe—11 29/32" (all shoes).

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Hand Brake: See Service Brakes (above).

1948-50 F-2, 3, 4, 5, 6 SERIES

Service—F-2 (All Wheels), F-3 (Front): Ford-Lockheed Hydraulic, self-centering, double anchor type. F-3 (Rear Wheels), F-4, 5, 6 (All Wheels)—Ford-Lockheed Hydraulic, double anchor type.

▷**Parcel Delivery Note—Ford-Lockheed Hydraulic, double anchor, with 13⅛" I.D. drums and independent shaft brake at transmission.**

See Brake Section for complete data.

Wheel Cylinder Diameters:	Frt. Wheel	Rear Wheel
F-2①	1⅜x1"	1⅜x1"
F-3	①1⅜x1"	1⅜"
F-3 Par. Del.	1⅜"	1¼"
F-4, F-5, F-6	1¼"	1½"

①—"Stepped" type (1⅜" prim. shoe, 1" secondary).

Drum Diameter:	Frt. Wheel	Rear Wheel
F-2	12"	12"
F-3	12"	14"
F-3 Parcel Del.	13⅛"	13⅛"
F-4, F-5, F-6	14"	15"

Drum Reboring Limits—.020" on diameter for all models except F-4, F-5, F-6 **Rear Drums**—.060".

Lining—Molded type (all models).

Shoe Lining	Width	Thick.	Lgth.	per Shoe①
F-2 (Front & Rear)	1.75"	.187"	13.5"	—10.375"
F-3 (Front)	1.75"	.187"	13.5"	—10.375"
(Rear)	2"	.25"	15.516"	—10.75"
Par. Del. (Fr.&Rr.)	2"	.25"②	14.563"	—12.25"
F-4, 5, 6 (Front)	2"	.25"	15.516"	—10.75"
(Rear)	3.5"	.313"	16.625"	—11.516"

①—Forward Shoe—Reverse (Rear) Shoe.

②—Primary shoe thickness .187" (3/16").

Clearance—Least possible amount without drag.

Hand Brake (F-2, F-3): Hand lever applies rear wheel service brakes. See Service Brakes above.

Hand Brake (F-3 Parcel Delivery, F-4, F-5, F-6): Independent external contracting band on drum at rear of transmission.

Brake Adjustment: Set hand lever in fully released position and make certain that flat portion of cam is resting on rear of brake band upper end (if cam not flat, remove clevis pin in upper end of cam, adjust clevis rod until cam is flat when rod re-connected). Remove locking wire from brake band anchor adjusting screw (left side), turn screw clockwise until clearance between band and drum is .010" at the anchor screw, install lock wire. Loosen locknut on adjusting screw for lower position of brake band (round screw on brake mounting bracket), turn screw until clearance between lower portion of brake band and drum is .010", tighten locknut. Tighten adjusting nut at lower end of main adjusting bolt (on which band positioning springs are located) until clearance between upper portion of band and drum is .010". **Drum Diameter**—7.81".

Lining—Woven. Lgth. 24.6". Width 2½". Thick. ¼".

Power Brakes: Midland Hy-Power Vacuum unit Optl. *See "Midland Hy-Power Unit" in Brake Section for complete data.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail just to rear of front suspension upper control arm.

TUNE-UP

COMPRESSION PRESSURE: 110 lbs. at cranking spd.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .030". Limits .029-.032".
Plug Type—Champion H-10. 14 mm.

DISTRIBUTOR: Ford No. 7HA-12127.
Breaker Gap—.024-.026".
Cam Angle—36° closed, 24° open.
Breaker Arm Spring Tension—17-20 ounces.
Advance Performance—*See Ignition.*
Distributor Line (Carburetor Connection) Vacuum at Carburetor—0.5-0.7" at 800 RPM., 1.2-1.6" at 1000 RPM., 4.8-6.6" at 2200 RPM., 4.9-6.7" at 2400 RPM. (In. of mercury at specified Engine RPM).

IGNITION TIMING: TDC.
Timing Procedure—*See Ignition Timing.*
Dampener Mark—Circular boss or groove (depending on type of dampener used). 2 pointers on front engine cover. ***Use pointer nearest to outer circumference of dampener for proper timing.***

CARBURETION: *Holley-Ford Carburetor 8HA-9510A.*
Idle Setting—Approx. 1 turn open. One screw—turning screw out gives richer mixture.
Idle Speed—Approximately 500 RPM.
Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (use Gauge No. 9550-A).
Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Fuel Pump Pressure: 4-5 lbs.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Valve should be closed (counterweight arm against stop pin) with engine cold and should operate freely).

VALVE TAPPET CLEARANCE: .009-.011" Intake, .013-.015" Exhaust, COLD. This setting correct for No. 7HA-6250-C Camshaft. *See "Camshaft & Bearings" in Ford Special Data for other camshaft settings.*

►*ADJUSTABLE SELF-LOCKING TAPPET SCREWS*

IGNITION

IGNITION SWITCH: Ford No. 6A-11572-A (Mitchell type), No. 6A-11572-B (Briggs & Stratton type).
Ignition Lock—Ford No. 1A-11582-A.

COIL: Ford No. 7RA-12029-A or 8BA-12029.
Location—On left side of engine above distributor.
Ignition Current—Idling 2.75-3.0 amperes at 6 volts, 5.0-5.5 stopped. Coil primary resistance 1.05-1.15 ohms, (75°F). Secondary resistance 4100 ohms, (75°F).

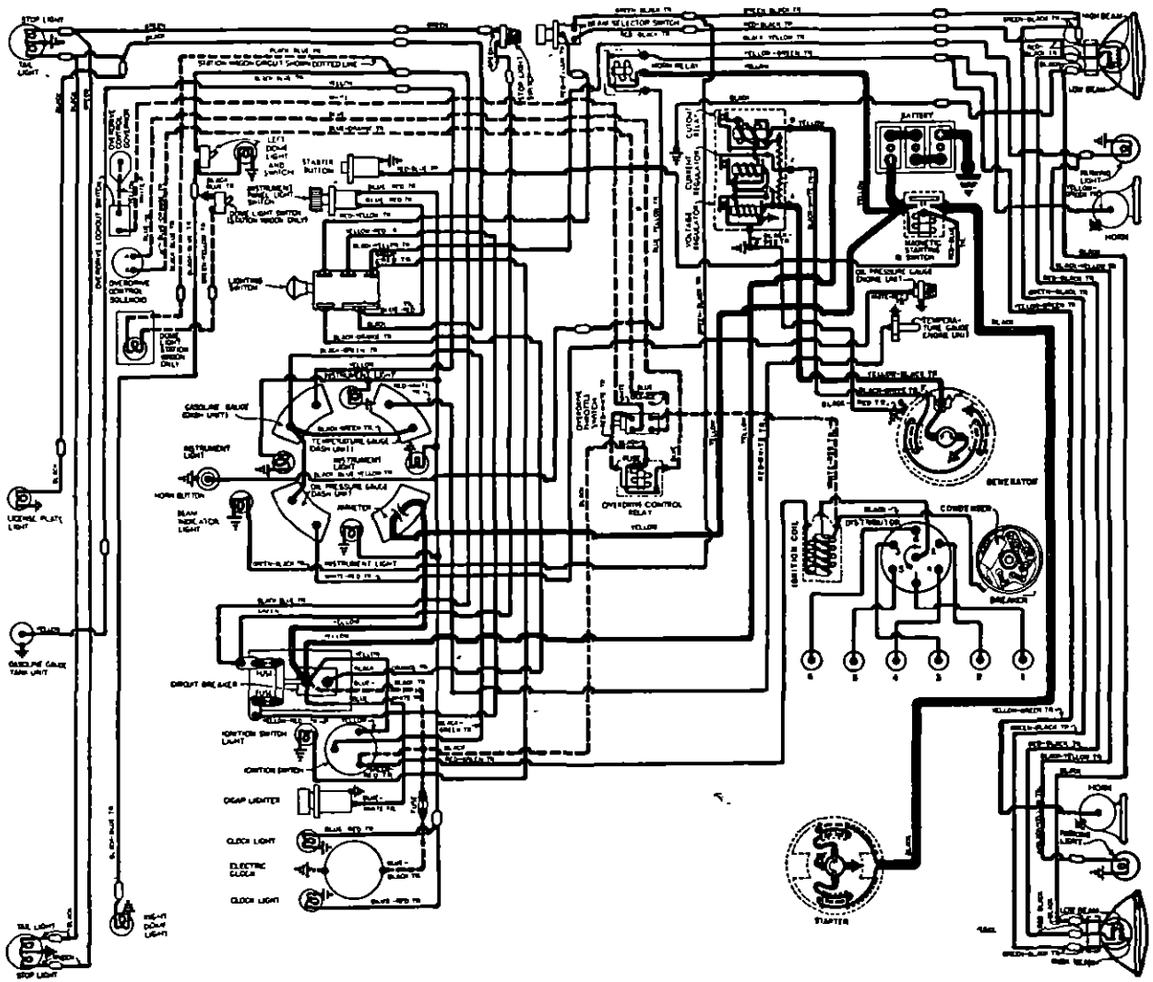
CONDENSER: Ford No. 7RA-12300-C.
Capacity—.21-.25 microfarad.

DISTRIBUTOR: Ford No. 7HA-12127 (Less Cap and Rotor). New "Pressure" distributor with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two breaker plate springs. Operating vacuum taken from 1 carburetor connection (2 passages inside carburetor, 1 at venturi, 1 at throttle valve). Full spark advance obtained at 18-35 MPH. with normal road load or for part throttle operation at any speed.
See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.
►**Excessive Pinging Correction**—*See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.*
Breaker Gap—.024-.026".
Cam Angle—36° closed, 24° open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Advance Performance
►With Distributor on Test Unit

Distr. Degrees	Vacuum	RPM.
0-0	0"	200
1¾-3	0.4"	500
5½-6¾	1.4"	1000
11½-13	5.5"	1000
8½-9¾	2.9"	1500
10½-11½	4.1"	2000

Distributor Line Vacuum Test—*See Tune-Up.*



IGNITION TIMING

Std. Setting ..... **at TDC.**
Dampener Mark—Circular boss or groove (depending on type of dampener used). 2 pointers on front engine cover. ***Use pointer nearest to outer circumference of dampener for proper timing.***
►**Timing (with Neon Timing Light)**—***CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.*** Mark proper timing pointer (see Dampener Mark above) and dampener mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark aligned with pointer.

CARBURETOR

Holley-Ford No. 8HA-9510A (Repl. Carb. 8HA-9509A). Single barrel downdraft type with vacuum passages for distributor advance control.
See Carburetor Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

▷**Throttle Body Gasket Change & Installation Caution.** *See "Ford (Holley) Carburetor" in Carburetor Section.*

▷**Accelerator Assy. Interference Correction:** *See "Ford (Holley) Carburetor" in Carburetor Section.*

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*

Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.

CARB. EQUIPMENT

Fuel Pump: (Std.) Ford No. 7HA-9350-B (Replaced by No. 1HA-9350-A). Diaphragm type.
(Optl. Fuel & Vacuum)—Ford No. 8HA-9350 (Replaced by No. 1HA-9350-H).
Pressure—4-5 lbs.
See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley Electric.
Dash Unit—Ford No. (Grn. Ptr.) 8A-9280-A, (Red Ptr.) 8A-9280-B.
Tank Unit—No. 8A-9275 (Sta. Wg. 01A-9275A).
See Carburetion Equipment Section for complete data.

Air Cleaner (Std.—oil wetted): Ford No. OHA-9600-A. **Optl. (oil bath)**—Ford No. OHA-9600-B1 (1 pint cap.), OHA-9600-B4 (1 quart cap.).

BATTERY

Ford No. 81A-10655-A. 6 Volt, 17 Plate, 100 Amp. Hr.
Grounded Terminal—Positive (+).
Location—On left side in engine compartment.

STARTER

Ford Model No. 7HA-11002. Armature No. 18-11005.
Service Replacement—Use No. 1A-11002A Starter with No. 1A-11140A Bracket.
Drive—Ford No. 8HA-11350 (9 tooth Pinion—use with 114 tooth Flywheel), or No. B-11350 (10 tooth Pinion—use with 112 tooth Flywheel).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on left front fender apron and controlled by panel pushbutton switch Ford No. 6H-11500.

GENERATOR

Ford. Two brush types with voltage and current regulation.

Generator No.	Type	Armature No.
8BA-10002-A①	35 Amp.	0A-10005-A
8BA-10002-B	40 Amp.	8EH-10005
8BA-10002-D	35 Amp.	0A-10005-A
8EL-10002-B	40 Amp.	8EH-10005

①—Replaced by 8BA-10002-D for service.
Maximum Charging Rate—See Performance.
Charging Rate Adjustment—See Regulator data.

Performance Data

Generator	Amperes	Eng. RPM.
8BA-10002-A	35	935
8BA-10002-B	40	
8BA-10002-D	35	900
8EL-10002-B	40	

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. each.
Belt Adjustment: ¼" deflection midway between generator and pump pulleys. To adjust, loosen 2 mounting bracket bolts under generator and capscrew in bracket slot behind generator.

REGULATOR

Ford. Vibrating, voltage and current type.

Ford Regulator No.	For Generator
51A-10505-A, C, H	8BA-10002-A, D
5EH-10505-C	8BA-10002-B
8L-10505	8BA-10002-B, 8EL-10002-B
8M-10505-A	*8BA-10002-D*

See Electrical Equipment Section for complete data.
NOTE—Separate ground wire extending to cowl must be in place when generator operated.

Cutout Relay

Regulator	Cut-in (Volts)	Cut-out (Amps.)
51A-10505-A	6.6-7.0	0-8
51A-10505-C	6.4-6.9	0-8
51A-10505-H	6.6-7.0	0-8
5EH-10505-C	6.4-6.9	0-8
8L-10505	6.0-6.9	0-8
8M-10505	6.0-6.9	0-8

Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Regulator	Voltage Setting①
51A-10505-A	7.2-7.6 volts
51A-10505-C	7.0-7.5 volts
51A-10505-H	7.2-7.6 volts
5EH-10505-C	7.2-7.6 volts
8L-10505, 8M-10505	7.2-7.6 volts

①—For regulator at normal operating temperature with room temperature of 70-80°F.

Checking & Adjustment—*See Elec. Equip. Section.*
Air Gap—.032-.035" between armature and core with contacts just closed.

Current Regulator

Regulator	Current Setting COLD	Amperes
51A-10505-A		30-34
51A-10505-C		30-33
51A-10505-H		34-38
5EH-10505-C		38-42
8L-10505		38-42
8M-10505		34-38

Checking & Adjustment—*See Elec. Equip. Section.*
Air Gap—.032-.035" between armature and core with contacts just closed.

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Bulb between 50 and 60 on speedometer. Lighted with Upper Beam "on".

Direction Signal: Optl. *See Electrical Equipment Section.*
Direction Indicators—Right and Left indicators on lower edge of speedometer.
Direction Signal Flasher—Ford No. 8L-13350-B.

Switches
Lighting—Ford No. 7RA-11654.
Instrument—Ford No. 21C-13740.
Beam Selector—Ford No. 7RA-13532 or 8A-13532.
Dome Light (Exc. Sta. Wgn.)—Ford No. 8A-13752-B.
Dome Light (Sta. Wagon)—Ford 8M-13752-A.
Stop Light—Ford No. 11A-13480.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting (Headlights)—Ford No. 8A-12258-A. Behind instrument panel together with two lighting fuses (see wiring diagram).
Convertible Top—Ford No. 51A-12250-A. 30 ampere. On hydraulic pump motor or on front of dash near convertible top control switch.

FUSES: Auxiliary Lights (Parking, Tail & Instrument)—14 ampere. On circuit breaker bracket behind instrument panel (see wiring diagram).
Dome & Stop Lights—14 ampere. Next to fuse listed above.
Clock—2 ampere. In clock feed wire.
Overdrive—30 ampere. On relay on dash under hood.
Direction Signal—15 ampere. In feed from ignition switch to flasher.

HORNS: Ford No. 51A-13832-A or B (High Pitch, Right Horn), No. 51A-13833-A or B (Low Pitch, Left Horn). Dual horns operated by relay. NOTE—"A" horns are 4.28" high, "B" horns are 4.14". Horns marked "HI" or "LO" on air columns.
Air Gap—.027-.029" for high pitch (right horn), .032-.034" for low pitch (left) for Sparks-Withington. NOTE—Air Gap for Auto-Lite type horns .040" HI, .050" LO.
Horn Current—13 amperes (high pitch), 14 (low).

Horn Relay: Ford No. 7RA-13853-B. On dash.

▷*CAUTION—Use only Ford type relay No. 7RA-13853-B with TAN plastic cover. If Mercury relay No. 7RA-13853-A with Black plastic cover installed, shock at button may result when blowing horn.*
Contact Gap—.015-.025".
Contact Closing Voltage—4 volts max.

ENGINE

ENGINE SPECIFICATIONS: Own 8HA. Six cylinder, "L" head type.
Bore—3.30". **Stroke**—4.40".
Displacement—226 cu. ins. **Rated HP**—26.13.
Developed Horsepower—95 at 3300 RPM.
Compression Ratio—6.8-1 cast iron head.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Ford Shop Notes.*

OIL PAN REMOVAL: *See Ford Special Data.*

ENGINE REMOVAL: *See Ford Special Data.*

CYLINDER HEAD AND GASKET INSTALLATION: *See "Cylinder Head" in Ford Shop Notes.*

▷**CYLINDER HEAD STUD CHANGE:** *See "Cylinder Head" in Ford Shop Notes.*

CYLINDER SLEEVE: Cast iron dry type cylinder sleeves furnished for replacement service.
See Ford Special Data.

PISTONS: 4-ring (all above pin), flat head, aluminum alloy, steel strut, U-slot, cam ground type.
Weight—17.35 ozs.
Removal—Pistons and rods removed from above.
Clearance—See Fitting Pistons

Fitting Pistons: Use ½" wide feeler inserted between piston and cylinder wall at right angles to pin. Pull of 6-12 lbs. should be required to withdraw feeler of .003" thickness (New or Used Pistons in New or Used Bore).

Replacement Pistons: Standard size and .0025", .005", .020", .030", .040", .060" Oversize. *See Ford Special Data.*

PISTON RINGS: 2 compression, 2 slotted oil rings, all above pin. Upper oil ring groove drilled with oil drain holes, lower ring groove slotted.

ENGINE

CONTINUED FROM PRECEDING PAGE

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.047"	.0015-.003"
Compr. (#2)	3/32"	.007-.047"	.001-.0025"
Oil (#3, 4)	3/16"	.007-.047"	.001-.0025"

Replacement Rings: *See Ford Special Data.*

PISTON PIN: Diameter .8504" (maximum). Floating type (lock ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0001-.0003" clearance (new), .0007" (worn limit).
Pin Fit in Rod—.0001-.0003" clearance.

Replacement Pins: Sizes and paint marks: Std. (green), .001" Oversize (blue), .002" Oversize (yellow).

CONNECTING ROD: Length 8¼". Weight 29.0 ozs.
Crankpin Journal Diameter—2.2980-2.2988". Wear limits .0015" (out-of-round), .001" (taper).
Lower Bearing—Removable, steel-backed, copper-lead alloy lined, locked in type. No shims. Upper and lower halves interchangeable.
Clearance—.0004-.0027"
Sideplay—.006-.014" (new), .017" (worn limit).
►*BEARING ADJUSTMENT "M" ENGINES—CAUTION*—Connecting rods having shims must be serviced with the SHIMS IN PLACE. When assembling new rods and new crankshafts, if the bearing clearance is in excess of .0007" to .0013", the removal of one shim will reduce the clearance .00075". If both shims removed, bearing clearance will be reduced .0015".
Replacement Bearings: Standard and .002", .010", .020", .030", .040" Undersize. *See Ford Special Data.*

CRANKSHAFT: 4 bearing, integral counterweights.
Vibration Dampener—Viscous or rubber type.
Journal Diameters—2.8732-2.8740" (all bearings) wear limits—Out-of-round .0015". Taper .001".
Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.0005-.0032".

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings. Tang on bearing must engage groove in block and cap.

Replacement Bearings: Std., .002", .020", .030" U. S. *See Ford Special Data.*

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.004-.008".

CAMSHAFT: Four bearing with helical gear drive.
►*CAMSHAFT IDENTIFICATION:* Camshaft No. 7HA-6250-C (stamped "CWC") used on both "H" & "M" engines. *See Ford Special Data for later Camshafts (which may be used as replacement on these engines).*
►*NOTE*—Camshaft has phosphate coating (shows black oxide) beginning Eng. No. 8HA-2401 (Passenger Cars), 7HT-98891 (Trucks).
Bearing Diameter—1.9285" (replace bearing if diameter greater than worn limit 1.9315").
Bearings—Steel-backed, babbitt lined bushings.
Clearance—.001-.002".
Camshaft Bearing Servicing—*See "Camshaft & Bearings" in Ford Special Data.*

Replacement Bearings: Furnished Standard and .015" Undersize. *NOTE*—Std. bearing also furnished .080" Oversize on O.D.

End Thrust: Thrust plate bolted to front of block behind camshaft hub (hub keyed on front end of shaft). **Endplay**—.003-.006".

Timing Gears: *CAUTION—Two types camshaft gears used. See "Timing Gears" in Ford Special Data.*
Crankshaft Gear—Cast Alloy Iron.
Replacement Camshaft Gears—Std., .006", .012" OS.

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diameter	Stem Diameter
Intake	1.65"	.3410"
Exhaust	1.51"	.3410"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	①.350"	②.0010-.0031"

①—Replace camshaft if lift less than .3375" (Intake), .3335" (Exhaust).
②—Replace guides if clearance exceeds .0031".
Valve Seat Width—1/16" maximum.
►*ROTATABLE VALVES: If used, see "Valve System" in Ford Special Data.*
Sticking Valve Correction—If necessary to ream guides, use .001" oversize reamer for exhaust valve guides, .0005" oversize reamer for intake valve guides.
Valve Seat Inserts—Used for exhaust valves. *See "Valve System" in Ford Special Data.*

Valve Guides: One-piece type pressed in block.
Removal: Use special tool 6510-0 to remove guides.
Installation—Upper end of guide 1.18" Intake, 1.08" Exhaust below top face of block. Install with stepped end down. Use tool 6510-N to drive guides in place.

Valve Lifters: Mushroom type with self-locking adjusting screws. Removable from below with camshaft out.
Diameter—.6240" (replace if worn to less than wear limit of .6225").
Clearance—.0005-.0015" (new) .003" (worn limit).

Valve Springs: Coated springs used. Install springs with closely spaced coils toward top (against block).
Spring Test—47-53 lbs. at 2.11". Free length 2.50".

VALVE TIMING

Tappet Clearance: .009-.011" Intake, .013-.015" Exhaust, COLD. This setting correct for No. 7HA-6250-C Camshaft. *See "Camshaft & Bearings" in Ford Special Data for other camshafts.*
►*ADJUSTABLE SELF-LOCKING TAPPET SCREWS*
►**VALVE TAPPET NOISE—Silencing springs available.** *See "Valve System" in Ford Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 11° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.
Valve Timing Check—Intake valve opens 11° BTDC. Valve timing mark location on vibration dampener.

LUBRICATION

Engine Oiling System: Pressure to main, connecting rod, and camshaft bearings. Timing gears lubricated by spray past camshaft thrust plate. Rotor type oil pump mounted externally on right side of engine.
Crankcase Capacity—4 quarts (5 quarts when changing filter).
Normal Oil Pressure—45 lbs. at 30 MPH.

Oil Pressure Relief Valve: In cylinder block just to rear of oil filter mounting. Not adjustable.
Spring Tension—12.64-12.88 lbs. at 1.14"

Oil Pump: Rotor type. Mounted externally on right side of engine with drive gear at center of camshaft.
►**Oil Pump Driven Gear Replacement before Eng. No. 8HA-107555**—*See Ford Shop Notes.*
Pump Removal & Overhaul—*See "Oil Pump" in Ford Special Data.*

Oil Filter: Mounted directly on block (no external oil lines) on left side. Replace cartridge each 5000 miles or more often if required.
Oil Filter Cartridge—Ford No. 7HA-6731A.

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. (Grn. Ptr) 8A-9273-A, (Red Ptr.) 8A-9273-B.
Engine Unit—Ford No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler cap (inlet) with outlet pipe in rear valve chamber extending down on right side of engine.
Servicing—Wash screen in cleaning fluid and wet with engine oil when dry at oil change period (2500 miles).

COOLING

Cooling System: Pressure type with relief valve in filler cap, one belt-driven pump, and by-pass.
Capacity—16 quarts.
Pressure Valve—In radiator filler cap. Ford No. 26H-8100-B (AC #846740). Opens at 3½-4½ lbs.

Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In cylinder head water outlet. Various types used as follows:

Thermostat No.	Opening Temperature
7HT-8575-A	148-153°F.
7HT-8575-B	157-162°F.
7HT-8575-C	①177-182°F.
1HA-8575-A	177-182°F.

①—Use with Permanent Anti-freeze.

Temperature Gauge: King-Seeley Electric.
Dash Unit—Ford No. (Grn. Ptr.) 8A-10883-A, (Red Ptr.) 8A-10883-B.
Engine Unit—Ford No. 8A-10884 (Stamped "224"—use with 4 lb. type Pressure Cap).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 9½ CF-TS, Ford No. 8A-7563A. Single plate, semi-centrifugal, dry disc type.
►DISC NOTE—Softer damper springs used on cars with Overdrive (black colored springs). Cars without Overdrive have aluminum colored damper springs.
See Clutch Section for complete data.
Facings—Thickness .125". Outside diameter 9½".
Pedal Adjustment: 1" free travel. Lock nut and adjusting nut at release lever end of release rod.
Removal: Remove transmission (see TRANSMISSION Removal below). Take off flywheel housing. Install wooden wedges between each release lever and cover to hold clutch in released position, take out 6 cover capscrews, lift assembly out.

TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

▷**Transmission Locking in Reverse Correction**—*See "Ford, Lincoln, Mercury Transmission" in Transmission Section.*

▷**Transmission Inoperative in Reverse (Overdrive Transmissions)**—*See "Ford, Lincoln, Mercury Transmission" in Transmission Section.*

▷*TRANSMISSION NOISE CORRECTION—See Transmission Section for complete data.*

Transmission Control: Steering column mounted shift *See Transmission Section for complete data.*

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame, Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model AS1-R10E (exc. Conv. & Sta. Wagon). Warner Model AS3-R10E (Conv. & Sta. Wagon). Optl. equipment. Overdrive is solenoid operated type (no centrifugal pawls) with Governor Control and throttle operated "kick-down."
See Transmission Section for complete data.

▷**Overdrive not engaging, and Prolonged shorting out of Ignition on Kick-down Corrections**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Transmission Section.*

▷**Overdrive Governor Production Change**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Transmission Section.*

▷**Overdrive Noise Correction on Early Cars**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Transmission Section.*

Solenoid—Ford No. 8M-6916A (8A-6916A or C, C is rubber-coated). (Sta. Wgn. & Convertible) Ford No. 8M-6916-A.
Control Relay—Ford No. 8M-6915. On dash.
Overdrive Fuse—30 ampere. On Control Relay.
Lock-out Switch—Ford No. 8M-6917A.
Throttle Kick-down Switch—Ford No. 8A-6918B.
Governor—Ford No. 8M-6943 (Assembly with gear).

Removal: Same as for Std. transmission (above) after disconnecting overdrive control cable and wiring.

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used.

▷*REPLACEMENT UNIVERSAL JOINT NOTE: TWO types furnished for service (interchangeable):*
1) **Pre-lubricated** (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).
2) **Grease Fitting** (1M-7042A Front & 1M-7039 Rear). Must be lubricated at 1000 mile intervals using pressure gun.

▷*CAUTION (ALL CARS EXCEPT STATION WAGON)—Rear universal joint companion flange nut controls pinion bearing "pre-load" (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own Make. Semi-floating hypoid gear type with Hotchkiss drive with separate carrier. Axle ends flanged (no separate hub). Wheel bearings are sealed-ball pre-lubricated (no lubrication required). *See Rear Axle Section for complete data.*

▷**Excessive Axle Shaft Endplay (causing noise in service) Correction**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

▷**Ring & Pinion Gear Production Change**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Ratio—Standard: 3.73-1 (41-11). With overdrive: 4.10-1 (41-10). Optional: 3.54-1 (41-11).
Backlash—.005-.008". *Screw adjustment.*

Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.

▷**Carrier Mounting Bolt Tightening Caution**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

▷*CAUTION—Pinion bearing pre-loading must be re-established whenever universal joint flange nut on pinion shaft is removed or disturbed. See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-P and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure backing plate.

Wheel Bearing Adjustment: None (sealed bearings).

STATION WAGON

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive (separate carrier not used). Axle ends flanged —(no separate hub). Wheel bearings are sealed (no lubrication required).

▷*NOTE—AXLE NOT SAME AS FORD PASSENGER CAR, similar to Mercury.*
See Rear Axle Section for complete data.
Ratio (Standard)—3.91-1 (43-11).
Ratio (with Overdrive)—4.27-1 (47-11).
Backlash—.003-.008". *Shim adjustment.*

Removal: Raise rear of car. Disconnect rear universal. Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

Axle Shaft Removal: Same as for Ford Pass. Car Rear Axle (above).

SHOCK ABSORBERS

Delco or Houdaille. Both types interchangeable. Direct acting hydraulic types. Service by replacement. Replacement types (Ford Nos.):

	Front	Rear
Pass. Cars	8A-18124-A	8A-18125-A
Station Wagon	8A-18124-B	8A-18125-B

▷*NOTE—Shock absorbers are permanently sealed and cannot be refilled or repaired.*

Rear Shock Absorber Installation—Lower tube has welded stone shield on lower end which must be installed toward front of car.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.
See Front Suspension Section for complete data.

▷**Riding Height & Car Leveling Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

▷**Front Suspension Noise (popping or chucking noise) Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

▷**Front Spring Production Change & Installation Caution**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

▷**Pitman Arm and Idler Arm Bracket Change**—Requires 2 different Toe In Settings listed below. *For identification of parts, see "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

▷*CAUTION—Specifications listed below supersede earlier 1949 Ford Front End Specifications.*
Kingpin Inclination—5¼° crosswise.
Caster (Pass. Cars)—Pos. ½° to Neg. 1°.
(Station Wagon)—Neg. ¼° preferred, Limits Neg. ¼° to Neg. 1¾°.
NOTE—½° max. variation between wheels.
Camber (All)—Pos. ¼° to Pos. ¾° preferred. Limits 0° to Pos. 1°.
NOTE—¼° max. variation between wheels.

▷**Toe In**—*CAUTION: Two settings as follows:*
1)—1/8" toe out to 3/16" toe out for cars built before March 1, 1949.
2)—1/16" toe in to 1/8" toe in for cars built after March 1, 1949.

Adjustment—Adjusting sleeve on outer end of each tie rod. Adjust equally.

STEERING GEAR

Ford. Worm-and-Roller type with eccentric adjustment. *See "1949-51 Ford Pass. Car Worm-&-Roller" in Steering Section for complete data.*

▷**Steering Idler Arm Looseness Complaints**—*See "Ford (6 & V8 Pass. Car)" in Steering Gear Section.*

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.
Wheel Cylinder Diameters—Front 1⅛" (hone limit 1.132"), Rear ⅞" (hone limit .880").
Drums—Diameter 10" (11" Sta. Wagon rear drums).
Lining—Molded or Woven. Width 2¼" (front wheel), 1¾" (rear wheel). Thickness 3/16". Length per shoe:

	Front Wheel Pri.	Front Wheel Sec.	Rear Wheel Pri.	Rear Wheel Sec.
Pass. Cars	11"	11"	11"	11 15/16"
Sta. Wgn.	11 15/16"	11 15/16"	11"	11 15/16"

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Hand Brake: See Service Brakes (above).

▷**Hand Brake Linkage Change (for easier application) and Cable Interference Correction**—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Top: Hydro-Lectric type (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders).
See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATI N

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail just to rear of front suspension upper arm.

TUNE-UP

►*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*

COMPRESSION PRESSURE: 110 lbs. at cranking spd.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2. See diagram.

SPARK PLUG GAPS: *.030". Limits .029-.032".*

Plug Type—Champion H-10, 14 mm.

DISTRIBUTOR: Ford No. 7RA-12127C or 8BA-12127 (Used with Cast Iron Front Cover) or 0BA-12127 (Used with Aluminum Front Cover).

Breaker Gap—.014-.016".

Cam Angle—27° closed, 18° open.

Breaker Arm Spring Tension—17-20 ounces.

Advance Performance—*See Ignition.*

Distributor Line (Carburetor Connection) Vacuum—2.0-2.9" at 800 RPM., 3.5-4.8" at 1000 RPM., 4.7-6.4" at 2200 RPM., 4.6-6.2" at 2400 RPM. (" of HG).

IGNITION TIMING: 2° BTDC.

Timing Procedure—*See Ignition Timing.*

Crankshaft Pulley Mark—Circular boss aligned with timing pointer on right side of engine front cover.

CARBURETION: Holley-Ford No. 8BA-9510-A. Dual downdraft type with manual choke control.

Idle Setting—Approx. 1 turn open. Two screws—turning screws out gives richer mixture.

Idle Speed—Approximately 500 RPM.

Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (use Gauge No. 9550-A).

Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Fuel Pump Pressure: 3½-4½ lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve located between right end of exhaust pipe cross over and right exhaust manifold.

VALVE TAPPET CLEARANCE: *CAUTION—Different settings required for each type camshaft.*

►**First type Camshaft No. 8BA-6250①**
(no markings on Engine or Camshaft)

Intake—.010-.012", **Exhaust**—.014-.016", Cold.

①—Before Eng. No. 8BA-622468—Partial production after this number.

►**Later type Camshaft No. 8BA-6250-B②**
(Eng. marked—"GAP, in- .014", ex- .018")③
(Camshaft marked "B" on front end)

Intake—.014" (.013-.015") **Exhaust**—.018" (.017-.019"), Cold.

②—Partial production after Eng. No. 8BA-622468, and service replacement on all engines.

③—On top of block at center under valve cover.

►*CAUTION—Loss of power will result if correct tappet clearance not used on engines with "B" CAMSHAFT.*

Adjustment—*See "Valve System" in Ford Shop Notes*

IGNITION

IGNITION SWITCH: Ford No. 6A-11572-A (Mitchell type), No. 6A-11572-B (Briggs & Stratton type).

Ignition Lock—Ford No. 1A-11582-A.

COIL: Ford No. 7RA-12029-A or 8BA-12029.

Location—On front lower corner of right cyl. head.

Ignition Current—Idling 2.75-3 amperes at 6 volts. 5-5.5 amperes stopped. Coil primary resistance 1.05-1.15 ohms (75°F). Secondary resistance 4100 ohms (75°F).

CONDENSER: Ford No. 7RA-12300-C.

Capacity—.21-.25 microfarad.

DISTRIBUTOR: Ford No. 7RA-12127-C or 8BA-12127 (With Cast Iron Front Cover), 0BA-12127 (With Aluminum Front Cover). "Pressure" type distributor with spark advance controlled by vacuum diaphragm which moves breaker plate against tension of two breaker plate springs.

►*CAUTION—Correct distributor must be used with each type front cover.*

See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.

►**Excessive Pinging Correction**—*See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.*

Breaker Gap—.014-.016".

Cam Angle—27° closed, 18° open.

Breaker Arm Spring Tension—17-20 ounces.

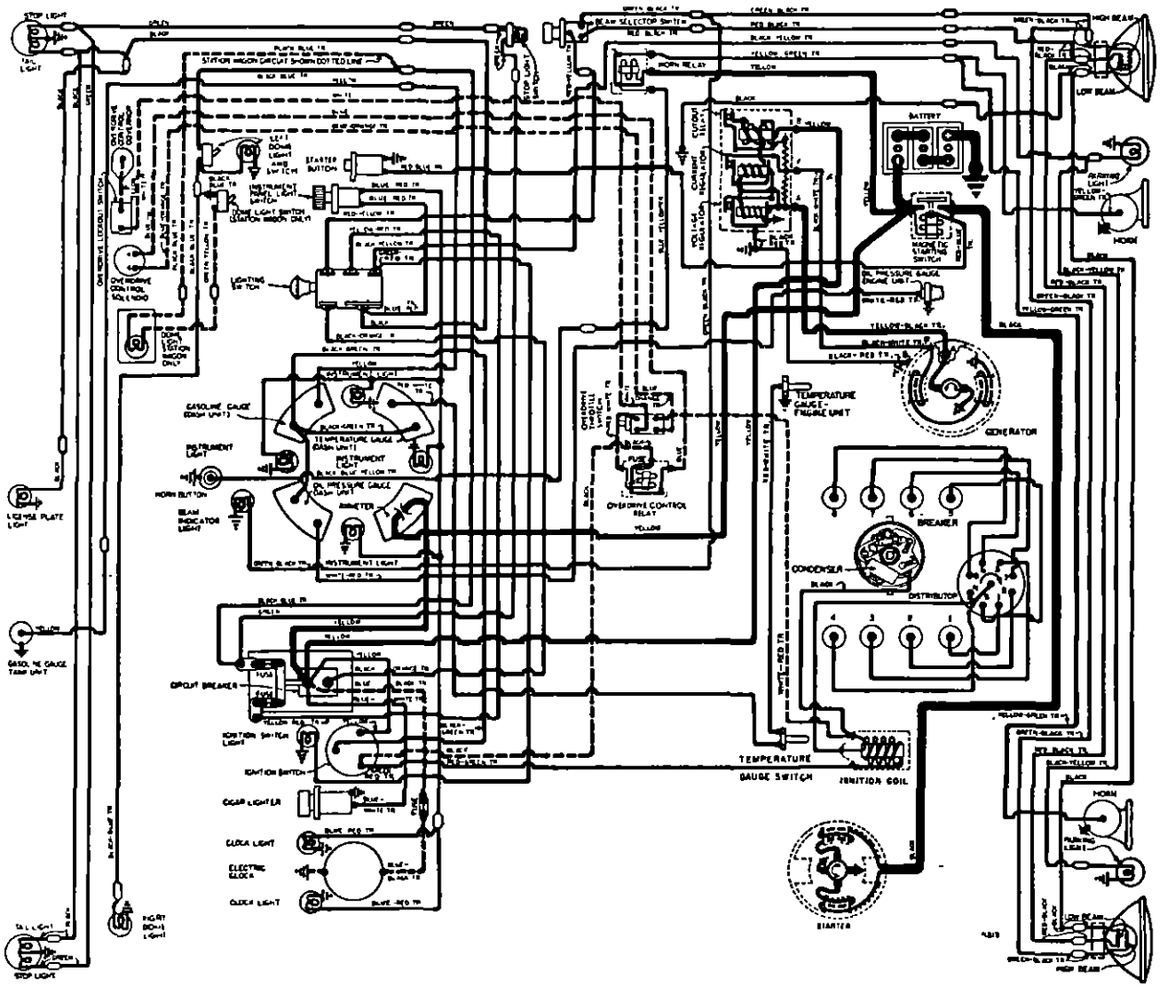
Rotation—Clockwise viewed from above.

Advance Performance
►With Distributor on Test Unit

7RA-12127-C		8BA & 0BA-12127	
Degrees①	Vacuum RPM	Degrees①	Vacuum RPM
0-0	0" 200	0-0	0" 200
1¼-2¼	0.4" 500	0-1	.0.3" 500
4¼-5¼	1.7" 1000	5.2-6.2	1.32" 1000
6¼-7¼	2.8" 1500	8¾-10	2.85" 1500
7½-8½	3.7" 2000	10-11¼	3.7" 2000

①—Distributor Degrees & RPM.

Distributor Line Vacuum Test—*See Tune-Up.*



IGNITION TIMING

Std. Setting ..... **2° BTDC.**

Crankshaft Pulley Mark—Circular boss on rear edge of pulley (timing pin on right front side of engine).

Timing—With #1 piston at firing position and timing mark on pulley aligned with timing pin on front of engine, loosen hold-down screw on distributor, rotate distributor until contacts begin to open,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tighten hold-down screw. Check spark plug connections (see diagram), see that rotor opposite #1 terminal in cap.

▷**Timing (with Neon Timing Light)**—***CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.*** Mark timing pin and pulley mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark and timing pin aligned.

CARBURETOR

Holley-Ford No. 8BA-9510-A. Dual (double barrel) downdraft type with new vacuum passages for distributor operation.

▷**Throttle Body Gasket Change & Installation Caution.** *See "Ford (Holley) Carburetor" in Carburetor Section.*

▷**Accelerator Assy. Interference Correction:** *See "Ford (Holley) Carburetor" in Carburetor Section.*

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*

Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.

CARB. EQUIPMENT

Fuel Pump (std.): Ford No. 7RA-9350-C.

Optl. (Fuel-&-Vacuum)—Ford No. 7RA-9350-E.

Pressure—3½-4½ lbs. (both types).

See Carburetion Equipment Section for complete data.

▷*FUEL PUMP PUSHROD WEAR (Causing Loss of Power or Engine Cutting out): See "Fuel System Notes" in Ford Special Data.*

Gasoline Gauge: King-Seeley Electric.

Dash Unit—Ford No. (Grn. Ptr.) 8A-9280-A, (Red Ptr.) 8A-9280-B.

Tank Unit—No. 8A-9275 (Sta. Wg. 01A-9275A).

See Carburetion Equipment Section for complete data.

Air Cleaner (Std.—Oil wetted): Ford No. OBA-9600-A.

Optl. (oil bath)—OBA-9600-B. Use OBA-9600-D with governor.

BATTERY

Ford No. 81A-10655-A. 6 Volt, 17 Plate, 100 Amp. Hr.

Grounded Terminal—Positive (+).

Location—On left side in engine compartment.

STARTER

Ford Model No. 7RA-11002. Armature No. 18-11005.

Drive—Bendix No. A1472 (Ford No. B-11350).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—48-56 ozs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on left front fender apron and controlled by panel pushbutton switch Ford No. 6H-11500.

GENERATOR

Ford. Two brush types with voltage and current regulation.

Generator No.	Type	Armature No.
8BA-10002-A①	35 Amp.	0A-10005-A
8BA-10002-B	40 Amp.	8EH-10005
8BA-10002-D	35 Amp.	0A-10005-A
8EL-10002-B	40 Amp.	8EH-10005

①—Replaced by 8BA-10002-D for service.

Maximum Charging Rate—See Performance.

Charging Rate Adjustment—See Regulator data.

Performance Data

Generator	Amperes	Eng. RPM.
8BA-10002-A	35	935
8BA-10002-B	40	
8BA-10002-D	35	900
8EL-10002-B	40	

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. each.

Generator Belt Adjustment: Loosen 2 bolts on fan mounting bracket, loosen generator support mounting stud nut, raise generator up until side movement on belt midway between generator and water pump pulleys is ½" (thumb and finger pressure),

REGULATOR

Ford. Vibrating, voltage and current type.

Ford Regulator No.	For Generator
51A-10505-A, C, H	8BA-10002-A, D
5EH-10505-C	8BA-10002-B
8L-10505	8BA-10002-B, 8EL-10002-B
8M-10505-A	8BA-10002-D

See Electrical Equipment Section for complete data.

NOTE—Separate ground wire extending to cowl must be in place when generator operated.

Cutout Relay

Regulator	Cut-in (Volts)	Cut-out (Amps.)
51A-10505-A	6.6-7.0	0-8
51A-10505-C	6.4-6.9	0-8
51A-10505-H	6.6-7.0	0-8
5EH-10505-C	6.4-6.9	0-8
8L-10505	6.0-6.9	0-8
8M-10505	6.0-6.9	0-8

Contact Gap—.010" (armature against upper stop).

Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Regulator	Voltage Setting①
51A-10505-A	7.2-7.6 Volts
51A-10505-C	7.0-7.5 Volts
51A-10505-H	7.2-7.6 volts
5EH-10505-C	7.2-7.6 volts
8L-10505, 8M-10505	7.2-7.6 volts

①—For regulator at normal operating temperature with room temperature of 70-80°F.

Checking & Adjustment—*See Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

Current Regulator

Regulator	Current Setting COLD	Amperes
51A-10505-A		30-34
51A-10505-C		30-33
51A-10505-H		34-38
5EH-10505-C		38-42
8L-10505		38-42
8M-10505		34-38

Checking & Adjustment—*See Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Beam Indicator—Bulb between 50 and 60 on speedometer. Lighted with Upper Beam "on".

Direction Signal: Optl. *See Electrical Equipment Section.*

Direction Signal Flasher—Ford No. 8L-13350-B.

Switches

Lighting—Ford No. 7RA-11654.

Instrument—Ford No. 21C-13740.

Beam Selector—Ford No. 7RA-13532 or 8A-13532.

Dome Light (Exc. Sta. Wgn.)—Ford No. 8A-13752-B.

Dome Light (Sta. Wagon)—Ford 8M-13752-A.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lighting (Headlights)—Ford No. 8A-12258-A. Behind instrument panel together with two lighting fuses (see wiring diagram).

FUSES: (Parking, Tail, Instr. Light) 14 ampere. On Circuit Breaker behind instrument panel. See Wiring Diagram.

Dome & Stop Lights—14 amp. On Circuit Breaker.

Clock—2 ampere. In clock feed wire.

Overdrive—30 ampere. On relay (on dash).

Direction Signal—15 ampere. In Flasher feed.

HORNS: *See 1949 Ford 6 Cyl. for complete data.*

ENGINE

ENGINE SPECIFICATIONS: Own 8BA. Eight cylinder, "L" head, 90° Vee type with both cylinder banks and crankcase cast Enbloc.

Bore—3.187". Stroke—3.75".

Displacement—239 cu. ins. Rated HP—32.5.

Developed Horsepower—100 at 3600 RPM.

Compression Ratio—6.8-1 cast-iron heads.

Compression & Vacuum Reading—*See Tune-Up.*

▷*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*

TIGHTENING TORQUES: *See Ford Special Data.*

OIL PAN REMOVAL: *See Ford Special Data.*

ENGINE REMOVAL: *See Ford Special Data.*

CYLINDER HEAD & GASKET INSTALLATION & PRODUCTION CHANGES: *See Ford Special Data.*

CYLINDER SLEEVE: Cast iron dry type cylinder sleeves furnished for replacement service.

PISTONS: *CAUTION—Two types used:*

"49T" U-Slot Pistons (Before Pass. Car Eng. No. 8BA-641087, Truck 8R Eng. No. 195401)—4 ring (lower ring below pin) aluminum alloy, steel strut, cam ground, dome head type.

CAUTION—49T pistons must be used in ALL steel sleeve engines. Use "29A" piston rings with this piston.

"8BA" Solid Skirt Pistons, AUTOTHERMIC type (After Pass. Car Eng. No. 8BA-641087, Truck 8R Eng. No. 195401)—4 ring (lower ring below pin) aluminum alloy "Autothermic" type with offset pin.

CAUTION—8BA Autothermic pistons must not be used on steel sleeve engines. Can be used to replace 49T pistons in sets on other engines. Use "8BA-" piston rings with this piston (29T rings must not be used).

Removal—Pistons and rods removed from above.

Clearance—See Fitting Pistons.

Replacement Pistons ("49T-"): Std., .005", .020", .030", .040", .060" Oversize.

Replacement Pistons ("8BA-" Autothermic): Std. (4 grades with limits 3.1879-3.1891 in .0003" steps for selective fitting), .0025", .020", .030", .040", .060" OS.

Fitting New Pistons (All Types): Use ½" wide feeler stock of correct thickness (see table below) inserted between piston and cylinder wall at right angles to pin to check clearance (On 8BA pistons, feeler should be placed on thrust side of piston). Pull to withdraw feeler should be 6-12 lbs. (49T Pistons), 3-12 lbs. (8BA-Pistons).

Feeler Thickness:	49T Pistons	8BA Pistons
New Piston—New Bore	.003"	.0015"
New Piston—Used Bore	.003"	.0015"
Used Piston—Used Bore	.004"	.003"

EN INE

CONTINUED FROM PRECEDING PAGE

Installing Pistons ("8BA-" Autothermic): Locating mark (small indention) on head of piston above one piston pin hole, to front on all pistons.

PISTON RINGS: 2 compression, 2 slotted oil rings (lower oil ring below pin). Upper oil ring groove drilled with oil drain holes, lower groove slotted.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0915-.0920"	.007-.047"	.0015-.003"
Compr. (#2)	.0915-.0920"	.007-.047"	.001-.0025"
Oil (#3, 4)	.1545-.1550"	.007-.047"	.001-.003"

Replacement Rings: *See Ford Special Data.*

PISTON PIN: Diameter .7504" (maximum). Floating type (lock ring in piston at each end).
Pin Fit in Piston—.0001-.0003" clearance (new), .0007" (worn limit).
Pin Fit in Rod—.0001-.0003" clearance (new).

Replacement Pins: Sizes and paint marks: Std. (green), .001" Oversize (blue), .002" OS (yellow).

CONNECTING ROD: Length 7". Weight 18.7 ozs.

►**Connecting Rod CAUTION**—Beginning Engine No. 8BA-628866 through 8BA-629940 and all Engines after 8BA-641087, new type connecting rod used with 5/64" squirt hole drilled on an angle into the side of the bearing flange web meeting a 3/16" hole in connecting rod bearing flange.

►***CAUTION—These new connecting rods should be used only on engines with neoprene seals on intake valve guides and increased capacity oil pump.***

►**CONNECTING ROD INSTALLATION**—*See "Connecting Rod & Bearings" in Ford Special Data.*
Crankpin Journal Diameter—2.138-2.139". Wear limits .0015" (out-of-round), .001" (taper).

►**Lower Bearing**—***Locked in (not floating type as used on earlier engines).*** Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves interchangeable.
Clearance—.0005-.003" (new), .005" (worn limit).
Side Play—(Early type rod) .006-.014". Late type rod .006-.020".

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings. Tang on bearing must engage groove in rod and cap.

Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize. *See Ford Special Data.*
Installing Rods—Rods with squirt hole installed with squirt hole toward valve push rod assembly.

CRANKSHAFT: 3 bearing, integral counterweights.

►***SLUDGE TRAPS—Crankpin throws equipped with sludge traps having removable plugs for cleaning. Always use new plugs if old plugs disturbed and peen or stake crankshaft to hold plugs in place securely.***
Journal Diameters—2.498-2.4990" (all bearings) wear limits—Out-of-round .0015", Taper .001".
Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.001-.0026".

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings. Tang on bearing must engage groove in block and cap.

Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize.

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.002-.006" (new), .008" (worn limit).

CAMSHAFT: ***CAUTION*—Two different types used, 8BA-6250**—All engines before No. 8BA-622468 and partial production after this number.
8BA-6250-B—Partial production beginning Eng. No. 8BA-622468 and service replacement of first type

►***CAMSHAFT IDENTIFICATION***—New 8BA-6250-B Camshaft stamped "B" on forward end (first type not marked), and engine marked "GAP, in- .014", ex- .018" on top of block under valve cover at center.

►***ENGINE MARKING CAUTION***—Gap mark (see above) must be added when "B" shaft installed on unmarked block, or removed if first type shaft installed on marked block.
Bearing Diameter—1.7985" (replace bearing if diameter greater than worn limit 1.8015").
Bearings—Steel-backed, babbitt lined bushings.
Clearance—.001-.002".

Replacement Bearings: Standard size and .010", .015" Undersize. Undersize bearings also furnished .080" overside on O.D.
Camshaft Bearing Servicing—*See "Camshaft & Bearings" in Ford Special Data.*

End Thrust: Taken by front end of camshaft and thrust surface on inner face of cylinder front cover.
Endplay—.007-.016".

Timing Gears: ***CAUTION—Two types camshaft gears used. See "Timing Gears" in Ford Special Data.***
Crankshaft Gear—Cast Alloy Iron.

►***CAUTION—Camshaft gear teeth REVERSE (L.H.) providing one-way thrust to camshaft for silencing backlash.***
Replacement Camshaft Gears—Std. .006", .012" OS.

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
All Valves	1.51"	.3410"①	4.750"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	①.292"	.0015-.0035"

①—Replace camshaft if valve lift less than .291" (Intake), .287" (Exhaust).
Valve Seat Width—1/16" maximum.
ROTATABLE VALVES: If used, see "Valve System" in Ford Special Data.
Valve Assembly Removal & Servicing—*See "Valve System" in Ford Special Data.*

►**Sticking Valve Correction**—If necessary to ream guides, use .001" oversize reamer for exhaust valve guides, .0005" oversize reamer for intake guides.
Valve Seat Inserts—*See "Valve System" in Ford Special Data.*

Valve Guides: One-piece type positioned and retained by "C" washer. Inside diameter .344", Outside diameter 1.031". Length 2.20". NOTE—Rubber seal used on intake guide.

Valve Lifters: Barrel type in guide holes in block.
Diameter—.9992" (replace if worn to less than .9977"). Length limit after resurfacing 1.700".
Clearance—.0007-.0016" (new), .003" (worn limit).

Valve Springs: Coated springs used.
Spring Pressure—37-40 lbs. (closed), 78-80 (open).
Spring Test—40-43 lbs. at 2.13". Free Length 2.41".

VALVE TIMING

VALVE TAPPET CLEARANCE: ***CAUTION—Different settings required for each type camshaft.***

►**First type Camshaft No. 8BA-6250①**
(no markings on Engine or Camshaft)
Intake—.010-.012", **Exhaust**—.014-.016", Cold.
①—Before Eng. No. 8BA-622468—Partial production after this number.

►**Later type Camshaft No. 8BA-6250-B②**
(Eng. marked—"GAP, in- .014", ex- .018")③
(Camshaft marked "B" on front end)
Intake—.014" (.013-.015") **Exhaust**—.018" (.017-.019"), Cold.
②—Partial production after Eng. No. 8BA-622468, and service replacement on all engines.
③—On top of block at center under valve cover.

►***CAUTION—Loss of power will result if correct tappet clearance not used on engines with "B" CAMSHAFT.***
Adjustment—*See "Valve System" in Ford Shop Notes*

Valve Timing: See Camshaft Setting above.

Early Camshaft No. 8BA-6250
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

Late Camshaft No. 8RA-6250-B
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 3° ATDC.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, timing gears and distributor drive gear.
Crankcase Capacity—4 quarts (5 quarts when changing oil filter).
Normal Oil Pressure—45 lbs. at 30 MPH.

Oil Pressure Relief Valve: In oil pump body. Not adjustable. **Spring Pressure** 12 lbs. at 1.14".

Oil Pump: Gear type (two types: one equipped with spur gears, later type helical gears).
Pump Removal & Overhaul—*See Ford Special Data.*

Oil Filter: On left cylinder head. Replace cartridge each 5000 miles or more often if required.
Oil Filter Cartridge—Ford No. 7HA-6731A.

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. (Grn. Ptr) 8A-9273-A, (Red Ptr.) 8A-9273-B. **Engine Unit**—No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler cap (inlet) with outlet pipe extending from top of engine down behind fan and out along left side.

COOLIN

Cooling System: Pressure type with relief valve in filler cap and two belt-driven pumps (one for each bank) with re-circulating by-pass.
Capacity—21 quarts.
Pressure Valve—In radiator filler cap. Ford No. 26H-8100-B (AC #846740). Opens at 3½-4½ lbs.

Water Pump: Two used. Packless type.

►***CAUTION—WATER PUMP LUBRICATION: Oil cup provided on each pump which should be filled with SAE #20 engine oil when new and every 1000 miles.***

►**Water Pump Change**—Late 1949 models use later type water pump with longer ball bearings and no oil cup. Requires no service lubrication. Later type pumps can be used on earlier 1949 engines, providing later type pulleys are also used.
See Water Pump Section for complete data.
Fan Belt Adjustment—Loosen 2 fan mounting bracket bolts, raise fan up until side movement of belt midway between fan and crankshaft pulleys is ½".

Thermostats: Two used (one in each head water outlet). Various types used as follows:

Ford Part No.	Opening Temperature
8BA-8575-B, D, E	152-157°F
8BA-8575-C, F	①172-177°F

①—For use with permanent Anti-freeze.

Temperature Gauge: King-Seeley Electric.
Dash Unit—Ford No. (Grn. Ptr.) 8A-10883-A, (Red Ptr.) 8A-10883-B.
Engine Unit—Ford No. 8A-10884 (stamped "224"—

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in left cylinder bank), No. 8A-1990 (stamped "217" —special excessive temperature switch in right bank). *NOTE*—Used with regular 4 lb. type pressure cap).

See Miscellaneous Section for complete data.

CLUTCH

Long Model 9½ CF-TS, Ford No. 8A-7563A. Single plate, semi-centrifugal, dry disc type.

See Clutch Section for complete data.

Facings—Thickness .125". Outside diameter 9½".

Pedal Adjustment: 1" free travel. Lock nut and adjusting nut at release lever end of release rod.

Removal: Remove transmission (see TRANSMISSION Removal below). Take off flywheel housing. Install wooden wedges between each release lever and cover to hold clutch in released position, take out 6 cover capscrews, lift assembly out.

TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

►*TRANSMISSION INOPERATIVE OR LOCKING IN REVERSE: See "Ford, Lincoln, Mercury" in Transmission Section.*

►*TRANSMISSION NOISE CORRECTION—See Transmission Section for complete data.*

Transmission Control: Steering column mounted shift

See Transmission Section for complete data.

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame, Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model AS1-R10E (exc. Conv. & Sta. Wagon). Warner Model AS3-R10E (Conv. & Sta. Wagon). Optl. equipment. Overdrive is solenoid operated type (no centrifugal pawls) with Governor Control and throttle operated "kick-down."

See Transmission Section for complete data.

►**Overdrive not engaging, and Prolonged shorting out of Ignition on Kick-down Corrections**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Trans. Sect.*

►**Overdrive Governor Production Change**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Trans. Sect.*

►**Overdrive Noise Correction on Early Cars**—*See "Ford, Lincoln, Mercury (Warner) Overdrive in Transmission Section.*

Solenoid—Ford No. 8M-6916A (8A-6916A or C, C is rubber-coated). (Sta. Wgn. & Convertible) Ford No. 8M-6916-A.

Control Relay—Ford No. 8M-6915. On dash.

Overdrive Fuse—30 ampere. On Control Relay.

Governor—Ford No. 8M-6943 (Assembly with gear).

Removal: Same as for Std. transmission (above) after disconnecting overdrive control cable and wiring.

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used.

►*REPLACEMENT UNIVERSAL JOINT NOTE: TWO types furnished for service (interchangeable):*

1) **Pre-lubricated** (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).

2) **Grease Fitting** (1M-7042A Front & 1M-7039 Rear). Must be lubricated at 1000 mile intervals using pressure gun.

►***CAUTION (ALL CARS EXCEPT STATION WAGON)—Rear universal joint companion flange nut controls pinion bearing "pre-load" (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.***

REAR AXLE

PASSENGER CARS

Own Make. Semi-floating hypoid gear type with Hotchkiss drive with separate carrier. Axle ends flanged (no separate hub). Wheel bearings are sealed-ball pre-lubricated (no lubrication required).

See Rear Axle Section for complete data.

►**Excessive Axle Shaft Endplay (causing noise in service) Correction**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

►**Ring & Pinion Gear Production Change**—*See "Ford Pass. Car (exc. Sta. Wgn.)" in Rear Axle Section.*

Ratio—Standard: 3.73-1 (41-11). With overdrive: 4.10-1 (41-10). Optional: 3.54-1 (41-11).

Backlash—.005-.008". *Screw adjustment.*

Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.

►**Carrier Mounting Bolt Tightening Caution**—*See Ford Pass. Car (exc. Sta. Wgn.)" in Rear Axle Section.*

►*CAUTION—Pinion bearing pre-loading must be re-established whenever universal joint flange nut on pinion shaft is removed or disturbed. See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-P and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal).

Wheel Bearing Adjustment: None (sealed bearings).

STATION WAGON

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive (separate carrier not used). Axle ends flanged —(no separate hub). Wheel bearings are sealed (no lubrication required).

►***NOTE—AXLE NOT SAME AS FORD PASSENGER CAR, See Rear Axle Section for complete data.***

Ratio (Standard)—3.91-1 (43-11).

Ratio (with Overdrive)—4.27-1 (47-11).

Backlash—.003-.008". *Shim adjustment.*

Removal: Raise rear of car. Disconnect rear universal. Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Delco or Houdaille. Both types interchangeable. Direct acting hydraulic types. Service by replacement. Replacement types (Ford Nos.):

	Front	Rear
Pass. Cars	8A-18124-A	8A-18125-A
Station Wagon	8A-18124-B	8A-18125-B

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs and direct acting shocks.

See Front Suspension Section for complete data.

►**Riding Height & Car Leveling Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

►**Front Suspension Noise (popping or chucking noise) Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

►**Front Spring Production Change & Installation Caution**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

►**Pitman Arm and Idler Arm Bracket Change**—Requires 2 different Toe In Settings listed below. *For parts identification, see Front Suspension Section.*

►*CAUTION—Specifications below supersede earlier data.*

Kingpin Inclination—5¼° crosswise.

Caster—(Pass. Cars) Pos. ½° to Neg. 1°. (Sta. Wgn). Neg. ¼° (Limits Neg. ¼° to Neg. 1¾°). Variation between wheels ½° maximum.

Camber—(All) Pos. ¼° to Pos. ¾° (Limits 0° to Pos. 1°). Variation between wheels ¼° maximum.

►**Toe In**—*CAUTION: Two settings as follows:*

1)—**1/8" toe out to 3/16" toe out for cars built before March 1, 1949.**

2)—**1/16" toe in to 1/8" toe in for cars built after March 1, 1949.**

STEERING GEAR

Ford. Worm-and-Roller type with eccentric adjustment. *See "1949-51 Ford Pass. Car Worm-&-Roller" in Steering Section for complete data.*

See Steering Gear Section for complete data.

►**Steering Idler Arm Looseness Complaints**—*See "Ford (6 & V8 Pass. Car)" in Steering Gear Section.*

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type. Hand lever applies rear wheel brakes.

See Brake Section for complete data.

Wheel Cylinder Diameters—Front 1⅛" (hone limit 1.132"), Rear ⅞" (hone limit .880").

Drums—Diameter 10" (11" Sta. Wagon rear drums).

Lining—Molded or Woven. Width 2¼" (front wheel), 1¾" (rear wheel). Thickness 3/16". Length per shoe:

	Front Wheel		Rear Wheel	
	Pri.	Sec.	Pri.	Sec.
Pass. Cars	11"	11"	11"	11 15/16"
Sta. Wgn.	11 15/16"	11 15/16"	11"	11 15/16"

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Hand Brake: See Service Brakes (above).

►**Hand Brake Linkage Change (for easier application) and Cable Interference Correction**—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Top: Hydro-Lectric type

See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.

See Miscellaneous Section for complete data.

M DEL IDENTIFICATION

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail to rear of front suspension control arm.

SERIAL NUMBERS: As follows:

Year	Engine Type	Model	Assembly Plant	Serial Number
1950	H	0	See below	100001 Up
1951	H	1	See below	100001 Up

Assembly Plant Designations

AT—Atlanta	**DA**—Dearborn	**MP**—Memphis
BF—Buffalo	**LU**—Louisville	**NR**—Norfolk
CS—Chester	**EG**—Edgewater	**RH**—Richmond
CH—Chicago	**KC**—Kansas City	**SR**—Somerville
DL—Dallas	**LB**—Long Beach	**SP**—Twin City
HM—Highland Park		(St. Paul)

TUNE-UP

COMPRESSION PRESSURE: 120 lbs. at cranking speed.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .030". Limits .029-.032".

Plug Type—Champion H-10. 14 mm.

DISTRIBUTOR: Ford No. 7HA-12127.

Breaker Gap—.024-.026".

Cam Angle—36° closed, 24° open.

Breaker Arm Spring Tension—17-20 ounces.

Advance Performance—*See Ignition.*

Distributor Line (Carburetor Connection) Vacuum 0.5-0.7" at 800 RPM., 1.2-1.6" at 1000 RPM., 4.8-6.6" at 2200 RPM., 4.9-6.7" at 2400 RPM. (In. of mercury at specified engine RPM).

IGNITION TIMING: TDC.

Timing Procedure—*See Ignition Timing.*

Dampener Mark—Circular boss or groove (depending on type of dampener used). 2 pointers on front engine cover. *Use pointer nearest to outer circumference of dampener for proper timing.*

CARBURETION: Holley-Ford No. 8HA-9510-A (1HA-9510-A on 1951 Fordomatic Cars). Carburetor on Fordomatic Cars has Anti-stall dashpot (see below).

Idle Setting—Approx. 1 turn open. One screw—turning screw out gives richer mixture.

Idle Speed—(Std. Trans.) Approx. 500 RPM.

Idle Speed—(Fordomatic Trans.) 425 RPM.

Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (use Gauge No. 9550-A).

Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Anti-Stall Dashpot Adjustment (Fordomatic Cars): After idle speed correctly set, hold throttle valve closed, loosen dashpot adjusting screw locknut on throttle lever, turn adjusting screw out until screw causes dashpot plunger to bottom in dashpot, then turn adjusting screw in 1½-2 turns and tighten locknut. This will provide correct clearance of .045-.064" between dashpot plunger and adjusting screw.

Fuel Pump Pressure: 4-5 lbs.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Valve should be closed (counterweight arm against stop pin) with engine cold and should operate freely).

VALVE TAPPET CLEARANCE: *CAUTION—Different settings required for each type camshaft.*

►First type Camshaft No. 7HA-6250-C
(Camshaft stamped "CWC")

Tappet Clearance—.009-.011" Intake, .013-.015" Exhaust, COLD. Self-locking tappet adjusting screws located in valve lifters.

Later type Camshafts No. 0HA-6250-A, B
(Eng. marked "0H" above #3 Intake Port)
(Camshaft marked "0" or "B" on front end)

Tappet Clearance—.013-.015" Intake, .017-.019" Exhaust, COLD. Self-locking tappet adjusting screws located in valve lifters.

CAUTION—Loss of power will result if correct tappet clearance not used with "0" or "B" camshafts.

►VALVE TAPPET NOISE—Silencing springs available. *See "Valve System" in Ford Special Data.*

IGNITION

IGNITION SWITCH: Ford No. 6A-11572-A or B (All 1950 & 1951 Sta. Wgn.), No. 1A-11572-B (1951 exc. Sta. Wgn.).

Ignition Lock—Ford No. 8A-11582-A (1950), 1A-11582-A (1951).

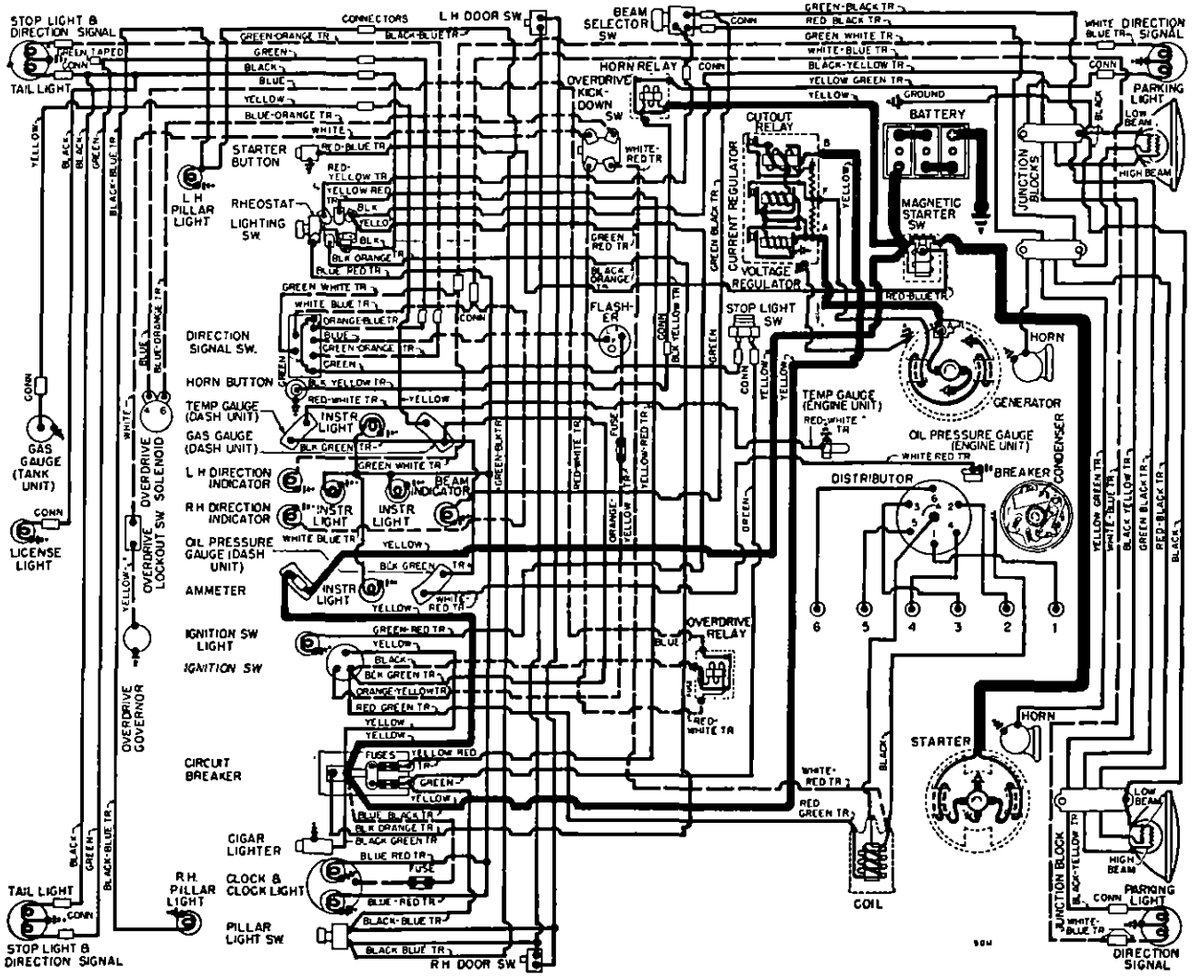
COIL: Ford No. 8BA-12029.

Location—On left side of engine above distributor.

Ignition Current—Idling 2.75-3.0 amperes at 6 volts, 5.0-5.5 stopped. Coil primary resistance 1.05-1.15 ohms, (75°F). Secondary resistance 4100 ohms, (75°F).

CONDENSER: Ford No. 7RA-12300-C.

Capacity—.21-.25 microfarad.



DISTRIBUTOR: Ford No. 7HA-12127 (Less Cap and Rotor), "Pressure" distributor with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two springs.

See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.

►Excessive Pinging Correction—*See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.*

Breaker Gap—.024-.026".

CONTINUED ON NEXT PAGE

1950 MODELS

CONTINUED FROM PRECEDING PAGE

Cam Angle—36° closed, 24° open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Advance Performance
▷With Distributor on Test Unit

Distr. Degrees	Vacuum	R.P.M.
0°	0"	200
1¾-3°	0.4"	500
5½-6¾°	1.4"	1000
11½-13°	5.5"	1000
8½-9¾°	2.9"	1500
10½-11½°	4.1"	2000

Distributor Line Vacuum Test—*See Tune-Up.*
Distributor Removal: Mounted on left side of engine at center. To remove, disconnect vacuum line, take out hold-down screw in timing arm, lift off.
▷*NOTE—Distributor angle-mounted on left side of engine and shaft splined to oil pump drive gear.*

IGNITION TIMING

Std. Setting.....**at TDC.**
Dampener Mark—Circular boss or groove (depending on type of dampener used). 2 pointers on front engine cover. *Use pointer nearest to outer circumference of dampener for proper timing.*
Timing—With #1 piston at firing position and timing mark aligned with pointer on front of engine, loosen clamp screw on timing arm, rotate distributor until contacts begin to open, tighten clamp screw. Check spark plug connections (see diagram), see that rotor opposite #1 terminal in cap).
▷**Timing (with Neon Timing Light)**—*CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.* Mark proper timing pointer (see Dampener Mark above) and dampener mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark and pointer aligned when light flashes.

CARBURETOR

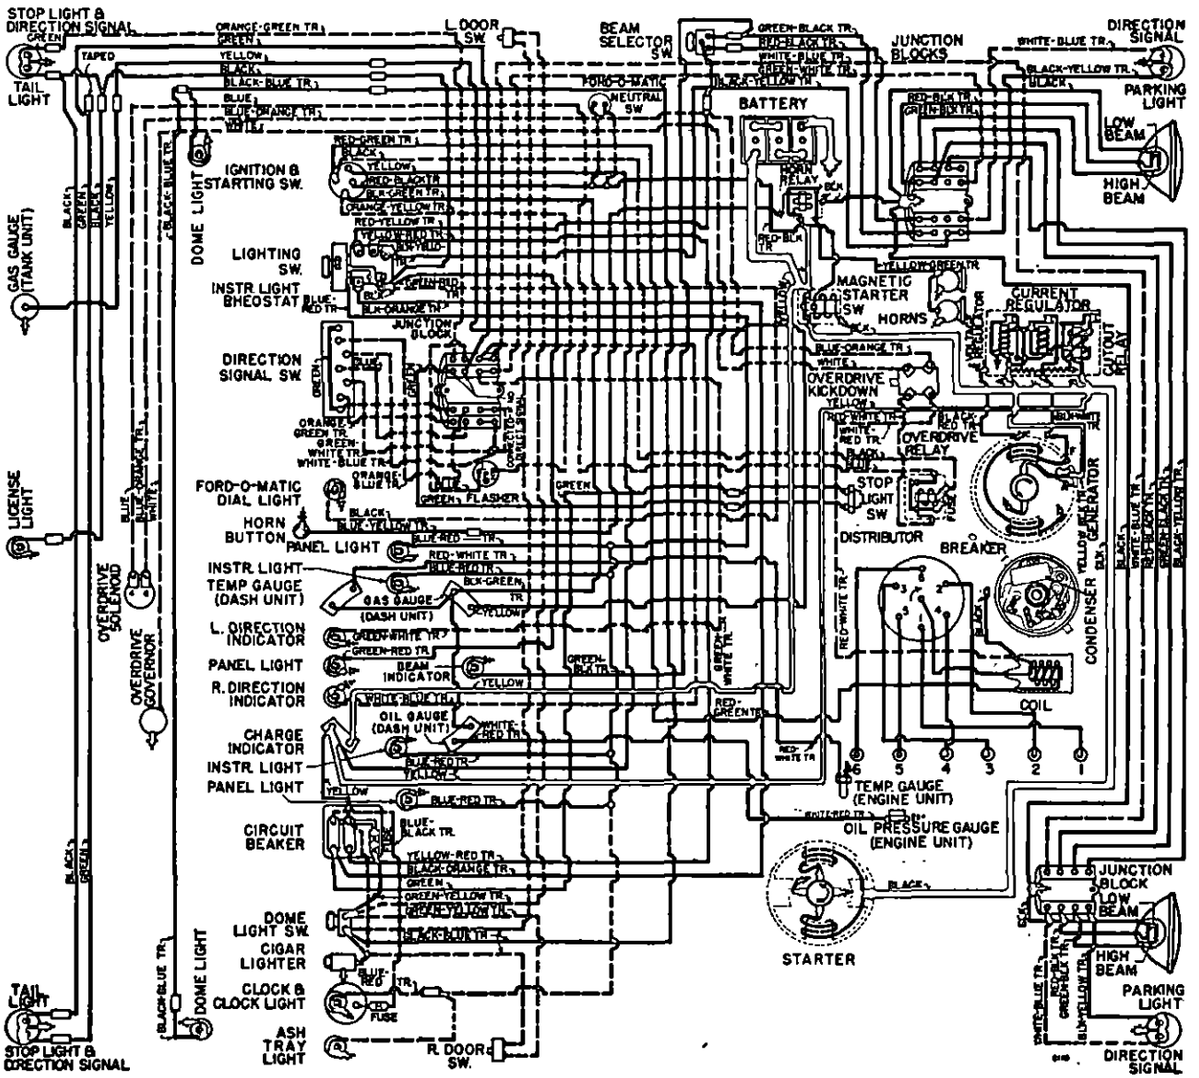
1950-51 (Std. Trans.) Holley-Ford No. 8HA-9510-A. 1951 (with Fordomatic Trans.) Holley-Ford No. 1HA-9510-A. *NOTE*—Replacement Carburetor 8HA-9509A.
Single barrel downdraft type with vacuum passages for distributor operation.
See Carburetor Section for complete data.
Setting (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
▷*CARBURETOR JET CHANGE—See Carburetor Section for complete data.*
Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.

CARB. EQUIPMENT

Fuel Pump: (Std.) Ford No. (1950) 7HA-9350-B, (1951) 1HA-9350-A. (Fuel & Vacuum) (1950) 8HA-9350, (1951) 1HA-9350-E or H.
Pressure—4-5 lbs.
See Carburetion Equipment Section for complete data.
Gasoline Gauge: King-Seeley Electric.
Dash Unit—(All 1950 & 1951 Sta. Wgn.—Red Pointer) Ford No. 8A-9280-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-9280-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-9280-B.
Tank Unit—Ford No. 8A-9275 (exc. Sta. Wgn.), No. 01A-9275-A (Sta. Wgn.).
See Carburetion Equipment Section for complete data.
Air Cleaner: Oil-wetted type Std., Oil-bath type Optl.

BATTERY

Ford No. 81A-10655-A. 6 Volt, 17 Plate, 100 Amp. Hr.
Grounded Terminal—Positive (+).
Location—On left side in engine compartment.



STARTER

1950 (All Models) Ford No. 7HA-11002.
1951 (Except Fordomatic) Ford No. 1A-11002-A.
1951 (With Fordomatic) Ford No. 1CM-11002-A.
NOTE—Starter No. 1A-11002-A with bracket 1A-11140-A used as replacement for 7HA-11002.
Armature—(Except Fordomatic) No. 18-11005. (With Fordomatic) No. 1CM-11005-A.
▷*STARTER DRIVE PRODUCTION CHANGE (LATE 1951)—Bendix "Folo-Thru" Starter Drive used on cars with FORDOMATIC TRANSMISSION. See Electrical Equipment Section for complete data.*
Drive—Ford No. 7HA-11350. New 9 tooth pinion type for use with 114 tooth flywheel ring gear.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

Starting Switch: (1950 All Models & 1951 Sta. Wgn.) Ford No. 21A-11450. (1951 Except Sta. Wgn.) Ford

1951 MODELS

No. 1A-11450-A. Mounted on left front fender apron and controlled as follows:

►*1951 STARTER SWITCH CAUTION*—(Except Station Wagon). Starter switch grounded at switch bracket.

1950—Pushbutton Switch No. 6H-11500 mounted on instrument panel.

1951—Key operated ignition & starter switch, Ford No. 1A-11572-B. Turn switch full right to start.

►*FORDOMATIC DRIVE NOTE*—Neutral Safety Switch, Ford No. 1M-15812-B in circuit between ignition switch and starter relay. Selector lever must be in neutral to operate starter.

GENERATOR

Ford. Two-brush with voltage and current regulation.

Generator No.	Type	Armature No.
8BA-10002-A①	35 Amp.	0A-10005-A
8BA-10002-B	40 Amp.	8EH-10005
8BA-10002-D	35 Amp.	0A-10005-A
8EL-10002-B	40 Amp.	8EH-10005
0HA-10000-A	35 Amp.	0A-10005-A
0HA-10000-B	40 Amp.	8EH-10005

①—Replaced by 8BA-10002-D for service.

Charging Rate Adjustment—None. See Regulator.

Maximum Charging Rate—36 amperes, 7 volts, at approximately 20 MPH. Controlled by regulator and dependent on load and battery condition.

Performance Data

Generator	Amperes	Engine RPM.
8BA-10002-A	35	935
8BA-10002-B	40	
8BA-10002-D	35	900
8EL-10002-B	40	
0HA-10000-A	35	890
0HA-10000-B	40	1060

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. each.

REGULATOR

Ford. Vibrating voltage and current type.

Regulator No.	For Generator No.
51A-10505-A, H	8BA-10002-A, D
5EH-10505-C	8BA-10002-B
8L-10505	8BA-10002-B, 8EL-10002-B
8L-10505	0HA-10000-B
8M-10505, A	8BA-10002-D, 0HA-10000-A

See Electrical Equipment Section for complete data.

NOTE—Separate ground wire extending to cowl must be in place when generator is operated.

Cutout Relay

Regulator	Cuts In	Cuts Out (Disch.)
51A-10505-A	6.6-7.0 Volts	0-8 Amperes
51A-10505-H	6.6-7.0 Volts	0-8 Amperes
5EH-10505-C	6.6-7.0 Volts	0-8 Amperes
8M-10505A	6.0-6.6 Volts	0-8 Amperes
8L-10505	6.0-6.6 Volts	0-8 Amperes

Contact Gap—.010" (armature against upper stop).

Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Regulator	Voltage Setting①
51A-1505-A, H	7.2-7.6 volts
5EH-10505-C	7.2-7.6 volts
8L-10505, 8M-10505, A	7.2-7.6 volts

①—For regulator at normal operating temperature with room temperature of 70-80°F.

Checking & Adjustment—*See Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

Current Regulator

Regulator	Current Setting COLD	Amperes
51A-10505-A, H		30-34
5EH-10505-C		38-42
8L-10505		38-42
8M-10505, A		34-38

Checking & Adjustment—*See Elec. Equip. Section.*

Air Gap—.032-.035" between armature and core with contacts just closed.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Beam Indicator—Bulb between 50 and 60 on speedometer. Lighted with Upper Beam "on".

Direction Signal: Optl. *See Electrical Equipment Section.*

Directional Signal Flasher—Ford No. ('50).. 8L-13350-B, ('51) 8L-13350-C.

Switches

Lighting—Ford No. 0A-11654 (All 1950, Sta. Wgn. 1951), No. 0L-11654 (1951 exc. Sta. Wgn.).

NOTE—Instrument switch is part of lighting switch (operated by rotating switch knob).

Beam Selector—Ford No. 8A-13532.

Dome Light—Ford No. ('50) 0A-13752, ('51) 1A-13752. (1950-51 Station Wagon) No. 0M-13752.

Stop Light—Ford No. 11A-13480 or 0A-13480.

MISC. ELECTRICAL

CIRCUIT BREAKER (1950): Ford No. 0A-12258A. Consists of ONE thermostatic circuit breaker (for headlight circuits) and TWO fuses (see below) to protect other lighting circuits. Mounted behind instrument panel.

CIRCUIT BREAKER (1951): Ford No. 1A-12258A. Consists of TWO thermostatic circuit breakers (one for headlights, other for Parking, Tail & Instr. Lights), and ONE fuse to protect other lighting circuits. Mounted behind instrument panel.

FUSES: Auxiliary Lights (Parking, Tail & Instrument) (1950 only)—14 ampere. On circuit breaker bracket behind instrument panel (see wiring diagram).

Dome & Stop (1950 only)—14 ampere. Next to fuse listed above.

Dome (1951)—14 ampere. On circuit breaker bracket behind instrument panel.

Clock—2 ampere. In clock feed wire.

Overdrive—30 ampere. On relay on dash under hood.

Direction Signal—15 ampere. In feed from ignition switch to flasher.

HORNS: Ford No. 51A-13832-A or B (High Pitch, Right Horn), No. 51A-13833-A or B (Low Pitch, Left Horn). Dual horns operated by relay. NOTE—"A" horns are 4.28" high, "B" horns are 4.14". Horns marked "HI" or "LO" on air columns.

Air Gap—.027-.029" for high pitch (right horn), .032-.034" for low pitch (left) for Sparks-Withington.

Horn Current—13 amperes (high pitch), 14 (low).

Horn Relay: Ford No. ('50) 7RA-13853-B, ('51) 7RA-13853-A.

►*CAUTION—Use only Ford type relay No. 7RA-13852-B with TAN plastic cover on 1950 cars. If 1951 relay No. 7RA-13853-A with BLACK plastic cover is used, shock at button may result when blowing horn.*

Contact Gap—.015-.025".

Contact Closing Voltage—4 volts max.

EN INE

ENGINE SPECIFICATIONS. Own 8HA. Six cylinder, "L" head type.

Bore—3.30". **Stroke**—4.40".

Displacement—226 cu. ins. **Rated HP**—26.13.

Developed Horsepower—95 at 3300 RPM.

Compression Ratio—6.8-1 cast iron head.

Compression & Vacuum Reading—*See Tune-Up.*

ENGINE REMOVAL: *See Ford Special Data.*

OIL PAN REMOVAL: *See Ford Special Data.*

NOTE—Engine must be removed to remove oil pan.

CYLINDER HEAD AND TIGHTENING TORQUE: *See Ford Special Data.*

►*CYLINDER HEAD PRODUCTION CHANGE NOTE—New type cylinder head used in production beginning early 1950. Interchangeable with previous head.*

CYLINDER SLEEVES: Cast iron dry type.

See Ford Special Data.

PISTONS: *CAUTION—Two types used.*

1950 (Early Production)—7HA piston, 4 ring (all above pin), flat head, aluminum alloy, steel strut, U-slot cam ground type.

1950-51 (Except early 1950 production) *New OHA AUTOTHERMIC TYPE used.* Solid skirt, 4 ring (all above pin), aluminum alloy.

►*CAUTION—When installing the OHA piston, make sure the small indentation at the top outer edge is towards the front of engine (pin offset 1/16" in piston).*

►*PISTON INTERCHANGE CAUTION*—The OHA piston should not be replaced with the earlier 7HA piston. However, the OHA piston can be used to replace the 7HA piston individually or in sets.

Replacement Pistons: Standard size and .0025", .005", .020", .030", .040", and .060" Oversize.

Fitting Pistons: Use ½" wide feeler inserted between piston and cylinder wall at right angles to pin on thrust side. Use correct thickness feeler gauge (see table below). Pull required to withdraw feeler should be 6-12 lbs. (7HA), 3-12 lbs. (0HA pistons).

Feeler Thickness	7HA Pistons	0HA Pistons
New Piston—New Bore	.003"	.002"
New Piston—Old Bore	.003"	.002"
Old Piston—Old Bore	.003"	.003"

PISTON RINGS: 2 compression, 2 slotted oil rings, all above pin. Upper oil ring groove drilled with oil drain holes, lower ring groove slotted.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.047"	.0015-.003"
Compr. (#2)	3/32"	.007-.047"	.001-.0025"
Oil (#3, 4)	3/16"	.007-.047"	.001-.0025"

►*PISTON RING PRODUCTION CHANGE 1950—New* 0HA rings (steel segment) used beginning early 1950.

►*CAUTION—When using the earlier type piston ring (7HA) on the OHA piston, install the oil ring expander in the 3rd groove rather than the 4th groove. OHA piston rings may be used on the 7HA piston.*

Replacement Rings: *See Ford Special Data.*

PISTON PIN: Diameter .8504". Floating type.

Pin Fit in Piston—.0001-.0003" clearance (new), .0007" (worn limit).

Pin Fit in Rod—.0001-.0003" clearance (new).

Replacement Pins: Sizes and paint marks: Std. (green), .001" Oversize (blue), .002" Oversize (yellow).

CONNECTING ROD: Length 8¼". **Weight** 29.0 ozs.

Crankpin Journal Diameter—2.2980-2.2988". Wear limits .0015" (out-of-round), .001" (taper).

Lower Bearing—Removable, steel-backed, copper-

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

lead alloy lined, locked in type.
Clearance—.0004-.0027"
Sideplay—.006-.014" (new), .017" (worn limit).

Bearing Adjustment: None (except early 1950 "M" engine). Do not file caps. Replace bearings. Tang on bearing must engage groove in rod and cap.

▷*BEARING ADJUSTMENT FIRST "M" ENGINES*—Engines built prior to January 25, 1950 were equipped with connecting rods having shims. Engines built after this date did not have shims.
CAUTION—Connecting rods having shims must be serviced WITH THE SHIMS IN PLACE. When assembling new rods and new crankshafts if the bearing clearance is in exces of .0007" to .0013", the removal of one shim will reduce the clearance .00075". If both shims are removed the bearing clearance will be reduced .0015".

Replacement Bearings: Standard size and .002", .010", .020, .030", .040" Undersize. *See Ford Special Data.*

CRANKSHAFT: 4 bearing, integral counterweights.
Vibration Dampener—Viscous or rubber type.
Journal Diameters—2.8732-2.8740" (all bearings) wear limits—Out-of-round .0015". Taper .001".
Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.0005-.0032" ("AHA" bearings), .0004-.0022" ("0HA" bearings).

Replacement Bearings: Standard and .002", .010", .020", .030" Undersize. *NOTE*—Standard bearings furnished in two sizes (stamped with Red "A" or Blue "B") for selective fitting. *See Ford Special Data.*

Bearing Adjustment: None. Replace bearings. Tang on bearing must engage groove in block and cap.

Replacement Bearings: Std., .002", .020", .030" U. S.

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.004-.008".

CAMSHAFT: *CAUTION—THREE different types used in production. See "Camshaft & Bearings" in Ford Special Data for identification data.*

▷*CAUTION—Special Tappet Clearance required for each type camshaft. See Tappet Clearance data under VALVE TIMING.*
Camshaft Journal Diameter—1.924" (worn limit).
Bearing Diameter—1.9285" (replace bearing if diameter greater than worn limit 1.9315").
Bearings—Steel-backed, babbitt lined bushings.
Clearance—.001-.002" (new), .005" (worn limit).
Camshaft Bearing Servicing—*See "Camshaft & Bearings" in Ford Special Data.*

Replacement Bearings: Standard and .015" Undersize. *NOTE*—Standard bearings also furnished .080" oversize on O.D.

End Thrust: Taken by thrust plate bolted on front of block behind camshaft hub. **Endplay**—.003-.006".

Timing Gears: *CAUTION—TWO types used. See "Timing Gears" in Ford Special Data for interchangeability caution and reworking required.*
Camshaft Gear—Aluminum or Fibre. See Caution above.
Crankshaft Gear—Cast Alloy Iron.
Replacement Camshaft Gears—Std., .006", .012" OS. *See "Timing Gears" in Ford Special Data.*

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head. Diam.	Stem Diam.	Length
Intake	1.65"①	.3410"	5.36"
Exhaust	1.51"②	.3410"	5.36"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	③.350"	④.0010-.0031"

①1.652" (1951). ②—1.515" (1951).
③—Replace camshaft if lift less than .3375" Intake, .3335" Exhaust.
④—Replace guides if clearance exceeds .0031".

▷*ROTATABLE VALVES: Used in 1951 engines, can be installed in 1950 engines. See "Valve System" in Ford Special Data.*
Valve Seat Width—1/16" maximum.
Valve Seat Inserts—Used for exhaust valves.
See "Valve System" in Ford Special Data.
Sticking Valve Correction—If necessary to ream guides, use .001" oversize reamer for exhaust valve guides, .0005" oversize reamer for intake valve guides.

Valve Guides: One-piece type pressed in block.
Removal: Use special tool 6510-O to remove guides.
Installation—Upper end of guide 1.18" Intake, 1.08" Exhaust below top face of block. Install with stepped end down. Use tool 6510-N to drive guides in place.

Valve Lifters: Mushroom type with self-locking adjusting screws. Removable from below with camshaft out.
Diameter—.6240" (replace if worn to less than wear limit of .6225").
Clearance—.0005-.0015" (new), .003" (worn limit).

Valve Springs: Coated springs used. Install springs with closely spaced coils toward top (against block).
Spring Test—47-53 lbs. at 2.11". Free length 2.50".

VALVE TIMING

▷**VALVE TAPPET NOISE**—Silencing springs available. *See "Valve System" in Ford Special Data.*

VALVE TAPPET CLEARANCE: *CAUTION—Different settings required for each type camshaft.*

▷First type Camshaft No. 7HA-6250-C
(Camshaft stamped "CWC")

Tappet Clearance—.009-.011" Intake, .013-.015" Exhaust, COLD. Self-locking tappet adjusting screws located in valve lifters.

Later type Camshafts No. 0HA-6250-A, B
(Eng. marked "0H" above #3 Intake Port)
(Camshaft marked "0" or "B" on front end)

Tappet Clearance—.013-.015" Intake, .017-.019" Exhaust, COLD. Self-locking tappet adjusting screws located in valve lifters.
CAUTION—Loss of power will result if correct tappet clearance not used with "0" or "B" camshafts.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 11° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.

LUBRICATION

Engine Oiling System: Pressure to main, connecting rod, and camshaft bearings. Timing gears lubricated by spray past camshaft thrust plate. Rotor type oil pump mounted externally on right side of engine.
Crankcase Capacity—4 quarts (5 quarts when changing filter).
Normal Oil Pressure—45 lbs. at 30 MPH.

Oil Pressure Relief Valve: Not adjustable.
Spring Tension—12.64-12.88 lbs. at 1.14".

Oil Pump: Rotor type. Mounted externally on right side of engine with drive gear at center of camshaft.

▷*OIL PUMP PRODUCTION CHANGE:* Pump No. 0HA-6600-A used with later 0HA-6250-A & 0HA-6250-B Camshafts. This pump has groove in bottom bearing surface in housing for increased lubrication of driving gears and copper-cadmium plate finish of driven gear. Interchangeable with previous type pump.

Pump Removal & Overhaul: *See Ford Special Data.*

Oil Filter: Mounted directly on block.
Oil Filter Cartridge—Ford No. 7HA-6731A.

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. (All 1950 & 1951 Sta. Wgn.—Red Pointer) 8HA-9273-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-9273-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-9373-B.
Engine Unit—Ford No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear valve chamber.

COOLING

Cooling System: Pressure type with relief valve in filler cap, one belt-driven pump, and by-pass.
Capacity—16 quarts.
Pressure Valve—In radiator filler cap. Ford No. (Except with Fordomatic) 26H-8100-B. Opens at 3½-4½ lbs.

Water Pump: Centrifugal, belt driven, packless type. *See Water Pump Section for complete data.*

Thermostat: In cylinder head water outlet.

Ford Thermostat No.	Opening Temperature
7HT-8575-A	148-153°F.
7HT-8575-B	157-162°F.
7HT-8575-C	①177-182°F.
1HA-8575-A	177-182°F.

①—For use with permanent anti-freeze.

Temperature Gauge: King-Seeley Electric type.
Dash Unit—Ford No. (All 1950 & 1951 Sta. Wgn.—Red Pointer) No. 8A-10883-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-10883-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-10883-B.
Engine Unit—Ford No. 8A-10884 (stamped "224"—use with 4 lb. type pressure cap).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 9½CF-TS (Pass. Cars), 10CF-TI (Police & Taxicab). Semi-centrifugal, single plate types.

	Ford Clutch Nos.
Pass. Cars	①8A-7563-A, ②1A-7563-A
Police & Taxicab	③19A-7563-A

①—Identified by Orange marking and Green sprgs.
②—Identified by Black Paint mark (Cover), Yellow Paint mark (Pressure Plate) and silver springs.
③—Identified by White marking and Blue springs.

▷*CLUTCH PRODUCTION CHANGE:* 8BA-7563-A Clutch used on 1950 & early 1951 cars. 1A-7563-A Clutch used in production on late 1951 cars and can be used on earlier cars (has greater load capacity). Use this clutch with driven member having molded facing on flywheel side (previous type woven facings).
See Clutch Section for complete data.

Driven Member: *CAUTION—Different types used for Overdrive Cars as follows:*

	9½" Clutch	10" Clutch
Std. Trans.	8HA-7550-A ④	8HAS-7550-A
Overdrive Cars	8HA-7550-B ⑤	8HAS-7550-B

④—Aluminum Springs. ⑤—Black Springs.

Pedal Adjustment: Free travel 1-1¼" (Pass. Cars), 1⅛-1⅜" (Police & Taxicab). Adjust by loosening locknut and turning adjusting nut on release rod at clutch throw-out fork.

Removal: Remove transmission (see TRANSMISSION Removal below). Take off flywheel housing. Install wooden wedges between each release lever and cover to hold clutch in released position, take out 6 cover capscrews, lift assembly out.

TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

►*TRANSMISSION NOISE CORRECTION—See Transmission Section for complete data.*

►**Transmission Inoperative in Reverse (Overdrive Transmissions)**—*See "Ford, Lincoln, Mercury Transmission" in Transmission Section.*

Transmission Control: Steering column mounted shift *See Transmission Section for complete data.*

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame, Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model. (1950) AS1-R10E, (1951) AS4-R10E, (1950-51 Convt. & Sta. Wgn.) AS3-R10E. Solenoid operated type with governor control and throttle operated kickdown. *NOTE*—Overdrive used on Convt. & Sta. Wgn. has special solenoid mounting (pawl connected through linkage). Lock-out switch not used on 1951 models.

►*LOCK-OUT SWITCH ELIMINATION*—Not used on 1951 cars, can be removed from earlier cars if inoperative. *See "Ford, Lincoln, Mercury Overdrive" in Transmission Section.*

Solenoid—Ford No. (exc. Convt.) 8A-6916-A replaced by 8A-6916-C (rubber coated) or 8M-6916-B. (Convertible Models) No. 8M-6916-A.

Control Relay—Ford No. 8M-6915.

Overdrive Fuse—30 amperes. On relay.

Lockout Switch—Ford No. 6917-A, (1950).

Throttle Kickdown Switch—Ford No. 8A-6918-B.

Removal: Same as for Std. Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and 3-speed automatic transmission with hydraulic control and parking lock.

►*LINKAGE PRODUCTION CHANGE*—Throttle Linkage changed on later cars for quieter and more efficient operation. Can be installed on earlier cars. *See Fordomatic Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See Fordomatic & Mercomatic in Transmission Section.*

►*TROUBLE SHOOTING & TESTING: See Fordomatic & Mercomatic in Transmission Section.*

Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15000 miles. **Use only Automatic Transmission Fluid, Type A.**

Capacity—Approx. 9 qts.

Checking Oil Level—With transmission selector lever in "Neutral," run engine approx. four minutes at idle speed. Clean floor mat and lift right side to expose plate in floor boards, remove plate. When engine and transmission are at normal operating temperature, move the selector lever through all ranges to distributor oil through transmission. Check fluid level on indicator in filler cap, add fluid to bring level to "full" mark on indicator. Make certain cap locked in place when replaced.

►*CAUTION—Do not fill above FULL mark.*

►*OTHER FORDOMATIC DATA: See Transmission Sect.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used.

►*REPLACEMENT UNIVERSAL JOINT NOTE: TWO types furnished for service (interchangeable):*

1) Pre-lubricated (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).

2) Grease Fitting (1M-7042A Front & 1M-7039 Rear). Must be lubricated at 1000 mile intervals using a pressure gun.

►*CAUTION (ALL CARS EXCEPT STATION WAGON)—Rear universal joint companion flange nut controls pinion bearing "pre-load" (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own Make. Semi-floating hypoid gear type with Hotchkiss drive with separate carrier. Axle ends flanged (no separate hub). Wheel bearings are sealed-ball pre-lubricated (no lubrication required). *See Rear Axle Section for complete data.*

►**Excessive Axle Shaft Endplay (causing noise in service) Correction**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Gear Ratio:	Ratio & Marking①
Synchro-mesh Trans.	3.73-1 (11/41)
Overdrive	4.10-1 (10/41)
Fordomatic	3.31-1 (13/43) or 3.54-1 (11/39)

①—Ring and pinion gear tooth ratio (11/41 etc.) stamped on carrier.

Backlash—.005-.008". *Screw adjustment.*

Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.

►**Carrier Mounting Bolt Tightening Caution**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

►*CAUTION—Pinion bearing pre-loading must be re-established whenever universal joint flange nut on pinion shaft is removed or disturbed. See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-P and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure backing plate.

Wheel Bearing Adjustment: None.

STATION WAGONS

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive (**separate carrier not used**). Axle ends flanged—(no separate hub). Wheel bearings are sealed (no lubrication required).

NOTE—AXLE NOT SAME AS PASSENGER CAR.

See Rear Axle Section for complete data.

Ratio (Standard)—3.91-1 (43-11).

Ratio (with Overdrive)—4.27-1 (47-11).

Ratio (with Fordomatic)—3.54-1 (39-11).

Backlash—.003-.008". *Shim adjustment.*

Removal: Raise rear of car. Disconnect rear universal. Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

Axle Shaft Removal: Same as Ford Pass. Cars.

SHOCK ABSORBERS

Direct acting hydraulic type. Two makes used which are interchangeable. Service by replacement.

Ford Part Nos.	Front	Rear
1950 Pass. Car Std.	8A-18124-A	8A-18125-A
1950 Pass. Car H.D.	8A-18124-C	8A-18080-C
1950 Station Wagon	8A-18124-B	8A-18125-B
1951 Pass. Car Std.	APA-18124-A	APA-18125-A
1951 Station Wagon①	APA-18124-B	APA-18125-B

①—Special Equipment on Passenger Cars.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.

See Front Suspension Section for complete data.

►**Riding Height & Car Leveling Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section).*

►**Front Suspension Noise (popping or chucking noise) Correction**—*See "Ford Passenger Cars, Lincoln, Mercury" in Front Suspension Section.*

Kingpin Inclination—5¼° crosswise.

Caster (Pass Cars)—Pos. ½° to Neg. 1°.

(Station Wagon)—Neg. ¼° preferred. Limits Neg. ¼° to Neg. 1¾°. Both wheels alike within ½°.

Camber (All)—Pos. ¼° to Pos. ¾° preferred. Limits 0° to Pos. 1°. Both wheels alike within ¼°.

Toe In—1/16" to 1/8".

STEERING GEAR

Ford. Worm & Roller type with eccentric adjustment. *See "1949-51 Ford Pass. Car Worm-&-Roller" in Steering Section for complete data.*

►**Steering Idler Arm Looseness Complaints**—*See "Ford (6 & V8 Pass. Car)" in Steering Gear Section.*

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinder Diameter—Front 1⅛" (none limit 1.132"), Rear ⅞" (none limit .880").

Drums—Diameter 10" (11" Sta. Wagon rear drums).

Lining—Molded or Woven. Width 2¼" (front wheel), 1¾" (rear wheel). Thickness 3/16". Length per shoe:

	Front Wheels		Rear Wheels	
	Pri.	Sec.	Pri.	Sec.
Pass. Cars	11"	11"	11"	11"
Sta. Wgn.	11 15/16"	11 15/16"	11"	11"

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Hand Brake: See Service Brakes (above).

►**Hand Brake Linkage Change (for easier application) and Cable Interference Correction**—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Top Control: *TWO types*

1949-50 Hydro-Lectric with Non-reversible Motor. Motor control combined with hydraulic valve to reverse flow to cylinders for up-down movement.

1951 Hydro-Lectric with Reversible Motor. Reversing motor rotation directs fluid to correct end of cylinder for up or down movement.

See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.

See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail just to rear of front suspension upper arm.

Year	Engine Type	Model	Assembly Plant	Serial Number
1950	B	0	See below	100001 Up
1951	B	1	See below	100001 Up

Assembly Plant Designations

AT—Atlanta	**DA**—Dearborn	**MP**—Memphis
BF—Buffalo	**LU**—Louisville	**NR**—Norfolk
CS—Chester	**EG**—Edgewater	**RH**—Richmond
CH—Chicago	**KC**—Kansas City	**SR**—Somerville
DL—Dallas	**LB**—Long Beach	**SP**—Twin City
HM—Highland Park		(St. Paul)

TUNE-UP

▷*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*

COMPRESSION PRESSURE: 120 lbs. at cranking spd.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2. See diagram.

SPARK PLUG GAPS: .030". Limits .029-.032".
Plug Type—Champion H-10. 14 mm.

DISTRIBUTOR: Ford No. 7RA-12127-C or 8BA-12127 (Used with Cast Iron Front Cover) or 0BA-12127 (Used with Aluminum Front Cover).
Breaker Gap—.014-.016".
Cam Angle—27° closed, 18° open.
Breaker Arm Spring Tension—17-20 ounces.
Advance Performance—*See Ignition.*
Distributor Line (Carburetor Connection) Vacuum—2.0-2.9" at 800 RPM., 3.5-4.8" at 1000 RPM., 4.7-6.4" at 2200 RPM., 4.6-6.2" at 2400 RPM.

IGNITION TIMING: 2° BTDC.
Timing Procedure—*See Ignition Timing.*
Crankshaft Pulley Mark—Circular boss aligned with timing pointer on right side of engine front cover.

CARBURETION: Holley-Ford Carburetor No. 8BA-9510-A (1BA-9510-A on Fordomatic Cars). Carburetor used on Fordomatic Cars has Anti-stall Dashpot (below).
Idle Setting—Approx. 1 turn open. Two screws—turning screws out gives richer mixture.
Idle Speed—(Std. Trans.) 475-500 RPM, (Automatic Trans.) 425 RPM.
Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (use Gauge No. 9550-A).
Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Anti-Stall Dashpot Adjustment (Fordomatic Cars): *After idle speed correctly set, hold throttle valve closed,* loosen dashpot adjusting screw locknut on throttle lever, turn adjusting screw out until screw causes dashpot plunger to bottom in dashpot, then turn adjusting screw in 1½-2 turns and tighten locknut. This will provide correct clearance of .045-.064" between dashpot plunger and adjusting screw.

Fuel Pump Pressure: 3½-4½ lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve located between right end of exhaust pipe cross over and right exhaust manifold.

VALVE TAPPET CLEARANCE: ***CAUTION—Different settings required for each type camshaft.***

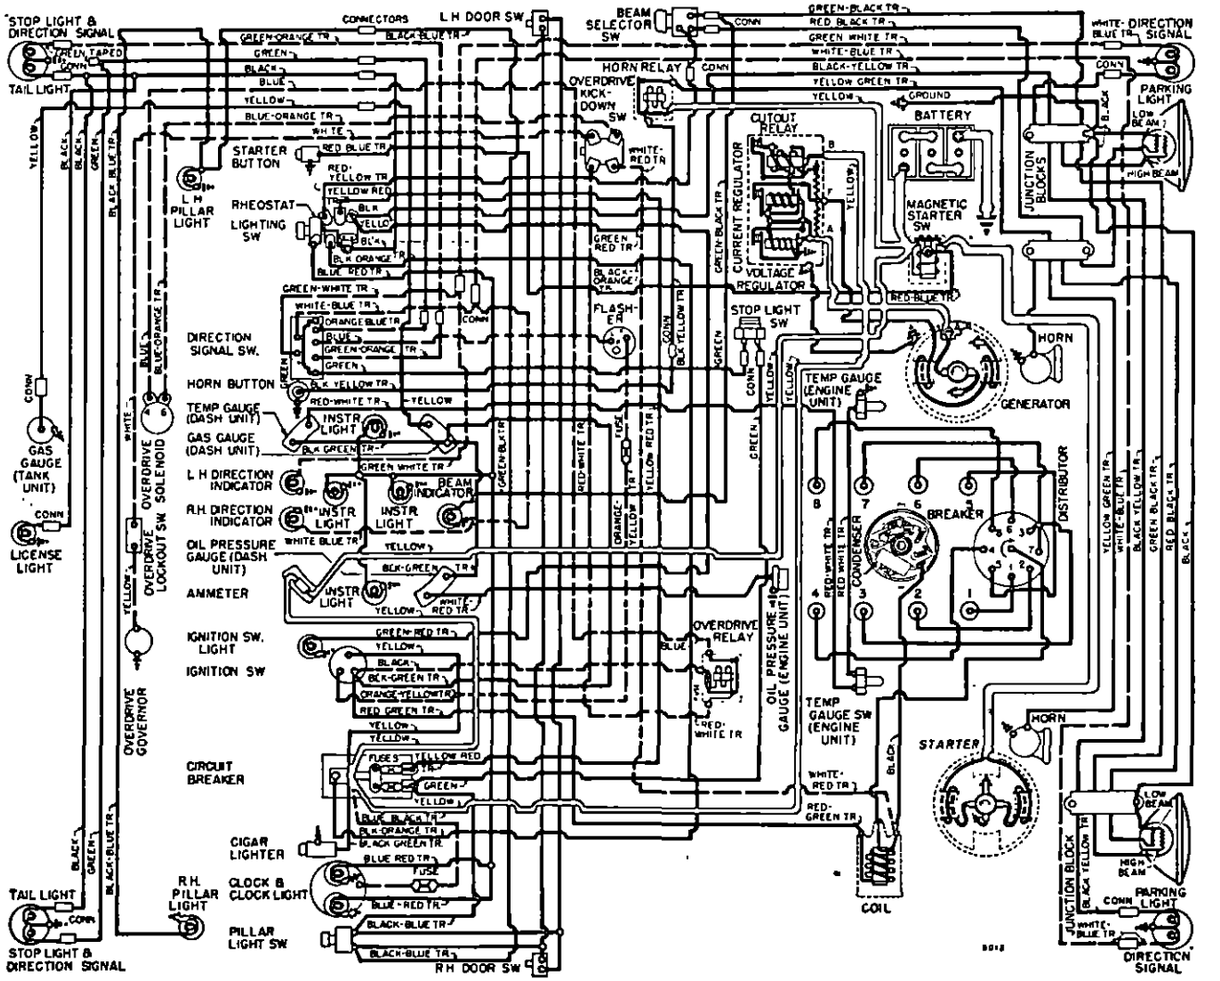
▷First Type Camshaft No. 8BA-6250-A①
(no markings on Engine or Camshaft)
Intake—.010-.012", **Exhaust**—.014-.016", Cold.
①—Before Eng. No. 8BA-622468—Partial production after this number.

▷Later type Camshaft No. 8BA-6250-B②
(Eng. marked—"GAP, in- .014", ex- .018")③.
(Camshaft marked "B" on front end)
Intake—.014" (.013-.015") **Exhaust**—.018" (.017-.019"), Cold.
②—Partial production after Eng. No. 8BA-622468, and service replacement on all engines.
③—On top of block at center under valve cover.

▷***CAUTION—Loss of power will result if correct tappet clearance not used on engines with "B" CAMSHAFT.***
Adjustment—*See "Valve System" in Ford Special Data.*

IGNITION

IGNITION SWITCH: Ford No. 6A-11572-A or B (All 1950 & 1951 Sta. Wgn.), No. 1A-11572-B (1951 exc. Sta. Wgn.).



Ignition Lock—Ford No. 8A-11582-A (1950), 1A-11582-A (1951).

COIL: Ford No. 8BA-12029. On lower front corner of right hand cylinder head.
Ignition Current—Idling 2.75-3.0 Amperes at 6 volts. 5.0-5.5 amperes stopped. Coil primary resistance 1.05-1.15 ohms (75°F). Secondary resistance 4100 ohms (75°F).

CONDENSER: Ford No. 7RA-12300-C.
Capacity—.21-.25 microfarad.

DISTRIBUTOR: (Early 1950) Ford No. 7RA-12127-C. Use with 8BA-6250-A Camshaft. (Late 1950-51) Ford No. 8BA-12127 (used with cast iron front cover), 0BA-12127 (used with aluminum front cover). Pressure type distributor with spark advance controlled by vacuum diaphragm moving plate to advance spark against two springs.

▷Excessive Pinging Correction—*See "Ford, Lincoln,*

1950 MODELS

Mercury Distributor" in Electrical Equipment Section.
Breaker Gap—.014-.016".
Cam Angle—27° closed, 18° open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

IGNITION TIMING

Std. Setting ..... **2° BTDC.**
Crankshaft Pulley Mark—Circular boss on rear edge of pulley (timing pin on right front side of engine).
Timing—With #1 piston at firing position and timing mark on pulley aligned with timing pin on front of engine, loosen hold-down screw on distributor, rotate distributor until contacts begin to open, tighten hold-down screw. Check spark plug connections (see diagram), see that rotor opposite #1 terminal in cap.
►**Timing (with Neon Timing Light)**—*CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.* Mark timing pin and pulley mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark and timing pin aligned.

CARBURETOR

1950-51 (Std. Trans.) Holley-Ford No. 8BA-9510-A.
1951 (With Fordomatic) Holley-Ford No. 1BA-9510-A.
Dual (double-barrel) downdraft type with new vacuum passages for distributor operation.
NOTE—Carburetors on Fordomatic Cars has Anti-stall Dashpot.
See Carburetor Section for complete data.
Setting (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.
Throttle Linkage Adjustment (Fordomatic Cars): *See "Fordomatic & Mercomatic" in Transmission Section.*

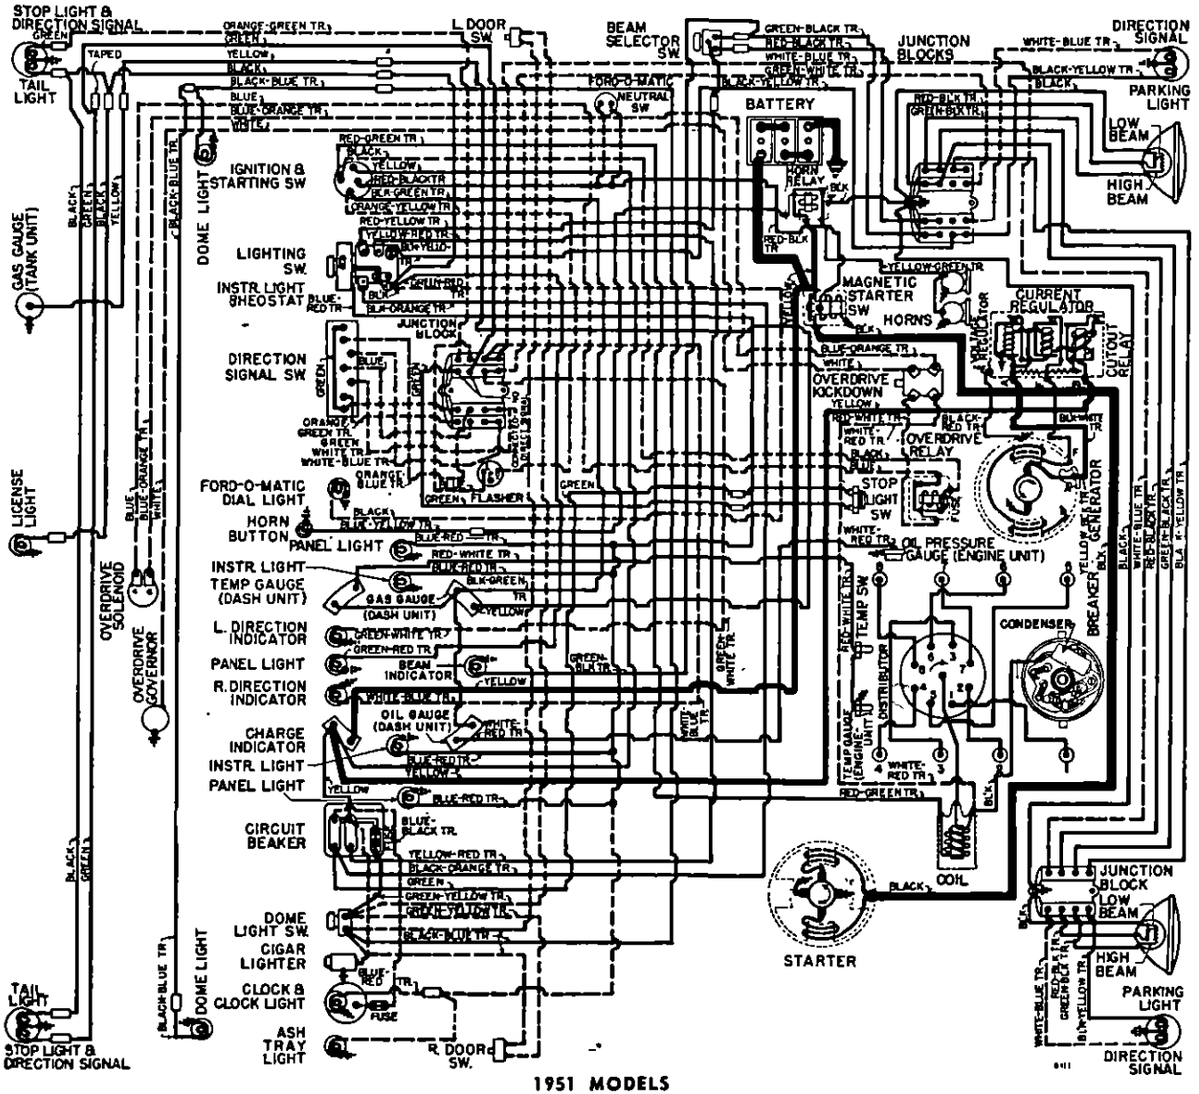
CARB. EQUIPMENT

Fuel Pump (std.): Ford No. (1950) 7RA-9350-C, (1951) 1BA-9350-A or 1BA-9350-G.
Optl. (Fuel & Vacuum)—Ford No. (1950) 7RA-9350-E, (1951) 1BA-9350-E or 1BA-9350-H.
►*FUEL PUMP PUSHROD WEAR (Causing Loss of Power or Engine Cutting Out): See "Fuel System Notes" in Ford Special Data.*
Pressure—3½-4½ lbs. (both types).
Gasoline Gauge: King-Seeley Electric.
Dash Unit—(All 1950 & 1951 Sta. Wgn.—Red Pointer) Ford No. 8A-9280-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-9280-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-9280-B.
Tank Unit—Ford No. 8A-9275 (exc Sta Wgn), No. 01A-9275-A (Sta. Wgn.).
See Carburetion Equipment Section for complete data.
Air Cleaner: Oil-wetted type Std., Oil-bath type Optl.

BATTERY

Ford No. 81A-10655-A. 6-Volt, 17 Plate, 100 Amp. Hr.
Grounded Terminal—Positive (+).
Location—On left side in engine compartment.

STARTER



1950 (All Models) Ford No. 7RA-11002.
1951 (Except Fordomatic) Ford No. 1A-11002-A.
1951 (With Fordomatic) Ford No. 1CM-11002-A.
Armature—(Exc. Fordomatic) No. 18-11005. (With Fordomatic) No. 1CM-11005-A.
Drive—Bendix No. A1472 (Ford No. B-11350).
►*STARTER DRIVE PRODUCTION CHANGE (LATE 1951)—Bendix "Folo-Thru" Starter Drive used on cars with FORDOMATIC TRANSMISSION. See Electrical Equipment Section for complete data.*
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

Starting Switch: (1950 All Models & 1951 Sta. Wgn.)

CONTINUED ON NEXT PAGE

1951 MODELS

CONTINUED FROM PRECEDING PAGE

Ford No. 21A-11450. (1951 Except Sta. Wgn.) Ford No. 1A-11450-A. Mounted on left front fender apron and controlled as follows:
1950—Pushbutton Switch No. 6H-11500.
1951—Key operated ignition & starter switch, Ford No. 1A-11572-B. Turn switch full right to start.
►*FORDOMATIC DRIVE NOTE*—Neutral Safety Switch, Ford No. 1M-15812-B in circuit between ignition switch and starter switch.

ENERATOR

Ford. Two-brush (voltage & current regulation).

Generator No.	Type	Armature No.
8BA-10002-A①	35 Amp.	0A-10005-A
8BA-10002-B	40 Amp.	8EH-10005
8BA-10002-D	35 Amp.	0A-10005-A
8EL-10002-B	40 Amp.	8EH-10005

①—Replaced by 8BA-10002-D for service.

Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—36 amperes, 7 volts, reached at approximately 20 MPH. Controlled by regulator (dependent on load & battery condition).

Performance Data

Generator	Amperes	Engine RPM.
8BA-10002-A	35	935
8BA-10002-B	40	
8BA-10002-D	35	900
8EL-10002-B	40	

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. each.
Generator Belt Adjustment: Loosen hub and bracket assembly adjusting nut, raise generator until belt deflection midway between generator and left hand water pump pulleys is 3/8" (thumb and finger pressure), tighten adjusting nut.
Fan Belt Adjustment—*See COOLING.*

REGULATOR

Ford. Vibrating voltage and current type.

Regulator No.	For Generator No.
51A-10505-A	8BA-10002-A or D
51A-10505-H	8BA-10002-A or D
5EH-10505-C	8BA-10002-B
8L-10505	8BA-10002-B
8M-10505-A①	8BA-10002-A or D

①Service replacement regulator.

See Electrical Equipment Section for complete data.
NOTE—Separate ground wire extending to cowl must be in place when generator operated.

Cutout Relay

Regulator	Cuts In	Cuts Out (Discharge)
51A-10505-A	6.6-7.0 Volts	0-8 Amperes
51A-10505-H	6.6-7.0 Volts	0-8 Amperes
5EH-10505-C	6.6-7.0 Volts	0-8 Amperes
8M-10505A	6.0-6.6 Volts	0-8 Amperes
8L-10505	6.0-6.6 Volts	0-8 Amperes

Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Regulator	Voltage Setting①
51A-1505-A, H	7.2-7.6 volts
5EH-10505-C	7.2-7.6 volts
8L-10505, 8M-10505, A	7.2-7.6 volts

①—For regulator at normal operating temperature
Checking & Adjustment—*See Elec. Equip. Section.*
Air Gap—.032-.035" between armature and core with contacts just closed.

Current Regulator

Regulator	Cold Setting	Amperes
51A-10505-A, H		30-34
5EH-10505-C		38-42
8L-10505		38-42
8M-10505, A		34-38

Checking & Adjustment—*See Elec. Equip. Section.*
Air Gap—.032-.035" between armature and core with contacts just closed.

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Bulb between 50 and 60 on speedometer. Lighted with Upper Beam "on".
Direction Signal: Optl. *See Electrical Equipment Section.*
Directional Signal Flasher—Ford No. ('50).. 8L-13350-B, ('51) 8L-13350-C.

Switches

Lighting—Ford No. 0A-11654 (All 1950, Sta. Wgn. 1951), No. 0L-11654 (1951 exc. Sta. Wgn.).
Beam Selector—Ford No. 8A-13532.
Dome Light—Ford No. ('50) 0A-13752, ('51) 1A-13752. (1950-51 Station Wagon) No. 0M-13752.
Stop Light—Ford No. 11A-13480 or 0A-13480.

MISC. ELECTRICAL

CIRCUIT BREAKER (1950): Ford No. 0A-12258A. Consists of ONE thermostatic circuit breaker (for headlight circuits) and TWO fuses (see below) to protect other lighting circuits. Mounted behind instrument panel.
CIRCUIT BREAKER (1951): Ford No. 1A-12258A. Consists of TWO thermostatic circuit breakers (one for headlights, other for Parking, Tail & Instr. Lights), and ONE fuse to protect other lighting circuits. Mounted behind instrument panel.
FUSES: Auxiliary Lights (Parking, Tail & Instrument) (1950 only)—14 ampere. On circuit breaker.
Dome & Stop (1950), Dome only (1951)—14 ampere. On circuit breaker.
Clock—2 ampere. In clock feed wire.
Overdrive—30 ampere. On relay on dash under hood.
Direction Signal—15 ampere. In feed from ignition switch to flasher.
HORNS: Ford No. 51A-13832-A or B (High Pitch, Right Horn), No. 51A-13833-A or B (Low Pitch, Left Horn).
Horn Relay: Ford No. ('50) 7RA-13853-B, ('51) 7RA-13853-A.
►***CAUTION—Use only Ford type relay No. 7RA-13852-B with TAN plastic cover on 1950 cars. If 1951 relay No. 7RA-13853-A with BLACK plastic cover is used, shock at button may result when blowing horn.***

ENGINE

►*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*
ENGINE SPECIFICATIONS: Own 8BA. Eight cylinder "L-head," 90° V8 type.
Bore—3.187". **Stroke**—3.75".
Displacement—239 cu. ins. **Rated HP**—32.5.
Developed Horsepower—100 at 3600 RPM.
Compression Ratio—6.8-1 cast-iron heads.
Compression & Vacuum Reading—*See Tune-Up.*
ENGINE REMOVAL: *See Ford Special Data.*
OIL PAN REMOVAL: *See Ford Special Data.*
NOTE—1951 oil pan new non-interchangeable type.
CYLINDER HEAD & GASKET INSTALLATION & PRODUCTION CHANGES: *See Ford Special Data.*
CYLINDER SLEEVES: Cast iron dry type.
See Ford Special Data.
PISTON: *CAUTION*—**Two types used:**
"49T" U-Slot Pistons (Before Pass. Car Eng. No. 8BA-641087, Truck 8R Eng. No. 195401)—4 ring (lower ring below pin) aluminum alloy, steel strut, cam ground, dome head type.
CAUTION—49T pistons must be used in ALL steel sleeve engines. Use "29A-" piston rings with this piston. Do not use 49T pistons to replace Autothermic pistons.
"8BA" Solid Skirt Pistons, AUTOTHERMIC type (After Pass. Car Eng. No. 8BA-641087, Truck 8R Eng. No. 195401)—4 ring (lower ring below pin) aluminum alloy, "Autothermic" type, 1/16" offset pin.
CAUTION—8BA Autothermic pistons must not be used on steel sleeve engines. Can be used to replace 49T pistons in sets on other engines. Use "8BA-" piston rings with this piston (29T rings must not be used).
Removal—Pistons and rods removed from above.
Clearance—See Fitting Pistons.
Replacement Pistons ("49T-"): Std., .005, .020", .030", .040", .060" Oversize.
Replacement Pistons ("8BA-" Autothermic): Std. (4 grades with limits 3.1879-3.1891 in .0003" steps for selective fitting), .0025", .020", .030", .040", .060" OS.
Fitting Pistons ("49T-"): Use .50" wide feeler stock of correct thickness (as listed below) inserted between piston and cylinder wall at right angles to pin to check clearance (on 8BA pistons, feeler should be placed on thrust side of piston). Pull to withdraw feeler 6-12 lbs. (49T), 3-12 lbs. (8BA pistons).

Feeler Thickness:	49T Pistons	8BA Pistons
New Piston—New Bore	.003"	.0015"
New Piston—Used Bore	.003"	.0015"
Used Piston—Used Bore	.004"	.003"

Installing Pistons ("8BA-" Autothermic): Locating mark (small indention) on head of piston above one pin hole to front on all pistons. *CAUTION*—This will place offset pin toward thrust side of piston.
PISTON RINGS: 2 compression, 2 slotted oil rings (lower oil ring below pin). Upper oil ring groove drilled with oil drain holes, lower groove slotted.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0915-.0920"	.007-.047"	.0015-.003"
Compr. (#2)	.0915-.0920"	.007-.047"	.001-.0025"
Oil (#3, 4)	.1545-.1550"	.007-.047"	.001-.003"

Replacement Rings: *See Ford Special Data.*
►***CAUTION—Use "29A-" rings on first type 49T Pistons, "8BA-" rings on 8BA Autothermic Pistons.***
PISTON PIN: Diameter .7504". Floating type.
Pin Fit in Piston—.0001-.0003" clearance (new), .0007" (worn limit).
Pin Fit in Rod—.0001-.0003" clearance (new).
Replacement Pins: Sizes and paint marks: Std. (green), .001" Oversize (blue), .002" OS (yellow).
CONNECTING ROD: Length 7". Weight 18.7 ozs.
►*CONNECTING ROD PRODUCTION CHANGE*—Beginning Engine No. 8BA-628866 through 8BA-629940 and all Engines after 8BA-641087, new type connecting rod used with 5/64" squirt hole drilled on an angle into the side of the bearing flange web meeting 3/16" hole in rod bearing flange.
►***CAUTION—These new connecting rods should be used only on engines with neoprene seals on intake valve guides and increased capacity oil pump.***
Crankpin Journal Diameter—2.138-2.139". Wear limits .0015" (out-of-round), .001" (taper).
Lower Bearing—Steel-backed, copper-lead alloy lined, replaceable shells.

ENGINE

CONTINUED FROM PRECEDING PAGE

Clearance—.0005-.003" (new), .005" (worn limit).
Side Play—(Early type rod) .006-.014". Late type rod .006-.020".

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings.

Replacement Bearings: Standard and .002", .010", .020", .030", .040" Undersize. *See Ford Special Data.*
Installing Rods—Rods with squirt hole installed with squirt hole toward valve push rod assembly.

CRANKSHAFT: 3 bearing. Integral counterweights.

►***SLUDGE TRAPS—Crankpin throws equipped with sludge traps having removable plugs for cleaning. Always use new plugs if old plugs disturbed and peen or stake crankshaft to hold plugs in place securely.***
Journal Diameters—2.498-2.4990" (all bearings) wear limits—Out-of-round .0015", Taper .001".
Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.001-.0026".

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings.

Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize.

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.002-.006" (new), .008" (worn limit).

CAMSHAFT: *CAUTION—Two different types used, each type requires different tappet clearance.*
8BA-6250-A—Engines before No. 8BA-622468.
8BA-6250-B—Partial production beginning Eng. No. 8BA-622468 and service replacement of first type.

►***CAMSHAFT IDENTIFICATION***—New 8BA-6250-B Camshaft stamped "B" on forward end (first type not marked), and engine marked "GAP, in- .014", ex- .018" on top of block under valve cover at center.

►***ENGINE MARKING CAUTION***—Gap mark (see above) must be added when "B" shaft installed on unmarked block, or removed if first type shaft installed on marked block.
Journal Diameters—1.794" (worn limit).
Bearing Diameter—1.7985" (replace bearing if diameter greater than worn limit 1.8015").
Bearings—Steel-backed, babbitt lined bushings.
Clearance—.001-.002".

Replacement Bearings: Standard size and .010", .015" Undersize. Undersize bearings also furnished .080" oversize on O.D.
Camshaft Bearing Servicing—*See "Camshaft & Bearings" in Ford Special Data.*

End Thrust: Taken by front end of camshaft. Adjust by replacing cover. **Endplay**—.007-.018".

Timing Gears: *CAUTION—Two types camshaft gears used. See "Timing Gears" in Ford Special Data.*
Crankshaft Gear—Cast Alloy Iron.

►***CAUTION—Camshaft gear teeth REVERSE (L.H.) providing one-way thrust to camshaft for silencing backlash.***
Replacement Camshaft Gears—Std. .006", .012" OS.

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
All (1950)	1.51"	.3410"	4.75"
All (1951)	1.515"	.3410"	4.54"

	Seat Angle	Lift	Stem Clearance
All	45°	①.292"	.0015-.0035"

①—Replace camshaft if lift less than .291" (Intake), .287" (Exhaust).

►***ROTATABLE VALVES—Used on 1951 cars, can be installed on earlier cars. See "Valve System" in Ford Special Data.***
Valve Seat Width—1/16" maximum.
Valve Assembly Removal & Servicing—*See "Valve System" in Ford Special Data.*
Valve Seat Inserts—*If used, see "Valve System" in Ford Special Data.*

►**Sticking Valve Correction**—If necessary to ream guides, use .001" oversize reamer for exhaust valve guides, .0005" oversize reamer for intake guides.

Valve Guides: One-piece type positioned and retained by "C" washer. Inside diameter .344", Outside diameter 1.031". Length 2.20". NOTE—Rubber seal used on intake guide.

Valve Lifters: Barrel type in guide holes in block.
Diameter—.9992" (replace if worn to less than .9977"). Length limit after resurfacing 1.700".
Clearance—.0007-.0016" (new), .003" (worn limit).

Valve Springs: Coated springs used.
Spring Test—40-43 lbs. at 2.13". Free length 2.41".

VALVE TIMING

VALVE TAPPET CLEARANCE: CAUTION—Different settings required for each type camshaft.

►**First Type Camshaft No. 8BA-6250-A①**
(no markings on Engine or Camshaft)
Intake—.010-.012", **Exhaust**—.014-.016", Cold.
①—Before Engine No. 8BA-622468.

►**Later type Camshaft No. 8BA-6250-B②**
(Eng. marked—"GAP, in- .014", ex- .018")③
(Camshaft marked "B" on front end)
Intake—.014" (.013-.015") **Exhaust**—.018" (.017-.019"), Cold.
②—Partial production after Eng. No. 8BA-622468, and service replacement on all engines.
③—On top of block at center under valve cover.

►***CAUTION—Loss of power will result if correct tappet clearance not used on engines with "B" CAMSHAFT.***
Adjustment—*See "Valve System" in Ford Special Data*

Valve Timing: See Camshaft Setting above.
First Type Camshaft No. 8BA-6250-A
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
Late Camshaft No. 8BA-6250-B
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 3° ATDC.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, timing gears and distributor drive gear.
Crankcase Capacity—4 quarts (5 quarts when changing oil filter).
Normal Oil Pressure—45 lbs. at 30 MPH.

Oil Pressure Relief Valve: In pump body. Not adj.
Spring Tension—12 lbs. compressed to 1.14".

Oil Pump: Gear type (two types: one equipped with spur gears, second with helical gears).
Pump Removal & Overhaul—*See Ford Special Data.*

Oil Filter: On left cylinder head.
Oil Filter Cartridge—Ford No. 7HA-6731A.

Oil Pan Removal: *See Ford Special Data.*

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. (All 1950 & 1951 Sta. Wgn.—Red Pointer) 8HA-9273-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-9273-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-9373-B.
Engine Unit—Ford No. 41A-9278.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure type with relief valve in filler cap and two belt-driven pumps (one for each bank) with re-circulating by-pass.
Capacity—21 quarts.
Pressure Valve—In radiator filler cap. Ford No. (Except with Fordomatic) 26H-8100-B. Opens at 3½-4½ lbs. (With Fordomatic) 1M-8100-B. Opens at 6½-7½ lbs.

Water Pumps: Two used. Packless type.
See Water Pump Section for complete data.
Fan & Pump Belt Adjustment—Loosen adjusting screw, shift fan until belt deflection midway between right hand water pump and fan pulleys is ¼"
Generator (& Water Pump) Belt Adjustment—*See GENERATOR.*

Thermostats: Two Used (one in each head water outlet). Various types used as follows:

Thermostat Part No.	Opening Temperature
8BA-8575-B	157-162°F
8BA-8575-C①	167-172°F
8BA-8575-D, E	152-157°F
8BA-8575-F①	172-177°F
8RT-8575-A, B	148-153°F
1BA-8575-A (Dole)	157-162°F
1BA-8575-B (Dole)①	177-182°F

①For use with permanent anti-freeze.

Temperature Gauge: King-Seeley Electric type.
Dash Unit—Ford No. (All 1950 & 1951 Sta. Wgn.—Red Pointer) No. 8A-10883-B, (1951 exc. Sta. Wgn.—Red Pointer) No. 1A-10883-A, (1951 exc. Sta. Wgn.—White Pointer) No. 1A-10883-B.
Engine Unit—Consists of "Sender" (Temperature Indicator located in one cylinder head) and "Switch" (Excessive heat indicator) in other head.
Sender—Ford No. 8A-10884 (Stamped "224"—used with 4 lb. Pressure Cap) or No. 1A-10884-A (Stamped "233F"—used with 7 lb. Pressure Cap).
Switch—Ford No. 8A-10990 (Stamped "217"—used with 4 lb. Pressure Cap), or No. 1A-10990-A (Stamped "226F"—used with 7 lb. Pressure Cap).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 9½CF-TS (Pass. Cars), 10CF-TI (Police & Taxicab). Semi-centrifugal, single plate types.

Ford Clutch Nos.

Pass. Cars ①8A-7563-A, ②1A-7563-A
Police & Taxicab ③19A-7563-A
①—Identified by Orange marking and Green sprgs.
②—Identified by Black Paint mark (Cover), Yellow Paint mark (Pressure Plate) and silver springs.
③—Identified by White marking and Blue springs.

►***CLUTCH PRODUCTION CHANGE:*** 8BA-7563-A Clutch used on 1950 & early 1951 cars. 1A-7563-A Clutch used in production on late 1951 cars and can be used on earlier cars (has greater load capacity). Use this clutch with driven member having molded facing on flywheel side (previous type woven facings).
See Clutch Section for complete data.

Driven Member: *CAUTION—Different types used for Overdrive Cars*	9½" Clutch	10" Clutch
Std. Trans.	8HA-7550-A ④	8HAS-7550-A
Overdrive Cars	8HA-7550-B ⑤	8HAS-7550-B

④—Aluminum Springs. ⑤—Black Springs.

Pedal Adjustment: Free travel 1-1¼" (Pass. Cars), 1⅛-1⅜" (Police & Taxicab). Adjust by loosening locknut and turning adjusting nut on release rod.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Remove transmission (see TRANSMISSION Removal below). Take off flywheel housing. Install wooden wedges between each release lever and cover to hold clutch in released position, take out 6 cover capscrews, lift assembly out.

TRANSMISSION

SYNCHRO-MESH

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). *See Transmission Section for data.*

▷*TRANSMISSION NOISE CORRECTION—See Transmission Section for complete data.*

▷**Transmission Inoperative in Reverse (Overdrive Transmissions)**—*See "Ford, Lincoln, Mercury Transmission" in Transmission Section.*

Transmission Control: Steering column mounted shift *See Transmission Section for complete data.*

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame, Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model. (1950) AS1-R10E, (1951) AS4-R10E, (1950-51 Convt. & Sta. Wgn.) AS3-R10E. Solenoid operated type with governor control and throttle operated kickdown. *NOTE*—Overdrive used on Convt. & Sta. Wgn. has special solenoid mounting (pawl connected through linkage).

▷*LOCK-OUT SWITCH ELIMINATION*—Not used on 1951 cars, can be removed from earlier cars if inoperative. *See "Ford, Lincoln, Mercury Overdrive" in Transmission Section.*

Solenoid—Ford No. (exc. Convt.) 8A-6916-A replaced by 8A-6916-C (rubber coated) or 8M-6916-B. (Convertible Models) No. 8M-6916-A.

Control Relay—Ford No. 8M-6915.

Overdrive Fuse—30 amperes. On relay.

Throttle Kickdown Switch—Ford No. 8A-6918-B.

Removal: Same as for Std. Transmission (above).

▷**Overdrive not engaging, and Prolonged shorting out of Ignition on Kick-down Corrections**—*See "Ford, Lincoln, Mercury Overdrive in Transmission Section.*

FORDOMATIC TRANSMISSION

Torque converter and 3-speed automatic transmission, hydraulic control, mechanical parking lock.

▷*LINKAGE PRODUCTION CHANGE*—Throttle Linkage changed on later cars for quieter and more efficient operation. Can be installed on earlier cars.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See Fordomatic & Mercomatic in Transmission Section.*

▷*TROUBLE SHOOTING & TESTING: See Fordomatic & Mercomatic in Transmission Section.*

Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15000 miles. **Use only Automatic Transmission Fluid, Type A.**

Capacity—Approx. 9 qts.

Checking Oil Level—With transmission selector lever in "Neutral," run engine approx. four minutes at idle speed. Clean floor mat and lift right side to expose plate in floor boards, remove plate. When engine and transmission are at normal operating temperature, move the selector lever through all ranges to distributor oil through transmission. Check fluid level on indicator in filler cap, add fluid to bring level to "full" mark on indicator. Make certain cap locked in place when replaced.

▷*CAUTION—Do not fill above FULL mark.*

▷*OTHER FORDOMATIC DATA: See Transmission Sect.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used. *See Universals Section for complete data.*

▷*REPLACEMENT UNIVERSAL JOINT NOTE: TWO types furnished for service (interchangeable):*

1) **Pre-lubricated** (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).

2) **Grease Fitting** (1M-7042A Front & 1M-7039 Rear). Must be lubricated at 1000 mile intervals using a pressure gun.

▷*CAUTION (ALL CARS EXCEPT STATION WAGON)—Rear universal joint companion flange nut controls pinion bearing "pre-load" (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own Make. Semi-floating hypoid gear type with Hotchkiss drive with separate carrier. Axle ends flanged (no separate hub). Wheel bearings are sealed-ball pre-lubricated (no lubrication required). *See Rear Axle Section for complete data.*

▷**Excessive Axle Shaft Endplay (causing noise in service) Correction**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Gear Ratio:	Ratio & Marking①
Synchro-mesh Trans.	3.73-1 (11/41)
Overdrive	4.10-1 (10/41)
Fordomatic	3.31-1 (13/43) or 3.54-1 (11/39)

①—Ring and pinion gear tooth ratio (11/41 etc.) stamped on carrier.

Backlash—.005-.008". *Screw adjustment.*

Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.

▷**Carrier Mounting Bolt Tightening Caution**—*See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

▷*CAUTION—Pinion bearing pre-loading must be re-established whenever universal joint flange nut on pinion shaft is removed or disturbed. See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-P and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal).

Wheel Bearing Adjustment: None.

STATION WAGONS

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive (separate carrier not used). Axle ends flanged—(no separate hub). Wheel bearings are sealed (no lubrication required).

NOTE—AXLE NOT SAME AS PASSENGER CAR.

See Rear Axle Section for complete data.

Ratio (Standard)—3.91-1 (43-11).

Ratio (with Overdrive)—4.27-1 (47-11).

Ratio (with Fordomatic)—3.54-1 (39-11).

Backlash—.003-.008". *Shim adjustment.*

Removal: Raise rear of car. Disconnect rear universal. Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

Axle Shaft Removal: Same as Ford Pass. Car.

SHOCK ABSORBERS

Direct acting hydraulic type. Two makes used which are interchangeable. Service by replacement. *See Ford 6 Cyl. data for replacement part numbers.*

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.

See Front Suspension Section for complete data.

▷**Riding Height & Car Leveling Correction:** *See Front Suspension Section for data.*

▷**Front Suspension Noise (popping or chucking noise) Correction:** *See Front Suspension Section for data.*

Kingpin Inclination—5¼° crosswise.

Caster (Pass Cars)—Pos. ½° to Neg. 1°.

(Station Wagon)—Neg. ¼° preferred, Limits Neg. ¼° to Neg. 1¾°. Both wheels alike within ½°.

Camber (All)—Pos. ¼° to Pos. ¾° preferred. Limits 0° to Pos. 1°. Both wheels alike within ¼°.

Toe In—1/16" to 1/8".

STEERING GEAR

Ford. Worm & Roller type with eccentric adjustment. *See "1949-51 Ford Pass. Car Worm-&-Roller" in Steering Section for complete data.*

▷**Steering Idler Arm Looseness Complaints**—*See "Ford (6 & V8 Pass. Car)" in Steering Gear Section.*

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinder Diameter—Front 1⅛" (hone limit 1.132"), Rear ⅞" (hone limit .880").

Drums—Diameter 10" (11" Sta. Wagon rear drums).

Lining—Molded or Woven. Width 2¼" (front wheel), 1¾" (rear wheel). Thickness 3/16". Length per shoe:

	Front Wheels		Rear Wheels	
	Pri.	Sec.	Pri.	Sec.
Pass. Cars	11"	11"	11"	11" 15/16"
Sta. Wgn.	11 15/16"	11 15/16"	11"	11 15/16"

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Hand Brake: See Service Brakes (above).

▷**Hand Brake Linkage Change (for easier application) and Cable Interference Correction**—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Top Control: *TWO types used as follows:*

1949-50 Hydro-Lectric with Non-reversible Motor. Motor control combined with hydraulic valve to reverse flow to cylinders for up-down movement.

1951 Hydro-Lectric with Reversible Motor. Reversing motor rotation directs fluid to correct end of cylinder for up or down movement.

See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.

See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

►***ENGINE IDENTIFICATION NOTE: Engines are designated as follows for specifications and equipment:***
1951 "226" Engine—6 Cyl. 226 cu.In. L-head.
1952-53 "215" Engine—6 Cyl. 215 cu. in. Valve-in-head.
1951-53 "254" Engine—6 Cyl. "M" 254 cu. in. L-head.
1951-53 "239" Engine—V8, 239 cu. in. Valve-in-head.

VEHICLE NUMBER: Stamped in upper left hand corner of RATING PLATE on glove box door assembly (except Parcel Delivery) or on dash panel (Parcel Delivery only) and stamped on left side of frame near steering gear mounting bracket.

1951-52 VEHICLE NUMBER

Vehicle Number includes identification data in following sequence (example "F1D2KC1001"):

Truck Series①	Engine Type②	Model Year③	Assembly Plant	Serial Number
F1	D	2	See below	10001 Up

①Truck Series Note

Serial Code	Truck Series	Serial Code	Truck Series
F1	F-1 Conv.	F5	F-5 Conv.
F2	F-2 Conv.	C5	F-5 C-O-E
F3	F-3 Conv.	B5	F-5 Sch. Bus.
P3	F-3 Parcel Del.	F6	F-6 Conv.
F4	F-4 Conv.	C6	F-6 C-O-E
		B6	F-6 Sch. Bus.

②Engine Type Note

H—"226" Engine. M—"254" Engine.
D—"215" Engine. R—"239" Engine.
See Engine Identification Note above.

③Model Year Note

1—1951, 2—1952 (Last digit of model year).

1951-52 Assembly Plant Designation

AT—Atlanta	DA—Dearborn	MP—Memphis
BF—Buffalo	LU—Louisville	NR—Norfolk
CS—Chester	EG—Edgewater	RH—Richmond

	M—Memphis	

TUNE-UP

►***1952 V8 ENGINE OVERHEATING CORRECTION & ENGINE COOLING IMPROVEMENTS: See COOLING data in 1952-53 Ford V8 Passenger Car data for production changes and recommended reworking of early 1952 engines.***

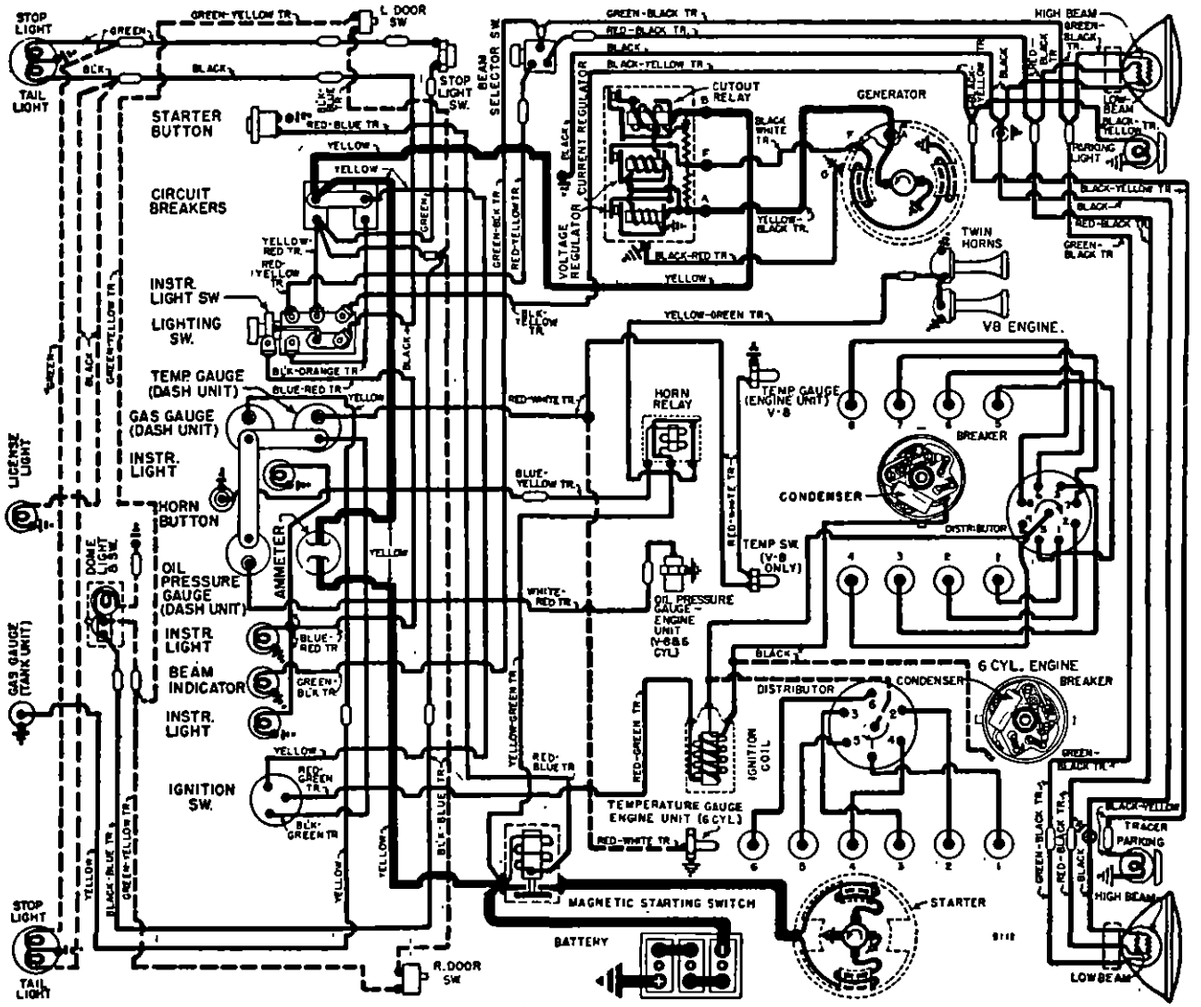
COMPRESSION PRESSURE: 215 Engine—130 lbs. at 110 RPM., 226 & 254 Engine—110 lbs. at 60 RPM., 239 Engine—110 lbs. at 90 RPM.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 6 Cyl. Engines—1-5-3-6-2-4. 8 Cyl. Engine—1-5-4-8-6-3-7-2. *See diagram for cylinder numbering order of all engines.*

SPARK PLUG GAPS: .025-.028".
Plug Type—Champion H-9 Std. *NOTE*—Type H-11 (hottest plug) can be used for slower-than-average driving. 14 mm. type.
CAUTION—Tighten plugs to 24-30 ft. lbs.

DISTRIBUTOR: "Loadomatic" type with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two springs.



Engine Type	Ford Distributor No.
1951 226 Engine	7HA-12127
1952-53 215 Engine	①FAA-12127A
1953 215 Engine	FAA-12127C
1951-53 254 Engine	8MTH-12127
1951-53 239 Engine	②8BA-12127 or OBA-12127

①—See Conversion to FAA-12127C Note below.
②—See application Caution below.

►***"215" ENGINE DISTRIBUTOR PRODUCTION CHANGE CAUTION: Two distributors used have different advance and require different Ignition Timing settings.***

►***FAA-12127-A DISTRIBUTOR CONVERSION TO FAA-12127-C TYPE: See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.***

CONTINUED ON NEXT PAGE

1951-52 MODELS

CONTINUED FROM PRECEDING PAGE

▷*CAUTION—Use 8BA-12127 with CAST IRON FRONT COVER, use 0BA-12127 with ALUMINUM COVER.*

Breaker Gap—(6 Cyl. Engines) .024-.026" (8 Cyl. Engine) .014-.016".

Cam Angle—(6 Cyl. Engines) 36° closed. (8 Cyl. Engines) 27° closed. Dwell should be 58-63% idling.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Automatic & Vacuum Advance—*See Ignition.*

▷*215 ENGINE DISTRIBUTOR INSTALLATION CAUTION—When installing distributor on engine, be sure oil pump tang engages slot in distributor shaft.*

COIL: Ford No. 8BA-12029.

Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).

CONDENSER: Ford No. 7RA-12300-C.

Capacity—.21-.25 microfarad at 70°F.

IGNITION TIMING: *CAUTION—Different timing required on "215" Engine for each type distributor.*

Engine & Distr.	Std. Ignition Setting
1951 226 Engine	At TDC.
1952-53 215 Eng. (FAA-12127A Distr.)	2° BTDC.
1953 215 Eng. (FAA-12127C Distr.)	5° BTDC.
1951-53 254 Engine	At TDC.
1951-53 239 Engine	2° BTDC.

215 Eng. Timing Mark—First type damper has one groove located 2° BTDC. (correct for first FAA-12127-A distr.). Later type damper has four marks (TDC or 0°, 3°, 7°, & 9° BTDC).

▷*REWORKING TIMING MARK ON FIRST 215 ENGINES:* If later FAA-12127-C distributor used on trucks with first type damper (2° BTDC mark only), make a new timing mark on the damper 3° or .165" to the right or clockwise from old mark for timing.

226 Engine Timing Mark—Circular boss or groove on dampener and two pointers on engine front cover. Use pointer nearest outer circumference of dampener.

254 Engine Timing Mark—Groove on damper aligned with pointer on engine front cover.

239 Engine Timing Mark—Mark on crankshaft pulley should be aligned with pointer on front cover.

Timing Procedure—*See Ignition Timing.*

CARBURETION (1952-53 "215" ENGINE): Holley-Ford. "Visi-flo" downdraft types. Carburetor used on 1953 Fordomatic Trucks has Anti-stall dashpot.

▷*1952 CARBURETOR LEAKAGE CORRECTION & FUEL BOWL CHANGE: See "Holley-Ford Visi-flo" in Carburetor Section.*

Idle Setting—Approximately 1 turn open. Set for highest steady vacuum reading with engine at normal operating temp., midway between rolling and missing points. Turn screw out for richer mixture.

Idle Speed—475-500 RPM.

CAUTION: Set idle speed only with engine warm and choke valve in wide open position.

Float Level: *See Ford "Visi-flow" Carburtor in Carburetor Section for complete data.*

Fuel Level—Flush to 1/16" below top edge of float hinge bracket in bowl. To adjust, remove bowl cover, bend float tab which contacts float needle spring. *NOTE—Fuel level can be checked through glass bowl cover without disturbing carburetor.*

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather (holes located in throttle lever). Shift pump link as required.

Throttle Linkage Adjustment (Fordomatic Trucks): *See "Fordomatic & Merco-Matic" in Transmission Section for complete data.*

Anti-Stall Dashpot (Fordomatic Trucks): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½ turns to 2 turns for .045-.064" clearance, tighten locknut.

Fuel Pump Pressure: 4-5 lbs.

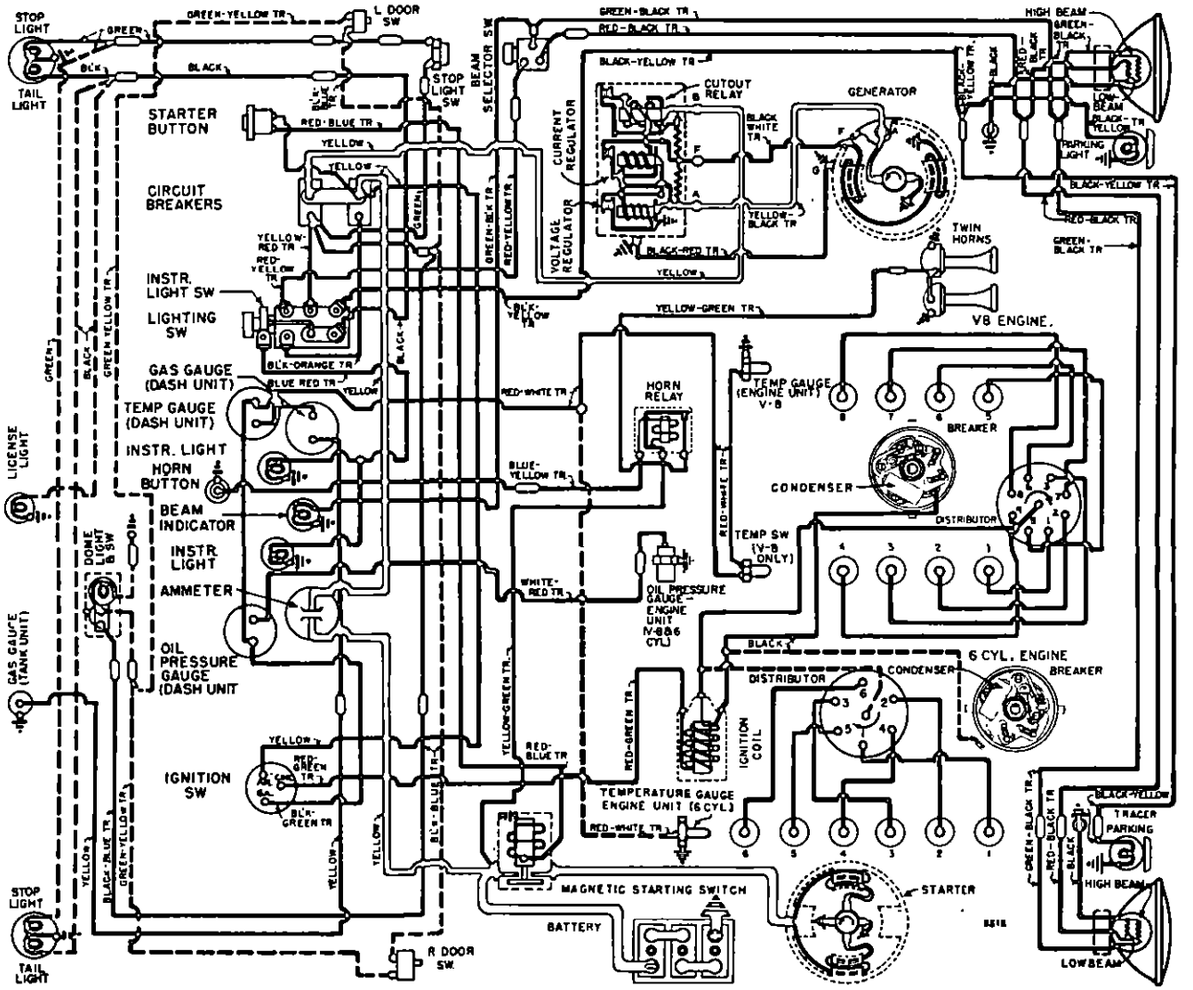
CARBURETION (1951 "226" & 1951-53 "254" ENGINE): Holley-Ford. Single barrel downdraft (conventional trucks), updraft (Parcel Delivery & Cab-over-Engine trucks) with manual choke control.

Idle Setting—1 turn open. Turning screw out gives richer mixture.

Idle Speed—475-500 RPM.

Float Level (Downdraft Carburetors)—1.322-1.353" (226 Eng. 7HT-9510A Carb.), 1.283-1.315" (254 Eng. 8MTH-9510A Carb.) measured from bottom of float to machined surface of air horn (invert assembly and allow float to hang down in valve closed position).

Float Level (Updraft Carburetors)—1.180-1.200" (all carburetors) measured from bottom of float to face of bowl cover with valve seated (invert assembly).



Accelerating Pump—Center hole average setting. Inner hole for hot weather, outer for cold.

Fast Idle: Integral type. Operated by choke lever. No adjustment required.

Fuel Pump Pressure: 4-5 lbs.

CARBURETION (1951-53 "239" V8 ENGINE): Holley-Ford. Dual downdraft type with manual choke control. Carburetor used on 1953 Fordomatic Trucks has Anti-stall dashpot.

Idle Setting—Approximately 1 turn open. Adjust both screws alike. Turn screws out for richer mixture.

1953 MODELS

Idle Speed—475-500 RPM.
Float Level—*CAUTION—DIFFERENT setting required for cars with "High-lift" Nozzle Bars as follows:* 1.322-1.353" (Std. Nozzle Bar Carburetors Nos. 7RT-9510A, 8RT-9510A). 1.275-1.305" (High-lift Nozzle Bar Carburetors Nos. 8RT-9510F, 8RT-9510G). Measure from bottom of float to underside of cover with needle valve seated (invert assembly).
Accelerating Pump—Center hole average setting. Inner hole for hot weather, Outer for cold.
Fast Idle: Integral type. Operated by choke lever. No adjustment required.
Throttle Linkage Adjustment (Fordomatic Trucks): *See "Fordomatic & Mercomatic" in Transmission Section for complete data.*
Anti-Stall Dashpot (Fordomatic Trucks): See 215 Engine Carburetor (above) for adjustment procedure.
Fuel Pump Pressure: 3½-4½ lbs.
MANIFOLD HEAT CONTROL: Automatic thermostatic type. **6 Cyl. Engines**—Located at center of exhaust manifold. **8 Cyl. Engine**—"Duck-Bill" type thermostatic valve located inside right side of crossover pipe near flange.
VALVE TAPPET CLEARANCE: *CAUTION—DIFFERENT setting required for each type engine as follows:*

"215" Engine

All Valves—.014-.016" HOT or cold setting of .013-.015" Intake, .015-.017" Exhaust. *NOTE*—Adjusting screws located in rocker arms on head.

"226" Engine

Intake—.013-.015", **Exhaust**—.017-.019". *NOTE*—Self-locking adjusting screws located in valve lifters in valve chamber.

"254" Engine

Intake—.009-.011", **Exhaust**—.014-.016" *NOTE*—Self-locking adjusting screws located in valve lifters in valve chamber.

"239" Engine

Intake—.014" (.013-.015"), **Exhaust**—.018" (.017-.019") COLD. *NOTE*—No tappet clearance adjustment provided. *See "Valve Tappet Clearance" in Ford Special Data.*

IGNITION

IGNITION SWITCH: Ford No. OL-11572-A (All Models 1951-52, Parcel Del 1953), **No. FAA-11572-A** (All Models exc. Parcel Del. 1953).
COIL: Ford No. 8BA-12029.
Ignition Current—Idling 2.75-3.0 amperes at 6 volts. 5-5.5 amperes stopped.
CONDENSER: Ford No. 7RA-12300-C.
Capacity—.21-.25 microfarad.
DISTRIBUTOR: Less distributor cap and rotor.
Type—"Loadomatic" type with spark advance controlled by diaphragm moving breaker plate to advance spark against two breaker plate springs.

Engine Type	Ford Distributor No.
1951 226 Engine	7HA-12127
1952-53 215 Engine	①FAA-12127A
1953 215 Engine	FAA-12127C
1951-53 254 Engine	8MTH-12127
1951-53 239 Engine	②8BA-12127 or OBA-12127

①—See Conversion to FAA-12127C Note below.
②—See application Caution below.

►*CAUTION—Use 8BA-12127 with CAST IRON FRONT COVER, use OBA-12127 with ALUMINUM COVER.*
►*"215" ENGINE DISTRIBUTOR PRODUCTION CHANGE CAUTION: Two distributors used have different advance and require different Ignition Timing settings.*
►*FAA-12127-A DISTRIBUTOR CONVERSION TO FAA-12127-C TYPE: See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.*
Breaker Gap—(6 cyl.) .024-.026"; (V8) .014-.016".
Cam Angle—(6 Cyl.) 36° closed. (8 Cyl.) 27° closed. Dwell should be 58-63% idling.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

IGNITION TIMING

►*215 ENGINE TIMING CAUTION—Different timing required for each type distributor:*

Engine & Distr.	Std. Ignition Setting
1951 226 Engine	At TDC.
1952-53 215 Eng. (FAA-12127A Distr.)	2° BTDC.
1953 215 Eng. (FAA-12127C Distr.)	5° BTDC.
1951-53 254 Engine	At TDC.
1951-53 239 Engine	2° BTDC.

215 Eng. Timing Mark—First type damper has one groove located 2° BTDC. (correct for first FAA-12127-A distr.). Later type damper has four marks (TDC or 0°, 3°, 7°, & 9° BTDC). Set timing at 5° BTDC (midway between 3° and 7° marks) with later FAA-12127-C distributor.
►*REWORKING TIMING MARK ON FIRST 215 ENGINES:* If later FAA-12127-C distributor used on trucks with first type damper (2° BTDC mark only), make a new timing mark on the damper 3° or .165" to right or clockwise from old mark for ignition timing.
226 Engine Timing Mark—Circular boss or groove on dampener and two pointers on engine front cover. Use pointer nearest outer circumference of dampener.
254 Engine Timing Mark—Groove on damper aligned with pointer on engine front cover.
239 Engine Timing Mark—Mark on crankshaft pulley should be aligned with pointer on engine front cover.
Timing (with Neon Timing Light)—*CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.* Mark timing mark and pointer with white chalk. Connect timing light to No. 1 spark plug, idle engine, adjust distributor by loosening clamp screw, rotate distributor until mark and pointer aligned, tighten clamp screw, connect vacuum line.

CARBURET R

Holley-Ford Types (as listed below)—Dual (8 cyl.), single barrel (6 Cylinder), Downdraft types (Updraft on 6 Cyl. Parcel Delivery & Cab-over-Engine Models). All carburetors have vacuum passages for distributor advance control and manual choke. Anti-stall Dashpot used on Fordomatic truck models.

Engine	Ford Carburetor No.
1951 "226" Eng. (Downdraft)	7HT-9510A
1951 "226" Eng. (Updraft)	7HW-9510
1951-53 "254" Eng. (Downdraft)	8MTH-9510A
1951-53 "254" Eng. (Updraft)	8MWH-9510A
1951-52 "239" Engine	7RT-9501A & 8RT-9510A
1953 "239" Eng. (exc. Fordomatic)	8RT-9510G
1953 "239" Eng. (Fordomatic)	8RT-9510H
1952-53 "215" Eng. (exc. Fordomatic)	EAG-9510B
1953 "215" Eng. (Fordomatic)	EAA-9510H

►*1952 EAG-9510B CARBURETOR LEAKAGE CORRECTION & FUEL BOWL CHANGE: See "Holley-Ford Visi-flo" in Carburetor Section.*
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, & Accelerating Pump): *See Tune-Up.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.
Throttle Linkage Adjustment (Fordomatic Trucks): *See "Fordomatic & Merco-Matic" in Transmission Section for complete data.*

CARB. EQUIPMENT

Air Cleaner: AC Oil Bath or Oil Wetted types.
Fuel Pump: AC. Diaphragm types as follows:

Engine	Ford Pump No.
1951 "226"	1HA-9350A & 1HA-9350G
1951 "254"	1HA-9350A
1951-53 "254"	1HA-9350G
1951 "239" (Fuel only)	1BA-9350A
1951 "239" (Fuel & Vacuum)	1BA-9350E
1951-53 "239" (Fuel only)	1BA-9350G
1951-52 "239" (Fuel & Vacuum)	1BA-9350H
1953 "239" (Fuel & Vacuum)	EAB-9350A
1952-53 "215" (Fuel only)	EAA-9350E
1952-53 "215" (Fuel & Vacuum)	EAA-9350F

►*6 CYL. "215" ENGINE LOW FUEL PUMP PRESSURE: Check for camshaft eccentric wear. See "Fuel System" in Ford Special Data.*
►*V8 "239" ENGINE LOSS OF POWER OR ENGINE CUTTING OUT DURING HEAVY OPERATION OR HIGH SPEED: May be caused by pushrod wear. See "Fuel System" in Ford Special Data.*
See Carburetion Equipment Section for complete data.
Gasoline Gauge: King-Seeley Electric (Not Constant Voltage type).
Dash Unit—Ford No. 1C-9280-A (1951-52 All Models & 1953 Parcel Del.), No. FAD-9280-A (1953 All Models exc. Parcel Delivery).
Tank Unit—Ford Nos. as follows:

1951-52 Trucks

21C-9275-B—F-1, F-2, F-3 Panels.
7RC-9275—All models (Closed Cabs).
7RT-9275—F-5, F-6 Panels & School Bus.

1953 Trucks

Ford No. 9275-B—F-100, F-250, F-350 Panels & F-350 & F-500 Parcel Delivery.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Ford No. 7RT-9275—F-500, F-600, F-700 Panels & School Bus (Exc. Parcel Delivery & C-O-E- Models).
Ford No. FAC-9275-B—F-500, F-600, F-700 Closed Cab (Except C-O-E- Models & Parcel Delivery).
Ford No. FAC-9275-A—All C-O-E Models.
See Carburetion Equipment Section for complete data.

BATTERY

F-100, *F-250, F-350 Series—Ford No. 81A-10655-L. 6 volt, 15 plate, 90 amp. hr. capacity (20 hr. rate).
F-500, F-600 Series—Ford No. 81A-10655-J. 6 volt 17 plate, 100 ampere hour capacity (20 hr. rate).
F-700 Series—Ford No. 01A-10655-J. 6 volt, 17 plate, 120 ampere hour capacity (20 hr. rate).
Grounded Terminal—Positive (+) terminal.
Location—(Except C-O-E) In engine compartment. (C-O-E)—On right running board.

STARTER

Engine	Ford Starter No.
1951 All Engines	1A-11002A
1952-53 254 Engine	FAD-11002A
1952 215 Engine	FAE-11002A
1953 215 Engine (exc. Fordomatic)	FAC-11002C
1953 215 Engine (Fordomatic)	FAE-11002A
1952-53 239 Eng. (exc. Fordomatic)	FAD-11002A
1953 239 Engine (Fordomatic)	FAE-11002A

Starter No.	Drive	Armature No.
1A-11002-A	④	18-11005
FAC-11002-A	①1CM-11350-C	52-11005
FAD-11002-A	②B-11350	18-11005
FAD-11002-A	③8HA-11350	18-11005
FAE-11002-A	①1CM-11350-C	1CM-11005-A

①—"Folo-thru" type drive.
②—239 Engine. ③—254 Engine.
④—B-11350 (10-tooth pinion), 8HA-11350 (9-tooth pinion).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs.
Normal Cranking Speed—100 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	①	6.5	70
16 ft. lbs.	Lock	3.5	700

①—With starter on engine and engine running.

Starting Switch: Ford No. 21A-11450 (1951), No. FAB-11450-B (1952-53) Magnetic type controlled by push-button on instrument panel. *NOTE*—Neutral Switch Ford No. FAC-15812-B used on trucks with Fordomatic Transmission.

GENERATOR

Own. Two-brush with voltage & current regulation.

Engine	Ford Generator No.	Armature
1951 (All)	8BA-10002A①	OA-10005A
1951 (All)	8BA-10002B	8EH-10005
1951 (All)	8BA-10002D	OA-10005A
1951-53 (All)	FAA-10002B	OA-10005A
1952-53 (239)	FAA-10002A	OA-10005A
1953 (239)	FAF-10002A②	
1953 (239)	8EL-10002B	8EH-10005
1953 (215)	FAF-10002B③	
1953 (All)	FAB-10002C	8EH-10005

①—Use 8BA-10002D for service replacement.
②—Use FAA-10002A for service replacement.
③—Use FAA-10002B for service replacement.
Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—Controlled by regulator and dependent on load and battery condition.

Performance Data

Generator	Amperes	Engine RPM.
8BA-10002-A	35	935
8BA-10002-B	40	
8BA-10002-D	35	900
FAA-10002-A	35	850
FAA-10002-B	35	1030
FAB-10002-C	①40	890
FAB-10002-C	②45	960
FAF-10002-A	32	
FAF-10002-B	32	
8EL-10000-B	①40	
8EL-10000-B	②45	

①—With FAD-10505-A Regulator.
②—With FAE-10505-A Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—26-34 ozs.

Belt Adjustment: (215 Engine)—½" belt deflection midway between fan and crankshaft pulleys, and ¼" deflection between generator and water pump pulleys.

Belt Adjustment (226 & 254 Engines): ¼" deflection midway between generator and water pump pulleys.

Belt Adjustment: (239 Engine)—Loosen two bolts on fan mounting bracket, loosen generator support mounting stud nut and raise generator up until side movement on belt midway between generator and water pump pulleys is ½" (thumb and finger pressure), tighten stud nut. Adjust fan belt in similar manner, tighten two fan bracket bolts.

REGULATOR

Ford Regulator No.	For Generator
51A-10505-A, H	8BA-1002-A, D
5EH-10505-A	8BA-10002-B
8L-10505	8BA-10002-B
8M-10505, A	8BA-10002-A, D; FAA-10002-B
FAC-10505-A	FAA-10002-A, B
FAD-10505-A	①FAB-10002-C, 8EL-10000-B
FAE-10505-A	②FAB-10002-C, 8EL-10000-B

①—With 40 ampere output.
②—With 45 ampere output.

Three-unit voltage and current regulators.
See Electrical Equipment Section for complete data.
NOTE—Settings below are for regulator at normal operating temperatures (after ½-hour operation) with room temperature of 75°F.

Cutout Relay

Cuts In—6.0-6.6 volts.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—*See Electrical Equipment Sec.*

Current Regulator

Setting (51A-10505-A)—30-34 amperes.
Setting (51A-10505-H)—34-38 amperes.
Setting (5EH-10505-A & 8L-10505)—38-42 amps.
Setting (8M-10505, A)—34-38 amperes.
Setting (FAC-10505-A)—34-38 amperes.
Setting (FAD-10505-A)—38-42 amperes.
Setting (FAE-10505-A)—43-47 amperes.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Light between fuel and oil gauges on panel. Lighted when upper beam in use.

Switches

Lighting—Ford. (1951-52) No. OL-11654-A, (1953) No. FAA-11654-A.
Beam Selector—Ford No. 8A-13532.
Instrument—Ford No. OL-13740.
Stop Light—Ford No. OA-13480.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Ford No. 8C-12258-B. Consists of a 15 ampere and a 30 ampere circuit breaker, located behind instrument panel.

HORNS: Dual horns with relay.

ENGINE

▷*ENGINE NOTE—Various engines used as follows:*

6 CYL. "226" ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. "H", L-head type.
Bore—3.30" **Stroke**—4.40"
Displacement—225.9 cu. ins. **Rated HP.**—26.1
Developed Horsepower—95 at 3300 RPM.
Compression Ratio—6.8-1.
CYLINDER SLEEVES: *See Ford Special Data.*
ENGINE & OIL PAN REMOVAL: *See Ford Special Data.*
CYLINDER HEAD & GASKET INSTALLATION: *See Ford Special Data.*
▷**ALL OTHER ENGINE DATA:** *See 1951 Ford 6 Cylinder Pass. Car engine data.*

6 CYL. "215" ENGINE

ENGINE SPECIFICATIONS: 6 Cylinder "D" Valve-in-head type.
Bore—3.65" **Stroke**—3.60"
Displacement—215 cu. ins. **Rated HP.**—30.4
Developed Horsepower—101 at 3500 RPM.
Compression Ratio—7.0-1.
▷*215 ENGINE VIBRATION NOTE—Vibration may be caused by incorrect installation of Rear Main Bearing Oil Seals. See "Crankshaft & Main Bearings" in Ford Special Data.*
ENGINE & OIL PAN REMOVAL: *See Ford Special Data.*
CYLINDER HEAD & GASKET INSTALLATION: *See Ford Special Data.*
▷**ALL OTHER ENGINE DATA:** *See 1952-53 Ford 6 Cylinder Pass. Car engine data.*

V8 "239" ENGINE

ENGINE SPECIFICATIONS: V8 "R" L-head type.
Bore—3.187" **Stroke**—3.75"
Displacement—239.4 cu. ins. **Rated HP.** 32.5
Developed Horsepower—106 at 3500 RPM.
Compression Ratio—6.8-1.
▷*239 ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING—May be caused by excessive wear or fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*
▷*1952 V8 ENGINE OVERHEATING CORRECTION & ENGINE COOLING IMPROVEMENTS: See COOLING data in 1952-53 Ford V8 Passenger Car data for production changes and recommended reworking of early 1952 engines.*
ENGINE & OIL PAN REMOVAL: *See Ford Special Data.*
CYLINDER SLEEVES: *See Ford Special Data.*
CYLINDER HEAD & GASKET INSTALLATION: *See Ford Special Data.*
▷*CYLINDER HEAD & GASKET PRODUCTION CHANGE: See Ford Special Data.*
▷**ALL OTHER ENGINE DATA:** *See 1951-1952-1953 Ford V8 Pass. Car engine data for all engine data EXCEPT THE FOLLOWING:*

CONTINUED ON NEXT PAGE

V8 "239" ENGINE (Cont.)

►**239 Engine Piston Fitting Note**—Use ½" wide feeler gauge inserted between piston and cylinder wall at right angle to pin on thrust side. Feeler thickness as follows: **New piston in new bore .0015". New piston in used bore .0015". Used piston in used bore .003".** Pull to withdraw feeler should be 3-12 lbs.

6 CYL. "254" ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. "M" L-head.
Bore—3.50" **Stroke**—4.40"
Displacement—254 cu. ins. **Rated HP.**—29.4
Developed Horsepower—112 at 3500 RPM.
Compression Ratio—6.8-1.

ENGINE & OIL PAN REMOVAL: *See Ford Special Data.*

CYLINDER SLEEVES: *See Ford Special Data.*

CYLINDER HEAD & GASKET INSTALLATION: *See Ford Special Data.*

►**ALL OTHER ENGINE DATA:** *See 1951 Ford 6 Cyl. Pass. Car "H" Engine data for all engine data EXCEPT THE FOLLOWING:*

PISTONS: Split skirt pistons used in early 1950, solid skirt pistons used beginning with later 1950 engines. Solid skirt piston data as follows:

►***CAUTION—Install piston with small indentation toward front of engine. Piston pin is offset 1/16".***
Removal—Pistons and rods removed from above.
Clearance—See Piston Fitting below.

Replacement Pistons: Std., .0025", .020", .030", .040", .060" Oversize.

Fitting Pistons: With piston inverted in cylinder bore so that end of piston is ⅝" below top of block and with piston pin bore parallel to crankshaft, use a ½" wide feeler gauge between piston and cylinder wall at right angle to pin on thrust side. Feeler thickness as follows: **New piston in new bore .0015". New piston in used bore .002". Used piston in used bore .003". 5-10 lbs.** pull should be required to withdraw feeler.

Installing Pistons: Locating mark (small indentation) on head of piston must be toward front of engine. Piston pin is offset 1/16" toward thrust side of piston.

PISTON RINGS: Two compression and one slotted oil control ring, all above piston pin.

Ring	End Gap	Side Clearance
Compr. #1	.007-.047"	.0020-.0035"
Compr. #2	.007-.047"	.0015-.0030"
Oil #3	.007-.047"	.0015-.0030"

►***NOTE—The minimum gap given above is for a new piston ring in a new (or rebored) bore. The maximum gap is for a new ring in a worn bore that is not to be resized.***

Replacement Rings: "Snap" type and "Expander" type rings available for service in the following sizes: Std., .020", .030", .040" .060" Oversize.

VALVE TIMING

VALVE TAPPET CLEARANCE: ***CAUTION—DIFFERENT setting required for each type engine as follows:***

"215" Engine

All Valves—.014-.016" HOT or cold setting of .013-.015" Intake, .015-.017" Exhaust. *NOTE*—Adjusting screws located in rocker arms on head.

"226" Engine

Intake—.013-.015". **Exhaust**—.017-.019". *NOTE*—Self-locking adjusting screws located in valve lifters in valve chamber on right side.

"254" Engine

Intake—.009-.011". **Exhaust**—.014-.016". *NOTE*—Self-locking adjusting screws located in valve lifters in valve chamber on right side.

"239" Engine

Intake—.014" (.013-.015"), **Exhaust**—.018" (.017" .019") COLD. *NOTE*—No tappet clearance adjustment provided. *See "Valve Tappet Clearance" in Ford Special Data.*

VALVE TIMING: *See "Camshaft Setting" in engine data for correct meshing of timing gears and chain.*

►***215"ENGINE CAUTION—Valve timing is different on Pass. Car and Truck engines.***

215 Engine①

Intake Valves—Open 13° BTDC. Close 68° ALDC.
Exhaust Valves—Open 55° BLDC. Close 22° ATDC.
①—With .015" Intake & Exhaust tappet clearance.

"226" & "254" Engine②

Intake Valves—Open 11° BTDC. Close 41° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.
②—With .010" Int., .014" Exh. tappet clearance.

1951 "239" Engine③

Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 3° ATDC.
③—With No. 8BA-6250-B Camshaft (marked "B") and tappet clearance of .014" Intake, .018" Exhaust.

1952-53 "239" Engine④

Intake Valves—Open 21° BTDC. Close 68° ALDC.
Exhaust Valves—Open 56° BLDC. Close 11° ATDC.
④—With No. EAB-6250-B Camshaft (marked "E") and tappet clearance of .014" Intake, .018" Exhaust.

LUBRICATION

Crankcase Capacity: (215, 226, 239 Engines) 5 quarts. (254) Engine) 6 quarts. One quart additional required when filter being changed.

Oil Filter (215 Engine): "Full-Flow" type with pressure relief valve in filter center bolt. Replace element at 4000-5000 mile intervals, or whenever oil becomes dirty.
Replacement Filter Element—Ford No. CPA-6731A (Kit—includes gaskets).

►***CAUTION—This special Full-Flow filter element MUST BE USED (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication).***

►***215 ENGINE OIL FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION—See "Oiling System" in Ford Special Data.***

Oil Filter (226, 254, 239 Engines); By-pass (partial flow) type. Mounted on left side of crankcase (226 & 254), on left hand cylinder head (239). Replace element at 4000 mile intervals or more often if required.
Replacement Filter Element—Ford No. 7HA-6731A (Kit—with gaskets).

Normal Oil Pressure (at 2000 RPM): 215 & 226 Engine) 45 lbs., (239 Engine) 57 lbs., (254 Engine) 50 lbs. Not adjustable.

Oil Pump Relief Valve Spring Testing

Engine	Pressure	Length
215 Engine	9.82 lbs.①	1.56"
239 Engine	12.00 lbs.②	1.14"
226 & 254 Eng.	12.75 lbs.③	1.14"

①—Plus or minus 2 ozs. ②—Plus or minus .12 lbs.

Oil Pump (215 & 239 Engines): Gear type mounted in crankcase.
Pump Removal & Overhaul—See Ford Special Data.

Oil Pump (226 & 254 Engine): Rotor type. Mounted externally on right side of engine.
Pump Removal & Overhaul—See Ford Special Data.

Oil Pressure Gauge: King Seeley Electric (Not Constant Voltage Type).
Dash Unit—Ford No. 1C-9273-A (1951-52 All Models & 1953 Parcel Delivery), No. FAE-9273-A (1953 All Models exc. Parcel Delivery).

►***ENGINE SENDING UNIT INSTALLATION CAUTION:*** Unit must be installed so that "UP" marking on cover is at top vertical position.
Engine Unit—Ford No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler cap (inlet).

COOLING

Cooling System: Pressure type with relief valve in filler cap, by-pass in block, and belt driven water pump (two used on V8 "R" engine).
Capacity—For each engine as noted. 1 qt./addtl. when heater is installed.
(226 Eng.) 17 qts. (F1, 2, 3), 18 qts. (F4, 5, 6).
(254 Eng.) 18 qts. (1951), 19.3 (1952), 20 (1953).
(215 Eng.) 15 qts. (1952 F1, 2, 3), 16 qts. (1952 F4, 5, 6), 18½ qts. (All 1953).
(239 Eng.) 23 qts. (1951-52), 24½ qts. (1953).
Pressure Valve—Ford No. 1T-8100-A. Radiator filler cap. 4-lb. type (opens at 3½-4½ lbs.).

Water Pumps: Centrifugal, belt driven, packless type. Two pumps used on V8 239 Engine.
See Water Pump Section for complete data.

Thermostat: In cylinder head water outlet.
215 Engine—Dole type. Ford No. EAG-8575-A. Opens at 147-152°.
239 Engine—Bellows type. Ford No. 8RT-8575-B. Opens at 148-153°.
226 Engine—Dole type. Ford No. 7HT-8575-B or 8HT-8575-B (Std.—opens at 157-162°F). Spring & Cartridge type No. 7HT-8575-C (Permanent Anti-freeze—opens at 177-182°F).
254 Engine—Dole type. Ford No. 7HT-8575-B or 8HT-8575-B (Std.—opens at 157-162°F) or No. 8HT-8575-A (opens at 148-153° F). Spring & Cartridge type No. 7HT-8575-C (Permanent Anti-freeze—opens at 177-182°F).

Temperature Gauge: King-Seeley Electric (Not Constant Voltage Type).
Dash Unit—Ford No. 1C-10883-A (1951-52 All Models & 1953 Parcel Delivery), No. FAE-10883-A (1953 All Models except Parcel Delivery).
Engine Unit—Ford No. 8A-10884 (stamped "224"). This "sender" unit mounted in right hand cylinder head on V8 engines with additional switch mounted in left hand cylinder head.
Engine Temperature Switch (V8 Engine)—Ford No. 8A-10990 (stamped "217"). In left hand cyl. head.
See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-T1, (F-1, F-100, F-250). Used with 3-speed transmission.
Long Model 11CF-C1 (All Other Models).
Semi-centrifugal, single plate dry disc type.
See Clutch Section for complete data.
Facings (10CF)—**Molded.** 10" O.D. .125" thick.
Facings (11CF)—**Woven.** (School Bus), **Molded**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

(others). Outside diameter 11". Thickness .137".

Pedal Adjustment: 1⅛-1⅜" pedal free travel. Adjusting clevis provided at forward end of connecting rod between pedal shaft and equalizer shaft.

Removal: Remove transmission (see TRANSMISSION removal below). Install wooden wedges between each release lever and cover to hold clutch in released position, take out cover capscrews, lift assembly out. NOTE—Flywheel housing bolts may have to be removed on some models.

TRANSMISSION

3-SPEED

Own Make. 3-speed, all helical gear type. Constant mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse). Steering column shift lever standard on F-1 and F-100 Trucks.

See Transmission Section for complete data.

Removal: Remove propeller shaft by disconnecting rear universal and sliding yoke out of transmission. Disconnect clutch linkage and speedometer cable. Remove front floor plate. Remove nuts and washers from two engine rear support bolts. Raise rear end of engine (use block of wood on jack under engine) until rear support clears mounting bolts. Remove transmission mounting capscrews, pull transmission straight back until main drive gear shaft clears clutch, lift transmission out through floor opening.

3-SPD. HEAVY DUTY

Own Make. Heavy duty, 3-speed helical gear, constant mesh, synchro-mesh (Second & High). Sliding gear (Low & Reverse).

See Transmission Section for complete data.

NOTE—This transmission standard equipment on 1951-52 F-2 & F-3 and on 1953 F-250, F-350 Conventional Trucks, F-350 & F-500 Parcel Delivery. Optional on 1951-52 F-1, F-4, & F-5, and on 1953 F-100 & F-500 Conventional Trucks & School Bus.

Removal: Same as for 4-speed type following.

4-SPD. SYNCHRO-MESH

Own Make. 4-speed constant-mesh type. Synchro-mesh (Second, Third & High). Helical gears used for second, third and fourth speed. Spur gears used low and reverse.

▷*SHIFTER SHAFT LOCK PLUNGER SPRING CHANGE (To prevent transmission jumping out of gear):* Heavier spring (Part No. BB-7234) now used in production. This spring exerts pressure of 22-26 lbs. against plunger balls (8-9 lbs. with previous 8D-7234 spring).

See Transmission Section for complete data.

NOTE—This transmission standard equipment on 1951-52 F-6 (with "M" Engine) and 1953 F-500, F-600, F-700 Conventional Trucks and School Bus, and F-500, F-600 C-O-E. Optional on 1951-52 F-4, F-5, & F-6, and on 1953 F-100, F-250, F-350 Conventional Trucks and F-350 & F-500 Parcel Delivery.

Removal: Remove seat cushion, floor mat, and transmission cover on floor. Support engine with jack under flywheel housing (use wood block on jack), raise jack until engine weight is off rear mounting. Free coupling shaft support bearing from crossmember by removing nuts on two bolts, disconnect front universal joint by taking out four bolts mounting universal joint flange at hand brake drum and disconnect intermediate universal joint at support bearing by removing nuts on "U" bolts (tape bearing caps in place to prevent losing needle bearings), remove front shaft. Remove clutch equalizer shaft by taking out pin in clutch shaft and clevis pin at lever and pulling equalizer shaft off the bracket (CAUTION—Do not lose spring and bushing halves). Remove two bolts in engine rear support. Disconnect speedometer shaft at transmission. Remove transmission capscrews from flywheel housing, pull transmission straight back until clutch (main drive gear) shaft clears, then lift transmission out through floor opening.

NOTE—To remove brake assembly, take out 2 capscrews in hand brake lever sector on transmission case and two capscrews in brake adjusting screw bracket, disconnect hand brake link from transmission and anchor adjusting screw from brake band, remove brake band assembly and hand brake lever.

▷*TRANSMISSION INSTALLATION CAUTION—Make sure that all Universal Joint yokes are in the same plane when reinstalling to avoid drive-line unbalance.*

OVERDRIVE

Warner Model AS4-R10F. Overdrive is solenoid operated (no centrifugal pawls) with Governor control and throttle operated kick-down. There is no Lock-out switch on this unit.

See Transmission Section for complete data.

Overdrive Solenoid—Ford No. FAA-6916-A.
Control Relay—Ford No. 1M-6915-A.
Overdrive Governor—Ford No. 8M-6943.
Overdrive Fuse—30 amperes, on relay.
Throttle Kick-down Switch—Ford No. 8A-6918-B.

Removal: Same as for standard transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque Converter and three-speed automatic transmission with hydraulic control and mechanical parking lever. *NOTE*—This unit similar to Pass. Car model except that external Oil Cooler is used.

Lubrication (Capacity & Checking Oil Level)—*See 1953 Ford 6 Cyl. or V8 Pass. Car data.*

▷*OTHER FORDOMATIC SERVICE DATA—See "Fordomatic and Merc-O-Matic" in Transmission Section for complete data.*

UNIVERSALS

Spicer. Needle bearing type.

▷*UNIVERSAL JOINT INSTALLATION CAUTION—Make sure that all universal joint yokes in drive line are in the same plane, to avoid drive-line unbalance.*

Coupling Shaft Center Bearing: Consists of cushion mounted ball bearing bolted to underside of frame intermediate cross-member. Bearing is mounted on end of coupling shaft in a sleeve with felt retainer sleeve on each end and bearing baffle on front end.

REAR AXLE

SEMI-FLOATING (F-1 & F-100)

Own Make. Semi-floating, Hypoid gear type with Hotchkiss drive **(separate carrier not used).** Axle end flanged (no separate hub). Wheel bearings are sealed (pre-lubricated). No lubrication required.

▷*NOTE—AXLE NOT SAME AS FORD PASSENGER CAR (EXCEPT STATION WAGON & SEDAN DELIVERY).*

See Rear Axle Section for complete data.

Ratio (Standard)—3.92-1 (47-12).
Ratio (Optional)—4.27-1 (47-11).
Ratio (Overdrive)—4.09-1 (45-11).
Ratio (Fordomatic)—3.92-1 (47-12).
Backlash—.003-.008". Shim adjustment.

Removal: Raise rear of truck. Disconnect rear universal. Remove axle shafts (see instructions below). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Remove nuts on rear spring U-bolts, drive bolts up free of housing, lower axle assembly and remove from underneath.

Axle Shaft Removal: Remove wheel. Take off drum. Remove four axle retainer nuts (work through opening in axle shaft flange). Use puller No. 4235 and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal).

Wheel Bearing Adjustment: None required in service.

FULL FLOATING

Own Make. Full-floating, Spiral Bevel or Hypoid Gear types as listed below. *DIFFERENT TYPES USED AS FOLLOWS:*

1951-52 Rear Axle Types

F-2, F-3, F-4, F-5 . . ..①Split Housing Spiral Bevel
F-4, F-5 (Later)..... ....②Split Housing Spiral Bevel
F-6 .... Split Housing Hypoid

1953 Rear Axle Types

F-250 Conv. .....③(Light) Split Housing Hypoid
F-350 Par. Del..... .③(Light) Split Housing Hypoid
F-350 Conv. .....④(Heavy) Split Housing Hypoid
F-500, F-600 . .....Banjo Housing Hypoid
F-700 ....④(Heavy) Split Housing Hypoid

①—With pinion bearings mounted directly in housing and pre-loaded by pinion shaft nut (tapered pinion shaft).
②—With pinion bearings in sleeve bolted in housing (bearings pre-loaded by spacer and universal yoke nut). Pinion shaft is splined.
③—Pinion bearings mounted directly in housing.
④—Pinion bearings mounted in sleeve bolted in axle housing.

See Rear Axle Section for complete data.

1951-52 Truck Models	Available Axle Ratios
F-2, F-3	4.86-1 (34-7), 4.11-1 (37-9)②
F-4	5.14-1 (36-7), 5.83-1 (35-6)②
F-5	6.66-1 (33-5), 5.83-1 (35-6), 5.14-1 (36-7)②

①—.008-.013" backlash. ②—.004-.018" backlash.
③—.006-.012" backlash. ④—.006-.016" backlash.
⑤—School Bus Models.

Removal: Loosen wheel and stud nuts, then raise rear of vehicle. Disconnect hydraulic brake hose from rear axle universal joint flange. Disconnect rear shock absorbers from spring seat clamps. Remove nuts and washers from spring clips (U-bolts), then remove spring clips. Roll axle out from under vehicle, remove wheels and rear axle hydraulic brake pipe from axle.

Axle Shaft Removal: Drain lubricant from axle housing, then remove axle shaft stud nuts and washers. Tap center of axle shaft flanges to loosen tapered dowels, then remove dowels. Remove axle shafts from housing, then remove hub and drum assemblies.

Wheel Bearing Adjustment: Remove axle shaft (see above), use special bearing adjusting wrench and remove bearing locknut (outer nut), and lockwasher. Adjust bearings by turning bearing adjusting nut (inner nut) up until tight and then backing off ⅛ turn. Install bearing lockwasher making certain that it fits over dowel pin on adjusting nut, install bearing locknut and turn up tight. NOTE—When installing axle shaft make certain that gasgasket in place under shaft flange, and that tapered dowels or cones are in place on studs, tighten stud nuts securely.

TWO-SPEED

Own Make. Two-speed, full-floating, spur gear planetary gear unit (reduction gearing), spiral bevel gear (final drive), Hotchkiss type drive. Shift control is vacuum operated (1951-52), electrically operated (1953).

See Rear Axle Section for complete data.

Ratio—(Standard) 5.83-1 (Direct), 8.11-1 (Second Speed). **(Optional)** 6.33-1 (Direct), 8.81-1 (Second Speed).

Backlash—.004-.018" (1951-52), .006-.016" (1953).

Removal: Same as for standard axle (above) after removal of wiring harness.

SHOCK ABSORBERS

Houde (Houdaile). Direct acting, hydraulic type. Shocks are sealed units and are not adjustable.

STEERING GEAR

Own Make (Gemmer 305 & 335 design). Worm-and-roller types with push-pull adjustments (See Gemmer Model 305 & 335 data).

See Steering Gear Section for complete data.

FRONT SUSPENSION

Front Axle—Conventional "I" beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination: As follows:

1951-52 F-1, F-2, F-3	8° ± ¼°
1951-52 Parcel Del. & School Bus.	8° ± ¼°
1951-52 F-4, F-5, F-6 (incl. C-O-E)	8¼° ± ¼°
1953 (All exc. F-700)	4° ± ½°
1953 F-700	8° ± ½°

Caster: As listed in table below. Maximum variation between wheels ½°.

	Caster (Min.-Max.)
1951-52 F-1, F-2, F-3.	①2½°-4½°
1951-52 F-4, F-5, F-6 incl. C-O-E.	1°-3½°
1951-52 Par. Del. & School Bus.	1°-3°
1953 F-100, F-250	3°-4°
1953 F-350 to F-700 incl.	3°-5°

①—Neg. ½° to Pos. ½° WITHOUT Caster Shims.

Camber (All Models): ¼° Minimum, 1° maximum. Maximum variation between wheels ¼°. Right wheel must not exceed left wheel.

Toe-In: 0" to 1/16" (All Models).

BRAKES

Service Brakes: Hydraulic types as listed below. Hand lever applies rear wheel service brakes (F-1 & F-100 only), independent shaft brake (All other models).

See Brake Section for complete data.

SERVICE BRAKE TYPES

Truck Model	Front	Rear
1951-52 F-1	Duo-Servo	Duo-Servo
1951 Early F-2, F-3	Double Anchor	Double Anchor
1951-52 F-2, F-3	Uni-Servo	Duo-Servo
1951 Early Pr. Del. F-3	Double Anchor	Double Anchor
1951-52 Par. Del. F-3	Double Anchor	Duo-Servo
1951-52 F-4, F-5, F-6	Double Anchor.	Double Anchor
1953 F-100	Duo-Servo	Duo-Servo
1953 F-250, F-350	Uni-Servo	Duo-Servo
1953 F-500, F-600	Uni-Servo.	①2 Cyl. Type.
1953 F-700	Double Anchor.	①2 Cyl. Type.

①—Two different types of 2 Cyl. rear brakes used. F-500 & F-600 has screw "Star Wheel" adjustment and F-700 has "Worm Type" requiring Allen wrench.

Duo-Servo Type—Ford-Bendix. Single anchor self-energizing. Wheel cylinder actuates both shoes. "Ratchet Type" adjusting screw.

Double-Anchor Type—Ford-Lockheed. Double anchor type. Wheel cylinder actuates both shoes.

NOTE—Some double anchor types are "self-centering" (do not require anchor pin adjustment).

2-Cylinder Type—Two types used. Two wheel cylinders in each brake assembly.

Clearance—Brake lining to drum clearance is different for each type brake as follows:

Single Anchor Type—.010" clearance, measured 1½" from each end of secondary shoe or adjusting screw backed off 14 notches or "clicks" from point where shoes drag on drum.

Double Anchor Type—*.007" heel, .010" toe of each* shoe. In service, adjust for least possible amount of clearance without drag.

2 Cyl. Type (F-500, F-600)—.025" from brake shoe to gauge surface on brake plate.

2 Cyl. Type (F-700)—Reduce clearance until lining drags on drum, then loosen adjustment until drag is relieved. Turn adjusting screw one additional turn to loosen to provide working clearance.

Hand Brake (F-1 & F-100): See Service Brake above.

Hand Brake (All exc. F-1 & F-100): Independent, external contracting band on drum at rear of transmission.

Adjustment—On cable controlled parking brakes, move lever to full released position. On transmission mounted parking brake levers, set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, adjust clevis rod to allow flat portion to rest on brake band bracket. Install clevis and cotter pins. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until .010" clearance is established between brake lining and drum at anchor bracket. Loosen locknut on adjusting screw from lower half of brake band. Adjust for .010" clearance between lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting rod nut until .010" clearance is established between upper half of band and drum. Re-install adjusting screw lockwire.

Drum Diameters—(3-Speed Trans.) 8". (4-Speed Trans.) 7 13/16". (5-Speed Trans.) 9½".

Hand Brake Lining

Transmission	Length	Width	Thickness
3-Speed	24 5/8"	2"	5/32"
4-Speed	①24 5/8"	2 1/2"	1/4"
5-Speed	②29 11/16"	3"	5/16"

①—F-350, F-500 Parcel Delivery—Three pieces of lining used. Length 23 5/64".

②—Three pieces of lining used.

Power Brake Units: Midland Hy-power Unit or Hydrovac Vacuum power units. *See "Midland Hy-power Unit" and "Hydrovac Power Unit" in Brake Section.*

MODEL IDENTIFICATION

VEHICLE NUMBER (1952): Stamped on plate attached to right front body pillar below upper hinge opening, and stamped on the frame in the following places. 1. On top of right hand reinforcement (side member to No. 1 crossmember). 2. On top of No. 2 crossmember (part of "K" member) near right hand side member (except Convertible). 3. (**Convertible only**) on top of right rear "X" member near right hand side member. 4. (**All passenger models**) on top of rear "X" member near right hand end.

NOTE—Vehicle Number (example "A2KC100001") includes following identification data in sequence:

Eng. Type①	Model Yr.②	Assy. Plant	Serial No.
A	2	See below	100001 Up

①—A is 6 Cyl. 215 cu. in. Valve-in-head engine.
②—Last digit of model year (1952).

Assembly Plant Designation

	M—Memphis	

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. at cranking spd.
VACUUM READING: Steady 18-20" idling at 500 RPM.
FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAPS: .034-.037".
Plug Type—Champion H-10, 14 mm.
CAUTION—Tighten plugs to 25-30 ft. lbs.
DISTRIBUTOR: Ford (1952 & Early 1953) No. FAA-12127A, (Late 1953) No. FAA-12127C. "Loadomatic" type with spark advance controlled by vacuum diaphragm unit moving breaker plate against two breaker plate springs.
▷***DISTRIBUTOR PRODUCTION CHANGE CAUTION:*** ***Two distributors used have different advance and require different Ignition Timing settings.***
Breaker Gap—.024-.026".
Cam Angle—36° closed (58-63% dwell idling).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*
▷***CAUTION—When installing distributor on engine, be sure oil pump tang engages slot in distributor shaft.***
COIL: Ford No. 8BA-12029. Mounted on right side of engine to rear of distributor.
Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).
CONDENSER: Ford No. 7RA-12300-C.
Capacity—.21-.25 microfarad at 70°F.
IGNITION TIMING: ***CAUTION—Different timing required for each type distributor.***
1952-53 (FAA-12127A Distr.) . . .. At TDC.
1953 (FAA-12127C Distr.) ....3° BTDC.
Timing Mark—First type damper has one groove at TDC (correct for first FAA-12127A distributor). Later type damper has four marks (TDC or 0°, 3°, 7°, & 9° BTDC.). Use second 3° mark for timing with later FAA-12127C distributor.
▷***REWORKING TIMING MARK ON FIRST CARS:*** If later FAA-12127C distributor used on cars with first type damper (TDC mark only), make a new timing mark on the damper 3° or .165" to right or clockwise from old mark for ignition timing.
Timing Procedure—*See Ignition Timing.*
CARBURETION: Holley-Ford "Visi-flo." Single barrel downdraft type with manual choke control. Anti-stall dashpot used on Fordomatic Cars.
▷***1952 CARBURETOR LEAKAGE CORRECTION & FUEL BOWL CHANGE: See "Holley-Ford Visi-flo Carburetor" in Carburetor Section.***
Idle Setting—Approximately one turn open. Set for highest steady vacuum reading with engine at

1952 MODELS

normal operating temperature, or midway between rolling and missing point. Turn screw out for richer mixture.

Idle Speed—(Synchro-mesh Cars) 475-500 RPM., (Fordomatic Cars) 440-460 RPM.

Float Level: *See Ford "Visi-flow" Carburetor in Carburetor Section for complete data.*

Fuel Level—Flush to 1/16" below top edge of float hinge bracket in bowl. To adjust, remove bowl cover, bend float tab which contacts float needle spring. *NOTE—Fuel level can be checked through glass bowl cover without disturbing carburetor.*

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather operation (holes located in throttle lever. Shift pump link as required).

Anti-Stall Dashpot (Fordomatic Cars): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½ to 2 turns to obtain .045-.064" clearance. Tighten locknut.

Throttle Linkage Adjustment (Fordomatic Cars): *See "Fordomatic & Merco-Matic" in Transmission Section.*

Fuel Pump Pressure: 4-5 lbs.

MANIFOLD HEAT CONTROL—Automatic thermostatic type with counter-weight. Valve is open at the top when engine cold. Thermostatic spring installed with ¾ turn and hooked over stop pin.

VALVE TAPPET CLEARANCE: .015" (.014-.016") with engine at normal operating temperature.

IGNITION

IGNITION SWITCH: Ford No. FAB-11572A. Combination ignition and starting switch.

COIL: Ford No. 8BA-12029. Mounted on right side of engine to rear of distributor.

Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).

CONDENSER: Ford No. 7RA-12300-C.

Capacity—.21-.25 microfarad at 70°F.

DISTRIBUTOR: Ford (1952 & Early 1953) No. FAA-12127A, (Late 1953) No. FAA-12127C. "Loadomatic" type with spark advance controlled by vacuum diaphragm unit moving breaker plate against two breaker plate springs.

►***DISTRIBUTOR PRODUCTION CHANGE CAUTION: Two distributors used have different advance and require different Ignition Timing settings.***

►***FAA-12127A DISTRIBUTOR CONVERSION TO FAA-12127C TYPE: See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.***

Breaker Gap—.024-.026".

Cam Angle—36° closed (58-63% dwell idling).

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Advance Performance
►With Distributor on Test Stand

FAA-12127A Distr.			FAA-12127C Distr.		
Degrees①	Vacuum	RPM	Degrees①	Vacuum	RPM

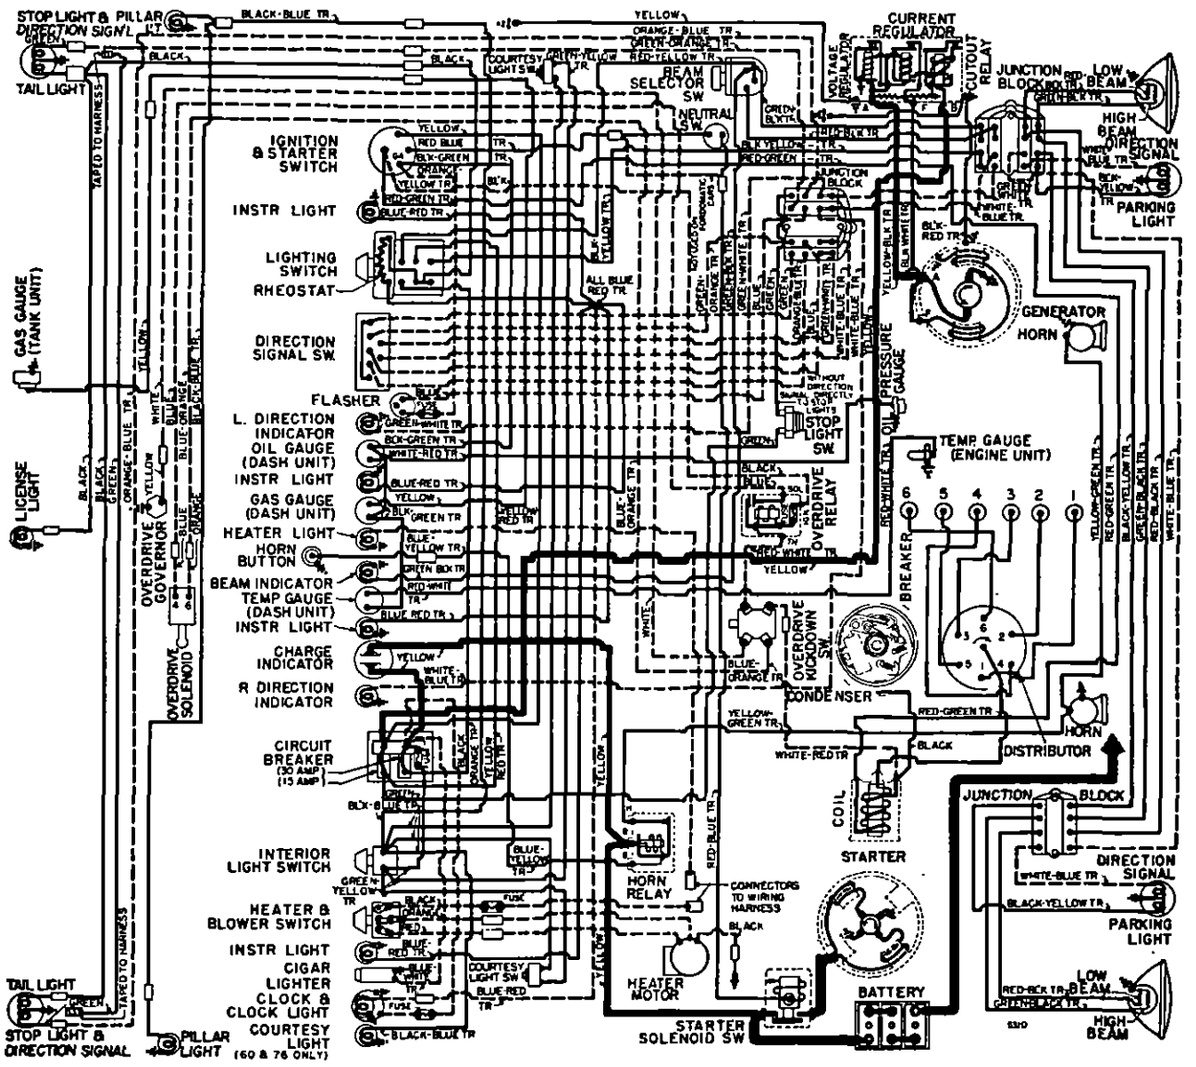
14¾-16¼	6.5"	1000	9¾-11	3.8"	1500
11¾-13	3.8"	1500	11½-13	6.0"	2000
14½-15¾	6.0"	2000			

①—Distributor degrees.

IGNITI N TIMING

►***TIMING CAUTION—Different timing required for each type distributor.***

1952-53 (FAA-12127A Distr.) ..... At TDC.
1953 (FAA-12127C Distr.) ..... 3° BTDC.



Timing Mark—First type damper has one groove at TDC (correct for first FAA-12127A distributor). Later type damper has **four** marks (TDC or 0°, 3°, 7°, & 9° BTDC.). Use second 3° mark for timing with later FAA-12127C distributor.

►***REWORKING TIMING MARK ON FIRST CARS:*** If later FAA-12127C distributor used on cars with first type damper (TDC mark only), make a new timing mark on the damper 3° or .165" to right or clockwise from old mark for ignition timing.

Timing—With #1 piston at firing position and timing mark on pulley aligned with timing pin on front of engine, loosen hold-down screw on distributor, rotate distributor until contacts begin to open, tighten hold-down screw. Check spark plug connections (see diagram), see that rotor is opposite #1 terminal in cap.

►**Timing (with Neon Timing Light)**—***CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.*** Mark timing pin and pulley mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark and timing pin aligned.

CARBURETOR

Holley-Ford "Visi-flo." Single barrel downdraft types with manual choke control. Anti-stall dashpot used on cars with Fordomatic Transmission.

Model	Ford Carburetor No.
1952 (Std. Trans.)	EAA-9510-D
1952 (Fordomatic)	EAA-9510-E
1953 (Std. Trans.)	EAA-9510-G
1953 (Fordomatic)	EAA-9510-H

▷*1952 CARBURETOR LEAKAGE CORRECTION & FUEL BOWL CHANGE: See "Holley-Ford Visi-flo Carburetor" in Carburetor Section.*

See Carburetor Section for complete data.

Setting (Idle Setting, Float Level, and Accelerating Pump:) ***See Tune Up.***

Throttle Linkage Adjustment (Fordomatic Cars): ***See "Fordomatic & Merco-Matic" in Transmission Section.***

Fast Idle: Integral type. Operated by choke valve. No adjustment required.

Choke Control: Manual type.

CARB. EQUIPMENT

Air Cleaner: Oil Wetted or Oil Bath types.

Fuel Pump: (Fuel Only) Ford No. EAA-9350E (1952-53).

(Fuel & Vacuum) Ford No. EAA19350D (1952), No. EAA-9350F (1952-53).

Pressure—4-5 lbs.

▷*LOW PUMP PRESSURE NOTE: If pressure with new pump is low, check for camshaft eccentric wear. See "Fuel System Notes" in Ford Special Data.*

Gasoline Gauge: King-Seeley Electric type.

Dash Unit—Ford No. FAB-9280-B.

Tank Unit—(Exc. Sta. Wgn. & Sed. Del.) Ford No. FAA-9275-A. (Sta. Wgn. & Sed. Del.)—Ford No. FAA-9275-B.

See Carburetion Equipment Section for complete data.

BATTERY

Ford No. 81A-10655-B. 6 volts, 15 plate, 90 ampere hour capacity at 20 hour rate.

Grounded Terminal—Positive (+) to engine.

Location—In engine compartment on right side.

STARTER

Ford No. FAE-11002A. Armature No. 1CM-11005A.

Drive—Ford No. 1CM-11350C. Bendix "Folo-Thru" type.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—48-56 ozs.

Cranking Speed—130 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	①	6.0	70
16 "	Lock		700

①—With starter on engine and engine running.

Starting Switch—Ford No. FAB-11450-B. Mounted on left front fender apron and controlled by ignition switch. Neutral switch, Ford No. FAC-15812A or B, used on Fordomatic cars.

GENERATOR

Ford No. FAA-10002-B. Two brush type with voltage and current regulation.

Armature—Ford No. OA-10005-A.

Charging Rate Adjustment—None. See Regulator.

Performance Data

Generator	Amperes	Eng. RPM.
FAA-10002-B	35	850

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—30 ozs.

Field Current—1½-2½ amperes at 6 volts.

Belt Adjustment: ¼" deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Ford No. FAC-10505A. Voltage & current type.

See Electrical Equipment Section for complete data.

▷*NOTE*—Settings below are for regulator at NORMAL OPERATING TEMPERATURE (after ½-hour operation) with room temperature of 70-80°F.

Cutout Relay

Cuts In—6.0-6.6 volts.

Voltage Regulator

Setting—7.4-7.8 volts.

Checking & Adjusting—*See Electrical Equipment Sec.*

Current Regulator

Setting—34-38 amperes.

Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Ford "Sealed Beam" type.

See Electrical Equipment Section for complete data.

Beam Indicator—Top center of instrument cluster above speedometer.

Directional Signal—Optl. ***See Electrical Equip. Section.***

Direction Indicators—Right and left indicators on lower edges of instrument cluster.

Directional Signal Flasher—Ford No. 8L-13350-C.

Switches

Lighting—Ford No. OL-11654.

Instrument—Part of lighting switch (controlled by turning knob).

Beam Selector—Ford No. 8A-13532.

Dome Light (Exc. Sta. Wgn. & Convertible)—Ford 1A-13752.

Dome Light (Sta. Wgn. & Convertible)—Ford No. 8M-13752.

Stop Light—Ford No. 11A-13480 & OA-13480.

MISC. ELECTRICAL

CIRCUIT BREAKER: 30 amperes (Headlights); 15 amperes (Park & Tail Lamps). Mounted behind instrument panel.

Convertible Top—40 amperes, mounted on right hand front fender apron.

FUSES: Interior lighting—14 amperes, on circuit breaker.

Turn Signal—20 amperes.

Overdrive—30 amperes. On overdrive relay.

Cigar Lighter—Special Fuse. In lighter base.

Clock—3 amperes. In clock lead.

Heater—14 amperes. In blower switch wire.

HORNS: Ford No. 51A-13832-A or B (High Pitch, Right Horn), 51A-13833-A or B (Low Pitch, Left Horn). Dual horns operated by relay.

Horn Current—13 amperes (high pitch), 14 (low).

Horn Relay: Ford No. FAA-13853-A.

ENGINE

ENGINE SPECIFICATIONS: Own. Six cylinder valve-in-head.

Bore—3.56". **Stroke**—3.60".

Displacement—215.3 cu. in. **Rated H.P.**—30.4.

Developed Horsepower—101 at 3500 RPM.

Compression Ratio—7.0-1.

Compression & Vacuum Readings—*See Tune-Up.*

▷*ENGINE VIBRATION CORRECTION: May be caused by incorrect installation of Rear Main Bearing Oil Seal. See "Crankshaft & Main Bearings" in Ford Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: ***See Ford Special Data.***

▷***HEAD GASKET INSTALLATION CAUTION:*** ***See Ford Special Data.***

ENGINE REMOVAL: ***See Ford Special Data.***

OIL PAN REMOVAL & INSTALLATION CAUTION: ***See Ford Special Data.***

PISTONS: Autothermic type. Solid skirt with three rings above pin.

Replacement Pistons: Furnished Std., .020", .030", .040", .060" oversize.

Fitting Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:

Feeler Gauge Thickness—New piston in new bore .0015". New piston in used bore .002". Used piston in used bore .003". Pull to withdraw feeler 5-10 lbs.

Installing Pistons: Small indentation on piston head toward FRONT of engine on all pistons.

PISTON RINGS: 2 compression, 1 oil ring, all above pin. Lower oil ring groove is slotted.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.047"	.002-.0035"
Compr. (#2)	3/32"	.007-.047"	.0015-.003"
Oil Contr.	3/16"	.007-.047"	.001-.0025"

Replacement Rings: Furnished Std., .020", .030", .040", .060" oversize.

NOTE—Snap type, Expander type, or Steel Section type rings furnished for service.

PISTON PIN: Floating type with lock ring at each end.

Diameter—.9122". **Length**—3.025".

Pin Fit in Piston—Hand push fit at 70°F.

Pin Fit in Rod Bushing—.0001-.0003" clearance. New pins should not fall through bushing of own weight.

Replacement Pins: Furnished Std. .001", .002 oversize.

CONNECTING ROD: Length 6¼". **Weight** 29.37 ozs.

Crankpin Journal Diameters—2.2980-2.2988".

Lower Bearing—Steel-backed, copper-lead alloy lined type. Upper and lower halves interchangeable.

NOTE—Steel-backed, lead-base babbitt bearings used on first 1952 cars (both types interchangeable).

Clearance—.0005-.0021".

Side Clearance—.004-.010".

Replacement Bearings: Furnished Standard (two sizes marked Red and Blue for selective fitting) and .010", .020", .030" Undersize.

Installing Rods: Install rod in piston so that oil squirt hole is toward valve side of engine. Numbers on rods and bearing caps must be together and installed in same numbered cylinder.

CRANKSHAFT: 4 bearing, integral counterweights.

Journal Diameters—2.4980-2.4988". Max. wear limits .0015". Taper .001".

Bearing Type—Removable precision type, steel-backed, copper-lead alloy lined. *NOTE*—Steel-backed, tin-base babbitt bearings used on first 1952 cars (both types interchangeable).

Clearance—.0005-.0021".

Bearing Adjustment: None. Replace bearings. Tang must engage groove in block and cap.

Replacement Bearings: Furnished Standard (two sizes marked Red and Blue for selective fitting), and .010", .020", .030" Undersize.

End Thrust: Taken on Rear Intermediate main bearing (#3). **Endplay**—.004-.008".

Crankshaft Rear Oil Seal Installation: ***See "Crankshaft & Main Bearings" in Ford Special Data.***

ENGINE

CONTINUED FROM PRECEDING PAGE

►*1952 CRANKSHAFT REAR OIL SEAL PRODUCTION CHANGE CAUTION: See "Crankshaft & Main Bearings" in Ford Special Data for latest type oil seal.*

►***CRANKSHAFT REAR OIL SEAL CAUTION:** Incorrect installation may cause engine vibration (due to rear bearing cap not being fully seated). See Oil Seal Installation data in Ford Special Data.*

CAMSHAFT: Four bearing, chain drive type.
Journal Diameters—1.924" (worn limit).
Clearance—.001-.003" (new), .005" (worn limit).
Replacement Bearings: Finished bearings furnished Standard and .015" Undersize. *CAUTION—Rear Intermediate (#3) bearing not interchangeable with other camshaft bearings.*

Camshaft Bearing Servicing: *See Ford Special Data.*

End Thrust: Taken by plate on forward end of block (between camshaft sprocket and shoulder on shaft).
Endplay—.003-.006".

Timing Chain: Side-guide type. Length 56 links.

Timing Chain Replacement—Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure sideplay on opposite side). Remove and install chain "endless" as a unit with both sprockets.

Camshaft Setting: Sprockets marked by "O" at one tooth, chain guide links similarly marked. Mesh so that sprocket marks in line with chain marks.

VALVES	Head Diam.	Seat Angle
Intake	1.65"	45°
Exhaust	1.515"	45°

	Stem Diam. ①	Stem Clearance
Intake	.3415"	② .0025"
Exhaust	.3410"	② .0030"

①—.003", .015", .030" O.S. furnished. *See Valve Guides.*
②—Worn limits .004" Intake. .005" Exhaust.

►*ROTATABLE VALVES—All valves rotatable type. See "Valve System" in Ford Special Data.*
Valve Stem Seals (Intake & Exhaust Valves)—Rubber seals installed on valve stems (below locks) on all valves in production. *See Change following.*

►*"UMBRELLA" TYPE VALVE STEM LOWER SEALS TO ELIMINATE SPARK PLUG FOULING (Caused by excessive oil at valve stem guides):* These 1954 type seals, Part No. EAA-6571-C should be installed on intake valve stems IN PLACE OF regular valve stem seals under valve locks. It is recommended that this type seal be installed on all valves (Intake & Exhaust) when valves being serviced. *NOTE*—Install seals with cupped side down on valve stem at guide boss on head.

Oversize Valve Stem Installation—*See "Valve System" in Ford Special Data.*

Valve Seat Width: .060-.070" (Intake); .095-.105" (Exhaust). *NOTE*—Keep seat at center of valve face.

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum, install valves with oversize stems. *See "Valve System" in Ford Special Data.*

Valve Lifters: Mushroom type. Removable from below with camshaft removed.

Valve Springs: Install with closed coil next to head.
Valve Spring Specifications: 54-62 lbs. pressure when compressed to 1.821", or 124-140 lbs. at 1.505".

Rocker Arm Assembly Removal & Installation: *See "Valve System" in Ford Special Data.*

►*ROCKER ARM SHAFT PRODUCTION CHANGE (& Installation of new type assemblies on 1952 engines): See "Valve System" in Ford Special Data.*

VALVE TIMING

VALVE TAPPET CLEARANCE: .015" (.014-.016") with engine at normal operating temperature.

►**Preliminary Valve Adjustment Procedure**—*See "Valve System" in Ford Special Data.*

VALVE TIMING: See Camshaft Setting above.
Intake Valves—Open 23° BTDC. Close 79° ALDC.
Exhaust Valves—Open 65° BLDC. Close 33° ATDC.

LUBRICATION

►*OIL LEAKAGE AT CAMSHAFT BEARING BORE HOLES IN CYLINDER BLOCK: See "Oiling System" in Ford Special Data for installation of plugs in these holes.*

Engine Oiling System: Pressure to main, connecting rod and camshaft bearings. Rocker arm assemblies are pressure lubricated. "Full-flow" oil filter filters entire output of oil pump before the oil enters engine lubricating system.
NOTE—Diaphragm used in oil filter mounting pad on engine to retain oil in filter and shorten pressure build-up interval when engine started.
Crankcase Capacity—4 qts. (5 qts. if filter changed).
Normal Oil Pressure—45 lbs. at 2000 RPM.
NOTE—Oil pump relief valve spring should have 9.82±.12 lbs. compressed to 1.56".

Oil Pan Removal: *See Ford Special Data.*

Oil Pump: Gear type pump located in crankcase.
Pump Removal & Overhaul—See Ford Special Data.

Oil Filter (Std. Equip.)—Full-flow type oil filter with pressure relief valve in filter center bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.
Replacement Filter Element—Ford No. CPA-6731A (Kit—includes gaskets).

►*CAUTION—This special Full-flow filter element MUST BE USED (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication).*

►*FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION: See "Oiling System" in Ford Special Data.*

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Ford No. FAB-9273-B.
Engine Unit—Ford No. 41A-9278.

►*ENGINE SENDING UNIT INSTALLATION CAUTION: Unit must be installed so that "UP" marking on cover is at top vertical position.*
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

Cooling System: Pressure system with relief valve in filler cap. One belt driven pump and by pass.
Capacity—16 qts. (1 qt. additional with heater).
Pressure Valve—Ford No. OL-8100-A. Radiator Filler Cap. 7 lb. type (opens at 6¼-7¾ lbs.). *Identification*—This cap measures approximately ⅝" from upper edge of flange on cap to lower edge of integral gasket (designed for use with AB-8005-A, B radiator which has short filler neck).

►*CAUTION—V8 Radiator Cap No. 1M-8100-B MUST NOT BE USED on 6 Cyl. cars (extra length of approx. ¼" will result in extra compression and excessive pressure. NOTE—Late 1953 V8 cars use same cap as 6 Cyl. cars (OL-8100-A).*

Water Pump: Centrifugal belt driven, packless type.
See Water Pump Section for complete data.

Thermostat: Mounted inside water outlet elbow in cylinder head. Ford No. EAA-8575-A (stamped 160 on operating cylinder) fully open at 180°F. *NOTE*—Use EAA-8575-B with permanent type anti-freeze.

Temperature Gauge: King-Seeley Electric type.
Dash Unit—Ford No. FAB-10883-C.
Engine Unit—Ford No. 1A-10884A (stamped 233F)
See Miscellaneous Section for complete data.

CLUTCH

Long Model 9½ CF-TS. Ford No. 1A-7563-A. Single plate, semi-centrifugal, dry disc type.
See Clutch Section for complete data.

Facings—Thickness .125". Outside diameter 9½".

Pedal Adjustment: (Pedal Travel) If total pedal travel is less than 6⅜", or more than 6⅝", reposition pedal bumper until travel is within limits.
Pedal Free Travel—⅞-1⅛". Loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.

Removal: Remove transmission (See Transmission Removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install tool No. 7563 and remove clutch pressure plate assembly (if tool is not available clutch may be released by backing off the attaching bolts evenly). Remove the clutch release bearing from the hub with an arbor press.

SYNCHRO-MESH TRANSMISSION

Own Make. 3 speed, all helical gear type. Constant mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Steering column type shift.
See Transmission Section for complete data.

Removal: Disconnect gearshift linkage at transmission. Remove speedometer cable and gear. Disconnect drive shaft at transmission and remove the capscrews attaching transmission extension to rear engine support. Place a support under engine and remove the frame cross member and rear engine support. Remove transmission-to-flywheel housing capscrews and install two guide pins. Pull transmission back until main drive gear splines clear housing and lower transmission from car.

OVERDRIVE

Warner Model AS4-R10F. Optional. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated kick-down. There is no Lock-out-Switch on this unit.

►*OIL LEAKAGE AT SOLENOID BASE PLATE (Early 1952 Cars):* May be caused by insufficient clearance at lower rear corner of gearshift housing and solenoid housing. Correct by filing corner of gearshift housing to provide clearance.
See Transmission Section for complete data.
Overdrive Solenoid—Ford No. FAA-6916A.
Control Relay—Ford No. 1M-6915-A.
Overdrive Fuse—30 amperes. On relay.
Throttle Kick-Down Switch—Ford No. FAA-6918-A.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Same as for Std. Transmission (above) after disconnecting control cable and wiring.

FORD-O-MATIC TRANSMISSION

Torque converter and three-speed automatic transmission with hydraulic control and mechanical parking lock.

▷*GEARSHIFT TUBE VIBRATION DAMPENER (Installation on early 1953 and previous cars): See "Fordomatic & Mercomatic Transmission" in Transmission Section.*

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic Transmission" in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See Transmission Section.*

Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15000 miles. **Use only Automatic Transmission Fluid, Type A.**

Capacity—Approx. 9 qts.

Checking Oil Level—Apply parking brakes, place transmission selector lever in "N" position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (Parking) position. When engine and transmission have reached normal operating temperature, move lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator. Wipe indicator clean and insert in tube (make sure indicator is pushed down all the way). Remove indicator and read level. Add sufficient fluid to raise fluid level to full mark on indicator. Replace indicator.

▷*TRANSMISSION VENT PRODUCTION CHANGE (& Installation of new vent on earlier cars to facilitate filling of transmission): See "Fordomatic & Mercomatic Transmission" in Transmission Section.*

▷*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Merc-O-Matic Transmission" in Transmission Section.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type, 2 used.

CAUTION—TWO types used interchangeably:

1) **Pre-lubricated** (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).

2) **Grease-fitting** (1M-7042A Front & 1M-7039 Rear). Must be lubricated with pressure grease gun at 1000 mile intervals.

▷*CAUTION (ALL CARS EXCEPT STATION WAGON & SEDAN DELIVERY)—Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own Make. Semi-floating hypoid gear type with Hotchkiss drive **(separate carrier)**. Axle ends flanged (no separate hub). Wheel bearings are sealed ball-bearing pre-lubricated type.

▷*NOTE—AXLE NOT SAME AS STATION WAGON. See Rear Axle Section for complete data.*

Ratios

Standard Transmission—3.90-1 (39-10).
Overdrive Transmission—4.10-1 (41-10).
Fordomatic Transmission—3.31-1 (43-13)①.
①—3.54-1 (39-11) Optional.

▷*AXLE CARRIER & GEAR RATIO IDENTIFICATION:* **Gear Ratio**—Carrier stamped with pinion-and-ring gear ratio (10/39 for 3.90-1 ratio, etc.)
Backlash—.003-.008".

Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.

Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure backing plate.

Wheel Bearing Adjustment: None.

SEDAN DEL. & STATION WGN.

Own Make: Semi-floating, hypoid gear type with Hotchkiss drive **(Integral Carrier)**. Axle ends flanged (no separate hub). Wheel bearings are sealed ball-bearing prelubricated type.

▷*NOTE—AXLE NOT SAME AS PASSENGER CAR. See Rear Axle Section for complete data.*

Ratios

Standard Transmission—4.09-1 (45-11).
Overdrive Transmission—4.27-1 (47-11).
Fordomatic Transmission—3.54-1 (39-11)①.
①—3.15-1 (35-9) Optional.

Removal: Raise rear of car. Disconnect rear universal Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

Axle Shaft Removal: Same as Ford Pass. cars.

SHOCK ABSORBERS

Direct acting type (front and rear). Not adjustable. Service by replacement.

▷*NOTE—Shock absorbers supplied for service in kit form only. Includes Shock Absorber and Bushing.*

▷*REPLACEMENT PARTS CAUTION: Ford numbers given below are 1953 production types and replace corresponding "CPA" parts used in 1952 production.*

	Front	Rear
Pass. Cars (Std.)	DPA-18124A	DPA-18125A
Pass. Cars (Heavy Duty)	DPA-18124C	DPA-18125C
Sta. Wgn. & Sedan Del.	DPA-18124B	DPA-18125C

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.

▷*TIRE & WHEEL BALANCING MARK CAUTION:* To maintain tire and wheel assembly balance, install tube with valve aligned with letter "V" stamped on tire, install wheel and tire assembly with "L" stamped on sidewall (light side of assy.) as nearly aligned as possible with "V" notch filed in brake drum (heavy side of drum and hub assy.).

▷*IDLER ARM INTERFERENCE-ON-LEFT TURN CORRECTION: See Front Suspension Section for complete data.*

Kingpin Inclination—4¾-5¾° crosswise.

Caster—(Pass. Cars & 1953 Sta. Wgn. & Sedan Delivery) Pos. ½° to Neg. 1° (1952 Sta. Wgn. & Sedan Delivery) Neg. ¼° to Neg. 1¾° (Neg. ¼° preferred). Maximum variation between wheels ½°.

Camber—Pos. ¼° to Pos. ¾° preferred with limits 0° to Pos. 1°. Maximum variation between wheels ¼°.

Toe-In—1/16-1/8". When adjusting toe-in, turn both connecting rod sleeves equally but in opposite directions (if steering wheel spokes in correct horizontal position), or lengthen one rod and shorten opposite rod, as necessary, to correct steering wheel spoke position while making toe-in adjustment.

STEERING GEAR

Std. Steering Gear: Own Make (Gemmer 305 design). Worm-and-roller type.
See Steering Gear Section for complete data.

Opti. Power Steering: Ford-Mercury Linkage type used in conjunction with standard type steering gear.
See "Ford & Mercury Power Steering" in Steering Section for complete data.

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

▷*BRAKE CABLE CONDUIT RUBBING ON REAR TIRE (First 1952 Cars): See Brake Section for complete data.*

Wheel Cylinder Diameter—Front Wheel 1⅛", Rear Wheel ⅞" (exc. 1953 Sta. Wgn. & Sedan Del. 15/16").

Drum Diameter—10" (Pass. Cars), 11" (Sta. Wgn. & Sedan Delivery). Maximum reboring limit .060" on diameter (to 10.060" and 11.060").

Lining—Molded type riveted to shoe. **Width**—2¼" (Front Pass. Cars). 2" (Front Sta. Wgn. & Sed. Del.), 1¾" (Rear—All).

Thickness—(1952—All Shoes) 3/16", (1953 Pass. Car Frt. Whl. Primary & All Rear Whl. Shoes) 3/16", (1953 Pass. Car Frt. Whl. Secondary Shoes) 7/32". (1953 Sta. Wgn. & Sedan Delivery—All Shoes) 7/32".

Length Per Shoe—10.85" (All shoes-Pass. Cars), 9.28" (Primary-Sta. Wgn. & Sed. Del.), 11.93" (Secondary-Sta. Wgn. & Sed. Del.).

Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw on each wheel backed off 14 notches or "clicks" from point where shoes drag on drum).

Brake Pedal Free Play Adjustment: ¼-7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Top: *TWO types used as follows:*

1952 & Early 1953 Top Control—Electric-mechanical type (reversible motor mounted under rear seat driving two screw type jacks through flexible cables).

▷*TOP FAILURE TO OPERATE (Due to disengagement of Drive Cables)—See Miscellaneous Section for recommended correction.*

Late 1953 Top Control—Hydro-Lectric type (motor driven hydraulic pump operating two hydraulic top lift cylinders).
See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

VEHICLE NUMBER (1952): Stamped on plate attached to right front body pillar below upper hinge *opening, and stamped on the frame in the following* places. 1. On top of right hand reinforcement (side member to No. 1 crossmember). 2. On top of No. 2 crossmember (part of "K" member) near right hand side member (except Convertible). 3. **(Convertible only)** on top of right rear "X" member near right hand side member. 4. **(All passenger models)** on top of rear "X" member near right hand end. *NOTE—Vehicle Number (example "B2KC100001") includes following identification data in sequence:*

Eng. Type①	Model Yr.②	Assy. Plant	Serial No.
B	2	See below	100001 Up

①—B is 8 Cyl. 239 cu. in. engine.
②—Last digit of model year (1952).

Assembly Plant Designation

AT—Atlanta	**DA**—Dearborn	**SR**—Somerville
BF—Buffalo	**LU**—Louisville	**SP**—St. Paul
CS—Chester	**EG**—Edgewater	**RH**—Richmond
CH—Chicago	**KC**—Kansas City	**MP**—Memphis
DL—Dallas	**LB**—Long Beach	**NR**—Norfolk
HM—Highland Park		

VEHICLE NUMBER (1953): Stamped on plate attached to left front door pillar and stamped on top of frame right-hand front cross-member to side-member reinforcement.

NOTE—Vehicle Number (example "A3FG 100001") includes following identification data in sequence:

Eng.① Type	Mod.② Year	Assy. Plant	Body③ Style	Serial No.
B	3	See Below	See Below	100001 Up

①—A—6 Cyl. 215 cu. in. engine; B—8 Cyl. 239 cu. in. engine; C—8 Cyl. Special Law Enforcement engine.
②—Last digit of model year (1953).
③—C—Convertible; S—Sedan Delivery; V—Victoria; W—Ranch Wagon; X—Country Sedan; Y—Country Squire; G—All others (Tudor-Fordor-Cpe).

Assembly Plant Designation

A—Atlanta	**F**—Dearborn	**N**—Norfolk
B—Buffalo	**G**—Chicago	**P**—St. Paul
C—Chester	**H**—Highland Park	**R**—Richmond
D—Dallas	**K**—Kansas City	**S**—Somerville
E—Edgewater	**L**—Long Beach	**U**—Louisville
	M—Memphis	

TUNE-UP

►*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*

►*1952 OVERHEATING CORRECTION & ENGINE COOLING IMPROVEMENTS: See COOLING data for production changes and recommended reworking of early engines.*

COMPRESSION PRESSURE: 125 lbs. at cranking spd.

VACUUM READING: 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinder Numbering—Right Bank 1-2-3-4, Left Bank 5-6-7-8, numbered from FRONT of engine.

SPARK PLUG GAPS: .029-.032".

Plug Type—Champion H-10. 14 mm.

CAUTION—Tighten plugs to 25-30 ft. lbs.

DISTRIBUTOR: Ford No. 8BA-12127 or OBA-12127. Pressure type distributor with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two breaker plate springs.

►*CAUTION—Use 8BA-12127 with CAST IRON FRONT COVER, use OBA-12127 with ALUMINUM COVER.*

Breaker Gap—.014-.016".

Cam Angle—27° closed (58-63% dwell idling).

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

Automatic & Vacuum Advance—*See Ignition.*

Distributor Line (Carburetor Connection) Vacuum—2.0-2.9" at 800 RPM., 3.5-4.8" at 1000 RPM., 4.7-6.4" at 2200 RPM., 4.6-6.2" at 2400 RPM.

COIL: Ford No. 8BA-12029.

Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).

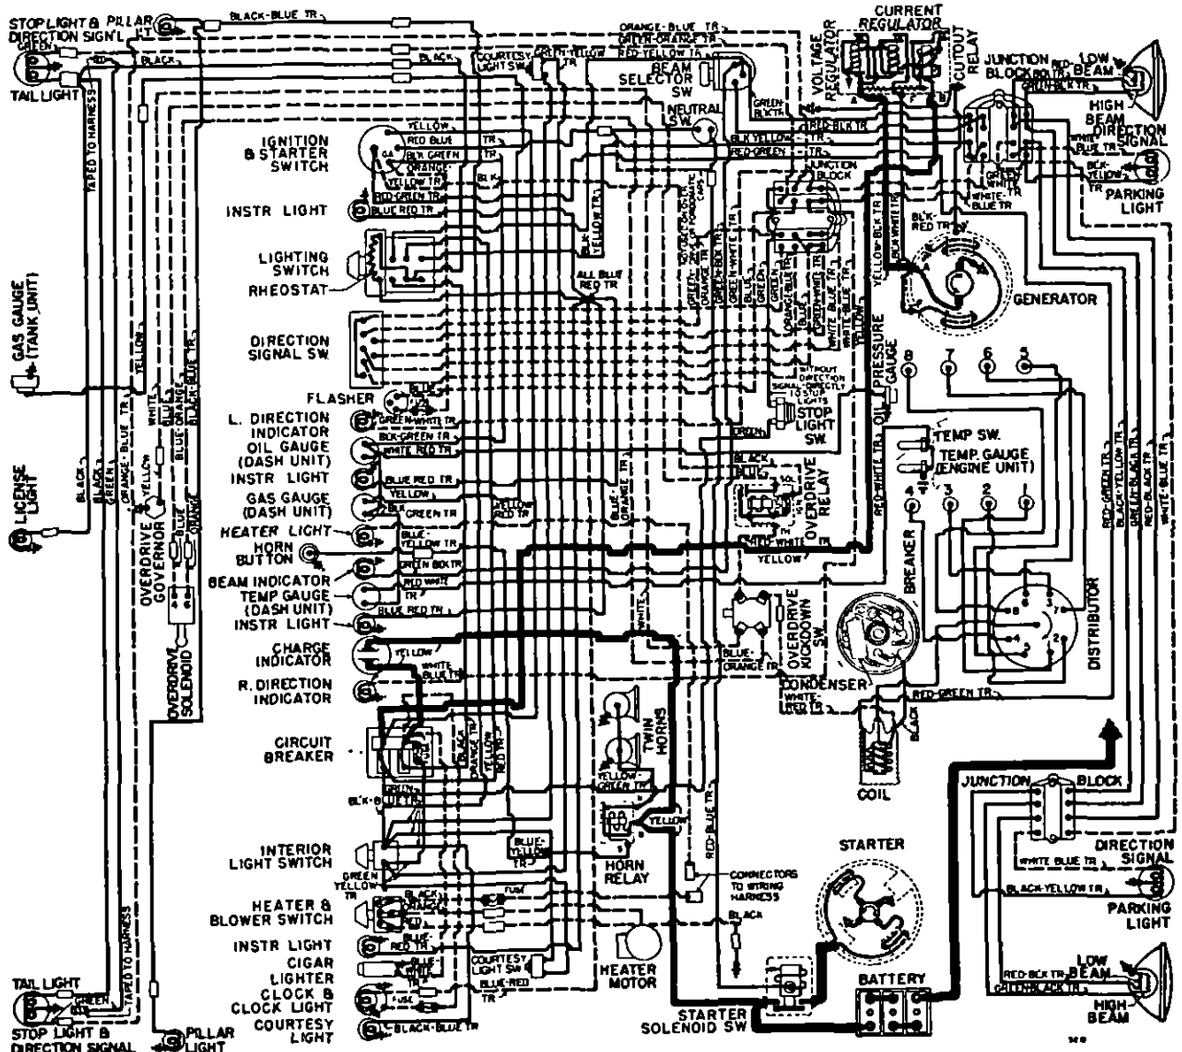
CONDENSER: Ford No. 7RA-12300-C.

Capacity—.21-.25 microfarad at 70°F.

IGNITION TIMING: 2° BTDC.

Timing Mark—On crankshaft pulley and pointer on front engine cover. Align pointer and timing mark.

Timing Procedure—*See Ignition Timing.*



CARBURETION: Holley-Ford. Dual downdraft type with manual choke control. Anti-stall dashpot used on Fordomatic Cars.

Idle Setting—Approx. 1 turn open. Set both screws for highest steady vacuum reading and highest engine RPM.

Idle Speed—475-500 RPM. (Std. Trans.), 415-425 RPM. (Fordomatic Trans.)

Float Level—1.275-1.305". Measured from bottom of float to underside of bowl cover with needle valve seated. Use Gauge T52L-9510-AHD. *NOTE*—These carburetors have "High-lift" Nozzle Bars and require above float level setting.

CONTINUED ON NEXT PAGE

1952 MODELS

CONTINUED FROM PRECEDING PAGE

Accelerating Pump—Center hole average setting. Inner hole for hot weather. Outer for cold weather.
Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.
Throttle Linkage Adjustment (Fordomatic Cars): *See "Fordomatic & Merc-O-Matic" in Transmission Section for complete data.*
Anti-Stall Dashpot Adjustment (Fordomatic Cars): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½-2 turns to obtain .045-.064" dashpot clearance. Tighten locknut.
Fuel Pump Pressure—3½-4½ lbs.
MANIFOLD HEAT CONTROL: "Duck-bill" type thermostatic valve located inside right side of cross-over pipe near the flange.
VALVE TAPPET CLEARANCE: Adjust by grinding end of valve stem or valve face.
Intake—.014" (.013-.015"). **Exhaust**—.018" (.017-.019"), Cold.

IGNITION

IGNITION SWITCH: Ford No. FAB-11572A. Combination ignition and starting switch.
COIL: Ford No. 8BA-12029.
Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).
CONDENSER: Ford No. 7RA-12300-C.
Capacity—.21-.25 microfarad at 70°F.
DISTRIBUTOR: Ford No. 8BA-12127, or OBA-12127. "Loadomatic" type with spark advance controlled by vacuum diaphragm moving breaker plate to advance spark against two breaker plate springs. *See "Ford, Lincoln, Mercury Distributors" in Electrical Equipment Section.*
▷*CAUTION—Use 8BA-12127 with CAST IRON FRONT COVER, use OBA-12127 with ALUMINUM COVER.*
Breaker Gap—.014-.016".
Cam Angle—27° closed (58-63% dwell idling).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

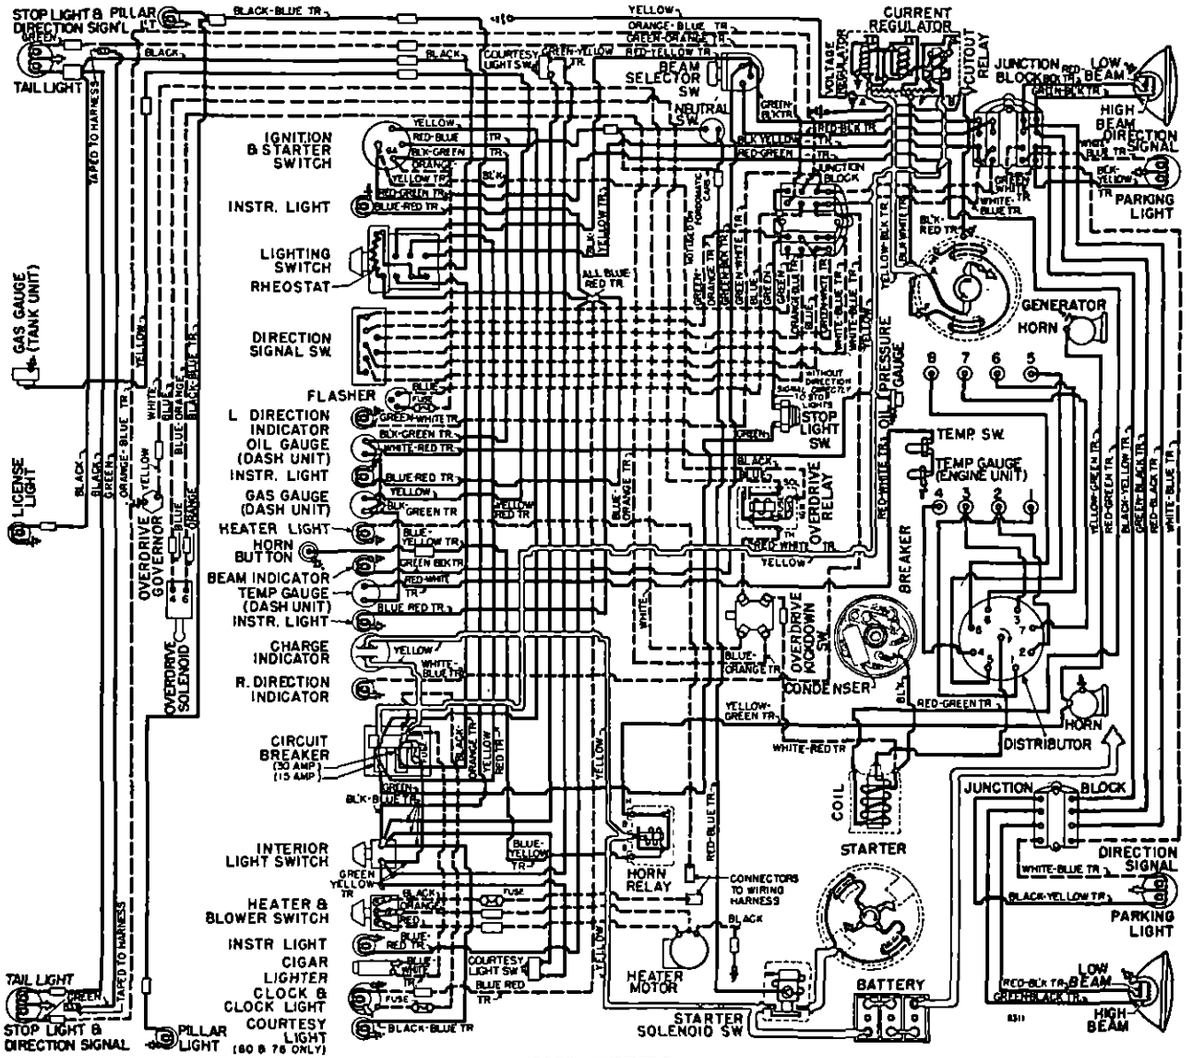
8BA, OBA 12127 Advance Performance
▷With Distributor on Test Unit

Distr. Degrees	Vacuum	RPM.
0°	0"	200
0-1°	0.30"	500
5.2-6.2°	1.32"	1000
8.75-10°	2.85"	1500
10-11.25°	3.7"	2000

IGNITION TIMING

Std. Setting.....2° BTDC.
Crankshaft Pulley Mark—Circular boss on rear edge of pulley (timing pin on right front side of engine).
Timing—With #1 piston at firing position and timing mark on pulley aligned with timing pin on front of engine, loosen hold-down screw on distributor, rotate distributor until contacts begin to open, tighten hold-down screw. Check spark plug connections (see diagram), see that rotor opposite #1 terminal in cap.
▷**Timing (with Neon Timing Light)**—*CAUTION—Vacuum line must be disconnected to avoid vacuum advance operating.* Mark timing pin and pulley mark with white chalk. Connect timing light to #1 spark plug. Idle engine and adjust distributor (as directed above) until mark and timing pin aligned.

CARBURETOR



Holley-Ford. Dual downdraft types with manual choke control. Anti-stall dashpot used on cars with Fordomatic Transmission.

Model	Ford Carburetor No.
1952-53 (Std. Trans.)	EAB-9510-C
1952-53 (Fordomatic)	EAB-9510-D
1952-53 (Repl. Carb.)	EAB-9510-F

See Carburetor Section for compete data.
Setting (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
Fast Idle: Integral type. Operated by choke valve. No adjustment required.
Throttle Linkage Adjustment (Fordomatic Cars): *See "Fordomatic & Merc-O-Matic" in Transmission Section.*
Choke Control: Manual type.

CARB. EQUIPMENT

Air Cleaner: Oil Wetted or Oil Bath types.
Fuel Pump: (Fuel only) No. 1BA-9350G. Diaphragm type.
(Fuel & Vacuum) No. 1BA-9350H (1952), No. EAB-9350A (1952-53).
Pressure—3½-4½ lbs.
▷*FUEL PUMP PUSHROD WEAR: Check when replacing pump. See "Fuel System Notes" in Ford Special Data.*
Gasoline Gauge: King-Seeley Electric type.
Dash Unit—Ford No. FAB-9280-B.
Tank Unit—(Exc. Sta. Wgn. & Sed. Del.) Ford No. FAA-9275-A. (Sta. Wgn. & Sed. Del.)—Ford No.

1953 MODELS

FAA-9275-B. *See Carburetion Equipment Section for complete data.*

BATTERY

Ford No. 81A-10655-A2. 6 volt, 17 plate, 100 ampere *hour capacity (20 hour rate).*
Grounded Terminal—Positive (+) to engine.
Location—In engine compartment on right side.

STARTER

Ford No. FAD-11002-A (without Fordomatic). **FAE-11002-A** (with Fordomatic).
Armature—Ford No. 18-11005 (FAD-11002-A); **ICM-11005-A** (FAE-11002-A).
Drive (FAD-11002A Starter)—Ford No. B-11350, Bendix Drive ("standard" type).
Drive (FAE-11002A Starter)—Ford No. 1CM-11350C Bendix "Folo-Thru" Drive.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs.
Cranking Speed—130 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	①	6.0	70
16 "	Lock	3.5	700

①—With starter on engine and engine running.

Starting Switch: Ford No. FAB-11450-B. On left front fender apron and controlled by the ignition switch. Neutral Switch, Ford No. FAC-15812A or B, used on cars with Fordomatic Transmission.

GENERATOR

Ford No. FAA-10002-A. Two brush type with voltage and current regulation.
Armature—Ford No. OA-10005-A.
Charging Rate Adjustment—None. See Regulator.

Performance Data

Generator	Amperes	Eng. RPM.
FAA-10002-A	35	850

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—30 ozs.
Field Current—1½-2½ amperes at 6 volts.
Belt Adjustment: (Generator & Water Pump) ⅜" deflection between generator pulley and left hand water pump pulley with normal thumb pressure.
Fan & Water Pump Belt—Raise or lower fan bracket until a deflection of ¼" is obtained by normal thumb pressure between fan pulley and right hand pump pulley.

REGULATOR

Ford No. FAC-10505A. Voltage & current type. *See Electrical Equipment Section for complete data.*
NOTE—Settings below are for regulator at NORMAL OPERATING TEMPERATURE (after ½ hour operation) with room temperature at 70-80°F.

Cutout Relay

Cuts In—6.0-6.6 volts.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—*See Electrical Equipment Sec.*

Current Regulator

Setting—34-38 amperes.
Checking & Adjusting—*See Electrical Equipment Sec.*

LIGHTING

Headlamps: Ford "Sealed Beam" type. *See Electrical Equipment Section for complete data.*
Beam Indicator—Top center of instrument cluster above speedometer.
Directional Signal: *Optl. See Electrical Equipment Section.*
Direction Indicators—Right and left indicators on lower edges of instrument cluster.
Directional Signal Flasher—Ford No. 8L-13350-C.

Switches

Lighting—Ford No. OL-11654.
Instrument—Part of lighting switch (operated by turning knob).
Beam Selector—Ford No. 8A-13532.
Dome Light (Exc. Sta. Wgn. & Convertible)—Ford No. 1A-13752.
Dome Light (Sta. Wgn. & Convertible)—Ford No. 8M-13752.
Stop Light—Ford No. 11A-13480 & OA-13480.

MISC. ELECTRICAL

CIRCUIT BREAKER: 30 amperes (Headlights); 15 amperes (Park & Tail Lamps). Mounted behind instrument panel.
Convertible Top—40 amperes, mounted on right hand front fender apron.
FUSES: Interior lighting—14 amperes, on circuit breaker.
Turn Signal—20 amperes.
Overdrive—30 amperes. On overdrive relay.
Cigar Lighter—Special Fuse. In lighter base.
Clock—3 amperes. In clock lead.
Heater—14 amperes. In blower switch wire.
HORNS: Ford No. 51A-13832-A or B (High Pitch, Right Horn), 51A-13833-A or B (Low Pitch, Left Horn). Dual horns operated by relay.
Horn Current—13 amperes (high pitch), 14 (low).
Horn Relay: Ford No. FAA-13853-A.

ENGINE

ENGINE SPECIFICATIONS: Eight cylinder "L" head "V" type with both cylinder banks and crankcase cast enbloc.
Bore—3.187", **Stroke**—3.75".
Displacement—239 cu. in. **Rated HP**—32.5.
Developed Horsepower—110 at 3800 RPM.
Compression Ratio—7.2-1.
Compression & Vacuum Reading—*See Tune-Up.*
►*ENGINE LOSS OF POWER OR CUTTING OUT AT HIGH SPEED OR WHEN PULLING: May be caused by excessive wear of fuel pump pushrod. See "Fuel System Notes" in Ford Special Data.*
►*1952 OVERHEATING CORRECTION & ENGINE COOLING IMPROVEMENTS: See COOLING data for production changes and recommended reworking of early engines.*
►*CYLINDER HEAD & GASKET PRODUCTION CHANGES & INSTALLATION CAUTION: See "Cylinder Head & Gasket" in Ford Special Data.*
CYLINDER HEAD & TIGHTENING TORQUES: *See Ford Special Data.*
ENGINE & OIL PAN REMOVAL: *See Ford Special Data.*
►*CYLINDER SLEEVES (When used): See Ford Special Data.*
PISTONS: Autothermic type, 4 ring (lower ring below pin), aluminum alloy with offset pin.
Removal—Pistons and rods removed from above.
Clearance—See Fitting Pistons.
Replacement Pistons: *Furnished Std., .0025", .020", .030", .040", .060" oversize.*
Fitting Pistons: Use ½" feeler inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:
New Piston in New Bore—.0015" feeler. 6-12 lbs. pull.
New Piston in Used Bore—.002" feeler. 6-12 lbs. pull.
Used Piston in Used Bore—.003" feeler. 6-12 lbs. pull.
Installing Pistons: *Locating mark (small indention)* on head of piston above one piston pin hole, to front on all pistons.
►*CAUTION—Piston pin offset 1/16". Must be installed toward thrust side.*
PISTON RINGS: 2 compression, 2 slotted oil rings (lower oil ring below pin). Upper oil ring groove drilled with oil drain holes, lower groove slotted.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0915-.0920"	.007-.047"	.0015-.0030"
Compr. (2)	.0915-.0920"	.007-.047"	.0010-.0025"
Oil (3, 4)	.1545-.1550"	.007-.047"	.001-.003"

Replacement Rings: Snap type, Expander type, or Steel Section type ring sets furnished in the following sizes: Std., .020", .030", .040", .060" oversize.
►*CAUTION—Use only rings designed for solid skirt pistons.*
PISTON PIN: Floating type (lock ring at each end). Pin hole in rod is bronze-bushed.
Diameter—.7501-.7504". **Length**—2.835".
Pin Fit in Piston—Hand push fit at 70°F.
Pin Fit in Rod Bushing—.0001-.0003" clearance. New pins should not fall through bushing of own weight.
Replacement Pins: Sizes and paint marks: Std. (Green); .001" Oversize (Blue) .002" Oversize (Yellow).
CONNECTING ROD: Length—7". **Weight**—18.7 ozs.
Crankpin Journal Diameter—2.1390". Maximum wear limits—out of round .002". Taper—.001".
Lower Bearing—Steel backed, copper lead alloy lined, replaceable shells. Upper and lower halves interchangeable. *NOTE*—Steel-backed, lead-base babbitt lined bearings used on first 1952 cars. Both types interchangeable.
Clearance—.0005-.0033" (copper-lead), .0008-.0029" (steel backed-babbitt).
Side Play—.006-.020".
Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize.
Installing Rods: Numbers on rods and bearing caps together and installed in same numbered cylinder with oil squirt hole in all rods pointing toward valve side of cylinder bore.
CRANKSHAFT: 3 bearing. Integral counterweights.
►*SLUDGE TRAPS—Crankpin throws equipped with sludge traps having removable plugs for cleaning. Always use new plugs if old plugs disturbed and peen or stake crankshaft to hold plugs in place securely.*
Journal Diameters—2.498-2.499" (All bearings). Max. wear limits Out-of-round .0015", Taper .001".
Bearing Type—Precision steel-backed, copper lead alloy lined removable type. *NOTE*—Steel-backed, lead-base babbitt bearings used on first 1952 cars. Both types interchangeable.
Clearance—.0005-.0025", (selective fit).
Replacement Bearings: Furnished Standard (two sizes marked Red and Blue for selective fitting) and .002", .010", .020", .030", .040" Undersize.
End Thrust: Taken by rear main bearing. Replace bearing if endplay excessive.
Endplay—.002-.006".
CAMSHAFT: Three bearing type. Gear driven.
Identification—Camshaft No. EAB-6250-A (Letter "E" stamped on forward end of shaft).
Bearings—Babbitt lined, steel backed.
Journal Diameters—1.794" (worn limit).
Bearing Diameter (I.D.)—1.7985" (replace bearing if diameter greater than worn limit 1.8015").
Clearance—.001-.0025" (new), .005" (worn limit).
Replacement Bearings: Furnished Std., .010", .015" Undersize (Inside diameter). Bearings are finished (reaming not required). *NOTE—Special .010" & .015"*

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Undersize bearings also furnished .080" Oversize on OUTER diameter.

Camshaft Bearing Servicing—*See Ford Special Data.*

Timing Gears: Bolted-on type.

Camshaft Gear—Fibre (Pass.Car), Aluminum (Trk.).

Crankshaft Gear—Cast iron.

Replacement Camshaft Gears—Std., .006", .012" OS.

Timing Gear Removal & Installation—*See Ford Special Data.*

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
All Valves	1.51"	.3410"	4.54"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.328"①	②

①—With ZERO valve lash (measure by inserting feeler gauge equal to valve lash between valve stem and lifter).

②—Max. .004" (In.), .005" (Ex.).

▷*ROTATABLE VALVES—All valves are rotatable type. See "Valve System" in Ford Special Data.*

Valve Seat Width—.060-.070" (all valves).

NOTE—Keep seat at center of valve face.

Valve Assembly Servicing—*See "Valve System" in Ford Special Data.*

Valve Seat Insert Removal & Installation: *See "Valve System" in Ford Special Data.*

Valve Guides: One piece type positioned and retained by "C" washer. Inside diameter .344", Outside diameter 1.031". Length 2.20". NOTE—Rubber seal used on intake guide.

Valve Lifters: Barrel type in guide holes in block.

▷*REPLACEMENT LIFTER CAUTION*—Lifters are Part No. EAB-6500-A and can be identified by over-all length of 1.742-1.749". DO NOT use 1949-51 type which is 1.715-1.722" long.

Diameter—.9992" (replace if worn to .9977").

Clearance—.0007-.0016" (new), .003" (worn).

Valve Springs: Free length 2.20" (9.12 coils). Install with closed-coil end up toward guide.

Spring Test—39-44 lbs. at 1.89".

VALVE TIMING

VALVE TAPPET CLEARANCE: Intake .014" (.013-.015"). **Exhaust** .018" (.017-.019").

ADJUSTMENT—Check tappet clearance with lifter on heel of cam. If clearance not within limits, grind end of valve stem (to increase clearance), install a new valve or grind valve in (to decrease clearance). *See "Tappet Clearance Adjustment" in Ford Special Data.*

VALVE TIMING: See Camshaft Setting above.

Intake Valves—Opens 21° BTDC. Close 68° ALDC.

Exhaust Valves—Opens 56° BLDC. Close 11° ATDC.

NOTE—Above specifications are for valve tappet clearance as given above.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, timing gears and distributor drive gear. Piston pins and valve lifters lubricated by splash. Oil pump mounted in crankcase at rear of engine.

Crankcase Capacity—4 qts. (5 qts. when changing oil filter).

Normal Oil Pressure—57 lbs. at 2000 RPM.

Oil Pressure Relief Valve: In pump. Not adjustable.

Spring Tension—12 lbs. at 1.14".

Oil Pump: Gear type (helical gears).

Pump Removal & Overhaul—*See Ford Special Data.*

Oil Filter: By-pass type. On left cylinder head.

Oil Filter Cartridge—Ford No. 7HA-6731-A.

Oil Pan Removal: *See Ford Special Data.*

Oil Pressure Gauge: King-Seeley Electric.

Dash Unit—Ford No. FAB-9273-B.

Engine Unit—Ford No. 41A-9278.

▷*ENGINE SENDING UNIT INSTALLATION CAUTION:* Unit must be installed so that "UP" marking on cover is at top vertical position.

See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter in oil filler cap.

COOLING

▷*1952 COOLING SYSTEM PRODUCTION CHANGES:* In 1952 production, following changes were made in the V8 engine to provide for a more uniform flow of coolant through the engine:

Cylinder Block Water By-pass Holes (Right and Left Banks)—These holes reduced in diameter from ½" to 11/32".

Water Pump Impeller Holes—Two 5/16" diameter holes added between impeller vanes.

Cylinder Head Gasket Change—Steam holes along inner side and center of head enlarged to ¼"

See New Gasket data under V8 CYLINDER HEAD.

▷*REWORKING OF EARLY 1952 ENGINES FOR IMPROVED COOLING:* Production changes listed above can be incorporated in earlier engines as follows:

Cylinder Block Water Bypass Hole (Right & Left Banks)—Make up reducer or adaptor tubes for installation in these holes as follows:

Adaptor Tubes—Use ½" O.D., 11/32" I.D. tubing. Cut one end off at 45° angle, cut angle end of tubing back .17" and chamfer resulting square end portion of tubing for .06" x 45° chamfer. Cut tubing off to overall length of 1.90" (for RIGHT HAND BANK), 1.54" (for LEFT HAND BANK). *CAUTION*—Measure depth of holes in each individual engine and vary overall length of adaptors as required so they are 1/32" shorter than measured depth.

Adaptor Tube Installation—Insert correct adaptor tube in cylinder block water bypass hole with taper end in and open portion upward to align with hole opening in upper face of block. Drive tube in until it bottoms in block. *CAUTION—Angle end opening MUST BE UPWARD (bypass flow from cylinder head will be cut off if angle end opening downward).*

Water Pump Impeller Holes—Locate hole centers 11/16" in from outer edge of impeller between vanes and at two points diametrically opposite each other. Drill completely through impeller using 5/16" diameter drill.

Cylinder Head Gaskets—Use only latest type gaskets which have enlarged steam holes.

Cooling System: Pressure type with relief valve in filler cap and two belt driven pumps (one for each bank) with re-circulating by-pass.

Capacity—21 qts.

Pressure Valve—Ford No. 1M-8100A (1952-53—Use with Radiators 1BA-8005-E & AC-8005-A), No. OL-8100-A (Late 1953—Use with Radiators AC-8005-F, G, H). Radiator filler cap, 7 lb. type (opens at 6¼-7¾ lbs).

▷*CAUTION—Correct type cap must be used with each type radiator. Use of wrong cap would result in EXCESSIVE PRESSURE (first type cap in later type radiator) or NO PRESSURE (later type cap in first type radiator).*

PRESSURE CAP IDENTIFICATION—First 1M-8100-A cap is 13/16" from upper edge of flange on cap to lower edge of integral gasket. Later OL-8100-A cap is approximately ¼" shorter than first type.

Water Pumps: Two used (packless type).

See Water Pump Section for complete data.

Fan Belt Adjustment—Raise or lower fan bracket until a deflection of ¼" is obtained by normal thumb pressure between fan pulley and right hand pump pulley.

Generator & Water Pump Belt Adjustment—See Generator.

Thermostat: In water outlet elbows on cylinder heads (two used).

Part No.	Identification①	Starts to Open
1BA-8575-A	160	157-162°
1BA-8575-B②	180	177-182°

①—Stamped on operating cylinder circumference.

②—Use with permanent type anti-freeze.

Temperature Gauge: King-Seeley Electric type.

Dash Unit—Ford No. FAB-10883-C.

Engine Unit—Consists of **Sender** (in right bank cyl. head), and **Switch** (left bank cyl. head).

Sender—Ford No. 1A-10884A. Stamped "233F."

Switch—Ford No. 1A-10990A. Stamped "226F."

See Miscellaneous Section for compete data.

CLUTCH

Long Model 9½ CF-TS. Ford No. 1A-7563-A. Single plate, semi-centrifugal, dry disc type.

See Clutch Section for complete data.

Facings—Thickness .125". Outside Diameter 9½".

Pedal Adjustment: (Pedal Travel). If total pedal travel is less than 6⅜" or more than 6⅝", reposition pedal bumper until pedal travel is within limits.

Pedal Free Travel—⅞-1⅛". Loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.

Removal: Remove transmission (See Transmission Removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install tool No. 7563 and remove clutch pressure plate assembly (if tool is not available clutch may be released by backing off the attaching bolts evenly). Remove the clutch release bearing from the hub with an arbor press.

SYNCHRO-MESH TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

Transmission Control: Steering column mounted shift.

See Transmission Section for complete data.

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame. Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model AS4-R10F. Optional equipment. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated kick-down. There is no Lock-out switch on this unit.

▷*OIL LEAKAGE AT SOLENOID BASE PLATE (Early 1952 Cars):* May be caused by insufficient clearance

at lower rear corner of gearshift housing and solenoid housing. Correct by filing corner of gearshift housing to provide clearance.
See Transmission Section for complete data.
Overdrive Solenoid—Ford No. FAA-6916A.
Control Relay—Ford No. 1M-6915-A.
Overdrive Fuse—30 amperes. On relay.
Throttle Kick-Down Switch—Ford No. 8A-6818-B.
Removal: Same as for standard transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque Converter and three speed automatic transmission with hydraulic control and mechanical parking lock.
►*GEARSHIFT TUBE VIBRATION DAMPENER (Installation on early 1953 and previous cars): See "Fordomatic & Mercomatic Transmission" in Transmission Section.*
►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic Transmission" in Transmission Section.*
►*TESTING & TROUBLE SHOOTING: See Transmission Section.*
Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15000 miles. Use only Automatic Transmission Fluid, Type A.
Capacity—Approximately 9 qts.
Checking Oil Level—Apply parking brake, place transmission selector lever in "N" position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (Parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt from fluid level cap, remove indicator. Wipe indicator clean and insert in tube (make sure indicator is pushed down all the way). Remove indicator and read level. Add sufficient fluid to raise fluid level to full mark on indicator. Replace indicator.
►*TRANSMISSION VENT PRODUCTION CHANGE (& Installation of new vent on earlier cars to facilitate filling of transmission): See "Fordomatic & Mercomatic Transmission" in Transmission Section.*
►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Merc-O-Matic Transmission" in Transmission Section.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type, 2 used.
CAUTION—TWO types used interchangeably:
1) **Pre-lubricated** (8M-7042 Front & 8M-7039 Rear). Requires lubrication at 20,000 mile intervals (repack bearings and replace seals).
2) **Grease-fitting** (1M-7042A Front & 1M-7039 Rear). Must be lubricated with pressure grease gun at 1000 mile intervals.

CAUTION (ALL CARS EXCEPT STATION WAGON & SEDAN DELIVERY)—Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford Passenger Cars (except Station Wagon)" in Rear Axle Section.

REAR AXLE

PASSEN ER CARS

Own Make. Semi-floating, hypoid type with Hotchkiss drive (separate carrier). Axle ends flanged (no separate hub). Wheel bearings are sealed ball-bearing pre-lubricated type.
►*NOTE—AXLE NOT SAME AS STATION WAGON.*
See Rear Axle Section for complete data.
Ratios
Standard Transmission—3.90-1 (39-10).
Overdrive Transmission—4.10-1 (41-10).
Fordomatic Transmission—3.31-1 (43-13)①.
①—3.54-1 (39-11) Optional.
►*AXLE CARRIER & GEAR RATIO IDENTIFICATION:*
Gear Ratio—Carrier stamped with pinion-and-ring gear ratio (10/39 for 3.90-1 ratio, etc.)
Backlash—.003-.008".
Removal: Disconnect rear universal. Remove axle shafts (see instructions below). Remove carrier from housing.
Axle Shaft Removal: Remove wheel. Take off drum. Remove 4 axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure backing plate.
Wheel Bearing Adjustment: None.

SEDAN DEL. & STATION WGN.

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive **(Integral carrier).** Axle ends flanged (no separate hub). Wheel bearings are sealed ball-bearing pre-lubricated type.
NOTE—AXLE NOT SAME AS PASSENGER CAR.
See Rear Axle Section for complete data.
Ratios
Standard Transmission—4.09-1 (45-11).
Overdrive Transmission—4.27-1 (47-11).
Fordomatic Transmission—3.54-1 (39-11)①.
①—3.15-1 (35-9) Optional.
Removal: Raise rear of car. Disconnect rear universal. Remove axle shafts (see instructions above). Disconnect brake line at "T" on left side of axle housing, and hand brake cable. Disconnect shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.
Axle Shaft Removal: Same as Ford Pass. Cars.

SHOCK ABSORBERS

Direct acting type (front and rear). Not adjustable. Service by replacement.
►*NOTE—Shock absorbers supplied for service in kit form only. Includes Shock Absorber and Bushing.*
►*REPLACEMENT PARTS CAUTION: Ford numbers given below are 1953 production types and replace corresponding "CPA" parts used in 1952 production.*

	Front	Rear
Pass. Cars (Std.)	DPA-18124A	DPA-18125A
Pass. Cars (Heavy Duty)	DPA-18124C	DPA-18125C
Sta. Wgn. & Sedan Del.	DPA-18124B	DPA-18125C

FRONT SUSPENSION

Front Suspension: Independent linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.
►*TIRE & WHEEL BALANCING MARK CAUTION:* To maintain tire and wheel assembly balance, install tube with valve aligned with letter "V" stamped on tire, install wheel and tire assembly with "L" stamped on sidewall (light side of assy.) as nearly aligned as possible with "V" notch filed in brake drum (heavy side of drum and hub assy.).
►*IDLER ARM INTERFERENCE-ON-LEFT TURN CORRECTION: See Front Suspension Section for complete data.*
Kingpin Inclination—4¾-5¾° crosswise.
Caster—(Pass. Cars & 1953 Sta. Wgn. & Sedan Delivery) Pos. ½° to Neg. 1° (1952 Sta. Wgn. & Sedan Delivery) Neg. ¼° to Neg. 1¾° (Neg. ¼° prefefred). Maximum variation between wheels ½°.
Camber—Pos. ¼° to Pos. ¾° preferred with limits 0° to Pos. 1°. Maximum variation between wheels ¼°.
Toe-In—1/16-1/8". When adjusting toe-in, turn both connecting rod sleeves equally but in opposite directions (if steering wheel spokes in correct horizontal position), or lengthen one rod and shorten opposite rod, as necessary, to correct steering wheel spoke position while making toe-in adjustment.

STEERING GEAR

Std. Steering Gear: Own Make (Gemmer 305 design). Worm-and-roller type.
See Steering Gear Section for complete data.
Optl. Power Steering: Ford-Mercury Linkage type used in conjunction with standard type steering gear.
See "Ford & Mercury Power Steering" in Steering Section for complete data.

BRAKES

Service: Ford-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
►*BRAKE CABLE CONDUIT RUBBING ON REAR TIRE (First 1952 Cars): See Brake Section for complete data.*
Wheel Cylinder Diameter—Front Wheel 1⅛", Rear Wheel ⅞" (exc. 1953 Sta. Wgn. & Sedan Del. 15/16").
Drum Diameter—10" (Pass. Cars), 11" (Sta. Wgn. & Sedan Delivery). Maximum reboring limit .060" on diameter (to 10.060" and 11.060").
Lining—Molded type riveted to shoe. **Width**—2¼" (Front Pass. Cars); 2" (Front Sta. Wgn. & Sed. Del.), 1¾" (Rear-All).
Thickness—(1952—All Shoes) 3/16", (1953 Pass. Car Frt. Whl. Primary & All Rear Whl. Shoes) 3/16", (1953 Pass. Car Frt. Whl. Secondary Shoes) 7/32". (1953 Sta. Wgn. & Sedan Delivery—All Shoes) 7/32".
Length Per Shoe—10.85" (All shoes—Pass. Cars), 9.28" (Primary—Sta. Wgn. & Sed. Del.), 11.93" (Secondary—Sta. Wgn. & Sed. Del.).
Clearance—.010" at each end of secondary shoe with primary shoe forced out against drum (adjusting screw on each wheel backed off 14 notches or "clicks" from point where shoe drags on drum).
Brake Pedal Free Play Adjustment: 1/4-7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance.
Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Top: *TWO types used as follows:*
1952 & Early 1953 Top Control—Electric-mechanical type (reversible motor mounted under rear seat driving two screw type jacks through flexible cables).
►*TOP FAILURE TO OPERATE (Due to disengagement of Drive Cables)—See Miscellaneous Section for recommended correction.*
Late 1953 Top Control—Hydro-Lectric type (motor driven hydraulic pump operating two hydraulic top lift cylinders).
See Miscellaneous Section for complete data.
Windshield Wipers: Vacuum Link & Crank Arm type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate attached to left front body pillar below upper hinge opening.

First Number—100001 up, for each year.

►*VEHICLE NUMBER NOTE:* Vehicle number (example "A5FS100001") includes following identification data in sequence.

Engine Type ①	Year ②	Assembly Plant ③	Body Style ④	Serial No.
A	5	F	S	100001 up

①—See Engine Type Code below.
②—4(1954), 5(1955).
③—See Assembly Plant Code below.
④—See Body Style Code below.

Engine Type Code

Code	1954 Engine	1955 Engine
A (6 Cyl.)	223 cu. in.	223 cu. in.
U (V8)	239 cu. in.	272 cu. in.
P (V8)	256 cu. in.	292 cu. in.

Body Style Code

Code	1954 Models	1955 Models
C	Sunliner	Sunliner
F	Skyliner	Skyliner
H		Thunderbird
R	Ranch Wagon ⑤	Ranch Wagon
S	Sedan Delivery	Sedan Delivery
T	Fordor ⑥	Fordor & Tudor
V	Victoria	Victoria
W	Ranch Wagon ⑦	Special Body
X	Country Sedan	Country Sedan
Y	Country Squire	Country Squire
G	All Others ⑧	All Others ⑦

⑤—Customline. ⑥—Crestline ⑦—Mainliner
⑧—Mainliner & Customliner.

Assembly Plant Designation

A—Atlanta	F-Dearborn	N—Norfolk
B—Buffalo	G-Chicago	P—St. Paul
C—Chester	K—Kansas City	R—Richmond
D—Dallas	L—Long Beach	S—Somerville
E—Edgewater	M—Memphis	U—Louisville

TUNE-UP

COMPRESSION PRESSURE: 120 lbs. (1954), 125 lbs. (1955), at cranking speed. Maximum variation between cylinders is 10 lbs.

VACUUM READING: Steady 18-20" idling at 500 RPM.

VALVE TAPPET CLEARANCE: .015" (Intake), .019" (Exhaust) with engine at operating temperature.

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve is open at top when engine cold. Thermostat spring installed with ¾ turn wind-up and hooked over stop pin.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .034-.037" (Champion H-10). .032-.036" (Champion 870).

Spark Plugs (1954)—Champion H-10. 14mm. Use Champion H-11 for slow or stop-and-go driving. Tighten to 25-30 ft. lbs.

Spark Plugs (1955)—Champion 870. 18mm. Special.

►*1955 SPARK PLUG CAUTION: Spark plug is new type with tapered seat and does not require a sealing gasket. It is important that plugs be torqued to 15-20 ft. lbs.*

COIL: Ford 8BA-12029.

Ignition Current—3.0 amperes idling, 5.0 amperes stopped.

DISTRIBUTOR: FAA-12127-C (1954); B5A-12127-C (1955).

Condenser—Ford 7RA-12300-C. **Capacity** .21-.25 mfd.
Contact Point Set—Ford 7RA-12171.
Breaker Gap—.024-.026".
Cam Angle—35-38°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Advance Performance
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
3½-4½	5	500
7-8	1.8	1000
9¾-11	3.8	1500
11½-13	6.0	2000

►*DISTRIBUTOR INSTALLATION CAUTION: Be sure oil pump intermediate shaft engages seat in oil pump.*

IGNITION TIMING

Setting—3° BTDC.
Timing Mark—5 marks—0°, 3°, 5°, 7°, 9°, on vibration damper. Align correct mark with pointer on engine front cover.

CARBURETOR

Ford No. EBP-9510-A (Except Fordomatic), EBP-9510-B (With Fordomatic). "Visi-flo", single barrel.

►*1955 ACCELERATOR LINKAGE CORRECTION (To Permit Full Accelerator Travel):* Bend upper arm of accelerator assembly so that it moves on a 6" radius (distance between center of accelerator shaft-carburetor rod pivot point hole and center line of straight portion of accelerator should be 2 9/64").

►*1955 STANDARD & OVERDRIVE TRANSMISSION ACCELERATOR BELL CRANK-TO-CARBURETOR ROD ASSEMBLY PRODUCTION CHANGE (To Correct Difficult Idle Adjustment):* If difficulty encountered in adjusting idle, check to see if car equipped with new rod assembly, Part No. TRAA-9772-A (has phosphate-dark-finish). Old rod assembly, Part No. AB-9772-A, had cadmium plated finish.

Idle Setting—Initial setting 1½ turns open. Set for highest steady vacuum reading with engine at normal operating temperature, or midway between missing and rolling points. Turn screw out for richer mixture.

Idle Speed (1954)—475-500 RPM (Std. & O.D.), 440-460 RPM (Fordomatic) with selector lever in "N".

Idle Speed (1955)—475-500 RPM (Std. & O.D.), 450-475 RPM (Fordomatic) with selector lever in "N".

Fuel Level—11/16" ±1/32" below power valve mounting surface (Tool T52L-9550-AEE). *See "Ford Visi-flo" in Carburetor Section of Manual.*

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather operation (holes located in throttle lever. Shift pump link as required).

Fast Idle: Integral type operated by choke valve. No adjustment required.

Throttle Linkage Adjustment (Fordomatic Cars): With selector lever in "N" position and engine at normal operating temperature, set engine idle speed at 440-460 RPM (1954 Models), 450-475 RPM (1955 Models). Adjust Anti-stall Dashpot, then turn engine off. Remove clevis pin from upper end of transmission control rod (at cross shaft). Pull gently upward on throttle control rod to hold transmission lever against its internal stop. Rotate rod clevis for free entry of clevis pin into holes in clevis and cross shaft lever. Lengthen control rod by rotating clevis 2½ turns counterclockwise. Connect control rod to cross shaft lever. Road Test car and if band or clutch slippage evident, **increase rod length to 3 turns of clevis but do not exceed 3½ turns.** Check transmission for kick-down action and if found to be incorrect, disconnect accelerator connecting link from cross shaft lever and adjust pedal height by turning the threaded trunnion on connecting link until top surface of accelerator pedal is 4 5/16" (1954), 4 9/16" (1955) from floor.

Anti-Stall Dashpot (Fordomatic Cars): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counterclockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½-2 turns to obtain .045-.064" clearance. Tighten locknut.

►*OTHER DATA: See Ford "Visi-flo" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs. at 900 RPM

CARB. EQUIPMENT

►*FUEL TANK FILTER CAUTION:* If particles of foreign material found in fuel pump or carburetor on units built prior to February 1, 1955, particles should be examined very closely (with magnifying glass and strong light). If particles clear or cream colored, short, and thread-like pieces, they are probably from a damaged fuel tank filter. To correct, replace fuel tank.

Fuel Pump (1954): Ford No. EAA-9250-E, Fuel only Except Fordomatic & Overdrive Cars); **EBP-9250-A,** Fuel & Vacuum (Fordomatic & Overdrive Cars).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fuel Pump (1955): **Ford No. B5A-9350-A,** Fuel only (Except Fordomatic & Overdrive Cars); **B5A-9350-B,** Fuel & Vacuum (Fordomatic & Overdrive Cars).

Fuel Pump Pressure–4-5 lbs. at 900 RPM.

See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric.

Dash Unit (1954)–Ford No. FAG-9280-A.
Dash Unit (1955)–Ford No. B5A-9280-A.
Tank Unit (1954)–Ford No. FAA-9275-A (Except Sta. Wgn. & Sedan Delivery). No. FAA-9275-B (Sta. Wgn. & Sedan Delivery).
Tank Unit (1955)–Ford No. B5A-9275-A (Exc. Sta. Wgn. & Sedan Delivery). B5A-9275-B (Sta. Wgn. & Sedan Delivery).

See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Ford No. FDA-10655-A. 6 volt, 17 plate, 90 ampere hour capacity (20 hr. rate).
Battery Ground–Positive (+) to engine.
Engine Ground–Cylinder head to dash.

STARTER

Ford No. FAC-11002-B (1954); FAC-11002-G (1955).
Armature–Ford No. 52-11005 (FAC-11002-B); **FAC-11005-B** (FAC-11002-G).

Drive–Ford No. 1CM-11350-C. Bendix "Folo-Thru" type.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–48-56 ozs.
Cranking Speed–115-125 RPM.

Performance Data–FAC-11002-B

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
16 ft. lbs.	Lock		700

Performance Data–FAC-11002-G

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
14 ft. lbs.	Lock		700

①–With starter on engine and engine running.

Starting Switch: Ford No. FAB-11450-B. Mounted on left front fender apron and controlled by Ignition Switch. *NOTE*–A Neutral Safety Switch is used on all models with Fordomatic.

Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C (1954); B5A-15812-A (1955).
Adjustment–*See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford No. FAA-10002-B. Armature–0A-10005-A.

►*GENERATOR BELT WEAR & IMPROPER CHARGING RATE CAUTION:* If either of these two conditions are encountered, check to make sure an 8-Cyl. generator is not being used.

►*GENERATOR BELT NOISE CORRECTION:* To make sure noise is coming from belt, squirt a few drops of hydraulic fluid on belt driving surface. If noise or whine disappears, belt is at fault and should be replaced with plain type belt, Part No. B5A-8620-B. In some cases, removal of paint in generator pulley groove has stopped noise without belt replacement.

Performance Data

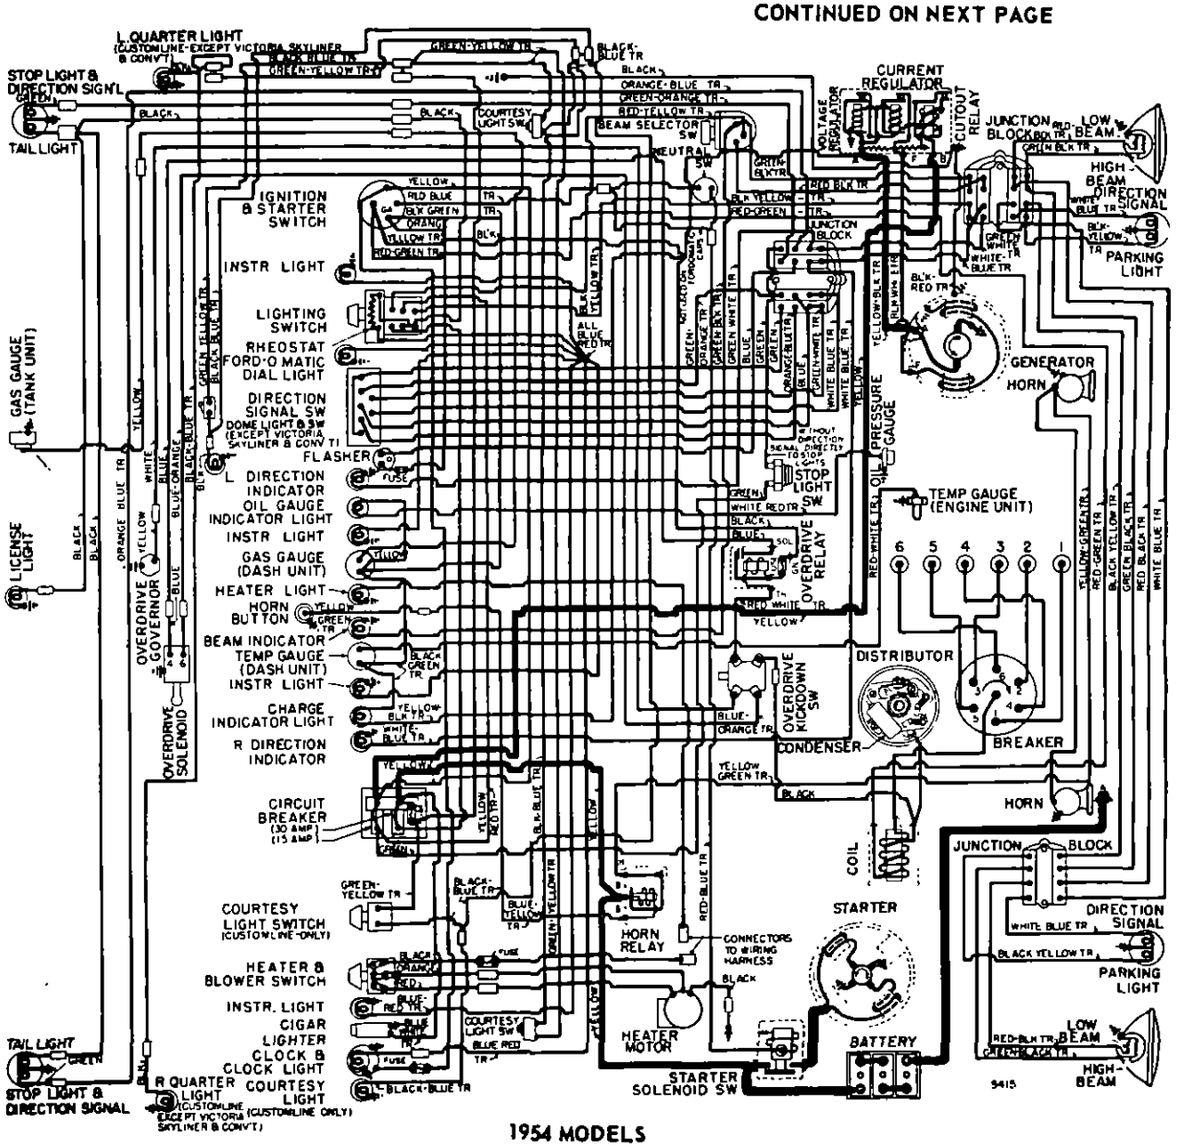
Generator	Amperes	Eng. RPM
FAA-10002-B	35 ①	850

①–See Regulator for maximum charging rate.

Brush Spring Tension–30 ozs.
Field Current–1½-2½ amperes at 6.0 volts.
Rotation–Counter-clockwise at commutator end.

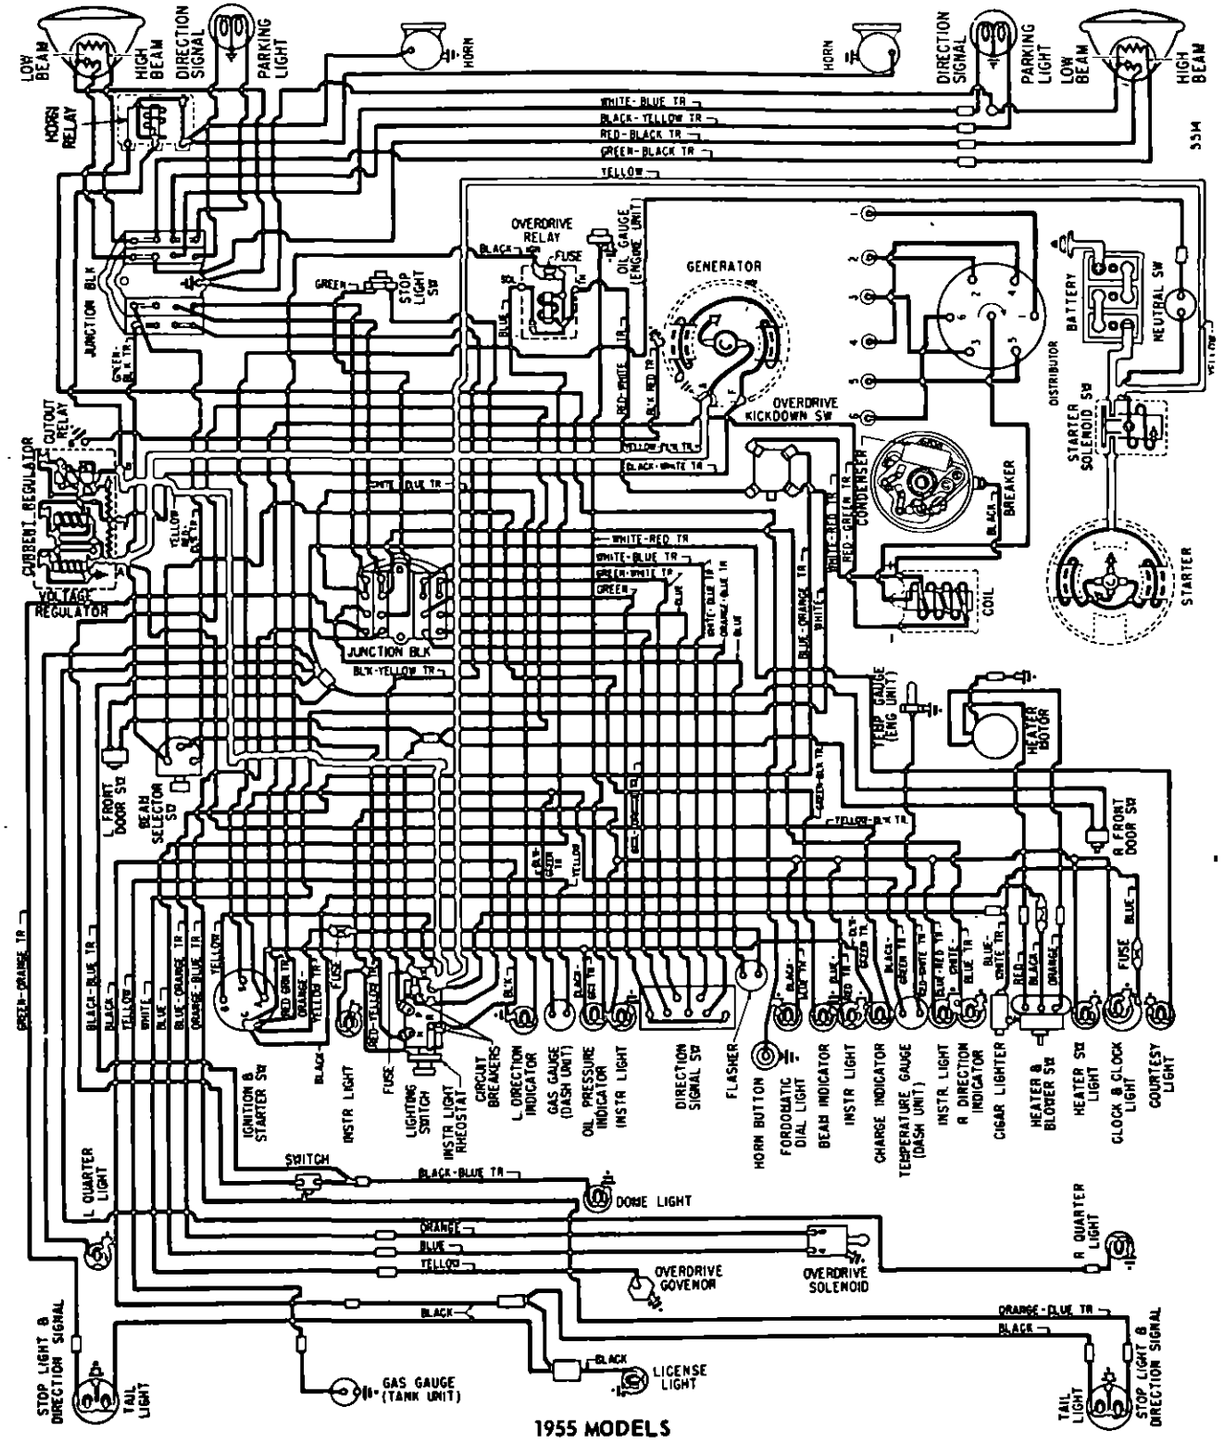
Belt Adjustment: ¼" belt deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR



Ford No. FAC-10505-A

►*SETTING NOTE:* Settings below are for regulator at NORMAL OPERATING TEMPERATURE (after ½ hour operation) with room temperature at 70°-80 ° F.



Cutout Relay

Cuts In–6.0-6.6 volts.

CONTINUED ON NEXT PAGE

1954 MODELS

1955 MODELS

CONTINUED FROM PRECEDING PAGE

▷*CUTOUT RELAY AIR GAP CHECK:* With cover off regulator, manually close cutout contacts. Measure air gap between armature and core. This dimension should be .009-.013". Air gap with contacts open should be .012-.020". If either or both of these dimensions are not up to specifications, regulator is defective and should be replaced.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—See *Electrical Equip. Section.*

Current Regulator

Setting—34-38 amperes.
Checking & Adjusting—See *Electrical Equip. Section.*

MISC. ELECTRICAL

▷*1955 BACK-UP LIGHT SWITCH BRACKET INSTALLATION CAUTION:* Change in steering gear shift rod on late production cars affects installation of back-up light switch bracket, Part B5A-15517-A. To install this bracket, bend upward to prevent switch from bottoming when gear shift lever in reverse position. New bracket, Part No. B5A-15517-B, is included in new kit, Part No. B5A-15517-B, however, some kits will be released with old bracket.

▷*1954 DIRECTIONAL SIGNAL BURNING OUT CORRECTION:* Replace 14 amp. fuse with a 9 amp. fuse by making a 3/16" long spacer from ¼" copper tubing. Cut spacer lengthwise and place on wire so that it will be between bottom of fuse holder and spring. Press sides of spacer together with pliers.

Headlamps: Sealed Beam. *See Electrical Equip. Section.*

Direction Signal: *See Electrical Equipment Section.*

Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.

Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.

FUSES: Located as indicated below:

Direction Signal—14 amp. (1954); 15 amp. (1955). In fuse holder between ignition switch and flasher. *1954 NOTE—See "Directional Signal Flasher Burning Out CORRECTION" above.*

Interior Lights—14 ampere. On lighting switch.
Overdrive—30 amps., on overdrive relay.
Cigar Lighter—Special fuse in lighter base.
Clock—3 amps., in clock lead.
Heater—14 amps., in blower switch wire.

LIGHTING CIRCUIT BREAKERS: On headlight switch. Combination headlight switch, circuit breaker, and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument, parking, stop and tail light circuits. The 14 ampere fuse protects interior lighting circuit.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

HORNS: (1954)—Ford No. FAC-13832-E or F (High pitch), FAB-13833-F or G (Low pitch). Dual horns operated by relay.

HORNS: (1955)—Ford No. B5A-13832-C (High pitch), B5A-13833-C (Low pitch). Dual horns operated by relay.

Horn Current—12-14 amps at 6.2-7.2 volts.

Horn Relay: Ford No. FAA-13853-A.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. Valve-in-head.

Bore—3.62". **Stroke**—3.60".

Displacement—223 cu. in. **Rated H.P.**—31.5.

Developed Horsepower—115 at 3900 RPM (1954). 120 at 4000 RPM (1955).

Compression Ratio—7.2-1 (1954). 7.5-1 (1955).

Compression & Vacuum Reading—*See TUNE-UP.*

►*1955 CAMSHAFT OR VALVE SPRING REPLACEMENT CAUTION:* Approximately 2000 1955 models were released with 1956 type camshafts installed. If valve springs or camshaft to be replaced, correct parts must be installed. *See "Camshaft" (below) for identification and parts replacement.*

►*1955 OIL BATH AIR CLEANER INTERFERENCE WITH HOOD CORRECTION: On early production cars* Oil Bath Air Cleaner interfered with hood. To correct, cut out 2½" long x 7/16" deep section out of top of air cleaner at point of interference with hood. Cars after November 13, 1954 have hoods corrected. If replacement cleaner B5A-9600-F installed on unrevised hood cars, correction will have to be made since service cleaners have not been reworked.

►*1955 DRIVE SHAFT-TO-FRAME INTERFERENCE NOTE & CORRECTION (Conv.):* On early production units, drive shaft may strike bottom of clearance hole in frame "X" member after vehicle passes over a severe bump. Current production is installing three shims and longer bolts (7/16"—20 x 1½") between engine rear support and "X" member to prevent interference, and can be installed on early units. *NOTE—If shims removed during repair operation, make sure they are reinstalled.*

►*1955 FUEL LINE (TOO LONG) CORRECTION:* All early production units should be checked for too long a fuel line causing sharp bend in flexible line installed at forward end of fuel line. To correct, bend forward end of fuel line outward, and increase radius of bend in flexible line. Drill a 7/32" hole in No. 2 crossmember. Install a clip, Part No. 8A-14588 and screw, Part No. 31498-58, to secure fuel line to No. 2 crossmember.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data.*

ENGINE REMOVAL: *See "Engine" in Ford Special Data.*

ENGINE FRONT MOUNTING: *See "Engine Mountings" in Ford Special Data.*

OIL PAN REMOVAL: Drain crankcase, remove oil dipstick. Drain coolant from engine and radiator. Disconnect upper radiator hose at engine. Remove engine front support bolts. Remove engine steady rest. Raise front end of engine about 2". Remove left and right engine splash aprons. Block engine and lower engine on block. Remove flywheel housing inspection cover. Remove oil pan retaining screws, remove pan and gasket.

PISTONS

Autothermic type. Solid skirt with three rings above pin.

Removal—Pistons and rods removed from above.

Fitting New Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:

New Piston in New Bore—.0015" feeler. 5-10 lbs. pull.

New Piston in Used Bore—.002" feeler. 5-10 lbs. pull.

Used Piston in Used Bore—.0025" feeler. 5-10 lbs. pull.

Replacement Pistons: Standard size, .020", .030", .040", .060" Oversize. Pistons furnished only with fitted pins.

Installing Pistons: Install with small indentation in head toward FRONT of engine.

PISTON PINS

Floating type with lock rings at each end.

Diameter—.9120-.9123". **Length**—3.016-3.030".

Pin Fit in Piston—.0001-.0003". Hand push fit at 70°F.

Pin Fit in Rod Bushing—.0001-.0003" clearance. New pin should not fall through bushing of own weight.

Replacement Pins: Standard size, .001", .002" Oversize.

PISTON RINGS

►*SPECIAL SERVICE PISTON RING SET (To reduce Possibility of Excessive Oil Consumption): Special Piston Ring Set, Ford Part No. B4A-6148-AAA furnished as service replacement in addition to standard "Expander and "Snap Ring" type sets.*

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.010-.027"	.002-.0035"
Compr. #2	3/32"	.010-.027"	.002-.0035"
Oil	3/16"	.010-.027"	.0015-.003"

Replacement Rings: Standard size, .020", .030", .040", .060" Oversize.

►*REPLACEMENT PISTON RING NOTE:* "Snap-Type" rings furnished in Std. size only. "Expander" type furnished in all above oversizes. *See "Special Service Piston Ring Set" above.*

CONNECTING RODS

Crankpin Journal Diameter—2.2980-2.2988".

Lower Bearings—Steel backed, copper lead alloy lined type. Upper and lower halves interchangeable.

Clearance—.0005-.0023" (1954). .0004-.0023" (1955).

Side Clearance—.005-.007".

Replacement Bearings: Standard size, (4 sizes marked **red** & **blue** for selective fitting) and .010", .020", .030", Undersize.

Installing Rods: Install rod in piston so that squirt hole is to right when indentation on top of piston is toward front of engine.

CRANKSHAFT

►*1954 CRANKSHAFT & FLYWHEEL PRODUCTION CHANGE:* Later type parts are interchangeable with previous parts except that later crankshaft cannot be used with early flywheel unless inner edge of flywheel bore is chamfered 1/16" x 45° to eliminate flywheel-to-crankshaft interference. Use a bearing scraper to chamfer.

Journal Diameter—2.4980-2.4988". Max. wear limits .0015", taper .001".

Bearings—Steel backed, copper lead alloy lined.

Clearance—.0005-.0025" (No. 1, 2, 3), .001-.0029" (No. 4).

Replacement Bearings: Standard size, (4 sizes marked **red** & **blue** for selective fitting) and .010", .020", .030" Undersize.

End Thrust: Taken on rear intermediate bearing (#3).

Thrust Bearing Alignment—*See "Crankshaft & Main Bearings" in Ford Special Data.*

Endplay—.004-.008".

Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Ford Special Data.*

CAMSHAFT

►*1955 CAMSHAFT & VALVE SPRING REPLACEMENT CAUTION:* When replacing either camshaft or valve springs on Late 1955 models, replacement parts must match the original parts exactly. Approximately 2000 Late 1955 models were equipped with 1956 type camshafts and valve springs. THESE PARTS ARE NOT INTERCHANGEABLE WITH STANDARD PRODUCTION 1955 PARTS. If replacement parts are not available, install 1955 camshaft, Part No. B5A-6250-B and valve springs, Part No. EAA-6513A. 1955 camshafts can be identified by a cam lobe lift of .242" (.273" on 1956 type). 1955 valve springs have 7½ coils with lower coil closely spaced. 1956 valve springs have 7 equally spaced coils. Use of mismatched camshafts and springs may result in early failure of camshaft and/or valve flutter at high speeds.

Journal Diameter—1.9255-1.9265".

Clearance—.001-.003" (new). .005" (worn limit).

End Thrust—Taken by plate on forward end of block (between camshaft sprocket and shoulder on shaft).

Endplay—.003-.007".

Replacement Camshaft Bearings: Finished bearings furnished Standard, and .015" Undersize. *CAUTION—Rear intermediate (#3) bearing not interchangeable with other bearings.*

Camshaft Bearing Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data.*

Timing Chain: Side-guide type. Length 56 links.

►*REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side).

Camshaft Setting: Sprockets marked by "O" at one tooth. Mesh chain so that there are 12 pins between "O" marks.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*CAMSHAFT SPROCKET SPACER INSTALLATION CAUTION:* If spacer, Part No. EBE-6265-A, installed backwards, it will allow an excessive amount of end-play. Chamfer on inside diameter of spacer must be toward No. 1 camshaft bearing journal.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Special Data.*

VALVES

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves): Stem diameter decreased. 0005" for greater stem clearance in guide. See "Valve System" in Ford Special Data.*

Tappet Clearance: .015" (Intake). .019" (Exhaust) with engine at operating temperature.

Valve	Head Diam.	① Stem Diam.	Length
Intake	1.785"	.3415"	5.02"
Exhaust	1.515"	.3405"	5.02"

Valve	Seat Angle	② Lift	Stem Clearance
Intake	45°	.340"	.002" max.
Exhaust	45°	.340"	.003" max.

①—Valves furnished with .003", .015", .030" Oversize stems for service replacement. *See "Valve Guides" in Ford Special Data.*

②—Minimum lift for checking camshaft lobe wear.

Valve Seat Width—.066-.084" (Intake). .087-.109" (Exhaust).

►*ROTATABLE VALVE NOTE: All valves are rotatable type. See "Valve System" in Ford Special Data.*

Valve Stem Oil Seals—"Umbrella" type oil seals used on intake and exhaust valve stems. Seals are installed with cupped side down on valve stem at at guide boss on cylinder head. *Install new seals whenever valves removed or when seals become loose on stem.*

►*VALVE STEM OIL SEAL INSTALLATION CAUTION:* New valve stem oil seal, Part No. B5A-6571-A, has been released and **should be used to service V8 engines only.** Old seal, Part No. EAA-6571-C, should be used to service only 6-cylinder engines.

Valve Springs: Install with closed coil end toward cylinder head.

►*1955 VALVE SPRING REPLACEMENT CAUTION: See "1955 Camshaft & Valve Spring Replacement Caution" under "Camshaft" above.*

Valve Spring Specifications

	Pressure	Length
Valve Closed	54-62 lbs.	1.821"
Valve Open	124-140 lbs.	1.505"

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.002" Intake, .003" Exhaust), ream guides and install oversize valves. *See "Valve System" in Ford Special Data.*

Valve Lifters: Mushroom type. Removed from below with camshaft removed.

Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated.

Intake Valves— Open 13° ①BTDC. Close 68° ①ALDC.
Exhaust Valves—Open 55° ②BLDC. Close 22° ②ATDC.
①—Camlift .013". ②—Camlift .016".

Valve Timing Check: *See "Camshaft Setting" under CAMSHAFT above.* Remove rocker chamber cover. Turn engine over until No. 1 intake tappet is on heel of No. 1 intake cam lobe. Back off No. 1 intake valve adjusting screw, push rocker arm to one side, then install dial indicator. Zero dial indicator, then rotate engine slowly until desired lift (.013") obtained. Compare degrees on pulley with specifications (13°). If not within specifications, check for bent timing pointer by bringing No. 1 piston to TDC and see if timing pointer aligned with TDC mark on vibration damper. If pointer not at fault, check timing chain, camshaft sprocket, camshaft, vibration damper, and crankshaft in order of accessibility.

OILING SYSTEM

Crankcase Capacity: 4 qts. (refill), 5 qts. (when new filter installed).

Normal Oil Pressure: 45 lbs. at 2000 RPM.

Pressure Regulator Valve—In pump body, not adjustable.

Oil Pressure Indicator—Indicator light on instrument panel, operated by Engine Unit—Ford No. FDA-9278-A (Stamped #7 on Hex.). Lights when ignition switch turned on, goes out when engine starts and pump operates.

Oil Pump: Gear type pump located in crankcase.

►*1955 OIL PUMP PRODUCTION CHANGE & PARTS INSTALLATION CAUTION:* New oil pump assembly, intermediate shaft and body plate released for service. Parts not interchangeable with those of previous type pump. *See "Oiling System" in Ford Special Data.*

Pump Overhaul—*See "Oil Pump" in Ford Special Data.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

Replacement Filter Element—Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION—This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication.*

►*FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION: See "Oiling System" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

Water Capacity: 15 qts. (without heater). 16 qts. (with heater).

Pressure Valve: Ford LA-8100-A (marked "13" or "14"). Radiator filler cap. Opens at 12-15 lbs. *CAUTION*—If replacement required use 12-15 lb. type.

Thermostat: Ford No. EAA-8575-A. Mounted inside water outlet elbow in cylinder head. (Stamped 160 on operating cylinder) 160° type. Part No. EAA-8575-B (180°) can be used for permanent anti-freeze.

Water Pump: Packless, sealed ball bearing type.
See "Ford 6" in Water Pump Section.

Temperature Gauge: King-Seeley Electric.

Dash Unit—Ford No. FDA-10883-A (1954). B5A-10883-A (1955).

Engine Unit—Ford No. 1A-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 9½ CF-TS. Ford No. 1A-7563-A.
See "Long Clutches" in Clutch Section.

►*1954 CLUTCH RELEASE BEARING NOISE CORRECTION:* Check release bearing hub shoulder for a second "step" that prevents bearing from seating properly. Correct by replacing hub.

►*1954 CLUTCH GRATING NOISE CORRECTION:* Retracting spring reversed and rubbing on steering housing. Long end of spring should be toward front of car.

Clutch Disc No.—Ford No. 8HA-7550-B.

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper until until travel is within limits.

Pedal Free Travel—1 1/8-1 3/8". Loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.

►*PEDAL FREE TRAVEL ADJUSTMENT CAUTION:* Normal action of pressure plate centrifugal weights at high engine speed will take up approximately ¼" of specified free travel. Check free travel when engine is operated at high speed and see if approximately ½" of free travel is left. Insufficient free travel will cause release bearing to rotate at all times and will result in early bearing failure.

Removal: Remove transmission (see Transmission Removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install Tool 7563 and remove clutch pressure plate assembly (if tool not available, clutch may be released by backing off the attaching bolts evenly). Remove clutch release bearing from hub with an arbor press.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See "Ford Synchro-mesh" in Transmission Section

►*INTERMEDIATE & HIGH GEAR JUMP-OUT CORRECTION: See "Ford Synchro-mesh" in Transmission Section.*

►*LOW GEAR JUMP-OUT CORRECTION (Due to Insufficient Clearance):* To correct, remove side cover, grind corner of detent boss to provide sufficient clearance between shift cam and detent boss.

►*GEAR CLASHING CORRECTION (Shifting from Neutral-to-Low or Reverse):* Check operation by depressing clutch pedal and allowing sufficient time for input shaft to stop rotating. If clashing still occurs,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

check fit of clutch disc hub on input shaft. If it binds on shaft, apply lapping compound to input shaft and lap hub to shaft. If condition continues to exist, it will be necessary to select-fit clutch disc and input shaft. *CAUTION–Reducing clutch free-play below specified limit will not correct condition.*

Transmission Control: *See "Transmission Control" in Transmission Section.*

Removal: Disconnect gearshift linkage at transmission. Remove speedometer cable and gear. Disconnect drive shaft at transmission and remove the capscrews attaching transmission extension to rear engine support. Place a support under engine and remove the frame cross member and rear engine support. Remove transmission-to-flywheel housing capscrews and install two guide pins. Pull transmission back until main drive gear splines clear housing, and lower transmission from car.

OVERDRIVE

Warner Model AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. No Lock-Out Switch used.

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Control: *See "Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

See "Fordomatic & Mercomatic" in Transmission Section.

►*FORDOMATIC "WHISTLING NOISE" CORRECTION: This condition may occur during normal engine operation. See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication–Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain & refill every 15,000 miles. **Use only Automatic Transmission Fluid, Type A.**

Checking Fluid Level–Apply parking brakes, place transmission selector lever in "N" position, run engine at idle speed for approximately four minutes. With parking brake applied and engine running at slow idle, move selector lever to "P" (Parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator. Wipe indicator clean and insert in tube (make sure indicator is pushed down all the way). Remove indicator and read level. Add sufficient fluid to raise level to full mark on indicator. Replace indicator.

►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.

►*CAUTION (All Cars Except Station Wagon & Sedan Delivery): Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford & Mercury (Separate Carrier Type) Hypoid" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own. Separate Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle not same as Station Wagon & Sedan Delivery.*

See "Ford & Mercury (Separate Carrier Type) Hypoid" in Rear Axle Section.

1954 Ratios

Standard Transmission–3.90-1 (39-10).
Overdrive Transmission–4.10-1 (41-10).
Fordomatic Transmission–3.31-1 (43-13). ①

①–3.54-1 (39-11) Optional.

1955 Ratios

Standard Transmission–3.89-1 (35-9).
Overdrive Transmission–4.11-1 (37-9).
Fordomatic Transmission–3.30-1 (33-10). ①

①–3.55-1 (32-9) Optional.

Backlash–.003-.008".

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: Disconnect rear universal. Remove axle shafts (see above). Remove carrier from housing.

Wheel Bearing Adjustment: None required.

SEDAN DEL. & STATION WGN.

Own. Integral Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle not same as passenger cars.*

See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.

Ratios

Standard Transmission–4.09-1 (45-11).
Overdrive Transmission–4.27-1 (47-11).
Fordomatic Transmission–3.54-1 (39-11).

Axle Shaft Removal: Same as Pass. Cars (above).

Rear Axle Assembly Removal: Raise rear of car and disconnect rear universal. Remove axle shafts. Disconnect brake lines at "T" on left side of axle housing. Disconnect hand brake cable, shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

1954 Models

Model	Front	Rear
Pass. Cars (Std.)	B4A-18124-D	B4A-18125-A
Pass. Cars (Hvy. Duty)	B4A-18124-F	B4A-18125-C
Sta. Wgn. & Sed. Del.	B4A-18124-E	B4A-18125-B

1955 Models

Model	Front ①	① Rear
Pass. Cars (Std.)	B5A-18124-A	B5A-18125-A
Pass. Cars (Hvy. Duty)	B5A-18124-C	B5A-18125-C
Sta. Wgn. & Sed. Del.	B5A-18124-C	B5A-18125-D

①–Furnished in kits which include shock absorber mounting bushings.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs.

See "Lincoln, Mercury, Ford (Ball-Joint)" in Front Suspension Section.

►*LOWER ARM BUMPER INSTALLATION:* Right and left hand bumpers are different and must be installed in the correct position. Damage to suspension system will result if installed incorrectly. **Bumpers when installed should point slightly inboard.**

Kingpin Inclination–0° minimum, 7° maximum, crosswise.

Caster–0° to Pos. 1° (1954). Pos. ¼° to Pos. 1¼° (1955). Maximum variation between wheels ½°.

Camber–Pos. ¼° to Pos. 1¼°. Maximum variation between wheels ¼°.

Toe-In–1/16" to 1/8".

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type. *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Power Steering: Ford-Mercury Linkage type. Used in conjunction with standard type steering gear.

See "Ford & Mercury Bendix" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BRAKES

Ford-Bendix Hydraulic (Single Anchor-with eccentric on front wheels, without eccentric on rear wheels). Hand lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section.

►*1955 FRONT WHEEL ADJUSTMENT NOTE: Eccentric has been moved from secondary shoe to primary shoe. Adjustment procedures are different for 1954 and 1955 models. See "Ford, Lincoln, Mercury Bendix" in Brake Section.*

►*1955 PARKING BRAKE "FIX" CORRECTION:* A new parking brake cable equalizer, Part No. B5A-2111-A, is available to correct permanent set of early brake cable equalizer. Before installing on a convertible, cut 1 5/8" from each end of equalizer.

►*1954 BRAKE DRUM INTERFERENCE CORRECTION (Sta. Wgn. & Sed. Del.):* Interference occurs between drum lugs and hand hole flange on wheel and does not allow wheel to seat flat against face of drum. Correct by grinding off outer edge of lugs (3) on an angle of 60° to braking surface of drum. *CAUTION–Do not grind corner of drum.*

Drum Diameter–10" (1954 Pass. Cars, Exc. Sta. Wgn. & Sed Del.) .11" (1954 Sta. Wgn. & Sed. Del. 1955 Pass. Cars, Sta. Wgn. & Sed. Del.).
Wheel Cylinder Diameter–1 1/8" (Front–All); 7/8" (Rear–Pass. Cars). 15/16" (Rear–Sta. Wgn.).

Lining Specifications

Car Model	Width	Thickness	Length
Pass. Car (Fr. Pri.)	2¼"	3/16"	10.84"
Pass. Car (Fr.Sec.)	2¼"	15/64"	10.84"
Pass. Car (Rear-All)	1¾"	3/16"	10.84"
Sta.Wgn.,Sed.Del. (Fr.Pri.)	①	7/32"	9.28"
Sta.Wgn.,Sed.Del. (Fr.Sec.)	①	7/32"	11.94"
Sta.Wgn.,Sed.Del. (Rr.Pri.)	②	7/32"	9.28"
Sta.Wgn.,Sed.Del. (Rr. Sec.)	②	7/32"	11.94"

①–2" (1954). 2¼" (1955). ②–1¾" (1954). 2" (1955).

Clearance–.010" at each end of both primary and secondary shoes. Maximum variation .003". *See Adjustment Change above.*

Brake Pedal Free Play Adjustment: ¼-7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder: Located on engine side of firewall.
Checking Fluid–Maintain fluid level to within ½" of top of reservoir.

Removal–Disconnect brake line from master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove cap screws and lock washers attaching master cylinder to firewall.

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinders. There are no mechanical connections and adjustments are required.
See "Midland Power Unit" in Brake Section.

Checking Fluid–Same as for manual brakes (above).
Removal of Power Unit–Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at the power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket bolts and lockwashers and remove the power unit.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Miscellaneous Section.*

►*POWER WINDOW REGULATOR RELAY FLUTTER CORRECTION: See "Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Electric-Hydraulic with reversible pump motor. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: Electric screw and jack type with individual motors and transmissions for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate attached to left front door pillar and stamped on top of frame right-hand front cross member-to-side member reinforcement. **First Number**—100001 up.

►*VEHICLE NUMBER NOTE:* Vehicle number (example "U4FG100001") includes following identification data

Eng. Type ①	Year ②	Assy. Plant	Body Style ③	Serial No.
U	4	See Below	See Below	100001 up

①—**A**—6 Cyl. 223 cu. in. engine; **U**—8 Cyl. 239 cu. in. engine; **P**—8 Cyl. 256 cu. in. engine (Special Law Enforcement).

②—Last digit of model year.

③—**C**—Sunliner; **F**—Skyliner; **R**—Ranch Wagon (Customline); **S**—Sedan Delivery; **T**—Fordor (Crestline); **V**—Victoria; **W**—Ranch Wagon (Mainliner); **X**—Country Sedan; **Y**—Country Squire; **G**—All Others (Tudor, Fordor, Coupe—Mainline & Customline).

Assembly Plant Designation

A—Atlanta	**F**—Dearborn	**M**—Memphis
B—Buffalo	**G**—Chicago	**N**—Norfolk
C—Chester	**H**—Highland Park	**P**—St. Paul
D—Dallas	**K**—Kansas City	**R**—Richmond
E—Edgewater	**L**—Long Beach	**S**—Somerville
	U—Louisville	

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. at cranking speed.

VACUUM READING: 18-21" idling at 500 RPM.

VALVE TAPPET CLEARANCE: .019" (intake & exhaust), with engine at normal operating temperature.

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve on cars with single exhaust system is located on front end of right hand exhaust manifold. Cars with dual exhaust system, the valve is located in rear end of left hand exhaust manifold. Thermostat spring installed with ¾ turn-windup and hooked over stop pin. NOTE—When valve installed, stop pin should be at top.

►*MANIFOLD HEAT CONTROL VALVE CHANGE (To improve fuel distribution and minimize stalling due to icing):* New 1955 Manifold Heat Control Valve, No. B5A-9685-D, can be installed. Valve has increased spring tension and will provide more exhaust gas heat.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinders—RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .033-.037".

Spark Plugs—Champion H-10 14mm. Use Champion H-11 for slow or stop-and-go driving.

COIL: Ford No. 8BA-12029.

Ignition Current—2.75-3.0 amperes (idling), 5.0-5.5 amperes (stopped).

DISTRIBUTOR: Ford No. FAE-12127-A.

Condenser—FAB-12300-A. **Capacity**—.21-.25 mfd.

Contact Point Set—Ford No. FAB-12171-A (Std.). FAB-12171-B (Heavy Duty).

Breaker Gap—.014-.016".

Cam Angle—26-28° (58-63% dwell idling).

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Advance Performance
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Dist. RPM
0	0	200
3¾-4¾	0.72	500
10-11	2.20	1000
12½-13½	3.46	1500
14-15½	4.40	2000

►*DISTRIBUTOR INSTALLATION CAUTION: Be sure oil pump tang engages slot in distributor shaft.*

IGNITION TIMING

►*TIMING CAUTION: Timing is different on Synchro-mesh and Fordomatic Drive Cars.*

Setting (Fordomatic Cars)—6° BTDC.

Setting (Synchro-mesh Trans. Cars)—3° BTDC. NOTE—Timing on synchro-mesh cars can be set up to 6° providing higher octane rating gasoline is used.

Timing Mark—On crankshaft pulley and pointer on front engine cover. Align pointer and timing mark. NOTE—Six timing marks (0°-2°-4°-6°-8°-10° BTDC) on dampener. Wide mark represents TDC.

CARBURETOR

Ford No. EBU-9510-E. Dual down-draft type. NOTE—Anti-stall dashpot used on Fordomatic Cars.

►*CARBURETOR INSTALLATION CAUTION:* Tighten carburetor hold-down bolts evenly to 12-15 ft. lbs. torque. Tightening one bolt completely would result in compressing spacer and cracking carburetor throttle body.

►*ACCELERATOR PEDAL ALIGNMENT NOTE: Clearance between brake pedal and accelerator pedal should be 1¾". If not correct, install one or two flat washers on left hand accelerator pedal bracket-to-floor pan bolt.*

►*ENGINE STALLING AT IDLE SPEED CORRECTION:* If engine stalls at idle speed when idle mixture setting is known to be correct, deviate from the specifications as follows:

Turn each idle mixture screw **out** 1/8th turn at a time until engine speed is reduced 25 RPM., then turn screw **in** until specified idle speed is obtained.

Idle Setting—Approximately one turn open. Set both screws for highest steady vacuum reading and highest engine RPM.

Idle Speed—475-500 RPM., (Std. Trans.). 445-455 RPM., (Fordomatic Trans.) with selector lever in "N" position.

Float Level: 1.275-1.305". Measured from bottom of float to underside of bowl cover with needle valve seated. Use Gauge No. T52L—9510AHD.

Accelerating Pump: Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Fast Idle: Integral type. Operated by choke valve lever. No adjustment required.

Anti-Stall Dashpot (Fordomatic Cars): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½-2 turns to obtain .045-.064" clearance. Tighten locknut.

Throttle Linkage Adjustment (Fordomatic Cars): *See "Fordomatic & Mercomatic" in Transmission Section.*

►*OTHER DATA: See "Holley-Ford Carburetors" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs.

CARB. EQUIPMENT

Fuel Pump: Ford No. EAN-9350-A, Fuel only (Except Fordomatic & Overdrive Cars). EBY-9350-A, Fuel & Vacuum (Fordomatic & Overdrive Cars.)

Pressure—4-5 lbs.

See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric.

Dash Unit—Ford No. FAG-9280-A.

Tank Unit—Ford No. FAA-9275-A (Exc. Sta. Wgn. & Sedan Delivery). No. FAA-9275-B (Sta. Wgn. & Sedan Delivery).

See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Ford No. FDA-10655-A. 6 volt, 17 plate, 90 ampere hour capacity (20 hr. rate).

Battery Ground—Positive (+) to cylinder head.

Engine Ground—Cylinder head to dash.

STARTER

Ford No. FAC-11002-B. Armature—No. 52-11005.

►*STARTER DRIVE INTERFERENCE WITH FLYWHEEL RING GEAR (FORDOMATIC CARS):* Identified by coarse grinding noise when starting, and a wear pattern at bottom lands of drive gear. To correct, install starter, leaving mounting bolts loose. Insert edge of pry bar between starter flange and engine block, and pry starter away from block. Hold in this position and tighten bolts securely. If not corrected in this manner, it may be necessary to replace converter housing.

►*STARTER SEAL INTERFERENCE WITH FLYWHEEL CORRECTION (FORDOMATIC CARS):* Identified by coarse grinding sound or a "ticking" noise (similar to a loose tappet) when engine is running. Correct by installing a new starter seal.

Drive—Ford No. 1CM-11350-C. Bendix "Folo-Thru".

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—48-56 ozs.

Cranking Speed—100 RPM.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
16 ft. lbs.	Lock		700

①—With starter on engine and engine running.

►*STARTER INSTALLATION CAUTION:* Tighten top and bottom flange bolts first, then tighten the center or outer flange bolt. This will avoid misalignment and prevent noisy starter operation.

Starting Switch: Ford No. FAB-11450-B. Mounted on left front fender apron and controlled by Ignition Switch. NOTE—A Neutral Safety Switch is used on all models with Fordomatic.

Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C

Adjustment—*See "Fordomatic & Mercomatic" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

GENERATOR

Ford No. FBC-10002-A. Armature—FBC-10005-A.

►*GENERATOR BELT WEAR & IMPROPER CHARGING RATE CAUTION:* If either of these two conditions are encountered, check to make sure a 6 Cyl. generator is not being used.

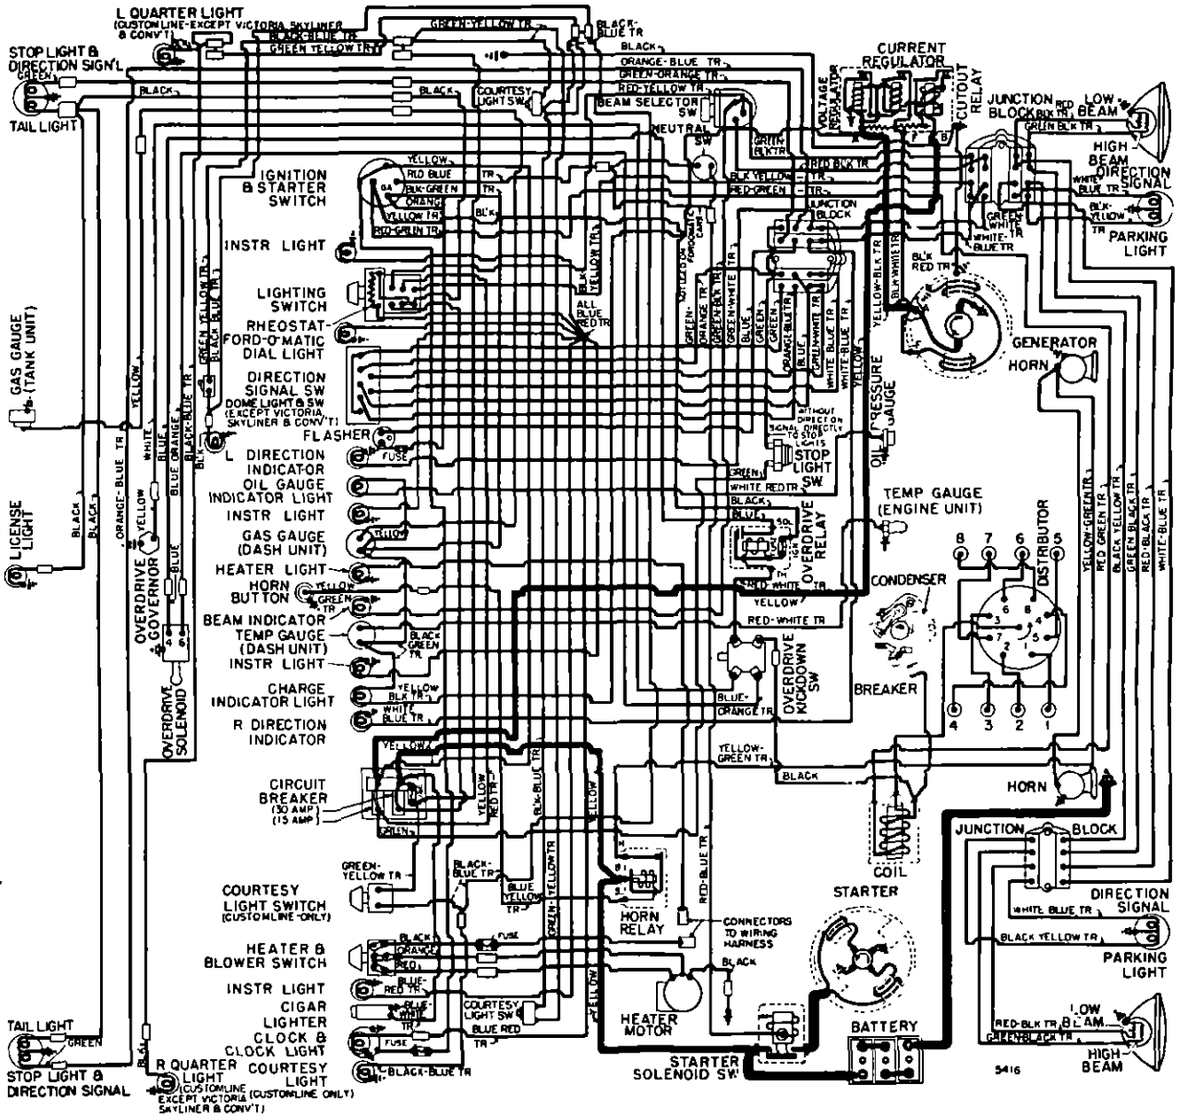
Performance Data

Generator	Amperes	Eng. RPM.
FBC-10002-A	35①	900

①—See Regulator for maximum charging rate.

Brush Spring Tension—30 ozs.
Field Current—1½-2½ amperes at 6.0 volts.
Rotation—Counter-clockwise at commutator end.

Belt Adjustment: ¼" belt deflection midway between generator and pump pulleys with normal thumb pressure.



REGULATOR

Ford No. FAC-10505-A.

►*SETTING NOTE:* Settings below are for regulator at NORMAL OPERATING TEMPERATURE (after ½ hour operation) with room temperature at 70-80°.

Cutout Relay

Cuts In—6.0-6.6 volts.

Voltage Regulator

Setting—7.5-7.8 volts.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

Setting—34-38 amperes.
Checking & Adjusting—*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Direction Signal: *See Electrical Equipment Section.*

►*DIRECTION SIGNAL FLASHER BURNING OUT CORRECTION:* Replace 14 amp. fuse with a 9 amp. fuse by making a 3/16" long spacer from ¼" copper tubing. Cut spacer lengthwise and place on wire so it will be between bottom of fuse holder and spring. Press sides of spacer together with pliers.

Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.

Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of brake booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.

FUSES: Located as indicated below:
Interior Lights—14 amps., on main circuit breaker.
Direction Signal—14 amps., in fuse holder between ignition switch and flasher. *NOTE—See "Direction Signal Flasher Burning Out Correction" above.*
Overdrive—30 amps., on overdrive relay.
Cigar Lighter—Special fuse in lighter base.
Clock—3 amps., in clock lead.
Heater—14 amps., in blower switch wire.

CIRCUIT BREAKERS: Two circuit breakers on a single panel located behind instrument panel. Upper circuit breaker protects tail & stop light circuits, and lower circuit breaker protects headlamp circuit.

HORNS: Ford No. FAC-13832-E or F (High Pitch), FAB-13833-F or G (Low Pitch). Dual horns operated by relay.
Horn Current—13 amps. (high pitch), 14 amps. (low pitch).
Horn Relay: Ford No. FAA-13853-A.

ENGINE

►*ENGINE FRONT COVER OIL LEAK CORRECTION:* Install gasket Part No. B4A-6020-A (.020" thicker than previous gasket), to correct oil leaks or whenever front cover is removed. Coat both sides of gasket with sealing compound.

►*CYLINDER HEAD PRODUCTION CHANGE:* A new cylinder head, Part No. B4A-6049-A or EBU-6090-B, identified by EBU-6090-B cast in side and top of head, used in later production cars. *CAUTION—LATER TYPE GASKET MUST BE USED WITH THIS HEAD. See "Cylinder Head Gasket Caution" below.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE SPECIFICATIONS: Own 90° V8.
Bore—3.50". **Stroke**—3.10"
Displacement—239 cu. in. **Rated H.P.**—39.2.
Developed Horsepower—130 at 4200 RPM.
Compression Ratio—7.2-1.
Compression & Vacuum Reading—*See Tune-Up.*

CYLINDER HEAD: *See Ford Special Data.*

►*CYLINDER HEAD GASKET CAUTION:* Later type gasket Part No. B4A-6051-A (identified by **elongated core hole** sealing area on outer edge of gasket on piston side between center piston holes), can be used with either early or late type heads. Early gasket Part No. EBU-6051-E (identified by **round hole** sealing area in same location as above), must NOT be used with later type head.

►*CYLINDER HEAD GASKET INSTALLATION CAUTION:* Gaskets are stamped on one side with the words "RIGHT FRONT". When installing gasket on **right hand** side of cylinder block, wording should be **upward** and toward front of engine. When installing on **left hand** side, wording should be **downward** and toward front of engine.

TIGHTENING TORQUES: *See Ford Special Data.*

ENGINE REMOVAL: *See Ford Special Data.*

ENGINE FRONT MOUNTING: *See Ford Special Data.*

OIL PAN REMOVAL: *NOTE—Later type oil pan has single piece oil pump screen cover and inlet tube assembly.* To remove oil pan rotate engine to place #1 piston on TDC. Drain oil and remove engine front splash pans and oil pan-to-oil pump pipe (early type pans), disconnect oil pipe at oil pump (later type pans). On Fordomatic Transmission cars, remove converter housing dust cover. Remove oil pan.

PISTONS

Autothermic type. Solid skirt with three rings above pin.

Removal—Pistons and rods removed from above.

Fitting New Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:
New Piston in New Bore—.0015" feeler. 5-10 lbs. pull.
New Piston in Used Bore—.002" feeler. 5-10 lbs. pull.
Used Piston in Used Bore—.0025" feeler. 5-10 lbs. pull.

Replacement Pistons: Standard size, .020", .030", .040", .060" Oversize. Pistons furnished only with fitted pins.

Installing Pistons: Install with small indentation in head toward FRONT of engine.

PISTON PINS

Floating type with lock rings at each end.
Diameter—.9120-.9123". **Length**—2.9820".
Pin Fit in Piston—Hand push fit at 70° F.
Pin Fit in Rod Bushing—.0001-.0003" clearance. New pin should not fall through of own weight.

Replacement Pins: Standard size, .001", .002" Oversize.

PISTON RINGS

►*SPECIAL SERVICE PISTON RING SETS (To Reduce Possibility of Excessive Oil Consumption):* The following "Special Service" piston ring sets are available in addition to the "Expander" & "Snap Ring" type service replacement rings: B4A-6149-ABA (Pass. Cars only), has "Unitized" oil ring. B4A-6149-ACA (Pass. Cars & Trucks) has "Steel Section" oil ring. B4A-6149-ADA (Pass. Car & Truck) has "Steel Rail" oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.3/32"	.010-.027"	.002-.0035"
Compr. #2	.3/32"	.010-.027"	.002-.0035"
Oil	.3/16"	.010-.027"	.0015-.003"

Replacement Rings: Standard size, .020", .030", .040", .060" Oversize.

►*REPLACEMENT PISTON RING NOTE:* "Snap-Type" rings furnished in Std. size only. "Expander" type furnished in all above oversizes. *See "Special Service Piston Ring Sets" above.*

CONNECTING RODS

►*1954 V8 CONNECTING ROD & BEARING PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Late production connecting rods have an oil hole (for cylinder lubrication) located on the same side as the bearing notch. Early type bearings, with one oil hole MUST NOT BE USED with the later type rod. Later type bearings may be used with either the old or new rod as they have two oil holes and will fit either rod.
Length—6 21/64". **Weight**—24.06 ozs.
Crankpin Journal Diameter—2.1880-2.1888".
Lower Bearing—Steel backed, copper lead alloy lined type. Upper and lower halves interchangeable.
Clearance—.0005-.0021".
Side Clearance—.006-.016" (two rods).

Replacement Bearings: Standard size (4 sizes marked **red & blue** for selective fitting) and .010", .020", .030" Undersize.

Installing Rods: Oil squirt hole in rod toward camshaft side of bore on all rods. Numbers on rods and bearing cap should be together and installed in same numbered cylinder.

CRANKSHAFT

►*CRANKSHAFT & FLYWHEEL PRODUCTION CHANGE:* Later type parts are interchangeable with previous parts except that later crankshaft cannot be used with early flywheel unless inner edge of bore in flywheel is chamfered 1/16" x 45° to eliminate crankshaft-to-flywheel interference. This operation can be accomplished with a bearing scraper.
Journal Diameter—2.4980-2.4988". Max. wear limits .0015", taper .001".
Bearings—Steel backed, copper lead alloy lined.

Replacement Bearings: Standard size, (4 sizes marked **red & blue** for selective fitting) and .010", .020", .030" Undersize.

End Thrust: Taken by No. 3 main bearing. Replace bearing if endplay excessive.
Thrust Bearing Alignment—*See "Crankshaft & Main Bearings" in Ford Special Data.*
Endplay—.002-.006".

Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Special Data.*

►*CRANKSHAFT REAR BEARING OIL SEAL PRODUCTION CHANGE: New type oil seal and oil seal retainer used in later production and is not interchangeable with early engines. See Ford Special Data.*

CAMSHAFT

►*1954 239" & 256" ENGINE CAMSHAFT BEARING CHANGE (To prevent oil starvation due to improperly installed front bearing):* On engines equipped with the "ECE" camshaft, new front camshaft bearings have been released for service replacement (Part No. B4C-6261-A, Standard. B4C-6261-B, .015" undersize). The later bearings have a slot instead of a 1/8" diameter oil hole. When installing the new bearing make sure that the slot is aligned with hole in cylinder block bore and that the bearing is pressed .005-.020" into cylinder block camshaft bearing bore to eliminate interference with camshaft thrust plate.
Journal Diameter—1.9255-1.9265" (new), 1.924" (worn limit).
Clearance—.001-.003" (new), .005" (worn limit).

End Thrust: Taken by plate on forward end of block (between camshaft sprocket and shoulder on block).
Endplay—.003-.006".

Replacement Camshaft Bearings: Finished bearings furnished Standard, .015" Undersize. CAUTION—Oil holes *in bearings must be lined up correctly. See Ford Special Data.*

Camshaft Bearing Removal & Installation: *See Ford Special Data.*

Timing Chain: Side-guide type. Length 56 links.

►*REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side).

Camshaft Setting: *(NOTE—Two types of timing chains used which have different index marks).* **"Brass disc"** type has a brass link pin washer which should be placed next to marked camshaft sprocket tooth (away from opposite sprocket). **"Punched link"** type has a hole punched in center of link which should index with marked tooth on camshaft sprocket. Place #1 piston on TDC (firing position). Place timing chain over camshaft and crankshaft sprockets, making sure that timing marks on sprockets are lined up adjacent to marks on timing chain. Align camshaft and crankshaft keys so that both timing chain sprockets and timing chain can be installed simultaneously.

VALVES

►*1954 VALVE PUSHROD BENDING & ROCKER ARM BREAKAGE CORRECTION:* If this condition is encountered at sustained speed over 40-50 MPH, check the guide clearance on the valve in question. The clearance should be .001"-.002" (intake), and .002"-.003" (exhaust). The above condition is usually encountered when less than minimum clearance is provided. Ream valve guides as necessary to provide proper clearance.

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves): Stem diameter decreased .0005" for greater stem clearance in guide. See "Valve System" in Ford Special Data.*

Tappet Clearance: .019" (Intake & Exhaust), with engine at normal operating temperature. *NOTE—Valve tappet clearance on truck engines is different.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve	Head Diam.	①Stem Diam.	Length
Intake	1.652"	.3415"	5.02"
Exhaust	1.515"	.3405"	5.02"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°	.345"	.004" max.
Exhaust	45°	.345"	.005" max.

①—Valves furnished with .003", .015", .030" Oversize stems for service replacement. *See "Valve System" in Ford Special Data.*

②—Minimum lift for checking camshaft lobe wear.

Valve Seat Width—.060-.070" (Intake). .070-.080" (Exhaust).

►*ROTATABLE VALVE NOTE: All valves are rotatable type. See "Valve System" in Ford Special Data.*

Valve Stem Oil Seals—"Umbrella" type oil seals used on intake & exhaust valve stems. Seals are installed with cupped side down on valve stem at guide boss on cylinder head. *Install new seals whenever valves removed or when seals become loose on valve stems.*

Valve Springs: Install with closed coil end toward cylinder head.

Valve Spring Specifications

	Pressure	Length
Valve Closed	54-62 lbs.	1.821"
Valve Open	124-140 lbs.	1.505"

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" Intake, .005" Exhaust), ream guides and install oversize valves. *See "Valve System" in Ford Special Data.*

Valve Lifters: Mushroom type. Removed from below with camshaft removed.

►*1954 V8 ENGINE TAPPET REPLACEMENT CAUTION:* The cast iron tappet, Part No. EAA-6500-C should no longer be used as service replacement on V8 engines as these tappets may contribute to camshaft lobe wear. Install tappet, Part No. EAA-6500-D (steel forging) which can be identified by forging marks on outer edge of tappet foot. The tappet foot is .140" thick as compared to .220" thickness of the cast iron tappet foot.

Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

►*ROCKER ARM COVER OIL LEAKAGE CORRECTION:* Cover may be slightly shallow requiring the use of an additional washer under the acorn nut to firmly seat cover on cylinder head.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves—Open 8° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 5° ATDC.

OILING SYSTEM

►*1954 239" & 256" ENGINE SERVICE REPLACEMENT OIL PUMP CHANGE & INSTALLATION CAUTION:* A new pump, Part No. EAM-6600-A, with steel gears is available for service replacement. The pump is furnished in Kit No. B5A-6600-C which includes a pump and spring. When installing pump on these engines, remove the Relief Valve Spring from the pump and replace it with the spring, Part No. EBU-6670-A, found in the box.

►*1954 V8 ENGINE OIL PUMP FAILURE CORRECTION (Due to oil pan-to-oil pump tube seal breaking off):* In some cases the tube is too short and when the retaining nut is tightened excessively, the seal is squeezed over the edge of the tube which cuts to seal. Always lubricate the seal with engine oil prior to installation, and tighten the retaining nut just enough to ensure against leakage.

Crankcase Capacity: 5 qts. (refill).

Normal Oil Pressure: 45-55 lbs. at 30-40 MPH.

Pressure Regulator Valve—In pump body, not adjustable.

Oil Pressure Indicator—Indicator light on instrument panel, operated by Engine Unit—Ford No. FDA-9278-A (Stamped #7 on Hex.). Lights when ignition switch turned on, goes out when engine starts and pump operates.

Oil Pump: Gear type pump located on left side of engine crankcase, driven by distributor drive gear.

Pump Overhaul—*See "Oil Pump" in Ford Special Data.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

Replacement Filter Element—Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION: This special Full-flow filter element must be used for replacement(use of by-pass type element would restrict oil flow and result in insufficient engine lubrication.*

►*FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION: See "Oiling System" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

►*CRANKCASE VENTILATOR OIL LEAKAGE CORRECTION:* Install gasket, Part No. B4A-6872-A, which is a firmer type neoprene gasket and will not distort when tightened.

COOLING

►*TEMPERATURE GAUGE FALSE READING CORRECTION:* In cases where heat indicator shows a reading higher than actual water temperature, check water temperature gauge bulb on engine to see that it is not contacting a casting flash inside cylinder head. Remove flashing with a rat tail file.

►*RESTRICTED WATER PUMP BY-PASS CAUTION:* A restricted or blocked passage caused by casting flash will retard or decrease the flow of water in engine when thermostat is closed. Check for this condition by listening for a gurgling sound when engine is stopped after a short period of operation. If noise is heard, remove water by-pass tube and inspect for a restricted opening in water pump housing. If necessary, remove pump and drill opening with a 19/32" drill.

Water Capacity: *20 qts. (without heater), 21 qts. (with heater).*

Pressure Valve: Ford No. 1M-8100-A. Radiator filler cap cap (7# type), opens at 6¼-7¾ lbs.

Thermostat: *Ford No. B4A-8575-A (160°), No. B4A-8575-B (180° used with permanent anti-freeze).* Mounted inside water outlet elbow on forward end of intake manifold. *NOTE—The above thermostat replaces type formerly used.*

Water Pump: Packless, sealed ball bearing type. *See "Ford V8" in Water Pump Section.*

Temperature Gauge: King-Seeley Electric.
Dash Unit—Ford No. FDA-10883-A.
Engine Unit—Ford No. 1A-10884-A.

Temperature Bulb Sleeve Removal—Thread adapter handle of tool T50T-100-A into sleeve. Tighten locknut against sleeve, then pull sleeve with sliding hammer.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 9½ CF-TS, Ford No. 1A-7563-A.
See "Long Clutches" in Clutch Section.

►*CLUTCH RELEASE BEARING NOISE CORRECTION: Check release bearing hub shoulder for a second "step" that prevents bearing from seating properly. Correct by replacing hub.*

►*CLUTCH GRATING NOISE CORRECTION:* Retracting spring reversed and rubbing on steering housing. Long end of spring should be toward front of car.
Clutch Disc No.—Ford No. 8HA-7550-B.

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper until travel is within limits.
Pedal Free Travel—7/8-1 1/8". Loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.

Removal: Remove transmission (see Transmission Removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install Tool 7563 and remove clutch pressure plate assembly (if tool not available, clutch may be released by backing off the attaching bolts evenly). Remove clutch release bearing from hub with an arbor press.

SYNCHRO-MESH TRANSMISSION

Own. *Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).*
See "Ford Synchro-mesh" in Transmission Section.

Transmission Control: *See "Transmission Controls" in Transmission Section.*

►*GEAR CLASHING CORRECTION (Shifting from Neutral-to-Low or Reverse):* Check operation by depressing clutch pedal and allowing sufficient time for input shaft to stop rotating. If clash still occurs, check fit of clutch disc hub on input shaft. If it binds on shaft, apply lapping compound to input shaft and lap hub to shaft. If condition continues to exist, it will be necessary to select-fit clutch disc and input shaft. *CAUTION—Reducing clutch free-play below specified limits will not correct condition.*

Transmission Control: *See "Transmission Control" in Transmission Section.*

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame. Take out 4 transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. Lock-out Switch not used on this model.

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Control: *See "Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

►*FORDOMATIC "WHISTLING" NOISE CORRECTION: This condition may occur during normal engine operation. See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain & refill every 15,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level—Apply parking brakes, place transmission selector lever in "N" (Neutral) position, run engine at idle speed for approximately four minutes. With engine and transmission at normal operating temperature and idling, move selector lever through all positions to distribute fluid through transmission. Return selector lever to "P", check fluid level on dipstick in filler cap in engine compartment. Maintain level at "Full" mark on dipstick.

►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Roller bearing type.

►*CAUTION (All Cars Except Station Wagon & Sedan Delivery): Rear universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford & Mercury (Separate Carrier)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own. Separate Carrier, semi-floating hypoid, with Hotchkiss drive.

See "Ford & Mercury (Separate Carrier)" in Rear Axle Section.

Ratios

Standard Transmission—3.90-1 (39-10).
Overdrive Transmission—4.10-1 (41-10).
Fordomatic Transmission—3.31-1 (43-13). ①

①—3.54-1 (39-11) Optional.

►*AXLE CARRIER & GEAR RATIO IDENTIFICATION: Carrier housing stamped with ring gear & pinion gear ratio (10/39 for 3.90-1 ratio, etc.).*

Backlash—.003-.008".

Axle Shaft Removal: Remove wheel, take off drum, Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: Disconnect rear universal. Remove axle shaft (see above). Remove carrier from housing.

Wheel Bearing Adjustment: None required.

SEDAN DEL. & STATION WGN.

Own. Integral Carrier. Semi-floating hypoid, with Hotchkiss drive.

See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.

Ratios

Standard Transmission—4.09-1(45-11).
Overdrive Transmission—4.27-1 (47-11).
Fordomatic Transmission—3.54-1 (39-11).

Axle Shaft Removal: Same as Pass. Cars (above).

Rear Axle Assembly Removal: Raise rear end of car and disconnect rear universal. Remove axle shafts. Disconnect brake lines at "T" on left side of axle housing. Disconnect hand brake cable, shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Model	Front	Rear
Pass. Cars (Std.)	B4A-18124-D	B4A-18125-A
Pass. Cars (Hvy. Duty)	B4A-18124-F	B4A-18125-C
Sta. Wgn. & Sed. Del.	B4A-18124-E	B4A-18125-B

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs.

See "Lincoln, Mercury, Ford (Ball-Joint)" in Front Suspension Section.

►*LOWER ARM BUMPER INSTALLATION CAUTION:* Right and left hand bumpers are different and must be installed in the correct position.

Kingpin Inclination—6° minimum, 7° maximum, crosswise.

Caster—0° to Pos. 1°. Maximum variation between wheels ½°

Camber—Pos. ¼° to Pos. 1¼°. Maximum variation between wheels ¼°.

Toe-In—1/16" to 1/8".

STEERING

MANUAL: Own (Gemmer 305 Design). Worm & Roller type.

See "Gemmer Worm & Roller (Type 305)" in Steering Section.

Power Steering: Ford-Mercury Linkage type. Used in conjunction with standard type steering gear.

See "Ford & Mercury Power Unit" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

BRAKES

Ford-Bendix Hydraulic (Single anchor—with eccentric on front wheels, without eccentric on rear wheels). Hand lever applies rear wheel service brakes. *See "Ford, Lincoln, Mercury Bendix" in Brake Section.*

►*BRAKE DRUM INTERFERENCE (Sta. Wgn. & Sed. Del.):* Interference occurs between drum lugs and hand hold flange on wheel and does not allow wheel to seat flat against face of drum. Correct by grinding off outer edge of lugs (3) at an angle of 60° to braking surface of drum. *CAUTION—Do not grind corner of drum.*

Drums—Diameter 10" (Pass. Cars). 11" (Sta. Wgn. & Sed. Del.).

Wheel Cyl. Diameter—1 1/8" (Front). 7/8" (Rear).

Lining— Molded type riveted to shoe.

Width—2¼" (Front, Pass Cars.). 2" (Front, Sta. Wgn. & Sed. Del.). 1¾" (Rear, All Models).

Thickness—(Pass. Cars) 3/16" (Exc. Front Whl. Secondary). 15/64" (Front Whl. Secondary). **Sta. Wgn. & Sed. Del. 7/32"** (All Shoes).

Length—10.84" (Pass. Cars—All Shoes). 9.28" (All Primary Shoes—Sta. Wgn. & Sed. Del.). 11.94" (All Secondary Shoes—Sta. Wgn. & Sed. Del.).

Clearance—.010" at each end of both primary and secondary shoes. Maximum variation .003".

Brake Pedal Free Play Adjustment: 1/4-7/16". If play not correct after brake adjustment, loosen lock nut on the eccentric bolt attaching brake pedal to master cylinder pushrod, rotate eccentric bolt.

Standard Master Cylinder: On engine side of firewall.

Checking Fluid—Maintain fluid level to within ½" of top of reservoir.

Removal—Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to firewall.

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line.

See "Midland Power Unit" in Brake Section.

Removal of Power Unit—Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at the power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket bolts and lockwashers.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Window Regulators: Reversible motor in each window. Two types used. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Top Control: Electric Hydraulic with reversible pump motor. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: Electric screw and jack type *See Miscellaneous Section for complete data.*

MODEL IDENTIFICATION

VEHICLE NUMBER: On Rating Plate attached to glove box door, Vehicle Number is also Engine Number. **First Number**—10001 up.

►*ENGINE IDENTIFICATION NOTE: Three engines used, and for identification purposes in the following Ford Truck pages, reference is made to each engine by piston displacement, "223", "239", "256". See "Vehicle Number Note" following.*

►*VEHICLE NUMBER NOTE: Vehicle number (example "F10D5A 10001") includes identification in the following sequence.*

Serial Code①	Engine Symbol②	Model Year③	Assy. Plant	Serial Number
F-10	D	5	See below	10001 Up

①—See Model & Serial Code Table below.

②—**D**—6 Cyl. 223 cu. in. O.H.V. engine. **V**—8 Cyl. 239 cu. in. O.H.V. engine **Z**—8 Cyl. 256 cu. in. O.H.V. engine.

③—Last digit of model year.

Models & Serial Codes

Model	Serial Code	Model	Serial Code

TUNE-UP

COMPRESSION PRESSURE: At cranking speed.

Engine	1954	1955
223"	120 lbs.	125 lbs.
239"	130 lbs.	130 lbs.
256"	115 lbs. ①	125 lbs.

①—With early type camshaft. 120 lbs. with later type camshaft. *See "Camshaft" below for identification.*

VACUUM READING: Steady 18-21" at idling speed.

VALVE TAPPET CLEARANCE: 223" Engine—.015" (Intake), .019" (Exhaust). **239" & 256" Engines**—.016" (Intake), .018" (Exhaust). With engine at normal operating temperature.

MANIFOLD HEAT CONTROL (239 Eng.): Automatic thermostatic type with counterweight. Valve is open at top when engine cold. Install thermostat spring with ¾ turn wind-up and hook over stop pin.

►*256 ENG. MANIFOLD HEAT CONTROL INSTALLATION (For Cold Weather Operation): See "Manifold Heat Control" in Ford Special Data.*

►*MANIFOLD HEAT CONTROL PRODUCTION CHANGE (239 & 256 Engs. with Single Exhaust):* To minimize engine stalling (due to carburetor icing) and to improve fuel distribution by directing more exhaust gases through crossover passage in intake manifolds, a new manifold heat control valve, Part No. B5A-9685-D, has been released for V8 engines with single exhaust. New valve has bi-metal thermostat spring that holds valve closed for a longer period of time

IGNITION

FIRING ORDER: 6 Cyl. Engines—1-5-3-6-2-4. **8 Cyl. Engines**—1-5-4-8-6-3-7-2.

Cylinders—RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .025-.029" (Champion H-9 or H-10). .028-.032" (Champion 860)

Spark Plugs (1954)—Champion H-9. 14mm. Use Champion H-10 for slow or stop-and-go driving. Tighten to 25-30 ft. lbs.

Spark Plugs (1955)—Champion 860. 18mm. Special. Tighten to 15-20 ft. lbs.

►*1955 SPARK PLUG CAUTION: Spark plug is new type with tapered seat and does not require a sealing gasket. It is important that plug be torqued to 15-20 ft. lbs.*

COIL: Ford No. 8BA-12029.

Ignition Current—2.75-3.0 amperes (idling). 5.0-5.5 amperes (stopped).

DISTRIBUTOR: Ford Part Numbers as listed below.

Engine	1954	1955
223"	FAA-12127-C	B5A-12127-C
239"	FAE-12127-A①	B5C-12127-B

IGNITION TIMING

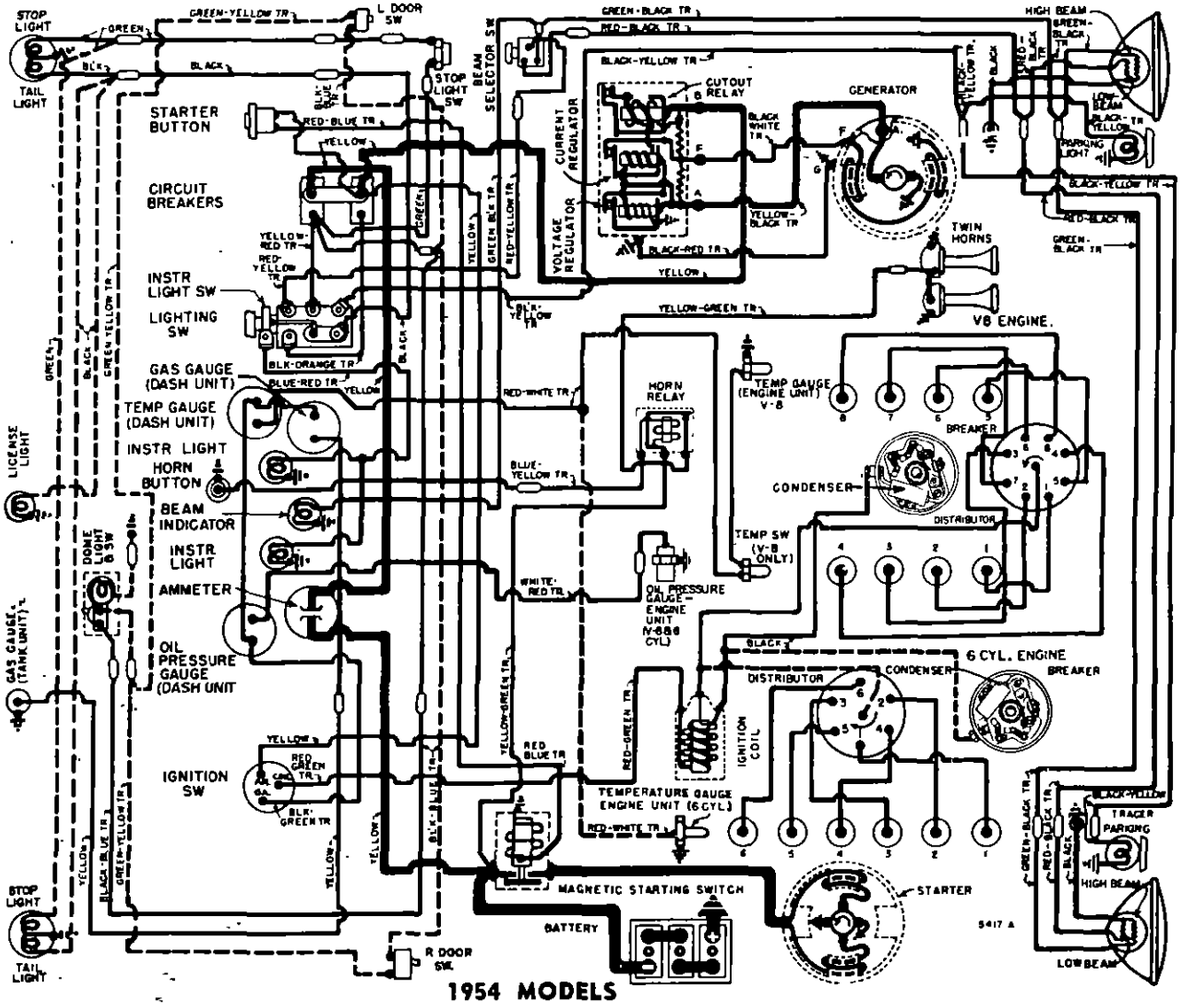
Setting—5° BTDC (223" Engine). 10° BTDC (239" & 256" Engines).

223" Engine Timing Mark—Rubber type dampener has 5 marks. The long mark represents TDC, and each succeeding mark 3°, 5°, 7°, 9° BTDC. Pointer located on front cover.

239" & 256" Engine Timing Mark—Crankshaft pulley grooved at 10° point. Pointer bolted to water pump cover.

CARBURETOR

ANTI-STALL DASHPOT ADJUSTMENT: First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes dashpot up to the end of its travel. Turn dashpot screw in (clockwise) 1½-2 turns to obtain .045-.064" clearance. Tighten locknut.



THROTTLE LINKAGE ADJUSTMENT (1954-55 6 CYL. FORDOMATIC TRUCKS): With selector lever in "N" position and engine at normal operating temperature, set engine idle speed at 440-460 RPM (1954 Models), 450-475 RPM. (1955 Models). Adjust Anti-stall Dashpot, (for Adjustment, see above) then turn engine off. Remove clevis pin from upper end of transmission control rod (at cross shaft). Pull gently upward on throttle control rod to hold transmission lever against its internal stop. Rotate rod clevis for free entry of clevis pin into holes in clevis and cross shaft lever. Length-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

en control rod by rotating clevis 2½ turns counter-clockwise. Connect control rod to cross shaft lever. *Road test truck and if band or clutch slippage evident,* **increase rod length to 3 turns of clevis but do not exceed 3½ turns.** Check transmission for kickdown action. If there is no action, loosen the accelerator stop bolts lock nut located under the accelerator pedal and adjust the stop bolt height until kickdown action is obtained.

THROTTLE LINKAGE ADJUSTMENT (1954-55 FORDOMATIC TRUCKS): Adjust idle speed and Anti-stall dashpot same as for 6 Cylinder models (above). Position Throttle Linkage Adjustment Tool T54L-77230-A on clean surface of accelerator mounting bracket. Lower pin of tool should freely enter hole in accelerator assembly lever. If pin does not enter hole in lever, loosen carburetor connecting link barrel locknut and rotate barrel until pin enters hole freely (with carburetor throttle valve lever against its stop). Tighten link barrel locknuts. Remove clevis pin from upper end of transmission throttle control rod at cross shaft. Pull upward gently on throttle control rod to hold transmission lever against its internal stop. Rotate rod clevis for free entry of clevis pin into holes in clevis and cross shaft lever. **Lengthen control rod by rotating clevis 3 turns counter-clockwise.** Connect control rod to cross shaft. Road test car and if band or clutch slippage is evident, ***increase rod length to 3½ turns of clevis but do not exceed 4 turns.*** *NOTE*—Connecting link between cross shaft and lever must be parallel to centerline of engine. Adjust as necessary by rotating adjusting screw lever. If height of accelerator pedal stop bolt prevents obtaining kickdown, loosen the accelerator pedal stop bolt jam nut and adjust stop bolt height sufficiently to provide kickdown.

1954 MODELS

CARBURETOR (223" ENGINE)

Ford No. EBR-9510-A (Except Fordomatic), EBP-9510-B (With Fordomatic).

Idle Setting—Approximately one turn open. Set for highest steady vacuum reading with engine at normal operating temperature, or midway between missing and rolling point. Turn screw out for richer mixture.

Idle Speed—475-500 RPM (Exc. Fordomatic), 450-475 (Fordomatic) with selector lever in Neutral "N".

Float Level: *See "Ford Visi-flo" in Carburetor Section.*

Fuel Level—Flush to 1/16" below top edge of float hinge bracket in bowl. To adjust, remove bowl cover, bend float tab which contacts float needle spring.

►*NOTE: Fuel level can be checked through glass bowl cover without disturbing carburetor.*

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather operation (holes located in throttle lever. Shift pump link as required).

Fast Idle: Integral type. Operated by choke valve. No adjustment required.

Anti-Stall Dashpot Adjustment: *See "Carburetor" above.*

Throttle Linkage Adjustment (Fordomatic Trucks): *See "Carburetor" above.*

►*OTHER DATA: See "Ford Visi-flo" Carburetor in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs.

CARBURETOR (239" ENGINE)

Ford No. **EBV-9510-H.** *Dual down-draft type with* manual choke.

►*FORDOMATIC NOTE: Anti-stall dashpot used on trucks with Fordomatic Transmission.*

Idle Setting—Approximately 1½ turns open from lightly seated position. Set both screws for highest steady vacuum reading and highest engine RPM.

Idle Speed—475-500 RPM (Exc. Fordomatic), 450-475 RPM (Fordomatic) with selector lever in Neutral.

Float Level: With throttle body inverted, distance between bottom of float and flanged surface of air horn should be 1.275-1.305". Use Float Level Gauge T52L-9510-AHD.

Accelerating Pump: Center hole average setting. Inner hole for hot weather, outer hole for cold weather.

Fast Idle: No adjustment required.

Anti-Stall Dashpot Adjustment: *See "Carburetor" above.*

Throttle Linkage Adjustment: *See "Carburetor" above.*

►*OTHER DATA: See "Holley-Ford Carburetors" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs.

CARBURETOR (256" ENGINE)

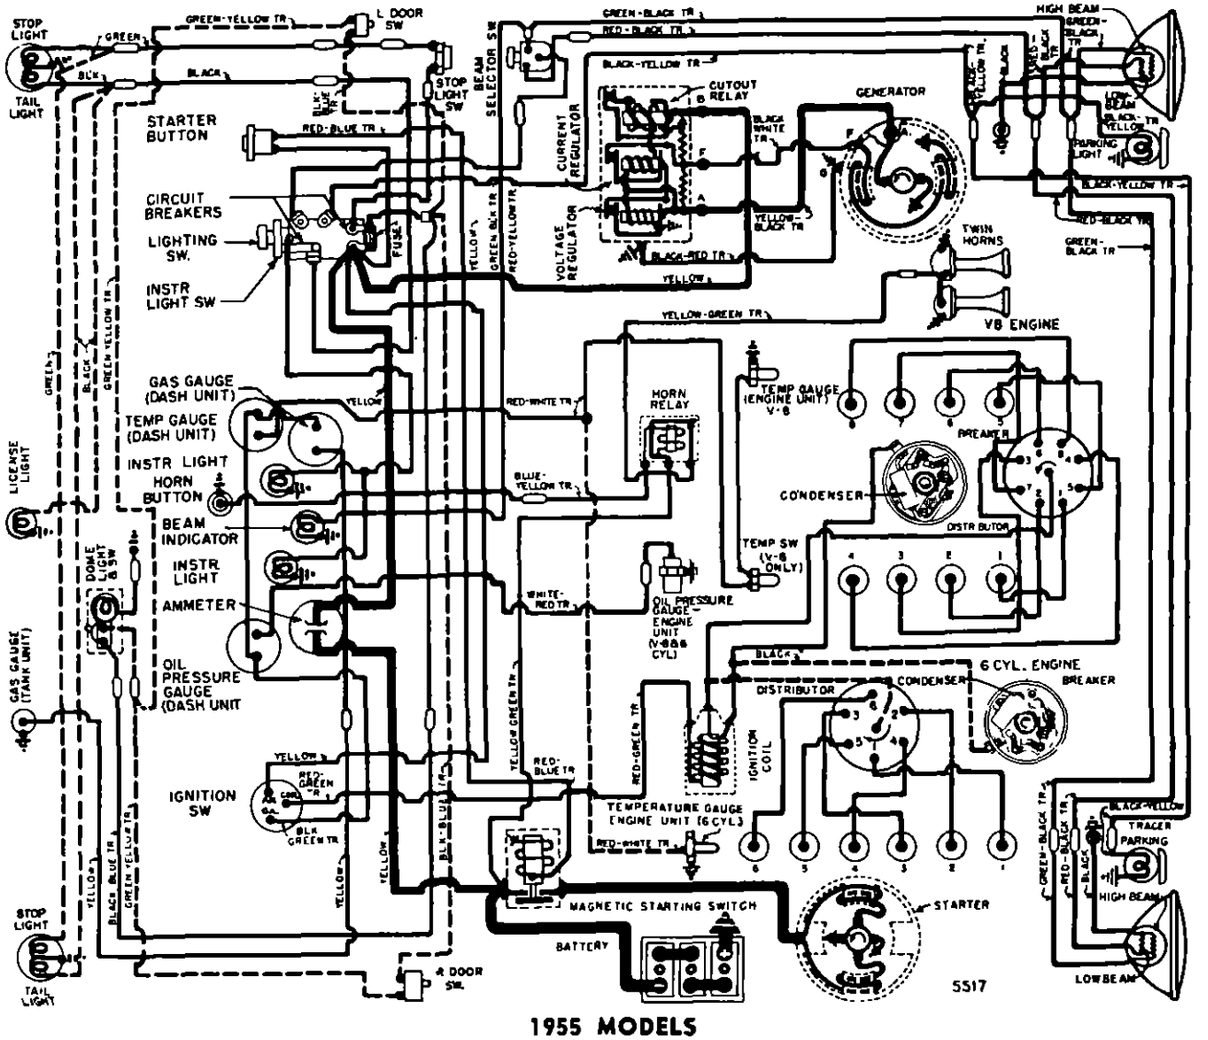
Ford No. EBZ-9510-C (1954); B4T-9410-A (Early 1955), B4T-9510-A (Late 1955). Dual "Concentric" downdraft type with manual choke control, governor actuating assembly, and "depopper" valve.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idle Setting—Approximately 1½ turns open from lightly seated position. Set both screws for highest steady vacuum reading and highest engine RPM.

Idle Speed—450-500 RPM. *See "Depopper Valve" Adjustment below.*



Fuel Level: ½"±1/32" below top edge of bowl with fuel pump pressure at 4-5 lbs. Use Fuel Level Gauge 9550-B to check fuel level, placing gauge squarely on top of main body so that gauge pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending tab on float lever which contacts intake needle.

Accelerating Pump: Center hole average setting. Inner hole for hot weather, outer hole for cold weather.

Fast Idle: No adjustment required.

Depopper Valve Adjustment: Turn depopper valve adjusting screw until it is lightly seated *(CAUTION—Do not force adjusting screw).* With depopper valve seated, adjust engine idle speed, with the stop screw, to 450-500 RPM. Adjust idle mixture screws (see above), then decrease engine idle speed to 300 RPM (do not disturb idle mixture screws). Turn depopper valve adjusting screw out until engine idle speed comes up to 450-500 RPM. If engine will not maintain a steady idle speed and has a tendency to roll, turn spring tension setscrews (directly opposite valve adjusting screw) "in" against piston spring until a steady idle is obtained *(CAUTION—Do not turn spring tension screw in more than is necessary to attain a smooth idle).* Readjust idle mixture with idle adjusting screw. If engine RPM increased, reset idle speed to 450-500 RPM with depopper valve adjusting screws. *NOTE*—If satisfactory adjustment cannot be made, disassemble and clean.

►**OTHER DATA:** *See "Ford Truck Dual Concentric Type" in Carburetor Section.*

1955 MODELS

CARB. EQUIPMENT

Fuel Pump Application

Truck Model	Fuel Only	Fuel & Vacuum
223" (1954)	B4A-9350-B	B4A-9350-C
223" (1955)	B5A-9350-A	
239" & 256" (1954)	B4A-9350-D	Ⓒ EBY-9350-A
239" & 256" (1955)	B5C-9350-A	

Ⓒ—B4A-9350-E also used.

Pressure—4-5 lbs. at 900 RPM.

See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric.

Dash Unit—Ford No. FAD-9280-A (All Models Exc. Parcel Delivery). No. 1C-9280-A (Parcel Delivery).

Tank Unit (Ford 21C-9275-B)—F-100, F-250, F,P-350, P-500 Panels. Not used with 30 gal. tank on P-500 (see below).

Ford FAC-9275-A—C-500, 600 Cab Forward.

Ford FAC-9275-B—F-500, 600. Closed Cab.

Ford FAC-9275-C—F-100, 250, 350 Closed Cab, B-500, School Bus, P-500 (with 30 gal. tank).

See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Ford No. 01A-10655-J. 6 volt, 17 plate, 120 ampere hour capacity (20 hr. rate.).

Battery Ground—Positive(+) to cylinder head.

Engine Ground—Cylinder head to dash.

STARTER

Ford No. FAC-11002-B (1954); FAC-11002-G (1955).

Armature—Ford No. 52-11005 (1954); FAC-11005-B (1955).

►*STARTER INSTALLATION CAUTION:* Make certain that rubber seal is properly positioned before mounting starter. If trouble encountered in keeping seal in position, apply rubber cement to both seal and engine block to hold seal in position while mounting starter.

Drive—ICM-11350-C. Bendix "Folo-Thru".

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—48-56 ozs.

Cranking Speed—100 RPM.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs	Ⓓ	6.0	70
16 ft. lbs	Lock		700

Ⓓ-With Starter on engine and engine running.

Starting Switch: Magnetic type. Ford No. B5A-11450-A. Starter switch is controlled by push button switch on instrument panel. *NOTE—Neutral safety switch used on Fordomatic Transmission Trucks.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fordomatic Neutrol Safety Switch: Ford No. FAC-15812-C. **Adjustment**—*See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Model	Generator No.	Armature No.
223"Engine	FAA-10002-B	OA-10005-A
239" & 256"Engines	FBC-10002-A	FBC-10005-A
All Engines (Optl.)	FBB-10002-A	FAB-10005-A

Performance Data

Generator	Amperes Ⓒ	Engine RPM.
FAA-10002-B	35	1000
FBC-10002-A	35	1000
FBB-10002-A	50	1200

Ⓒ—See Regulator for maximum charging rate.

Brush Spring Tension—30 ozs.
Rotation—Counter-clockwise at commutator end.

Belt Adjustment: 223" *ENGINE NOTE—When this engine used on F-500, F-600 Trucks and Buses, a separate belt is used to drive the fan.*
223" Engine (Generator Belt)—¼" deflection between water pump and crankshaft pulleys with normal thumb pressure.
223" Engine (Separate Fan Belt)—½"deflection between fan and crankshaft pulleys with normal thumb pressure.
239" & 256" Engine (Both Belts): ½" deflection midway between pulleys with normal thumb pressure.

REGULATOR

Regulator No.	For Generator No.
FAC-10505-A	FAA-10002-A & FBC-10002-A
FAJ-10505-A	FBB-10002-A

►*SETTING NOTE:* Settings below are for regulator at NORMAL OPERATING TEMPERATURE (After ½ hour operation with room temperature at 70-80°F).

Cutout Relay

Cuts In—6.0-6.6 volts.

►*CUTOUT RELAY AIR GAP CHECK:* With cover off regulator, manually close cut-out contacts. Measure air gap between armature and core. The dimension should be .009-.013". Air gap with contacts open should be .012-.020". If either or both of these dimensions are not up to specifications, regulator is defective and should be replaced.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

Setting—33-37 amps (FAC—10505-A). 48-52 amps (FAJ-10505-A).
Checking & Adjusting—*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.

Stop Light Switch Location: On brake master cylinder, or on brake power unit assembly. Master cylinder located on engine side of firewall (F-100), and on bracket attached to left frame member below brake pedal (Other Trucks).

FUSES: Located as indicated below:
Overdrive—30 amps., on overdrive relay.
Cigar Lighter—Special fuse in lighter base.
Clock—3 amps. in clock lead.
Heater—14 amps. in blower switch wire.
Interior Lights—14 ampere. On lighting switch.

LIGHTING CIRCUIT BREAKERS: On headlight switch. Combination headlight switch, circuit breaker, and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument lights, parking lights and stop and tail light circuits. Fuse protects interior lighting circuit (14 amps.).

HORNS: Ford B5A-13832-C (High Pitch), B5A-13833-C (Low Pitch). Dual horns operated by relay
Horn Current—12-14 amperes.
Horn Relay: Ford No. FAA-13853-A.

ENGINE

ENGINE SPECIFICATIONS: (223" Engine)—6 Cyl. O.H.V. **(239" Engine & 256" Engine)**—V8 O.H.V.

Engine	Bore	Stroke	Displacement
223"	3.62"	3.60"	223 cu. ins.
239"	3.50"	3.10"	239 cu. ins.
256"	3.62"	3.10"	256 cu. ins.

Engine	Comp. Ratio	Rated HP	Developed HP
1954 223"	7.2-1	31.5	115 at 3900 RPM
1955 223" (F-100-250)	7.5-1	31.5	118 At 3900 RPM
1955 223" (Others)	7.5-1	31.5	116 at 3900 RPM
1954 239"	7.2-1	39.0	130 at 4200 RPM
1955 239"	7.5-1	39.0	132 at 4200 RPM
1954 256"	7.2-1	42.0	138 at 3900 RPM
1955 256"	7.5-1	42.0	140 at 3900 RPM

CYLINDER HEAD: *See Ford Special Data.*
TIGHTENING TORQUES: *See Ford Special Data.*
ENGINE REMOVAL: *See Ford Special Data.*
OIL PAN REMOVAL (223" Engine): Drain crankcase. Pull dipstick out of tube. Remove oil pan retaining screws, remove pan and gasket.
OIL PAN REMOVAL (239" & 256" Engines): *CAUTION—Place #1 piston on top dead center before removing oil pan.* Drain crankcase and remove engine front splash pans, then remove oil pump-to-oil pan tube. On Fordomatic equipped trucks, remove converter housing dust cover. Remove oil pan.

223" 6 CYL. ENGINE
(See Engine Specifications Above)

See 1954-55 Ford 6 Passenger Car Pages. Engine is similar to those used in 1954-55 Pass. Cars and all passenger cars engine data applies to truck engines.

►*1955 OIL PUMP PRODUCTION CHANGE & PARTS INSTALLATION CAUTION (223" Engine):* New oil pump assembly, intermediate shaft, and body plate released for service. Parts not interchangeable with those of previous type pump. *See "Oiling System" in Ford Special Data.*

239" & 256" ENGINES
(See Engine Specifications Above)

See 1954 Ford V8 Passenger Car Pages. Engine is similar to those used in 1954 Pass. Cars, and all passenger car engine data applies to truck engines EXCEPT AS NOTED BELOW.

►*1954 239" ENG. CAMSHAFT PRODUCTION CHANGES:* First type camshaft, Part No. EBU-6250-A (13 tooth distributor drive gear, and 2.0500-2.0510" diameter bearing journals), replaced by camshaft, Part No. B4A-6250-A (with 14 tooth distributor drive gear, and 1.9255-1.9265" diameter bearing journals). The B4A-6250-A camshaft was replaced in later production with camshaft, Part No. B4T-6250-A (with 14 tooth distributor drive gear, and 1.9255-1.9265" diameter bearing journals). The B4T-6250-A camshaft is identified by "14" stamped on front end, or "ECE" cast into shaft.

►*1954 256" ENG. CAMSHAFT PRODUCTION CHANGE:* Early type camshaft, Part No. EBY-6250-A replaced in production with Part No. B4T-6250-A. Later type camshaft is identified by "14" stamped on front end of shaft, or "ECE" cast into shaft. 256" Engines with later type camshaft have a blue or white daub of paint on right or left side of block. Engines with early camshafts have a daub of orange paint on right or left side of block. *CAUTION—Valve Timing, Valve Lift, and Compression Pressures are different with early and late type camshafts. See data below for differences.*

►*1954 V8 ENGINE CONNECTING ROD & BEARING PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Late 1954 production connecting rods have an oil hole (for cylinder lubrication) located on same side as the bearing notch. Early type bearings, with one oil hole, MUST NOT BE USED with the later type rod. Later type bearings may be used with either the old or new rod as they have two oil holes and will fit either rod.

►*1954 239" & 256" ENGINE CAMSHAFT BEARING CHANGE (To prevent oil starvation due to improperly installed front bearing):* On engines equipped with camshafts (marked "14" on end, or "ECE" cast into shaft), new front bearings have been released for service replacement, Part No. B4C-6261-A Standard, B4C-6261-B (.015" undersize). The later type bearings have a slot instead of a 1/8" diameter oil hole. When installing the new bearing, make sure that the slot is aligned with hole in cylinder bore and that bearing is pressed .005-.020" into cylinder block camshaft bearing bore to eliminate interference with camshaft thrust plate.

►*1954 239" & 256" ENGINE ROCKER ARM ADJUSTING NOTE:* On engines equipped with B4T-6250-A camshaft, (marked "14" on end of shaft, or "ECE" cast into shaft), it may be found in some cases that the rocker arm adjusting screws are too short to provide proper tappet adjustment and still maintain the neces-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

sary amount of thread contact. If necessary new adjusting screws, Part No. EAA-6549-B should be installed. The new screws are .060" longer when measured from end to center of the socket, than the old screw.

►*1954 239" & 256" ENGINE OIL PUMP SERVICE REPLACEMENT CHANGE & INSTALLATION CAUTION:* A new oil pump, Part No. EAM-6600-A, with steel gears is available for service replacement. The pump is furnished in Kit No. B5A-6600-C which includes a pump and spring. When installing pump on these engines, remove the Relief Valve Spring from the pump and install spring, Part No. EBU-6670-A.

►*1954 V8 ENGINE TAPPET REPLACEMENT CAUTION:* The cast iron tappet, Part No. EAA-6500-C should no longer be used as a service replacement on V8 engines as these tappets may contribute to camshaft lobe wear. Install tappet, Part No. EAA-6500-D (Steel forging) which can be identified by forging marks on outer edge of tappet foot. The tappet foot is .140" (steel forging), .220" (cast iron).

►*239" & 256" TRUCK ENGINE OIL PAN BAFFLE INSTALLATION (To Prevent Loss of Oil Pressure on Sudden Brake Stops):* Fabricate a baffle plate from hot rolled, low carbon, oil hardened steel (.042" thick) to fit the inside of the oil pan at a point 7 11/16" (239" engine), 9 7/8" (256" engine), from rear of pan. The baffle should be 3 9/16" high with the lower corners trimmed off on a 27/32" radius (this will allow oil to flow between both sides of the baffle). Allow 11/16" of material at side and bottom which must be turned at right angles on a 3/16" radius. Tack weld baffle to oil pan securely at sides and bottom.

VALVES:	Head Diam.	Stem Diam①	Length
Intake	②	③	5.02"
Exhaust	1.515"	④	5.02"

Valve	Seat Angle	Lift⑤	Stem Clearance
Intake	45°	.345"	.002" max.
Exhaust	45°	.345"	.003" max.

①—Valves furnished with .003", .015", .030" oversize stems for service replacement.

②—1.652" (239" engine), 1.785" (256" engine).

③—Two standard sizes for selective fitting (Red-.3415-.3420" & Green-.3420-.3425").

④—Two standard sizes for selective fitting (Red-.3405-.3410" & Green-.3410-.3415").

⑤—All models except 1954 256" Engine with EBY-6250-A camshaft. Valve lift for models with the EBY-6250-A camshaft is: .345-.350" (Intake), .339-.343" (Exhaust). *See "1954 256" Engine Camshaft Production Change" above.*

►*256" ENGINE VALVE SEAT INSERT NOTE:* Valve seat inserts used on exhaust valves in production and furnished for service replacement in Std. size, and .020" oversize. *See "Valve System" in Ford Special Data.*

VALVE LIFTERS: *INSTALLATION CAUTION*—Cast iron tappet, Part No. EAA-6500-C, should no longer be used as service replacement on V8 engines as these tappets may contribute to camshaft wear. Use steel tappet, Part No. EAA-6500-D. Cast iron tappet has smooth molded appearance on unmachined portion of tappet foot. Tappet foot is .220" thick. Steel tappet has forging marks on outer edge of tappet foot and is .140" thick.

VALVE TIMING: *NOTE*—The following valve opening and closing points are with camlift as indicated in following table.

Valve Timing
(EBY-6250-A Camshaft)①

Intake Valves—Open 15°②BTDC. Close 67°③ALDC.
Exhaust Valves—Open 57°④BLDC. Close 19°⑤ATDC.

Valve Timing
(Except Trucks with EBY-6250-A Camshaft)①

Intake Valves—Open 8°④BTDC. Close 44°⑥ALDC.
Exhaust Valves—Open 47°④BLDC. Close 5°⑥ATDC.

①—See 1954 256" Engine Camshaft Production Change above.

Camlift—②—.016". ③—.018". ④—.015".⑤—.017".⑥—.019".

Valve Timing Check: Remove right hand rocker chamber cover. Turn engine over until No. 1 intake tappet is on heel of No. 1 intake cam lobe. Back off No. 1 intake valve adjusting screw, push rocker arm to one side, then install dial indicator. Zero dial indicator, then rotate engine slowly until desired lift (.015") obtained. Compare degrees on pulley with specifications (8°). If not within specifications check for bent timing pointer by bringing No. 1 piston to TDC and see if timing pointer is aligned with TDC mark on crankshaft pulley. *If pointer not at fault, check timing* chain, camshaft sprocket, crankshaft pulley and crankshaft in order of accessibility.

►*CAMSHAFT SPROCKET SPACER INSTALLATION CAUTION (V8 Eng.):* If spacer, Part No. EBE-6265-A, is installed backwards, it will allow an excessive amount of endplay. Inside diameter of spacer has a chamfer on one side and this chamfered side should be installed toward No. 1 camshaft bearing journal.

VALVE TAPPET CLEARANCE: .016" (Intake), .018" (Exhaust). With engine at normal operating temperature.

OILING SYSTEM

►*F-100 TRUCK OIL PRESSURE INDICATOR:* Indicator light on instrument panel operated by engine unit. Lights when ignition switch turned on, goes out when engine starts and oil pump operates. *All other truck models have an oil pressure indicator gauge on instrument panel.*

►*1955 223" ENGINE OIL PUMP PRODUCTION CHANGE & PARTS INSTALLATION CAUTION:* New oil pump assembly, intermediate shaft, and body plate released for service. Parts not interchangeable with those of previous type pumps. *See "Oiling System" in Ford Special Data.*

►*CRANKCASE VENTILATION GASKET INSTALLATION CAUTION (V8 Eng.):* On some units gasket, Part No. B4A-6872-A, may have been installed upside down causing leak at gasket location. Bolt center line is 5/64" below center line of gasket.

Crankcase Capacity: 5 qts. (223 & 239 Eng.), 6 qts. (256 Eng.). 1 qt. addtl. when filter element changed.

Normal Oil Pressure: 45 lbs. at 2000 RPM. (223 Eng.), 45-55 lbs. at 30-40 MPH. (239 & 256 Eng.).

Pressure Regulator Valve: In oil pump body. Not adjustable. *NOTE*—Valve spring pressure should be 9.82 lbs. at 1.56" (223 Eng.), 10.86 lbs. at 1.40" (239 & 256 Eng.).

Oil Pressure Indicator: *See Note above for F100 Trucks.* King-Seeley Electric type.
Dash Unit—Ford No. FAE-9273A (Exc. Par. Del.), 1C-9273A (Parcel Delivery).
Engine Unit—Ford No. 41A-9278 (All).
See "King-Seeley Gauges" in Miscellaneous Section.

Oil Pump: Gear type pump mounted in crankcase (223 Eng.), on left side of crankcase (239 & 256" Eng.).
Pump Overhaul—*See "Oil Pump" in Ford Special Data.*

Oil Filter: Full-flow (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.
Replacement Filter Element—Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION:* This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication.

►*FILTER INSTALLATION CAUTION & OIL LEAKAGE CORRECTION: See "Oiling System" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

COOLING

►*TEMPERATURE GAUGE FALSE READING CORRECTION (8 CYL. ENGINES):* In cases where heat indicator shows a reading higher than actual water temperature, check water temperature gauge bulb on engine to see that it is not contacting a casting flash inside cylinder head. Remove flashing with a rat tail file.

►*RESTRICTED WATER BY-PASS CAUTION (8 CYL. ENGINES):* A restricted or blocked passage caused by casting flash will decrease flow of water in engine when thermostat is closed. Check for this condition by listening for a gurgling sound when engine is stopped after a short period of operation. If noise is heard, remove water by-pass tube and inspect for a restricted opening in water pump housing. If necessary, remove pump and drill opening with a 19/32" drill.

Water Capacity (Without Heater): 18½ qts. (223" Engine), 22 qts. (239" Engine), 22½ qts. (256" Engine).

Pressure Valve: Ford No. 1T-8100-A. Radiator filler cap (opens at 4 lbs.).

Thermostat: Ford No. EAG-8575-A (147-152°). No. EBR-8575-A (167-173°). Mounted inside water outlet elbow.

►*THERMOSTAT INSTALLATION (V8 Engines): Install thermostat with word "TOP" in uppermost position.*

Water Pump: Packless, sealed ball bearing type.
See "Ford 6" or "Ford V8" in Water Pump Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Temperature Gauge: King-Seeley Electric type.
Dash Unit—Ford No. FAE-10883-A.
Engine Unit—Ford No. 8A-10884.
Temperature Bulb Sleeve Removal (V8 Engines)—Thread adapter handle of tool T50T-100-A into sleeve. Tighten locknut against sleeve, then pull sleeve with sliding hammer.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 10CF, No. L5222 (F-100, F-250)—Ford No. AE-7563-A. Models with 3-Speed Transmission.
Long Model 11CF, No. L1440 (Std. All Other Models and F-100, F-250 with 4-Speed Transmission)—Ford No. 51-7563-A.
Long Model 11CF, No. L1478 (Heavy Duty All Models Except F-100, F-250)—Ford No. 8MTH-7563-A.
See "Long" in Clutch Section.

Clutch Disc—Use with cover assembly as follows:

Long No.	Ford No.	Cover Assembly
CD870	59T-7550-A①	Ford No. 51-7563-A
CD606	51A-7550-A	Ford No. AE-7563-A
CD887	TDAA-7550-A	Ford No. 8MTH-7563-A
CD607	TDAA-7550-A	Ford No. 51-7563-A

①—Replaced by Ford No. 81T-7550.

Pedal Adjustment: 1 1/8-1 3/8" free travel. Adjusting clevis provided, at forward end of connecting rod between pedal shaft and equalizer shaft.

►*PEDAL FREE TRAVEL ADJUSTMENT CAUTION:* Normal action of pressure plate centrifugal weights at high engine speed will take up approximately ¾" of specified free travel. Check free travel when engine is operated at high speed and see if approximately ½" of free travel is left. Insufficient free travel will cause release bearing to rotate at all times and will result in early bearing failure.

Removal: Disconnect clutch pedal retracting spring from clutch release lever. Remove lock nut and adjusting nut from release lever rod, then remove rod. Remove transmission assembly from clutch housing (see below). Remove clutch release bearing and hub from release lever. Mark pressure plate and cover assembly and flywheel so that parts may be reinstalled in same relative positions. Loosen pressure plate and cover assembly-to-flywheel bolts until pressure plate springs are expanded, then remove bolts. Remove pressure plate and cover assembly and clutch disc assembly through opening in bottom of clutch housing. Remove pilot bearing from flywheel with Tool 7600-E.

TRANSMISSION

►*239" ENGINE HARD SHIFTING CORRECTION (ALL TRANSMISSIONS):* If hard shifting occurs with truck standing and clutch completely disengaged, pilot bearing bore in crankshaft may not be deep enough. This locks transmission input shaft to crankshaft and makes it almost impossible to shift transmission. To correct, grind approximately 1/8" off pilot bearing end of input shaft to provide clearance between end of shaft and counterbore in crankshaft.

3-SPEED (LIGHT DUTY)

Own. 3-Speed, all helical gear. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). *Steering column shift standard.*
See "Ford Truck 3-Speed (Light Duty)" in Transmission Section.

►*INTERMEDIATE & HIGH GEAR JUMP-OUT CORRECTION:* *See "Ford Synchro-mesh" in Transmission Section.*

Removal: Remove floor mat and floor plate. Loosen two nuts that secure top of transmission to clutch housing studs. Raise truck, then drain lubricant from transmission. Disconnect the drive shaft from the transmission. If truck equipped with band-type parking brake, disconnect brake cable at brake and at gear shift housing. Disconnect gear shift linkage at transmission, then disconnect clutch pedal retracting spring from clutch release lever. Remove bolts and lockwashers which attach clutch release equalizer bar anchor bracket to transmission. Disconnect speedometer cable from transmission. Remove dust cover from bottom of clutch housing. Position transmission jack under transmission. Remove two top nuts, two bottom bolts, and lockwashers that secure transmission to clutch housing. Move transmission to rear until input shaft splines clear clutch housing. Be careful not to allow clutch release bearing and hub to drop out of release lever fork. Lower transmission to floor.

3-SPEED (HEAVY DUTY)

Own. 3-Speed, helical gear (second & high), spur gear (low & reverse). Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Steering column shift standard.
See "Ford Truck 3-Speed (Heavy Duty)" in Transmission Section.

Removal: Same as for 3-Speed (Light Duty) above.

4-SPEED

Own. 4-Speed, Constant mesh, synchro-mesh (second, third & high). Helical gears used for second, third & high. Spur gears used for low & reverse. Center, floor mounted gear shift lever standard.
See "Ford Truck 4-Speed (Synchro-mesh)" in Transmission Section.

Removal: Same as for 3-Speed (Light Duty) above and note following: *If hoist not used, it may be necessary to remove gear shift lever assembly and lever housing before transmission can be removed from truck.* Disconnect drive shaft, or coupling shaft, at parking brake drum. If truck equipped with coupling shaft support, disconnect support bracket from support plate, then remove coupling shaft.

OVERDRIVE

Warner Model AS4-R10F. Overdrive with solenoid operated (no centrifugal pawls) with governor control and throttle operated kick-down. There is no lockout switch on this unit.
See "Warner R10 Overdrive" in Transmission Section.
Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for 3-Speed Synchro-mesh Transmission (above), after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.
See "Fordomatic & Mercomatic" in Transmission Section.

►*1955 F-100 TRUCK FORDOMATIC OIL COOLER PRODUCTION CHANGE:* The Fordomatic oil cooler discontinued in production after May 1955. A by-pass tube assembly is being used in place of the oil cooler.

►*FORDOMATIC WHISTLING NOISE CORRECTION: This condition may occur during normal engine operation. See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication—Check transmission oil every 1000 miles and maintain fluid level at "Full" mark on dipstick. Drain & refill every 15,000 miles. Use only Automatic Transmission Fluid Type A.

Checking Fluid Level—Apply parking brakes, place transmission selector lever in "N" (neutral) position, *run engine at idle speed for approximately four minutes.* With parking brake applied and engine running at slow idle, move selector lever to "P" (parking) position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission. Return selector lever to "P" position. Raise hood, clean dirt away from fluid level cap, remove indicator. Wipe clean and insert in tube (make sure indicator is pushed all the way down). Remove indicator and read level. Add sufficient fluid to raise level to full mark on indicator. Replace indicator.

►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

►*UNIVERSAL JOINT INSTALLATION CAUTION: Make sure that all universal joint yokes in drive line are in the same plane to avoid drive line unbalance.*

Coupling Shaft Center Bearing: Consists of cushion mounted ball bearing bolted to underside of frame intermediate cross member. Bearing is mounted on end of coupling shaft in a sleeve with felt retainer on each end and bearing baffle on front end.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

REAR AXLE
SEMI-FLOATING

Own. Semi-floating, hypoid gear with Hotchkiss drive. *NOTE*—Same axle as used in Station Wagon & Sedan Delivery.

See "Ford & Mercury (Separate Carrier Type) Hypoid" in Rear Axle Section.

Ratios—As follows:
Standard—3.92-1 (47-12).
Optional—4.27-1 (47-11).
Overdrive—4.09-1 (45-11).
Fordomatic—3.92-1 (47-12).

Backlash—.003-.008". Shim adjustment.

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer nuts (work through opening in axle shaft flange). Use Puller No. 4235 and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal).

Axle Assembly Removal: Raise rear of truck, then disconnect hydraulic brake hose from hydraulic brake line at rear axle. Disconnect parking brake cable from equalizer rod, then remove screws which attach brake cable brackets to frame crossmember. Disconnect drive shaft at rear axle universal joint flange. Remove nuts from rear spring clips (U-bolts), then remove spring clips. Loosen shock absorber stud nuts and move shock absorbers out of way. Roll axle assembly away from truck, remove wheels.

Wheel Bearing Adjustment: None required in service.

FULL-FLOATING

Own. Full floating hypoid gear with Hotchkiss drive.

Model	Rear Axle Type
F-250 Conventional (Early)	① Split Housing
P-350 Parcel Del. (Early)	① Split Housing
F-250 Conventional (Later)	Integral Housing
P-350 Parcel Del. (Later)	Integral Housing
F-350 Conventional	② (Heavy Duty) Split Housing
F-500, F-600 (All Models)	Banjo Housing

①—Drive pinion bearings pressed in axle housing.
②—Drive pinion bearings pressed in sleeve and bolted to axle housing.

See Various Types of Ford Rear Axles in Rear Axle Section.

Axle Ratios

Model	Ratio
F-250 Conv.	4.86-1 (34-7), 5.83-1 (35-6) ①
P-350 Par. Del.	4.86-1 (34-7), 5.83-1 (35-6) ①
F-350 Conv.	5.14-1 (36-7), 5.83-1 (35-6) ②
F-500 (All)	5.29-1 (27-7), 6.2-1 (31-5), 6.8-1 (34-5) ③
F-600 (All)	7.2-1 (36-5), 6.2-1 (31-5), 6.8-1 (34-5) ③

①—.008-.013" backlash. ②—.004-.018" backlash.
③—.006-.012" backlash. ③—.006- .016" backlash.

Axle Shaft Removal: Drain lubricant from axle housing, then remove axle shaft stud nuts and washers. Tap center of axle shaft flanges to loosen tapered dowels, then remove dowels. Remove axle shafts from housing, remove hub and drum assemblies.

Axle Assembly Removal: Loosen wheel and stud nuts, then raise rear of vehicle. Disconnect hydraulic brake hose from rear axle universal joint flange. Disconnect rear shock absorbers from spring seat clamps. Remove nuts and washers from spring clips (U-bolts), then remove spring clips. Roll axle out from under vehicle, remove wheels and rear axle hydraulic brake pipe from housing.

Wheel Bearing Adjustment: Remove axle shafts (see above), use special bearing adjusting wrench and remove bearing locknut (outer nut), and lockwasher. Adjust bearings by turning bearing adjusting nut (inner nut) up until tight then backing off 1/8 turn. Install bearing lockwasher. (*NOTE*—If adjusting nut equipped with dowel, make sure lockwasher fits over dowel). Install bearing locknut and draw nut up tight. If flange type lockwasher is used, bend one flange over adjusting nut and one flange over locknut. Install axle shaft and lower vehicle.

TWO-SPEED

Own. Electrically operated shift, Two-speed, Full-floating spur gear planetary unit (reduction gearing). Spiral bevel gear final drive.

See "Ford Truck Two-Speed" in Rear Axle Section.

Ratio—5.83-1 (Direct Speed), 8.11-1 (Second Speed). 6.33-1 (Direct Speed), 8.81-1 (Second Speed).

Backlash—.006-.016".

Removal: Same as for standard axle (above) after removal of wiring harness.

SHOCK ABSORBERS

Direct acting hydraulic. Shock absorbers are sealed units and are not adjustable or refillable.

►*REPLACEMENT SHOCK ABSORBER NOTE: Shocks are supplied for service replacement in kits consisting of shock absorber and necessary bushings.*

►*SHOCK ABSORBER APPLICATION NOTE:* Front and rear shocks are standard equipment on all F-100, F-250, & P-350 (Parcel Delivery). Front shocks only are standard on F-350. Front and rear shocks are optional on all other models.

1954 Replacement Shock Absorbers

B, F-500, 600	B3T-18124-A
B, C, F-500, 600	B3T-18125-A

FRONT SUSPENSION

Conventional "I" beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—4°±½°.

Caster—(F-100, F-250) 3° to 4°, (Others) 3° to 5°. ½° maximum variation between wheels.

Camber—¼° to 1°. ½° maximum variation between wheels.

Toe-In—0-1/16".

STEERING

Own. (Gemmer 305 & 335 Design). Worm-and-roller types with push-pull adjustment.

►*F-100, 250 DRAG LINK INSTALLATION CAUTION:* Due to design of drag link (THAA-3305-A) it is possible to install link in a reverse position causing steering interference. When properly installed, offset end of drag link is attached to sector shaft arm, and lubrication fittings will be at bottom side of link.

See "Gemmer Worm-and-Roller Types" in Steering Gear Section.

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305 & 335)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305 & 335)" in Steering Section.*

BRAKES

Brake types are as listed in application table below. Hand lever applies rear wheel service brakes on F-100 only (independent shaft brake on other models).

►*1954 F-100 TRUCK REAR WHEEL SKIDDING CORRECTION:* If rear wheel skidding on severe brake application (no load) is encountered, replace both rear wheel cylinders with Ford No. 8A-2261 and 8A-2262. These are passenger car type cylinders and are smaller than original truck cylinders. *CAUTION—Right and left wheel cylinders must be replaced.*

►*1955 F-500 BRAKE PRODUCTION CHANGE:* Effective approximately April 13, 1955 all F-500 Series trucks will be equipped with larger rear wheel brakes previously used on these models with 2-Speed Rear Axles. See tables below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*1955 F-500 & F-600 REAR WHEEL BRAKE CYLINDER LEAK CORRECTION (Due to Excessive Depth of Counterbore):* To correct, install two 91A-2152 gaskets between brake pipe and wheel cylinder body.

Brake Type Application

Truck Model	Front	Rear
F-100	Duo-Servo	Duo-Servo
F-250, F-350	Uni-Servo	Duo-Servo
F-500, F-600	Uni-Servo	2 Cyl. Type

Uni-Servo - Ford Bendix. Single anchor. Wheel cylinder actuates primary shoe. Ratchet adjusting screw.

See "Ford-Bendix Uni-Servo Hydraulic" in Brake Section.

Duo-Servo - Ford-Bendix. Single anchor, self energizing. Wheel cylinders actuates both shoes. Ratchet adjusting screw.

See "Ford-Bendix Hydraulic" in Brake Section.

Two-Cylinder Type—Two wheel cylinders in each brake assembly.

See "Ford Truck Two Cylinder" in Brake Section.

Ⓒ—Single Speed Axle.

Clearance—Brake lining to drum clearance different as follows:

Uni-Servo & Duo-Servo—*.010" clearance measured* 1½" from each end of secondary shoe.

Two-Cylinder Type—.025" from brake shoe to gauge surface on brake plate.

Hand Brake (Except F-100): External contracting type consisting of a brake drum bolted to transmission main shaft companion flange, and an external contracting band mounted on rear of transmission.

Adjustment—On cable controlled parking brakes, move lever to full released position. On transmission mounted parking brake levers, set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, adjust clevis rod to allow flat portion to rest on brake band bracket. Install clevis and cotter pins. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until .010" clearance is established between brake lining and drum at anchor bracket. Loosen locknut on adjusting screw from lower half of brake band. Adjust for .010" clearance between lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting rod nut until .010" clearance is established between upper half of band and drum. Re-install lockwire in anchor adjusting screw.

Hand Brake Drum Diameter—(F-250, 350) 8". (Others) 7 13/16"

Hand Brake Lining

Series	Length	Width	Thickness
F-250, 350	24 5/8"	2"	5/32"
P-350, 500 Ⓓ	23 5/64"	2½"	1/4"
B, C, F-500, 600	24 5/8"	2½"	1/4"

Ⓓ—Three-piece lining used.

Brake Pedal Free Play Adjustment: 3/16-3/8". Adjust free play by loosening brake pedal-to-master cylinder push rod and rotating rod to obtain correct free play. Tighten lock nut while holding push rod securely.

Standard Master Cylinder: Located on bracket attached to left frame side member below brake pedal.

Checking Fluid—Maintain fluid level to within ½" of top of reservoir.

Removal—Disconnect brake lines from master cylinder and depress brake pedal a few times to empty master cylinder. Remove brake pedal return spring from brake pedal clevis pin and remove clevis pin. Disconnect stop light switch wires at switch. Remove assembly from bracket.

Power Brakes: Midland or Hydrovac unit mounted in various positions depending on truck model and connected in hydraulic brake line between master cylinder and wheel cylinders. There are no mechanical connections and adjustments are not required.

See "Midland" or "Hydrovac" Power Units in Brake Section.

Checking Brake Fluid—Same as for manual brakes (above).

Removal of Power Unit—Depress brake pedal several times to remove all vacuum from system. Loosen brake power unit air inlet tube clamp and remove tube. Disconnect master cylinder to power unit hydraulic line at power unit. Disconnect vacuum tube at power unit. If stop light switch located on brake power unit, disconnect wires. Remove mounting bracket bolts and power unit.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate attached to left front body pillar below upper hinge opening.
First Number–100001.

►*VEHICLE NUMBER NOTE:* Vehicle number (example "P5FV100001") includes following identification data

Eng. Type①	Year②	Assy. Plant	Body Style③	Serial No.
P	5	See below	See below	100001 up.

①–**A**–6 Cyl. 223 cu. in. engine; **U**–8 Cyl. 272 cu. in. engine; **P**–8 Cyl. 292 cu. in. engine (Special Law Enforcement & Thunderbird).
②–Last digit of model year.
③–**C**–Sunliner; **F**–Skyliner; **H**–Thunderbird; **R**–Ranch Wagon; **S**–Sedan Delivery; **T**–Fordor & Tudor (Fair lane); **V**–Victoria; **W**–Special Body (Solid top); **X**–Country Sedan; **Y**–Country Squire; **G**–All Other (Fordor, Tudor, Mainline & Customline).

Assembly Plant Designation

A–Atlanta	**F**–Dearborn	**N**–Norfolk
B–Buffalo	**G**–Chicago	**P**–St. Paul
C–Chester	**K**–Kansas City	**R**–Richmond
D–Dallas	**L**–Long Beach	**S**–Somerville
E–Edgewater	**M**–Memphis	**U**–Louisville

TUNE-UP

►*FORD & THUNDERBIRD V8 ENGINE ROUGH IDLE: Can usually be corrected by this procedure:*
1) Tappet Clearance Adjustment–Adjust using "GO" and "NO GO" gauges (below).
2) High Tension Coil & Spark Plug Cable Installation–If wires loosen at coil and plug connections, check location of pressure relief hole in boot. If hole too low, pierce new .062" hole in side of boot 1/2-3/4" above lower edge of boot.
3) Carburetor Fuel Level–Check for fluctuations caused by burrs or rough spots on float hinge or pin, worn or ridged fuel inlet needle or seat and leakage, or incorrect float setting. *See "Holley (Ford) Dual" and "Holley (Ford, Lincoln, Mercury) 4-Barrel" in Carburetion Section for checking procedure and float and fuel level specifications.*

COMPRESSION PRESSURE: 130 lbs. (Except Special), 140 lbs. (Special).

VACUUM READING: 18-21" idling at 500 RPM.

VALVE TAPPET CLEARANCE: .019" (intake & exhaust), with engine at normal operating temperature. *NOTE*–Adjust with engine hot and idling, use .018" feeler as "GO", .020" feeler as "NO GO" gauge. This will insure tappet clearance being .019"±.001".

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located at front end of right exhaust manifold (Single Exhaust), rear end of left exhaust manifold (Dual Exhaust). Install spring with ¾ turn windup. *NOTE*–Stop pin should be at top with valve installed.

►*MANIFOLD HEAT CONTROL PRODUCTION CHANGE* **(272 Engine with Single Exhaust):** New Manifold Heat Control Valve, No. B5A-9658-D can be installed. Valve has increased spring tension and will improve fuel distribution and minimize stalling (due to icing) by providing more exhaust gas heat.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders– RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.
SPARK PLUG GAP: .032-.036"
Spark Plug–Champion 870. 18mm. Special.

►*SPARK PLUG CAUTION: Spark plug is new type with tapered seat and does not require a sealing gasket. It is important that plugs tightened to 15-20 ft. lbs.*

COIL: Ford 8BA-12029. On engine at distributor.
Ignition Current–3.0 amps. idling, 5.0 stopped.

DISTRIBUTOR: Ford. Used as follows:

	Distributor No.
272 (Std.-2-barrel Carb.)	B5A-12127-B
272 (Special–4-Barrel Carb.)①	③ FEC-12127-A
272 (Special–4-Barrel Carb.)②	⑨ B5A-12127-F
292 (Interceptor)①	③ B5S-12127-D
292 (Interceptor)②	⑨ B5S-12127-E

①–Early Cars. ②–Later Cars. ③–See Distributor Modification (below). ⑨–Modified Distributors (with new spring combination for the Distributor Modification.

►*DISTRIBUTOR MODIFICATION & PRODUCTION CHANGE (Distr. Nos. FEC-12127-A & B5S-12127-D on Early 272 Special & Interceptor 292 Engines):* To minimize detonation, particularly in areas where fuel octane rating is below average, above distributors can be modified by replacing secondary spring (nearest vacuum chamber) with new spring No. 8EQ-12225, and recalibrating distributor advance as indicated in MODIFIED Advance Performance Table below. *NOTE*–Later B5A-12127-F & B5S-12127-E Distributors have this new spring and MODIFIED advance performance

►*CAUTION:* Above modification must NOT be made on 272 Std. Engine Distr. B5A-12127-B (will result in excessive spark advance and cause detonation).
Condenser–Ford FAB-12300-A. **Capacity** .21-.25 mfd.
Contact Point Set–Ford FAB-12171-A (B5A-12127-B Distr.), FAB-12171-B (All Others).
Breaker Gap–.014-.016".
Cam Angle–26-28½°.
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Counter-clockwise viewed from above.

0	0	200
¼-1¼	16	300
6½-7½	75	700
9½-10½	1.27	1200
11¼-12¼	1.59	1500
14-15¼	2.19	2000

►*DISTRIBUTOR INSTALLATION CAUTION: Make sure oil pump intermediate shaft properly engages distributor shaft. It may be necessary to turn over the engine with starter, after distributor drive gear is partially engaged, to engage distributor intermediate shaft.*

IGNITION TIMING

►*TIMING CAUTION: Timing is different on Synchro-mesh and Fordomatic Drive Cars.*
Setting (Fordomatic Cars)–6° BTDC.
Setting (Synchro-mesh Trans. Cars)–3° BTDC. NOTE–Timing on synchro-mesh cars can be set up to 6° providing higher octane rating gasoline is used.
Timing Mark–On crankshaft pulley and pointer on front engine cover. Align pointer and timing mark. NOTE–six timing marks (0°-2°-4°-6°-8°-10°-BTDC) on dampener. Wide mark represents TDC.

CARBURETOR

►*CARBURETOR APPLICATION: Two-barrel and four-barrel carburetors used on 272 Cu. In. Engine. Four-barrel carburetors used on 292 Cu. In. Engine.*

►*ACCELERATOR ROD-TO-BELL CRANK CONNECTING LINK CORRECTION (To Prevent Linkage Disconnection):* Install a No. 10 lockwasher, Part No. 34803-S7, between lock nut and accelerator rod. New rods which incorporate this change and which have improved design ball end sockets are available.

Anti-Stall Dashpot (Fordomatic Cars): First adjust engine idle speed then turn engine off. Loosen dashpot adjusting screw locknut. Hold throttle in closed position and turn dashpot adjusting screw out (counter-clockwise) until head of adjusting screw pushes the dashpot rod up to the end of its travel. Turn dashpot screw in (clockwise) 1½-2 turns to obtain .045-.064" clearance.

Throttle Linkage Adjustment (Fordomatic Cars): With selector lever in "N" position and engine at normal operating temperature, set idle speed to 450-475 RPM. Adjust Anti-Stall Dashpot, then turn engine off. Disconnect transmission throttle control rod from accelerator assembly lever on engine and insert a locking pin (¼" drill rod) through adjusting holes in lever and assembly. Adjust length of link between assembly and carburetor throttle valve lever to close lever against its stop. Adjust accelerator assembly connecting link (assembly-to-cross shaft link) to obtain a pedal height of 3 11/16" (Exc. Interceptor & Special), 3 9/16" (Interceptor & Special), Remove locking pin and pull up gently on transmission throttle control rod to hold transmission lever against its internal stop. Rotate clevis on upper end of rod until clevis fits freely on pin on accelerator assembly lever, **then lengthen rod by turning clevis 3 turns counter-clockwise.** Install throttle control rod on lever. Hold lever in alignment

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

to prevent binding, and tighten locknut. Road test car and if band or clutch slippage evident, **increase rod length to 3½ turns of clevis but do not exceed 4 turns.** *NOTE*–Connecting link between cross shaft and lever must be parallel to center line of engine. Adjust as necessary by rotating adjusting screw in lever.

FORD TWO-BARREL

Transmission	Ford Carb. No.
Std. & Overdrive	B5A-9510-J
Fordomatic	B5A-9510-K

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting–Initial setting 1½ turns open. Set both screws alike. Set for highest steady vacuum reading with engine at normal operating temperature, or midway between rolling and missing points. Turn screws out for richer mixture.

Idle Speed–475-500 RPM. (Std. & O.D.), 450-475 RPM. (Fordomatic) with selector lever in Neutral "N".

Float Level–1.275-1.305" measured from flange surface of air horn (near each end), to bottom side of float (not soldered seam). To correct float setting, bend float lever arm up or down.

Accelerating Pump: Center hole average setting. Inner hole for hot weather, Outer for cold weather.

Fast Idle: *Integral type. Operated by choke valve lever.* No adjustment required.

Throttle Linkage & Anti-Stall Dashpot Adjustment: See CARBURETOR above.

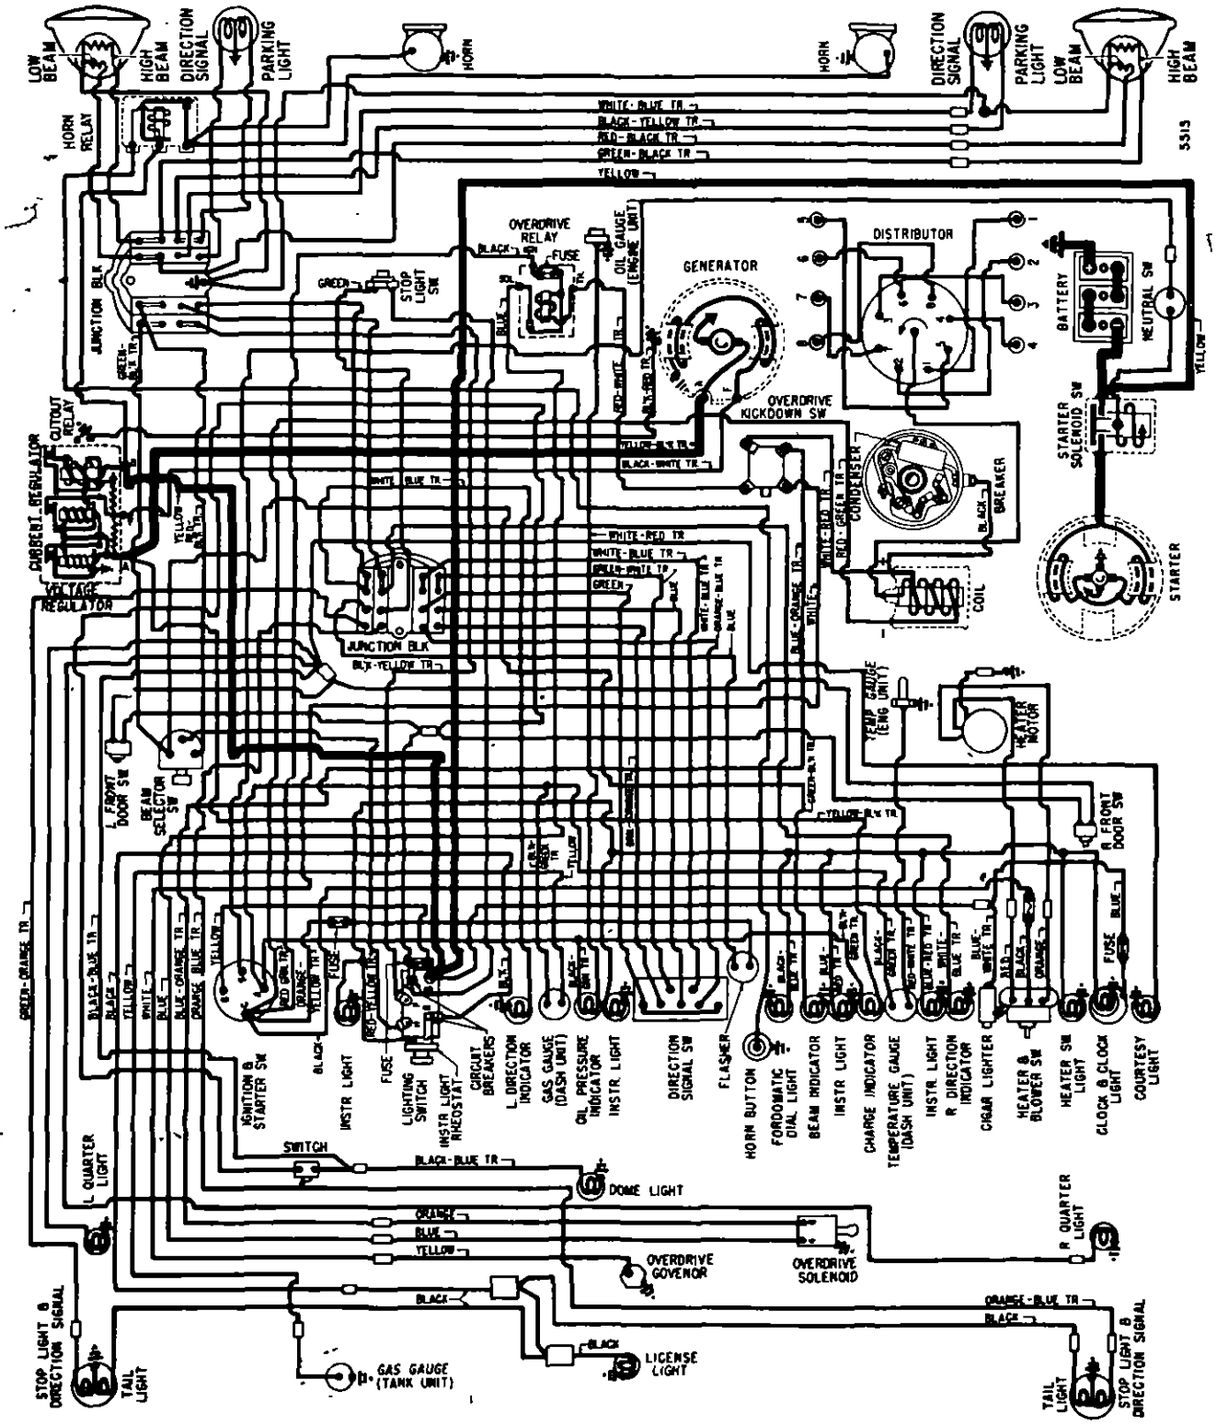
►*OTHER DATA: See "Holley-Ford Carburetors" in Carburetor Section*

Fuel Pump Pressure: 4-5 lbs. at 900 RPM.

FORD FOUR-BARREL

Transmission	Ford Carb. No.
Std. & Overdrive (Early)	B5A-9510-G
Fordomatic (Early)	B5A-9510-H
Std. & Overdrive (Later) ①	B5A-9510-M
Fordomatic (Later) ①	B5A-9510-N
All Transmissions (Latest) ②	B5A-9510-B

①–When used on 292 Eng. use air cleaner screw, Part No. B5S-9813-A (same as installed on old carburetor).



②–Have leaner setting, accomplished by redesigned idle tube assemblies, nozzle bar air bleeds, main jets, some main body drillings, and changed accelerator nozzles. New carburetor units identified by suffix "-5" either stamped or cast in side of main body following ECG model identification. *See "Ford, Lincoln, Mercury Centri-Quad 4-Barrel" in Carburetor Section.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*ROUGH ENGINE IDLE CORRECTION: See Tune-Up above.*

►*CARBURETOR ICING CORRECTION:* On early cars, Radiator Upper Air Deflector, No. B5A-8327-A, can be installed to restrict cold air entering engine compartment (this deflector installed in production beginning May, 1955). *CAUTION*–Deflector should be removed during summer months in extremely hot temperatures to avoid possibility of engine overheating.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*CHOKE VALVE BIND CORRECTION (First Cars): See "Ford Lincoln, Mercury Centri-Quad" Carburetor in Carburetor Section.*

►*CARBURETOR INSTALLATION CAUTION (First Cars):* Care must be taken not to dislodge choke air inlet tube washer in carburetor throttle body which may be carried into engine combustion chamber. *See "Ford, Lincoln, Mercury Centri-Quad 4-Barrel" in Carburetor Section.*

Idle Setting–1¼ turns open (B5A-9510-G, H), 1/2-5/8 turn open (B5A-9510-M, N). Set both screws alike. Set for highest steady vacuum reading with engine at normal operating temperature, or midway between missing and rolling points. Turn screws out for richer mixture.
Idle Speed–475-500 RPM (Std. & O.D.), 450-475 RPM. (Fordomatic Pass. Car), 475-500 RPM (Fordomatic Interceptor) with selector lever in Neutral "N".
Throttle Linkage & Anti-Stall Dashpot Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Ford, Lincoln, Mercury Centri-Quad 4-Barrel" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs. at 900 RPM.

CARB. EQUIPMENT

►*FUEL TANK FILTER CAUTION:* If particles of foreign material found in fuel pump or carburetor on units built prior to February 1, 1955 are clear or cream colored, short, and thread like; they are probably from damaged fuel tank filter. Replace tank.

Fuel Pump: Ford B5A-9350-C, Fuel only (Except Fordomatic & Overdrive Cars). B5A-9350-D, Fuel & Vacuum (Fordomatic & Overdrive Cars).
Pressure–4-5 lbs. at 900 RPM.
See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric.
Dash Unit–Ford B5A-9280-A.
Tank Unit–Ford B5A-9275-A (Exc. Sta. Wgn. & Sedan Del.). B5A-9275-B (Sta. Wgn. & Sedan Del.).
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Ford No. FDA-10655-A. 6 volt, 17 plate, 90 ampere hour capacity (20 hr. rate).
Battery Ground–Positive (+) to cylinder head.
Engine Ground–Cylinder head to dash.

STARTER

Ford FAC-11002-G. Armature–FAC-11005-B.
Drive–Ford 1CM-11350-C, Bendix "Folo-thru" type.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–48-56 ozs.
Cranking Speed– 115-125 RPM.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
14 ft. lbs.	Lock		700

①–With starter on engine and engine running.

►*STARTER INSTALLATION CAUTION:* Make certain that rubber seal properly positioned (can be held in place with rubber cement).

Starting Switch: Ford No. FAB-11450-B. Mounted on left front fender apron and controlled by Ignition Switch.

Fordomatic Neutral Safety Switch: Ford B5A-15812-A. **Adjustment**–*See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford FBC-10002-A (272 Eng.), **B5S-10002-A** (292 Eng.). **Armature**–FBC-10005-A.

►*GENERATOR BELT NOISE CORRECTION:* To make sure noise is coming from belt, squirt a few drops of hydraulic fluid on belt driving surface. If noise or whine disappears, replace belt with plain type No. B5A-8620-B belt.

Performance Data

Generator	Amperes ①	Eng. RPM
FBC-10002-A	35	850
B5S-10002-A	40	850

①–See Regulator for maximum charging rate.

Brush Spring Tension–30 ozs.
Field Current–1.5-2.5 amperes at 6.0 volts.
Rotation–Counter-clockwise at commutator end.
Belt Adjustment: ¼" belt deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Ford FAC-10505-A (FBC-10002-A Gen.), **FAD-10505-A** (B5S-10002-A Gen.).

Cutout Relay

Cuts In–6.0-6.6 volts.

►*CUTOUT RELAY AIR GAP CHECK:* With cover off regulator, manually close cut-out contacts. Measure air gap between armature and core. The dimension should be .009-.013". Air gap with contacts open should be .012-.020". If either or both of these dimensions are not up to specifications, regulator is defective.

Voltage Regulator

Setting–7.4-7.8 volts.
Checking & Adjusting–*See Electrical Equip. Section.*

Current Regulator

Setting–33-37 amperes (FAC-10505-A Reg.), 38-42 amperes (FAD-10505-A Reg.).
Checking & Adjusting–*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Direction Signal: *See Electrical Equipment Section.*
Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N.
Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of brake booster assembly (Power Brakes).

FUSES: Located as indicated below:
Interior Lights–14 amps. on lighting switch.
Direction Signal–14 amps., in fuse holder between ignition switch and flasher.
Overdrive–30 amps., on overdrive relay.
Cigar Lighter–Special fuse in lighter base.
Clock–3 amps., in clock lead.
Heater–14 amps., in blower switch wire.

LIGHTING CIRCUIT BREAKERS: On Lighting Switch. Combination headlight switch circuit breaker and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument lights, parking lights and stop and tail light circuits.

HORNS: Ford B5A-13832-C (High Pitch), B5A-13833-C (Low Pitch). Dual horns operated by relay.
Horn Relay–Ford FAA-13853-A.

►*BACK-UP LIGHT SWITCH BRACKET INSTALLATION CAUTION:* Change in steering gear shift rod on late production cars affects installation of back-up light switch bracket, Part No. B5A-15517-A. To install this bracket, bend upward to prevent switch from bottoming when gear shift lever in reverse position. New bracket, Part No. B5A-15517-B, is included in new kit, Part No. B5A-18276-B. However, some new kits will be released with old bracket.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8.

Engine	Bore	Stroke	Displmnt.	Rated HP
272 Eng.	3.62"	3.30"	272 cu. ins.	42.0
292 Eng.	3.75"	3.30"	292 cu. ins.	45.0

Engine	Compr. Ratio	Developed HP
272 Exc. Special	7.6-1	162 at 4400 RPM
272 Special	8.5-1	182 at 4400 RPM
292 Interceptor	7.6-1	188 at 4400 RPM

Compression & Vacuum Reading–*See TUNE-UP.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Special Data.*

►*CYLINDER HEAD IDENTIFICATION:* Identified by number cast in top of head. In addition, 292 Eng. Interceptor has ECK cast in recess in head gasket surface. Identification as follows:

Engine	Compr. Ratio	Casting No.
272 Standard	7.6-1	ECL-6090-A
292 Thunderbird Std.	8.1-1	ECL-6090-A
272 Special (Early)	8.5-1	① ECL-6090-B
272 Special (Later)	8.5-1	ECG-6090-A
292 Thunderbird Fordomatic	8.5-1	① ECL-6090-B
292 Interceptor (Early)	7.6-1	ECL-6090-B
292 Interceptor (Later)	7.6-1	ECK-6090-B

①–These two heads identified from each other by measuring thickness of either of two center machine locating pads (directly beneath No. 2 & No. 3 spark plug holes on right bank, below No. 6 & No. 7 holes on left bank). Thicknesses are: .964-.966" on 272 Special, .999-1.001" 292 Thunderbird.

►*DRIVE SHAFT-TO-FRAME INTERFERENCE CAUTION & CORRECTION (CONVERTIBLE):* On early production units, drive shaft may strike bottom of clearance hole in frame "X" member after vehicle passes over severe bump. Current production is installing three shims and longer bolts (7/16"-20" x 1½") between engine rear support and "X" member to prevent interference, and can be installed on early units. *NOTE*– If shims removed during repair operation, make sure they are reinstalled.

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data.*
ENGINE REMOVAL: *See "Engine" in Ford Special Data.*
ENGINE FRONT MOUNTING: *See "Engine Mountings" in Ford Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OIL PAN REMOVAL: Drain crankcase. Remove engine front splash pans. Disconnect oil pump inlet tube at oil pump. Remove oil pan retaining screws and remove oil pan. *(NOTE*—No. 1 cylinder must be on TDC before oil pan can be removed). Remove nut securing oil pump inlet tube to oil pan, then remove oil pump screen and inlet tube assembly from oil pan.

PISTONS

Autothermic type. Solid skirt with three rings above pin.
Removal—Pistons and rods removed from above.
Fitting New Pistons: Use ½" feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:
New Piston in New Bore—.0015" feeler. 5-10 lbs. pull.
New Piston in Used Bore—.002" feeler. 5-10 lbs. pull.
Used Piston in Used Bore—.0025" feeler. 5-10 lbs. pull.
Replacement Pistons: Standard size, .020", .030", .040", .060" Oversize. Pistons furnished only with fitted pins.
Installing Pistons: Install with small indentation in head toward FRONT of engine.

PISTON PINS

Floating type with lock rings at each end.
Diameter—.9120-.9123". **Length**—3.016-3.030".
Pin Fit in Piston—Hand push fit at 70°F.
Pin Fit in Rod Bushing—.0001-.0003" clearance. New pin should not fall through of own weight.
Replacement Pins: Standard size, .001", .002" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.010-.027"	.002-.0035"
Compr. #2	3/32"	.010-.027"	.002-.0035"
Oil	3/16"	.010-.027"	.0015-.003"

Replacement Rings: Standard size, .020", .030", .040", .060" Oversize.
►*REPLACEMENT PISTON RING NOTE:* "Snap type" rings furnished in standard size only, "Steel section type" in all above oversizes.

CONNECTING RODS

Crankpin Journal Diameter—2.1880-2.1888".
Lower Bearing—Steel backed, copper lead alloy lined type. Upper and lower halves interchangeable.
Clearance—.0008-.0027".
Side Clearance—.006-.016" (two rods).
Replacement Bearings: Standard size (4 sizes marked **red & blue** for selective fitting) and .010", .020", .030" Undersize.
Installing Rods: Rod bearing lock slot in rod should be toward outside of engine "V". When installing rod and piston assembly in engine indentation on top of piston head should be to front of engine, and numbers on rod and cap should be to left (left bank) and to right (right bank).

CRANKSHAFT

Journal Diameter—2.4980-2.4988". Max. wear limits .0015", taper .001".
Bearings—Steel backed, copper lead alloy lined.
Replacement Bearings: Standard size, (4 sizes marked **red & blue** for selective fitting) and .010", .020", .030" Undersize.
End Thrust: Taken by No. 3 main bearing. Replace bearing if endplay excessive.
Thrust Bearing Alignment—*See "Crankshaft & Main Bearings" in Ford Special Data.*
Endplay—.002-.006".
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Special Data.*
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Special Data.*

CAMSHAFT

Journal Diameter—1.9255"-1.9265" (new). 1.924" (worn limit).
Clearance—.001-.003" (new). .005" (worn limit).
End Thrust: Taken by plate on forward end of block (between camshaft sprocket and shoulder on block).
Endplay—.003-.007".
Replacement Camshaft Bearings: Finished bearings furnished Standard, .015" Undersize. *CAUTION—Oil holes in bearings must be lined up correctly. See Ford Special Data.*
Camshaft Bearing Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data.*
Timing Chain: Side-guide type. Length 56 links.
►*REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side).
►*CAMSHAFT SPROCKET SPACER INSTALLATION CAUTION:* If spacer, Part No. EBE-6265-A, installed backwards, it will allow an excessive amount of endplay. Inside diameter of spacer has a chamfer on one side and this chamfered side should be installed toward No. 1 camshaft bearing journal.
Camshaft Setting: Sprockets marked by "O" at one tooth. Mesh chain so that there are 12 pins betweeh "O" mark s.
Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Ford Special Data.*

VALVES

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves): Stem diameter decreased .0005" for greater stem clearance in guide. See "Valve System" in Ford Special Data.*
Tappet Clearance: .019" (Intake & Exhaust), with engine at normal operating temperature. *NOTE—Valve tappet clearance on truck engines is different.*

Valve	Head Diam.	Stem Diam. ①	Length
Intake	1.785"	.3415"	5.02"
Exhaust	1.515"	.3405"	5.02"

Valve	Seat Angle	Lift ②	Stem Clearance
Intake	45°	.345"	.002" max.
Exhaust	45°	.345"	.003" max.

①—Valves furnished with .003", .015", .030" oversize stems for service replacement. *See "Valve Guides" in Ford Special Data.*
②—Minimum lift for checking camshaft lobe wear.
Valve Seat Width—.060-.070" (Intake). .070-.080" (Exhaust).
►*ROTATABLE VALVE NOTE: All valves are rotatable type. See "Valve System" in Ford Special Data.*
Valve Stem Oil Seals—"Umbrella" type oil seals used on intake & exhaust valve stems. Seals are installed with cupped side down on valve stem at guide boss on cylinder head. *Install new seals whenever valves removed or when seals become loose on valve stems.*
►*VALVE STEM OIL SEAL PRODUCTION CHANGE & INSTALLATION CAUTION:* New valve stem oil seal (Part No. B5A-6571-A) is being installed in production and is available for service. Skirt length has been increased .001" to seal a greater area of valve stem from oil splash. Also, seal will minimize amount of oil permitted to enter combustion chamber via stem-to-valve guide clearance. *When servicing engines with old type seal, new seal should be used.*
Valve Springs: Install with closed coil end toward cylinder head. **Free Length**—2.11-2.13".

Valve Spring Specifications

	Pressure	Length
Valve Closed	54-62 lbs.	1.821"
Valve Open	124-140 lbs.	1.505"

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (See table above), ream guides and install oversize valve. *See "Valve Guides" in Ford Special Data.*
Valve Lifters: Mushroom type. Removed from below with camshaft removed.
►*VALVE LIFTER INSTALLATION CAUTION:* Cast iron tappet, Part No. EAA-6500-C, should no longer be used as service replacement on 8-cylinder engines as these tappets may contribute to cam lobe wear. Use steel tappet, Part No. EAA-6500-D. Cast iron tappet has smooth molded appearance on unmachined portion of tappet foot. Tappet foot is .220" thick. Steel tappet has forging marks on outer edge of tappet foot and is .140" thick.
Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
►*VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated.
Intake Valves—Open 12° ① BTDC. Close 54° ① ALDC.
Exhaust Valves—Open 58° ③ BLDC. Close 8° ③ ATDC.
①—Camlift .016". ②—Camlift .019". ③—Camlift .014". ④—Camlift .018".
Valve Timing Check: *See "Camshaft Setting" under CAMSHAFT above.* Remove right-hand rocker chamber cover. Turn engine over until No. 1 intake tappet is on heel of No. 1 intake cam lobe. Back off No. 1 intake valve adjusting screw push rocker arm to one side, then install dial indicator. Zero dial indicator, then rotate engine slowly until desired lift (.016") obtained. Compare degrees on pulley with specifications (12°). If not within specifications check for bent timing pointer by bringing No. 1 piston to TDC and see if timing pointer aligned with TDC mark on crankshaft pulley. If pointer not at fault, check timing chain, camshaft sprocket, camshaft, crankshaft pulley, and crankshaft in order of accessibility.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add 1 qt. when filter changed.
Normal Oil Pressure: 45-55 lbs. at 30-40 MPH.
Pressure Regulator Valve—In pump body, not adjustable.
Oil Pressure Indicator—Indicator light on instrument panel, operated by Engine Unit—Ford No. FDA-9278-A (Stamped No. 7 on Hex.). Lights when ignition switch turned on, goes out when engine starts.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pump: Gear type pump located on left side of engine crankcase, driven by distributor drive gear.
Pump Overhaul—*See "Oiling System" in Ford Special Data.*

►*OIL PUMP LEAK CORRECTION:* On some oil pumps, oil pump cover bolt holes may be tapped into gear cavity of pump causing oil leak past threads and out between bolt and pump cover. To correct, remove cover bolts. Coat threads of bolts with Sealing Compound, Part No. 8A-19554-B. Install bolts.

►*OIL PAN-TO-PUMP TUBE SEAL INSTALLATION CAUTION:* Pump failures have been encountered due to pieces of oil pan-to-oil pump seal (Part No. B4A-6698-A) breaking off and lodging between oil pump gears. In some cases, oil inlet tube is too short. As a result, when retaining nut is tightened excessively, seal is squeezed over edge of tube which cuts seal. *Always lubricate seal with engine oil prior to installation, and tighten retaining nut just enough to insure against leakage.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil dirty or polluted.
Filter Element Installation—*See "Oiling System" in Ford Special Data.*
Replacement Filter Element—Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION: This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication.*

►*BRAKE LINE INTERFERENCE WITH OIL FILTER CORRECTION:* Clip, Part No. B4A-2244-A, and attaching screw, Part No. 39883-S7, now available to secure brake line to rear side of No. 2 crossmember. On vehicles not equipped with additional clip (now used in production), and on which interference is encountered proceed with installation of additional clip as follows: Locate and mark spot on No. 2 crossmember 4½" to left, and 4 15/16" up from center of existing clip at left hand rear side of crossmember. Drill 9/32" hole at this spot. Position brake line on crossmember, and secure line with clip and screw. *NOTE*—Brake line will move far enough to permit installation without bending or crimping line.

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

►*CRANKCASE VENTILATION GASKET INSTALLATION CAUTION:* On some units gasket (B4A-6872-A) may have been installed upside down causing leak at gasket location. Bolt center line is 5/64" below center line of gasket.

COOLING

Water Capacity: 20 qts. (without heater), 21 qts. (with heater).
Pressure Valve: Ford LA-8100-A, 12-15 lbs. (marked "13" or "14"). *CAUTION*—If replacement required use 12-15 lb. type, Radiator filler cap.
Thermostat: Ford No. B4A-8575-A (160°), No. B4A-8575-B (180° used with permanent anti-freeze). Mounted inside water outlet elbow on forward end of intake manifold. *NOTE—The above thermostat replaces type formerly used.*
Water Pump: Packless, sealed ball bearing type.
See "Ford V8" in Water Pump Section.
Temperature Gauge: King-Seeley Electric.
Dash Unit—Ford No. B5A-10883-A.
Engine Unit—Ford No. 1A-10884-A.
Temperature Bulb Sleeve Removal: Thread adapter handle of tool T50T-100-A. into sleeve. Tighten locknut against sleeve, then pull sleeve with sliding hammer.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 10NC. Ford B5A-7563-A. (Heavy Duty) **B5S-7563-A (11").**
See "Long Clutches" in Clutch Section.

►*ENGINE VIBRATION CORRECTION (Due to Improper Clutch Disc Friction-Lag):* Vibration noted on some cars equipped with Standard and Overdrive Transmissions. To help this condition, install service clutch disc, Part No. B5A-7550-A, which has proper friction-lag characteristics. *NOTE*—Only disc should be replaced. Repairs to transmission or replacement of clutch pressure plate have proven of little value in correcting condition.

Clutch Disc No.—(B5A-7563-A Clutch) B5A-7550-A, (B5S-7563-A Clutch) B5S-7550-A.
Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper until travel is within limits.
Pedal Free Travel—1 1/8-1 3/8". Loosen lock nut on clutch pedal release rod, turn adjusting nut until correct travel is reached.
Removal: Remove transmission (see Transmission Removal below), and slide clutch release bearing off clutch release lever. Disconnect clutch pedal release rod from clutch release lever assembly. Remove clutch release equalizer bar bracket from flywheel housing and remove equalizer bar. Remove split bronze bushing from bracket and then remove flywheel housing. Install Tool 7563 and remove clutch pressure plate assembly (if tool not available, clutch may be released by backing off the attaching bolts evenly). Remove clutch release bearing from hub with an arbor press.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See "Ford Synchro-mesh" in Transmission Section.
Transmission Control: *See "Transmission Controls" in Transmission Section.*

►*INTERMEDIATE & HIGH GEAR JUMP-OUT CORRECTION: See "Ford Synchro-mesh" in Transmission Section.*

►*STANDARD & OVERDRIVE TRANSMISSION INSTALLATION CAUTION:* 292 Eng. Police Interceptor uses Lincoln-Mercury Transmissions which are not interchangeable with Ford Transmissions.

►*TRANSMISSION GEARSHIFT ROD BIND CORRECTION (Interceptor):* To correct, weld 5/16" flat washer (Part No. 44722-S8) on each rod 5/8" from end.

►*SYNCHRO-MESH LOW GEAR JUMP-OUT CORRECTION (Due to Insufficient Clearance):* To correct, remove side cover, and grind corner of detent boss to provide sufficient clearance between shift cam and detent boss.

Removal: Drain transmission, disconnect gear shift linkage at transmission. Remove speedometer cable and gear, remove drive shaft. Remove bolts which hold transmission extension to engine rear support. Remove frame cross-member and engine rear support. Remove bolts and lock washers which attach transmission to clutch housing, then install two guide pins. Move transmission assembly to rear until input shaft splines clear clutch housing, then lower transmission and pull forward to remove from car.

OVERDRIVE

Warner Model AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. Lock-out Switch not used on this model.
See "Warner R10 Overdrive" in Transmission Section.
Overdrive Control: *See "Overdrive Control" in Transmission Section.*
Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.
See "Fordomatic & Mercomatic" in Transmission Section.

►*FORDOMATIC "WHISTLING" NOISE CORRECTION: This condition may occur during normal engine operation. See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*
Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain & refill every 15,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level: With selector lever in "N" (Neutral) and emergency brake applied, run engine approximately four minutes at idle speed. Check to see that emergency brake is applied and that engine is on slow idle, move selector lever to the "P" (Park) position. (*NOTE*—When engine and transmission are at normal operating temperature, move selector lever through all ranges to assure fluid distribution throughout transmission). Raise hood and wipe top of oil level indicator. Remove indicator and read fluid level. Add Automatic Transmission Fluid "Type A" if necessary to bring fluid level to "Full" mark on indicator. Replace fluid level indicator.

THROTTLE LINKAGE ADJUSTMENT: *See Carburetor above.*

►*OTHER "FORDOMATIC" SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

UNIVERSALS

Mechanics. Needle bearing type.

►*CAUTION: (All Cars Except Station Wagon & Sedan Del. & Interceptor): Rear Universal joint companion flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). See "Ford & Mercury (Separate Carrier)" in Rear Axle Section.*

REAR AXLE

PASSENGER CARS

Own. Separate Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle not same as Station Wagon & Sedan Delivery. See "Ford & Mercury (Separate Carrier)" in Rear Axle Section.*

Ratios	Standard	Overdrive	Fordomatic
V8 Cars	3.78-1	3.89-1	3.55-1, 3.30-1

►*RATIO, DRIVE GEAR & DIFFERENTIAL CASE IDENTIFICATION:*

Gear Ratio	Differential Case Color	Drive Gear No. (on Edge of Gear)
3.89-1	Black	AD-4210-B
3.78-1	Black	AG-4210-A
3.55-1	Red	AF-4210-B
3.30-1	Gray	AF-4210-A

Backlash—.003-.008".

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: Drain lubricant from rear axle housing. Remove carrier-to-housing nuts, then remove identification tag (ratio) and set it aside for reference during assembly of axle. Remove carrier assembly from axle housing.

EXCEPT PASSENGER CARS

Own. Integral Carrier, semi-floating hypoid, with Hotchkiss drive.

►*NOTE: Axle assembly not same as passenger cars. See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.*

Ratios:	Standard	Overdrive	Fordomatic
Sta. Wgn.	4.09-1	4.27-1	3.54-1
Sedan Del.	4.09-1	4.27-1	3.54-1
Interceptor	3.92-1		3.31-1

Axle Shaft Removal: Same as Pass. Cars (above).

Rear Axle Assembly Removal: Raise rear end of car and disconnect rear universal. Remove axle shafts. Disconnect brake lines at "T" on left side of axle housing. Disconnect hand brake cable, shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Model	① Front	① Rear
Pass. Cars (Std.)	B5A-18124-A	B5A-18125-A
Pass. Cars (H. Dty)	B5A-18124-C	B5A-18125-C
Sta. Wgn. & Sed. Del.	B5A-18124-C	B5A-18125-D

①—Furnished in kits which include shock absorber mounting bushings.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs.

See "Lincoln, Mercury, Ford (Ball-Joint)" in Front Suspension Section.

►*LOWER ARM BUMPER INSTALLATION CAUTION:* Right and left hand bumpers are different and must be installed in the correct position. Damage to suspension will result if installed incorrectly. **Bumpers when installed should point slightly inboard.**

Kingpin Inclination—6° minimum, 7° maximum, crosswise.

Caster—Pos. ½° to Pos. 1½°. Maximum variations between wheels ½°.

Camber—Pos. ¼° to Pos. 1¼°. Maximum variation between wheels ¼°.

Toe-In—1/16" to 1/8".

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type.
See "Gemmer Worm & Roller (Type 305)" in Steering Section.

Power Steering: Ford-Mercury Linkage type. Used in junction with standard steering gear.
See "Ford & Mercury Bendix" in Steering Section.

Pump Belt Adjustment: Install torque wrench on pump pulley bolt. Check torque required to slip pulley against belt friction. If torque is not 14-16 ft. lbs. adjustment is required. To adjust, position a heavy duty 1½" "C" clamp with bottom against lower side of pump support bracket and top of clamp resting on pump bracket at its center. Loosen four pump attaching bolts until pump body may be repositioned by tightening "C" clamp. Tighten "C" clamp until torque of 14-16 ft. lbs. is required to slide pump pulley. (*NOTE*—Hold final torque as close as possible to upper limit). Tighten pump attaching bolts, remove "C" clamp, and make a final check of pulley sliding torque.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

BRAKES

Ford-Bendix Hydraulic (Single Anchor—with eccentric on front wheels, without eccentric on rear wheels). Hand lever applies rear wheel service brakes.

See "Ford, Lincoln, Mercury Bendix" in Brake Section. and note following change:

►*FRONT WHEEL ADJUSTMENT CHANGE:* Eccentric has been moved from secondary shoe to primary shoe. Initial adjustments made on primary instead of secondary shoe.

►*PARKING BRAKE "FIX" CORRECTION:* New parking brake equalizer, Part No. B5A-2119-A, available to correct permanent set of early cable equalizer, Part No. 8A-2119-A. Before installing on a convertible, cut 1 5/8" from each end of equalizer.

►*BRAKE LINE INTERFERENCE WITH OIL FILTER CORRECTION: See "Oil Filter" under CILING SYSTEM above.*

Drum Diameter—11" front and rear. Maximum boring limit 11.06".

Wheel Cyl. Diameter—1 1/8" (Front—All), 7/8" (Rear—Pass. Car), 15/16" (Rear—Sta. Wgn. & Sed. Del.).

Lining—Molded type riveted to shoe.
Lining Width—2¼" (Front-All), 1¾" (Rear—Pass. Car), 2" (Rear—Sta. Wgn. & Sed. Del.).

Lining Thickness—3/16" (Exc. Front Whl. Secondary—Pass. Car), 15/64" (Front Whl. Secondary—Pass. Car), 7/32" (All Shoes—Sta. Wgn. & Sed. Del.).

Lining Length—10.84" (All Shoes—Pass. Car), 9.28" (Primary Shoes—Sta. Wgn. & Sed. Del.), 11.94' (Secondary Shoes—Sta. Wgn. & Sed. Del.).

Clearance—.010" at each end of both primary and secondary shoes. Maximum variation .003" (Adjusting screws backed off 10-12 notches from point where shoes drag on drum. *See Adjustment Change above.*

Brake Pedal Free Play Adjustment: 1/4-7/16". If play not correct after brake adjustment, loosen lock nut on the eccentric bolt attaching brake pedal to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder: Located on engine side of firewall.

Checking Fluid—Maintain fluid level to within ½" of top of reservoir.
Removal—Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to firewall.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinder. There are no mechanical connections and no adjustments are required.
See "Midland Power Unit" in Brake Section.

Checking Brake Fluid—Same as for manual brakes (above).

Removal of Power Unit—Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at the power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket bolts and lockwashers and remove the power unit.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Miscellaneous Section.*

►*POWER WINDOW REGULATOR RELAY "FLUTTER" CORRECTION: See "Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Electric Hydraulic with reversible pump motor. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: Electric screw and jack type with individual motors and transmissions for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

Air Conditioning: *See Ford "SelectAire" in Miscellaneous Section.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate installed on dash panel in engine compartment.

First Number—100001.

►*VEHICLE NUMBER NOTE:* Vehicle number (example "P5FV100001") includes following identification data

Eng. Type①	Year②	Assy. Plant	Body Style③	Serial No.
P	5	See below	H	100001 up.

①—**A**—6 Cyl. 223 cu. in. engine; **U**—8 Cyl. 272 cu. in. engine; **P**—8 Cyl. 292 cu. in. engine (Special Law Enforcement & Thunderbird).

②—Last digit of model year.

③— **H**—Thunderbird.

Assembly Plant Designation

A—Atlanta	**F**—Dearborn	**N**—Norfolk
B—Buffalo	**G**—Chicago	**P**—St. Paul
C—Chester	**K**—Kansas City	**R**—Richmond
D—Dallas	**L**—Long Beach	**S**—Somerville
E—Edgewater	**M**—Memphis	**U**—Louisville

TUNE-UP

►*THUNDERBIRD V8 ENGINE ROUGH IDLE: See TUNE-UP on Ford V8 Passenger Car page for complete corrective procedure.*

COMPRESSION PRESSURE: 135 lbs. (Std. & O.D.), 140 lbs. (Fordomatic), at cranking speed.

VACUUM READING: 18-21" idling at 500 RPM.

VALVE TAPPET CLEARANCE: .019" (intake & exhaust), with engine at normal operating temperature. *NOTE*—Adjust with engine hot and idling, use .018" feeler as "GO", .020" feeler as "NO GO" gauge. This will insure tappet clearance being .019"±.001".

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve on cars with single exhaust system is located on front end of right hand exhaust manifold. Cars with dual exhaust system, the valve is located in rear end of left hand exhaust manifold. Thermostat spring installed with ¾ turn windup and hooked over stop pin. NOTE—When valve installed, stop pin should be at top.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinders—RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036"

Spark Plug—Champion 870. 18mm. Special.

►*SPARK PLUG CAUTION: Spark plug is new type with tapered seat and does not require a sealing gasket. It is important that plugs be tightened to 15-20 ft. lbs.*

COIL: *Ford 8BA-12029. On engine at distributor.*

Ignition Current—3.0 amps. idling, 5.0 stopped.

DISTRIBUTOR: Ford	**Distributor No.**
Early Cars	① B5S-12127-D
Later Cars	② B5S-12127-E

①—See Distributor Modification (below).

②—Modified Distributor (with new spring combination indicated in Distributor Modification).

►*DISTRIBUTOR MODIFICATION & PRODUCTION CHANGE: (Distr. No. B5S-12127-D on early cars):* To minimize detonation, particularly in areas where fuel octane rating is below average, distributor can be modified by replacing secondary spring (nearest vacuum chamber) with new spring, No. 8EQ-12225, and recalibrating distributor advance as indicated in MODIFIED Advance Performance Table below. *NOTE*—Later Distr. B5S-12127-E has this new spring and MODIFIED advance performance.

Condenser—Ford FAB-12300-A **Capacity** ..21-.25 mfd.

Contact Point Set—FAB-12171-B.

Breaker Gap—.014-.016".

Cam Angle—26-28½°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Advance Performance

Original Distributor B5S-12127-D

►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
½-1½	19	300
11-12½	1.36	1000
12¾-13¾	1.59	1400
14¼-15½	1.95	2000

Modified B5S-12127-D, & B5S-12127-E

►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
¼-1¼	16	300
6½-7½	75	700
9½-10½	1.27	1200
11¼-12¼	1.59	1500
14-15¼	2.19	2000

►*DISTRIBUTOR INSTALLATION CAUTION: Make sure oil pump intermediate shaft properly engages distributor shaft. It may be necessary to turn over the engine with starter, after distributor drive gear is partially engaged, in order to engage distributor intermediate shaft.*

IGNITION TIMING

►*TIMING CAUTION: Timing is different on Synchro-mesh and Fordomatic Drive Cars.*

Setting (Fordomatic Cars)—6° BTDC.

Setting (Synchro-mesh Trans. Cars)—3° BTDC. NOTE—Timing on synchro-mesh cars can be set up to 6° providing higher octane rating gasoline is used.

Timing Mark—On crankshaft pulley and pointer on front engine cover. Align pointer and timing mark. NOTE—six timing marks (0°-2°-4°-6°-8°-10°-BTDC) on dampener. Wide mark represents TDC.

CARBURETOR

FORD FOUR-BARREL

Transmission	Ford Carb. No.
Std. & Overdrive (Early)	B5A-9510-G
Fordomatic (Early)	B5A-9510-H
Std. & Overdrive (Later) ①	B5A-9510-M
Fordomatic (Later) ①	B5A-9510-N

①—When used on 292 Eng. use air cleaner screw, Part No. B5S-9813-A (same as installed on old carburetor).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*ROUGH ENGINE IDLE CORRECTION: See TUNE-UP on Ford V8 Passenger Car page for complete corrective procedure.*

►*FORDOMATIC THROTTLE LINKAGE PRODUCTION CHANGE & NO DOWNSHIFT CORRECTION (Early Cars):* To correct "No Downshift" condition on cars built prior to January 12, 1955, a new transmission control shaft-to-accelerator rod, Part No. B5A-9784-F, and a new control shaft, Part No. B5S-77230-F, are available. New parts eliminate bend or twist in bellcrank portion of transmission control shaft and bracket assembly. Cars built after January 12, 1955 have new parts installed.

►*THUNDERBIRD ACCELERATOR ASSEMBLY PRODUCTION CHANGE (To Correct Permanent Set):* New accelerator assembly, Part No. B5S-9725-B, available to replace assembly, Part No. B5S-9725-A, which was found to take a permanent set under operating load conditions.

►*CHOKE VALVE BIND CORRECTION (First Cars): See "Ford Lincoln, Mercury Centri-Quad" Carburetor in Carburetor Section.*

►*CARBURETOR INSTALLATION CAUTION (First Cars):* Care must be taken not to dislodge choke air inlet tube washer in carburetor throttle body which may be carried into engine combustion chamber. *See "Ford, Lincoln, Mercury Centri-Quad" in Carburetor Section.*

Idle Setting—1¼ turns open (B5A-9510-G, H), 1/2-5/8 turn open (B5A-9510-M, N). Set both screws alike. Set for highest steady vacuum reading with engine at normal operating temperature, or midway between missing and rolling points. Turn screws out for richer mixture.

Idle Speed—475-500 RPM (Std. & O. D.), 475-500 RPM (Fordomatic) with selector lever in Neutral.

Anti-Stall Dashpot Adjustment (Fordomatic Cars): First adjust engine idle speed, then turn engine off. Loosen dashpot adjusting screw locknut, hold throttle inclosed position and turn adjusting screw out (counter-clockwise) until screw pushes dashpot rod in to the end of its travel, then turn adjusting screw in (clockwise) 1½-2 turns to provide correct clearance of .045-.064", tighten locknut.

Throttle Linkage Adjustment (Fordomatic Cars): With selector lever in "N" position and engine at normal operating temperature, set engine idle speed to 450-475 RPM. Adjust Anti-Stall Dashpot, then turn engine off. Disconnect transmission throttle control rod from accelerator assembly lever on engine and insert a locking pin (¼" drill rod) through adjusting holes in lever and assembly. Adjust length of link between assembly and carburetor throttle valve lever to close lever against its stop. Adjust accelerator assembly connecting link (assembly-to-cross shaft link) to obtain a pedal height of 4¼". Remove locking pin and pull up gently on transmission throttle control rod to hold transmission lever against its internal stop. Rotate clevis on upper end of rod until clevis fits freely on pin on accelerator assembly lever, **then lengthen rod by turning clevis 3 turns counter-clockwise.** Install throttle control rod on lever. Hold lever in alignment to prevent binding, and tighten locknut. Road test car and if band or clutch slippage evident, **increase rod length to 3½ turns of clevis but do not exceed 4 turns.** *NOTE*—Connecting link between cross shaft and lever must be parallel to center line of engine. Adjust as necessary by rotating adjusting screw in lever.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

▷*OTHER DATA: See "Ford, Lincoln, Mercury Centri-Quad" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs. at 900 RPM.

CARB. EQUIPMENT

▷*FUEL TANK FILTER CAUTION:* If particles of foreign material found in fuel pump or carburetor on units built prior to February 1, 1955 particles should be examined very closely (with magnifying glass and strong light). If particles clear or cream colored, short, and thread-like pieces, they are probably from a damaged fuel tank filter. To correct, replace fuel tank.

Fuel Pump: Ford B5S-9350-A, Fuel only (Except Ford-omatic & Overdrive Cars). B5S-9350-B, Fuel & Vacuum (Fordomatic & Overdrive Cars).
Pressure–4-5 lbs. at 900 RPM.
See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric.
Dash Unit–Ford B5A-9280-A.
Tank Unit–Ford B5A-9275-A.
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Ford 01A-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hr. rate).
Battery Ground–Positive to engine.
Engine Ground–Cylinder head to dash.

STARTER

Ford FAC-11002-G. Armature FAC-11005-B.
Drive–Ford 1CM-11350-C, Bendix "Folo-thru" type.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–48-56 ozs.
Cranking Speed–115-125 RPM.

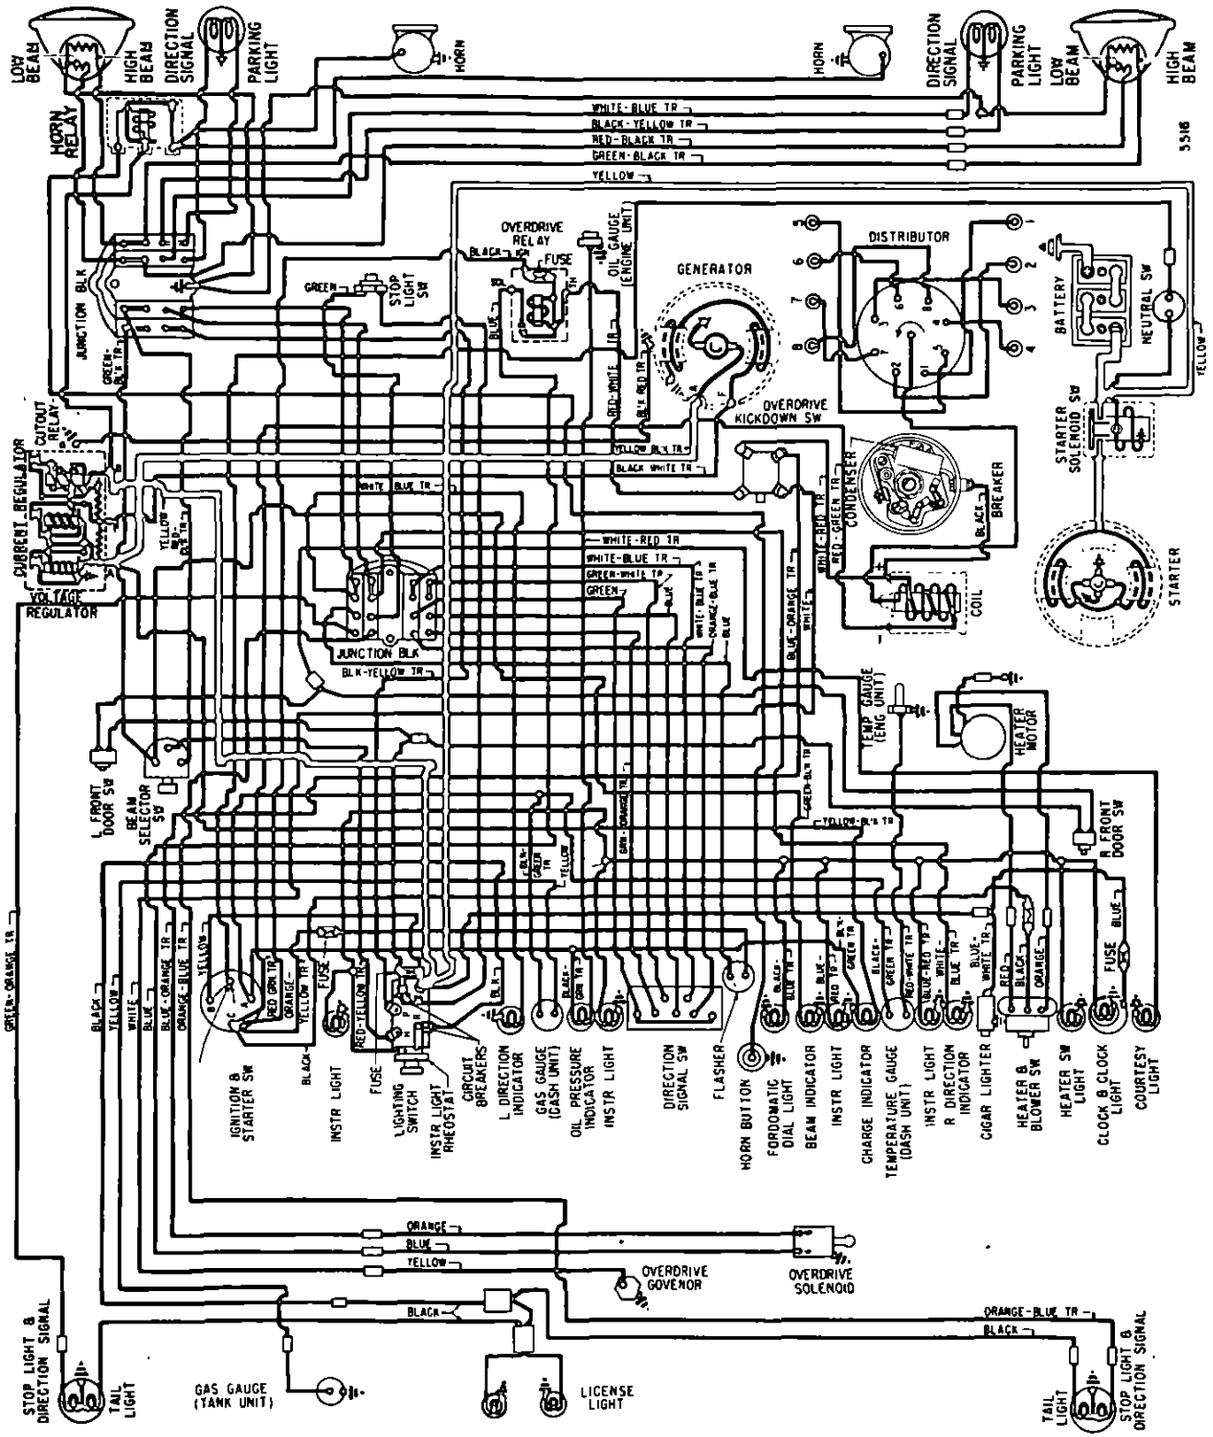
Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
14 ft. lbs.	Lock		700

①–With starter on engine and engine running.

▷*STARTER INSTALLATION CAUTION:* Make certain that rubber seal is properly positioned before mounting starter. If trouble encountered in keeping seal in position, apply rubber cement to both seal and engine block to hold seal in position while mounting starter.

Starting Switch: Ford FAB-11450-B. Mounted on left front fender apron and controlled by Ignition Switch. *NOTE*–Neutral Safety Switch is used on all cars with Fordomatic.



Fordomatic Neutral Safety Switch: Ford B5S-15812-B.
Adjustment–*See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford B5S-10002-A. Armature FBC-10005-A.

▷*GENERATOR BELT NOISE CORRECTION:* To make sure noise is coming from belt, squirt a few drops of hydraulic fluid on belt driving surface. If noise or whine disappears, belt is at fault and should be replaced with plain type belt, Part No. B5A-8620-B. In some cases, removal of paint in generator pulley groove has stopped noise without belt replacement.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Generator	Amperes ①	Eng. RPM
FBC-10002-A	35	850
B5S-10002-A	40	850

①—See Regulator for maximum charging rate.

Brush Spring Tension—30 ozs.
Field Current—1.5-2.5 amperes at 6.0 volts.
Rotation—Counter-clockwise at commutator end.

►*THUNDERBIRD GENERATOR REMOVAL PROCEDURE (To Prevent Loss of Coolant):* Disconnect generator leads, remove two nuts from generator mounting bolts and capscrew from adjusting bracket. Remove fan belt. Remove capscrew attaching support bracket to front of generator mounting bracket. Remove top capscrew attaching main generator mounting bracket to engine front cover, and loosen lower capscrew about two full turns. Remove capscrew attaching front of generator to main generator mounting. *(NOTE*—Do not remove lower capscrew as it is tapped into water jacket and coolant will be lost). Swing generator up to let bracket pivot outboard on its lower mounting capscrew enough to permit removal of rear generator mounting bolt. Remove generator. *CAUTION*—If generator not immediately installed, tighten lower capscrew to prevent possible loss of coolant.

Belt Adjustment: ¼" belt deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Ford FAD-10505-A.

Cutout Relay

Cuts In—6.0-6.6 volts.

►*CUTOUT RELAY AIR GAP CHECK:* With cover off regulator, manually close cut-out contacts. Measure air gap between armature and core. The dimension should be .009-.013". Air gap with contacts open should be .012-.020". If either or both of these dimensions are not up to specifications, regulator is defective and should be replaced.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

Setting—38-42 amperes.
Checking & Adjusting—*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Direction Signal: *See Electrical Equip. Section.*
Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out to switch. Unscrew mounting nut with Tool 17470-N. Remove switch and disconnect all wires.
Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of brake booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.

►*BACK-UP LIGHT SWITCH BRACKET INSTALLATION CAUTION:* Change in steering gear shift rod on late production cars affects installation of back-up light switch bracket, Part No. B5A-15517-A. To install this bracket, bend upward to prevent switch from bottoming when gear shift lever in reverse position. New bracket, Part No. B5A-15517-B, is included in new kit, Part No. B5A-18276-B. However, some new kits will be released with old bracket.

FUSES: Located as indicated below:
Interior Lights—14 amps., on lighting switch.
Direction Signal—14 amps., in fuse holder between ignition switch and flasher.
Overdrive—30 amps., on overdrive relay.
Cigar Lighter—Special fuse in lighter base.
Clock—3 amps., in clock lead.
Heater—14 amps., in blower switch wire.

LIGHTING CIRCUIT BREAKERS: On lighting switch. Combination headlight switch circuit breaker and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument lights, parking lights and stop and tail light circuits. Fuse protects interior lighting circuit (14 amps.).

HORNS: Ford B5A-13832-C (High Pitch), B5A-13833-C (Low Pitch). Dual Horns operated by relay.
Horn Current—12-14 amperes.
Horn Relay—Ford FAA-13853-A.

ENGINE

ENGINE SPECIFICATIONS: 90° V8.

Engine	Bore	Stroke	Displmnt	Rated HP
292 Eng.	3.75"	3.30"	292 cu. ins.	45.0

Transmission	Compr. Ratio	Developed HP
Std. & Overdrive	8.1-1	193 at 4400 RPM
Fordomatic	8.5-1	198 at 4400 RPM

Compression & Vacuum Reading—*See TUNE-UP.*

►*OTHER ENGINE DATA:* *See Ford V8 Passenger Car.*

VALVE TIMING

See "Camshaft Setting" under Ford V8 Passenger Cars.

►*VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated.
Intake Valves—Open 12° ① BTDC. Close 54° ② ALDC.
Exhaust Valves—Open 58° ③ BLDC. Close 8° ④ ATDC.
①—Camlift .016". ②—Camlift .019". ③—Camlift .014" ④—Camlift .018".

Valve Timing Check: *See "Camshaft Setting" under Ford V8 Pass. Cars.* Remove right-hand rocker chamber cover. Turn engine over until No. 1 intake tappet is on heel of No. 1 intake cam lobe. Back off No. 1 intake valve adjusting screw, push rocker arm to one side, then install dial indicator. Zero dial indicator, then rotate engine slowly until desired lift (.016") obtained. Compare degrees on pulley with specifications (12°). If not within specifications check for bent timing pointer by bringing No. 1 piston to TDC and see if timing pointer aligned with TDC mark on crankshaft pulley. If pointer not at fault, check timing chain, camshaft sprocket, camshaft, crankshaft pulley, and crankshaft in order of accessibility.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add 1 qt. when filter changed.
Normal Oil Pressure: 45-55 lbs. at 30-40 MPH.
Pressure Regulator Valve—In pump body, not adjustable.
Oil Pressure Indicator—Indicator light on instrument panel, operated by Engine Unit—Ford No. FDA-9278-A (Stamped No. 7 on Hex.). Lights when ignition switch turned on, goes out when engine starts and pump operates.

Oil Pump: Gear type pump located on left side of engine crankcase, driven by distributor drive gear.
Pump Overhaul—*See "Oiling System" in Ford Special Data.*

►*OIL PUMP LEAK CORRECTION:* On some oil pumps, oil pump cover bolt holes may be tapped into gear cavity of pump causing oil leak past threads and out between bolt and pump cover. To correct, remove cover bolts. Coat threads of bolts with Seal Sealing Compound, Part No. 8A-19554-B. Install bolts.

►*OIL PAN-TO-PUMP TUBE SEAL INSTALLATION CAUTION:* Pump failures have been encountered due to pieces of oil pan-to-oil pump seal (Part No. B4A-6698-A) breaking off and lodging between oil pump gears. In some cases, oil inlet tube is too short. As a result, when retaining nut is tightened excessively, seal is squeezed over edge of tube which cuts seal. *Always lubricate seal with engine oil prior to installation, and tighten retaining nut just enough to insure against leakage.*

Oil Filter: Full-flow type (Std. Equip.) with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

►*BRAKE LINE INTERFERENCE WITH OIL FILTER CORRECTION:* Clip, Part No. B4A-2244-A, and attaching screw, Part No. 39883-S7, now available to secure brake line to rear side of No. 2 crossmember. On vehicles not equipped with additional clip (now used in production), and on which interference is encountered proceed with installation of additional clip as follows: Locate and mark spot on No. 2 crossmember 4½" to left, and 4 15/16" up from center of existing clip at left hand rear side of crossmember. Drill 9/32" hole at this spot. Position brake line on crossmember, and secure line with clip and screw. *NOTE*—Brake line will move far enough to permit installation without bending or crimping line.

Replacement Filter Element—Ford No. B2A-6731-A (Kit includes new gaskets).

►*CAUTION: This special Full-flow filter element must be used for replacement (use of by-pass type element would restrict oil flow and result in insufficient engine lubrication.*

Filter Element Installation—*See "Oiling System" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) with outlet pipe in rear of crankcase on right side of engine.

►*CRANKCASE VENTILATION GASKET INSTALLATION CAUTION:* On some units gasket (B4A-6872-A) may have been installed upside down causing leak at gasket location. Bolt center line is 5/64" below center line of gasket.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

COOLING

Water Capacity: 20 qts. (without heater), 21 qts. (with heater).

Pressure Valve: Ford LA-8100-A, 12-15 lbs. (marked "13" or "14"). *CAUTION–If replacement required use 12-15 lb. type. Radiator filler cap.*

Thermostat: Ford No. B4A-8575-A (160°), No. B4A-8575-B (180° used with permanent anti-freeze). Mounted inside water outlet elbow on forward end of intake manifold. *NOTE–The above thermostat replaces type formerly used.*

Water Pump: Packless, sealed ball bearing type. *See "Ford V8" in Water Pump Section.*

Temperature Gauge: King-Seeley Electric.
Dash Unit–Ford No. B5A-10883-A.
Engine Unit–Ford No. 1A-10884-A.

Temperature Bulb Sleeve Removal: Thread adapter handle of tool T50T-100-A into sleeve. Tighten locknut against sleeve, then pull sleeve with sliding hammer. *See "Temperature Gauges" in Miscellaneous Section.*

CLUTCH

Long Model 11CF. Ford B5S-7563-A (11"). *See "Long Clutches" in Clutch Section.*
Clutch Disc No.–Ford B5S-7550-A.

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper until travel is within limits.

Pedal Free Travel–1 1/8-1 3/8". Loosen locknut on clutch pedal release rod, turn adjusting nut until correct travel is reached.

Removal: Drain transmission, remove drive shaft, and disconnect shift rods at transmission. Place jack under transmission. Disconnect transmission from clutch housing, and move transmission toward rear of car so that clutch parts can be removed from clutch housing. Slide clutch release bearing and hub assembly off end of release lever assembly. Remove pressure plate and cover assembly and clutch disc from engine flywheel. Remove bolts that attach clutch housing to engine, then lower clutch housing (*NOTE–*Clutch housing must be pivoted downward and forward to remove it from car). Press clutch release bearing off bearing hub assembly.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second and high), sliding gear (low and reverse). *See "Ford Synchro-mesh" in Transmission Section.*

Transmission Control: *See "Transmission Controls" in Transmission Section.*

►*INTERMEDIATE & HIGH GEAR JUMP-OUT CORRECTION:* Before attempting to correct gear jump-out by overhaul of transmission, check as follows: Check high and intermediate shift rod for interference with low and reverse shift rod, and if interference caused by bent rod it will be necessary to compare old shift rods with new rods to determine which rod is at fault. Defective rod must be bent to contour of new rod or replaced. Check for interference between floor panel and shift rod. If interference due to excess wear, rod must be replaced. If interference exists between clutch release rod and high and intermediate shift rod, remove enough stock from threaded end of clutch rod to provide necessary clearance between rods when clutch is released.

►*LOW GEAR JUMP-OUT CORRECTION (Due to Insufficient Clearance):* To correct, remove side cover, and grind corner of detent boss to provide sufficient clearance between shift cam and detent boss.

Removal: Drain transmission, then disconnect the gear shift linkage at transmission. Remove speedometer cable and gear. Remove drive shaft. Remove cover from bottom of clutch housing, then remove starter from clutch housing. Disconnect clutch pedal linkage from clutch release lever. Raise rear of engine slightly, then disconnect engine rear mount and remove frame crossmember. Place transmission jack under transmission, remove bolts that secure transmission to clutch housing. Move transmission toward rear of car so that clutch parts can be removed from clutch housing. Slide clutch release bearing and hub assembly off end of release lever assembly. Remove pressure plate and cover assembly and clutch disc from engine flywheel. Remove bolts that attach clutch housing to engine, lower clutch housing, then remove transmission.

*NOTE–*Clutch housing must be pivoted downward and forward to remove it from car.

OVERDRIVE

Warner Model AS4-R10F. Solenoid operated type, with governor control and throttle operated kick-down. Lock-out Switch not used on this model. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

See "Fordomatic & Mercomatic" in Transmission Section.

►*FORDOMATIC "WHISTLING" NOISE CORRECTION: This condition may occur during normal engine operation. See "Fordomatic & Mercomatic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication–Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain & refill every 15,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level: With selector lever in "N" (Neutral) and emergency brake applied, run engine approximately four minutes at idle speed. Check to see that emergency brake is applied and that engine is on slow idle, move selector lever to the "P" (Park) position. (*NOTE–*When engine and transmission are at normal operating temperature, move selector lever through all ranges to assure fluid distribution throughout transmission). Raise hood and wipe top of oil level indicator. Remove indicator and read fluid level. Add Automatic Transmission Fluid "Type A" if necessary to bring fluid level to "Full" mark on indicator. Replace fluid level indicator.

THROTTLE LINKAGE ADJUSTMENT: *See CARBURETOR above.*

►*OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.

REAR AXLE

Own. Integral Carrier, semi-floating hypoid, with Hotchkiss drive. *See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.*
Ratios–3.92-1 (Std.), 3.31-1, 3.73-1 (Fordomatic).

Axle Shaft Removal: Remove wheel and tire assembly, then remove Tinnerman nut that secures brake drum to axle flange. Remove brake drum. Working through hole provided in axle shaft flange, remove nuts that secure brake carrier plate to axle housing. Pull axle shaft assembly out of housing with Tool 7600-C. Be careful not to dislodge brake carrier plate or damage oil seal in housing. Install one nut to hold brake carrier plate in place.

Rear Axle Assembly Removal: Raise rear end of car and disconnect rear universal. Remove axle shafts. Disconnect brake lines at "T" on left side of axle housing. Disconnect hand brake cable, shock absorbers, spring U-bolts and shackles. Remove axle housing assembly from car.

SHOCK ABSORBERS

Direct acting, non-adjustable. Serviced by replacement.
Shock Absorber Nos.–Ford B5S-18124-B (Front), B5S-18125-A (Rear) *NOTE–*Furnished in kits which include shock absorber mounting bushings.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs. *See "Lincoln, Mercury, Ford (Ball-Joint)" in Front Suspension Section.*

►*LOWER ARM BUMPER INSTALLATION CAUTION:* Right and left hand bumpers are different and must be installed in the correct position. Damage to suspension will result if installed incorrectly. **Bumpers when installed should point slightly inboard.**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Kingpin Inclination–6° minimum, 7° maximum, crosswise.
Caster–Pos. ½° to Pos. 1½°. Maximum variation between wheels ½°.
Camber–Pos. ¼° to Pos. 1¼°. Maximum variation between wheels ¼°.
Toe-In–1/16" to 1/8".

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type. *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Power Steering: Ford-Mercury Linkage type. Used in conjunction with standard type steering gear.
See "Ford & Mercury Bendix" in Steering Section.
Pump Belt Adjustment–Install torque wrench on pump pulley bolt. Check torque required to slip pulley against belt friction. If torque is not 14-16 ft. lbs., adjustment is required. To adjust, position a heavy duty 1½" "C" clamp with bottom against lower side of pump support bracket and top of clamp resting on pump bracket at its center. Loosen four pump attaching bolts until pump body may be repositioned by tightening "C" clamp. Tighten "C" clamp until torque of 14-16 ft. lbs. is required to slide pump pulley. (*NOTE*–Hold final torque as close as possible to upper limit). Tighten pump attaching bolts, remove "C" clamp, and make a final check of pulley sliding torque.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 305)" in Steering Section.*

BRAKES

Ford-Bendix Hydraulic (Single Anchor–with eccentric on front wheels, without eccentric on rear wheels). Hand lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section and note the following change:
►*FRONT WHEEL ADJUSTMENT CHANGE:* Eccentric is located on primary shoe. Initial adjustments made on primary instead of secondary shoe.
►*BRAKE LINE INTERFERENCE WITH OIL FILTER CORRECTION: See "Oil Filter" under OILING SYSTEM above.*
Drum Diameter–11" front and rear. Rebore limit 11.06".
Wheel Cylinder Diameter–1 1/8" (front), 7/8" (rear).
Lining–Molded type riveted to shoe.
Lining Width–1¾" (Front-Primary), 2¼" (Front-Secondary), 1¾" (Rear-Primary & Secondary).
Clearance–.010" at each end of both primary and secondary shoes. Maximum variation .003" (Adjusting screws backed off 10-12 notches from point where shoes drag on drum). *See Adjustment Change above.*

Brake Pedal Free Play Adjustment: 1/4-7/16". If play not correct after brake adjustment, loosen lock nut on the eccentric bolt attaching brake pedal to master cylinder pushrod, rotate eccentric bolt for desired clearance.
►*BRAKE PEDAL PRODUCTION CHANGE:* New brake pedal (Part No. B5S-2455-B) is being installed in production to provide greater clearance between brake and accelerator pedals. Clearance with new pedal is 1¾" as compared with 1¼" with old pedal. If greater clearance desired, new pedal should be installed.

Standard Master Cylinder: Located on engine side of firewall.
Checking Fluid–Maintain fluid level to within ½" of top of reservoir.
Removal–Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to firewall.

Power Brakes: Midland Hy-Power Unit mounted on left side of car in engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinder. There are no mechanical connections and no adjustments are required.
See "Midland Power Unit" in Brake Section.
Checking Brake Fluid–Same as for manual brakes (above).
Removal of Power Unit–Depress brake pedal a few times to remove all vacuum from system. Disconnect hydraulic lines at the power unit and remove wires from brake stop light switch. Remove power unit to mounting bracket bolts and lockwashers and remove the power unit.
►*PARKING BRAKE "FIX" CORRECTION:* New parking brake cable equalizer, Part No. B5A-2119-A, available to correct permanent set of early cable equalizer, Part No. 8A-3119-A.

MISC. MECHANICAL

Windshield Wipers: Vacuum link and crank arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Miscellaneous Section.*

►*POWER WINDOW REGULATOR RELAY "FLUTTER" CORRECTION: See "Power Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Electric screw and jack type with individual motors and transmissions for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

►*POWER SEAT "JAMMING" CORRECTION: See "Power Seat Adjusters" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

1947-48 MODELS

	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts①	40-50	480-600
Spark Plugs	5-10	60-120
Con. Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mtg. Bolts	36-40	432-480
Camshaft Sprocket Bolts	35-40	420-480
Camshaft Retaining Nut	30-35	360-420
Timing Gear Cover Bolts	14-20	168-240
Filler Block Screws	14-16	168-192
Int. & Exh. Manifolds	31-35	372-420
Oil Pan Screws	10-14	120-168
Vibration Dampener Bolt	100-130	1200-1560
Engine Mountings		See Note

①—Tighten cold and recheck with engine at 150°.

1949-51 MODELS

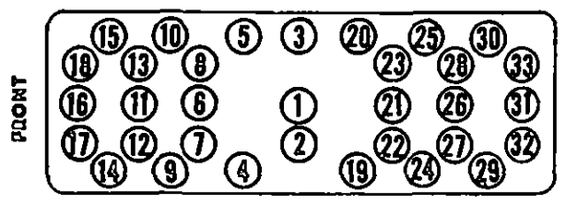
	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts	30-35	360-420
Spark Plugs	30	360
Con. Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mounting Bolts	35-40	420-480
Camshaft Sprocket Nut	35-40	420-480
Camshaft Thrust Plate	12-15	144-180
Timing Gear Cover	12-15	144-180
Eng. Front End Plate 5/16"	12-15	144-180
Eng. Front End Plate 7/16"	40-50	480-600
Oil Pan Screws	12-15	144-180
Vibration Dampener Bolt	100-130	1200-1560

CAUTION—Torque figures given are for clean and dry threads. If threads oiled, reduce torque approx. 10%.

CYLINDER HEAD

CYLINDER HEAD INSTALLATION: Following procedure is recommended:

1) Blow out all blind tapped holes in head to insure full tightening of bolts without bottoming.



2) Install guide pins in head bolt holes #14 and #30 (see diagram). These holes are smaller diameter in gasket and head for piloting. *NOTE*—Guide pins can be made from #207354 Head Bolts by cutting heads off and slotting end so that they can be installed and removed with a screwdriver.

3) Install head gasket and cylinder head.

4) Coat head bolts with Perfect Seal Gasket Paste, K-F No. 200047, tighten bolts snugly in sequence shown in head diagram, then torque bolts to 30-35 ft. lbs. in same sequence.

5) Warm engine up to normal operating temperature and retorque bolts to 30-35 ft. lbs. Check head bolts and gasket for leaks. *NOTE*—Recheck head bolts after 500-600 miles of operation.

Tightening Torque: See Tightening Specifications.

ENGINE REMOVAL

ENGINE REMOVAL: Proceed as follows:

1. Remove Hood (see Hood Assembly above).
2. Drain cooling system.
3. Disconnect windshield wiper hose at manifold (or at vacuum pump), disconnect fuel line at point where fuel pump flexible line connected to tubing at frame, disconnect exhaust pipe at manifold.
4. Remove Radiator (see Radiator removal below).
5. Remove Battery. Disconnect cables, lift out.
6. Disconnect Wiring. Disconnect ground cable near left front engine mounting, disconnect wiring at starter, generator, and distributor.
7. Remove Air Cleaner.
8. Disconnect Temperature Gauge by removing bulb from cylinder head (Frazer), disconnecting lead (Kaiser). Disconnect oil gauge by disconnecting line at flexible hose connection on left side of engine (Frazer), disconnecting lead at engine unit (Kaiser).
9. Disconnect throttle linkage at carburetor.
10. Disconnect heater inlet and outlet hoses.
11. Remove transmission (and overdrive if used).
12. Disconnect clutch throw-out linkage.
13. Install lifting bracket at #7 and #28 cylinder head bolts—see cylinder head diagram (remove distributor if required). Raise engine slightly with hoist.
14. Disconnect front engine mountings.
15. Hoist engine from car with engine turned at slight angle to frame with front end of engine raised to clear shroud. *CAUTION*—Do not damage engine accessories when lifting engine from car.

ORIGINAL BORE & PISTONS

BORE & PISTON SIZES: Engines originally equipped at factory with special oversize pistons may be identified by code letter following engine number:
"N"—Pistons are .020" Oversize.
"AN"—Pistons .020" Oversize. Main and connecting rod bearings Undersize (See Original Bearing Sizes).
"NX"—Pistons .020" Oversize. Main bearings are Undersize (see Original Bearing Sizes following).

PISTONS

PISTON IDENTIFICATION: Two types of aluminum alloy pistons used which can be identified as follows:

▷*CAUTION—Piston weight different on each type.*

Strut Type Piston—Has wide strut embedded within skirt at each piston pin boss and drilled oil drain holes in both #3 and #4 ring grooves.

T-Slot Type Piston—Has horizontal slot in lower (#4) ring groove and short vertical slot on one side of piston skirt. #3 oil ring groove has drilled oil drain holes.

REPLACEMENT PISTONS: See "Piston Identification" for types used. Each type furnished in following sizes: *CAUTION—Piston weight different for each type.*

Strut Type Pistons: Standard and .005", .010", .020", .025", .030" Oversize.

T-Slot Type Pistons: Standard and .005", .010", .020", .025", .030", .040", .050", .060" Oversize.

PISTON RINGS

REPLACEMENT RINGS: Rings furnished as single rings (12 Compression, 12 Oil Rings required), or in complete sets (1 Set per car) as follows:

Single Rings: Standard and .010, .020", .030" Oversize.

Ring Sets: Use for cylinder sizes indicated: Standard (Std. to .009" OS), .020" Oversize (.010" to .029" OS), .040" Oversize (.030" to .049" OS), .060" Oversize (.050" to .069" OS).

ORIGINAL BEARING SIZES

MAIN & CONNECTING ROD BEARING SIZES: Engines originally equipped with special undersize main and connecting rod bearings may be identified by code letter following engine number:
"A"—Main & Connecting Rod Bearings .010" Undersize.
"X"—Main Bearings .002" Undersize.
"AN"—Main & Connecting Rod Bearings .010" Undersize and Pistons Oversize (see Original Bore and Pistons).
"NX"—Main Bearings .002" Undersize and Pistons Oversize (see Original Bore and Pistons).

CRANKSHAFT & MAIN BEARINGS

1947-48 MODELS

FRONT MAIN BEARING CHANGE: Two types of front main bearing used (flanged & unflanged). This bearing takes end thrust (see Endplay Adjustment).
1)—Front Main Bearing (Flanged Type). End thrust taken by flange on bearing.
2)—Front Main Bearing (Not Flanged). End thrust taken by thrust washer installed in front of bearing.

Replacement Note—Both types of front main bearings are interchangeable. Flanged type can be used to replace unflanged type by removing thrust-washer and dowel pins.

1947-50 MODELS

CRANKSHAFT ENDPLAY ADJUSTMENT: Requires removal of radiator, vibration dampener, timing gear cover, timing gears and chain (remove as an assembly), thrustplate, and shims.

Endplay Adjustment: *CAUTION*—Two thrust washers (1 at each side of front bearing) must be in place when checking endplay. With front end of crankshaft disassembled as described above, re-install thrust plate (do not install shims at this time), install checking sleeve No. KF-28 on end of shaft, secure sleeve on shaft with vibration dampener bolt and lockwasher. Mount dial indicator at front of engine with button against front end of shaft. Pry shaft to rear, set indicator at zero and then pry shaft forward, reading will be endplay. Select shim pack (shims furnished .002" and .008" thick) so that when installed, endplay will be .004-.006".

▷*CAUTION—Make certain that clearance exists between slinger on rear end of crankshaft and upper and lower filler blocks in rear end of crankcase.*

1947-51 MODELS

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front and rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket). Rear filler blocks (additional upper filler block guard in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger.

Front Filler Block (Lower) Servicing: Remove by taking out mounting capscrews and timing gear cover capscrews which enter the filler block. When installing filler block, first install oil pan side gaskets (No. 200266), install filler block (use Perma-tex), install new end gasket (No. 200267) on block.

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal). Remove and discard old gasket or seal. Install new seal (no. 204654) in same manner as described below for Rear Filler Block (Upper) Guard. Install lower filler block after upper filler block guard has been installed.

Rear Filler Block (Upper) Guard Servicing: Guard is seated in groove in crankcase and can be "rotated" out without disturbing crankshaft after lower filler block removed. Remove and discard old gasket or seal, clean out seal groove. Install new graphite impregnated seal (no. 204654), flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward the center (ends must extend slightly above flat surface of guard). **Do not use shellac or sealing compound in groove.**

►*CAUTION*—Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft. If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal.

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Camshaft can be removed with radiator off and engine in car as follows:

1. Remove timing gears (remove both gears and chain as an assembly). This requires removal of vibration dampener and pulley, timing gear cover.
2. Remove cylinder head.
3. Remove fuel pump.
4. Remove oil pan, oil pan return tube & oil pump.
5. Lift valves, using valve spring lifter tool C-482 (see Note below), block valves up by inserting a clothespin or block of wood under each valve head. NOTE—Remove right front tire and wheel and take off splash shield under fender for access to valves.
6. Block up Valve Lifters (lift each lifter up by hand and fasten in upper position with a wire).
7. Remove Camshaft Thrustplate by taking out two screws retaining thrustplate on crankcase.
8. Pull camshaft out through front of engine.

Camshaft Bearing Replacement Note—Requires removal of engine from car for access to plug at rear of block which must be removed.

1951 MODELS

CAMSHAFT & REPLACEMENT PARTS CAUTION: ***TWO DIFFERENT CAMSHAFTS used in production and special VALVE LIFTERS and OIL PUMP DRIVE GEAR must be used with each camshaft as listed below.***

1951 Camshaft

Type & Identification①	Part No.
Cast Iron (Circle O & #733340)	207218
Steel Forging (#700599)	203017

①—Identification number and marks are cast or stamped on shaft.

VALVE LIFTERS: Steel lifters must be used ONLY with Cast Iron camshaft. Cast Iron lifters can be used with Cast Iron or steel camshaft.

OIL PUMP DRIVE GEAR: Oil pump drive gear must be SAME material as camshaft (use Cast Iron gear with cast iron camshaft, steel gear with steel camshaft).

1951 Valve Lifters

Type & Identification	Part No.
Steel (Stamped with "diamond")	②207171
Cast Iron (no mark)	②207219

②—Std. Size. Also furnished .001", .002", .005" Oversize.

1951 Oil Pump Drive Gear

Type & Identification	Gear	Gear & Shaft
Cast Iron (Stamped "O")	207222	207221
Steel (no mark)	200248	203185

TAPPET CLEARANCE ADJUSTMENT

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below). Remove right front wheel and access cover in fender splash shield for access to valve compartment. Remove spark plugs so that engine can be turned over by moving fan or fan belt. By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment.**

Valve Tappet Adjustment Order (numbered from FRONT of engine)

Fully Raise Valve	Then ADJUST Valve:
Nos. 1 and 3	Nos. 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos. 2 and 6	Nos. 7 and 11
Nos. 10 and 12	Nos. 1 and 3
Nos. 4 and 5	Nos. 8 and 9
Nos. 7 and 11	Nos. 2 and 6

OIL PAN REMOVAL

OIL PAN REMOVAL: Raise front end of car and support it securely on stands. Disconnect steering drag link at idler arm on frame, turn wheels to right and work drag link clear of oil pan. Drain oil, remove oil pan capscrews and lockwashers, slide pan to rear.

►INSTALLATION NOTE—Lower Filler Blocks (front and rear) must be removed to install new oil pan side gaskets. See "Front & Rear Filler Blocks" under Crankshaft & Main Bearings (above) for data.

OIL PUMP

OIL PUMP SERVICING: Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling. Service pump as follows:

Disassembly—Take out cotter pin and remove screen float assembly. Remove cover and gasket. Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear. Remove idler gear (remove idler shaft if required). Take off lower drive gear (press fit and keyed to shaft).

Oil Pump Clearances—Check as follows:

1)—Pump Body Bushing: If over .005" clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to .500-.501".

2)—Pump Shaft: shaft diameter .4990-.4985".

3)—Lower Drive Gear: end of gear should be .001-.006" beyond gasket seat on pump body.

4)—Upper Drive Gear: .002-.004" clearance between underside of gear and upper end of pump body. Controlled by pressing lower drive gear on shaft until this clearance obtained.

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose). Replace by using drift inserted in distributor drive shaft bore from top of block. Install new bushing from below (must be flush with bottom of block).

Reassembly—Press upper drive gear on shaft with pin hole at right angles to tongue on shaft. Insert new pin and peen ends flush with gear. Install shaft and gear in pump body. Press lower drive gear on shaft (with key in place) until .002-.004" clearance obtained between upper drive gear and upper end of pump body. Press idler gear shaft in body, install idler gear. Install cover using new gasket and pin oil screen float assembly on cover.

Oil Pump Installation—Set #1 piston at top dead center. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx. parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut. Remove distributor shaft for cyl. head installation.

►***CAUTION—Check Ign. Timing after pump installed.***

RADIAT R

RADIATOR REMOVAL (1947-48): Disconnect hose connections. Disconnect two tie rods at top of radiator. Remove nuts on mounting studs underneath radiator, lift radiator up and out.

RADIATOR REMOVAL (1949-51): Disconnect hose connections. Take out radiator-to-shroud screws, 6 total (3 each side). Lift core out, tilting upper end to rear as core being raised.

PROPELLER SHAFT

CENTER SUPPORT BEARING: Consists of a ball bearing on rear end of front propeller shaft mounted in rubber in steel plate mounted on frame.

Removal & Disassembly—Disconnect front and intermediate universal joints, take off nuts on center support frame mounting bolts, remove front shaft and support bearing assembly. Clamp front shaft in a vise, remove bolt, lockwasher, and plain washer on rear end of shaft (in universal joint companion flange), pull companion flange using Puller C-452. Remove rear dust shield. Pull support plate off bearing insulator, remove bearing insulator. Use jaw type puller (KF-56) and pull bearing off shaft, remove front dust shield.

►***CAUTION—Do not wash bearing in gasoline or solvent.***

Reassembly—Install front dust shield and bearing (use driver KF-11) on splined end of front propeller shaft (bearing must support shield firmly). Place rubber insulator over bearing (small diameter to rear). Coat outer surface of insulator with liquid soap and slip support plate in place over insulator (flanged end of sleeve to front, insulator bottomed against bead on inside of sleeve). Install rear dust shield, companion flange, flat washer, lock washer, and bolt. Tighten bolt until flange and dust shield bottom against shaft shoulder (25-30 ft.lbs. torque).

Bearing Support Installation: When installing front propeller shaft and support bearing assembly in car, install washers and insulators on each support stud on frame cross-member in the following order: Spacer, Bushing, Front Support Insulator (fluted end to rear), Front Support Washer (has large hole), Support Bearing Plate, Rear Support Insulator (fluted end forward), Rear Support Washer (has small hole), and nut (tighten to 15-20 ft. lbs.).

►***CAUTION—Install center bearing support on frame studs so that sleeve in which bearing seated slopes downward toward the rear to provide correct propeller shaft angularity.***

M DEL IDENTIFICATI N

STARTING SERIAL NUMBERS

	Model	Serial Numbers
1947 Frazer	F-47	F-47-001001 Up
1947 Frazer Manhattan	F-47C	F-47C-1000001 Up
1948 Frazer	F-485	F-485-001001 Up
1948 Frazer Manhattan	F-486	F-486-001001 Up

SERIAL NUMBER: On left front door hinge post.

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Nameplate on left side of crankcase. NOTE—Numeral following Engine Model Designation (first part of Engine Number) indicates Engine Plant as follows: 4—Detroit, 8—Muskegon.

►**Engine Number Symbol (Special Bore & Bearing Sizes)** *See "Original Bore & Pistons" & "Original Bearing Sizes" in Fraser Shop Notes.* NOTE—Symbol consists of 1 or 2 letters following engine number

TUNE-UP

COMPRESSION PRESSURE: 115-125 lbs. (6.86-1 Heads). 120-130 lbs. (7.3-1 Heads) at cranking speed of 140 RPM. (engine hot, all plugs out, throttle wide open). All cylinders must be equal within 10 lbs.

►*NOTE—7.3-1 Heads marked by "73" stamped on Head directly above engine number pad on block.*

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAPS: .032"
Plug Type—Auto-Lite A-5 (normal driving), A-7 (for short runs or to correct hard-starting in cold climates). 14 mm. metric type.

IGNITION: *See Coil, Condenser, and Distributor.*
Breaker Gap—.020" (.018-.022").
Cam Angle or Dwell—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Distributor.*

IGNITION TIMING: TDC. (at Top Dead Center).
Timing Procedure—*See Ignition Timing.*
Timing Mark—Mark "DC" on flywheel (first cars), on vibration dampener (beginning Eng. No. 17160).
Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION: *See Carburetor & Carb. Equipment.*
Idle Setting—¾-1¼ turn open—one screw (WA1 Carb.), 1¼-2¼ turns open—one screw (W1 Carb.), 1-1¾ turns open—2 screws (WCD Carb.). Turn screws out for richer mixture.
Idle Speed—550 RPM.
Float Level (WA1 Carb.)—5/16" (610S), ⅜" (622S with first Float and Inlet Valve), ½" (622SA, SB & 622S with late type Float and Inlet Valve). Measure from top of projection on bowl cover to top of soldered seam on free end of float with bowl cover assembly inverted.
Float Level (W1)—½" from top of float at free end to gasket seat on cover.
Float Level (WCD Carb.)—9/64" (685S with first type Inlet Valve), 1/16" (685S & 685SA with later type Inlet Valve) from top of each float to gasket seat on cover with valve closed (assembly inverted).
Accelerating Pump—Lower hole (medium) Normal. NOTE—Pump on 574S has no seasonal adjustment.

Fuel Pump Pressure: 3½-4½ lbs. (for pump mounted at rear of engine), 3-4¼ lbs. (pump mounted at

►*CAUTION—Pump pressure must not exceed 4½ lbs.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

►**VALVE TAPPET CLEARANCE:** *CAUTION—Two settings used.*
Before Eng. No. 10769—.010" Int., .014" Exh. Cold.
After Eng. No. 10769—.014" All Valves, Cold.

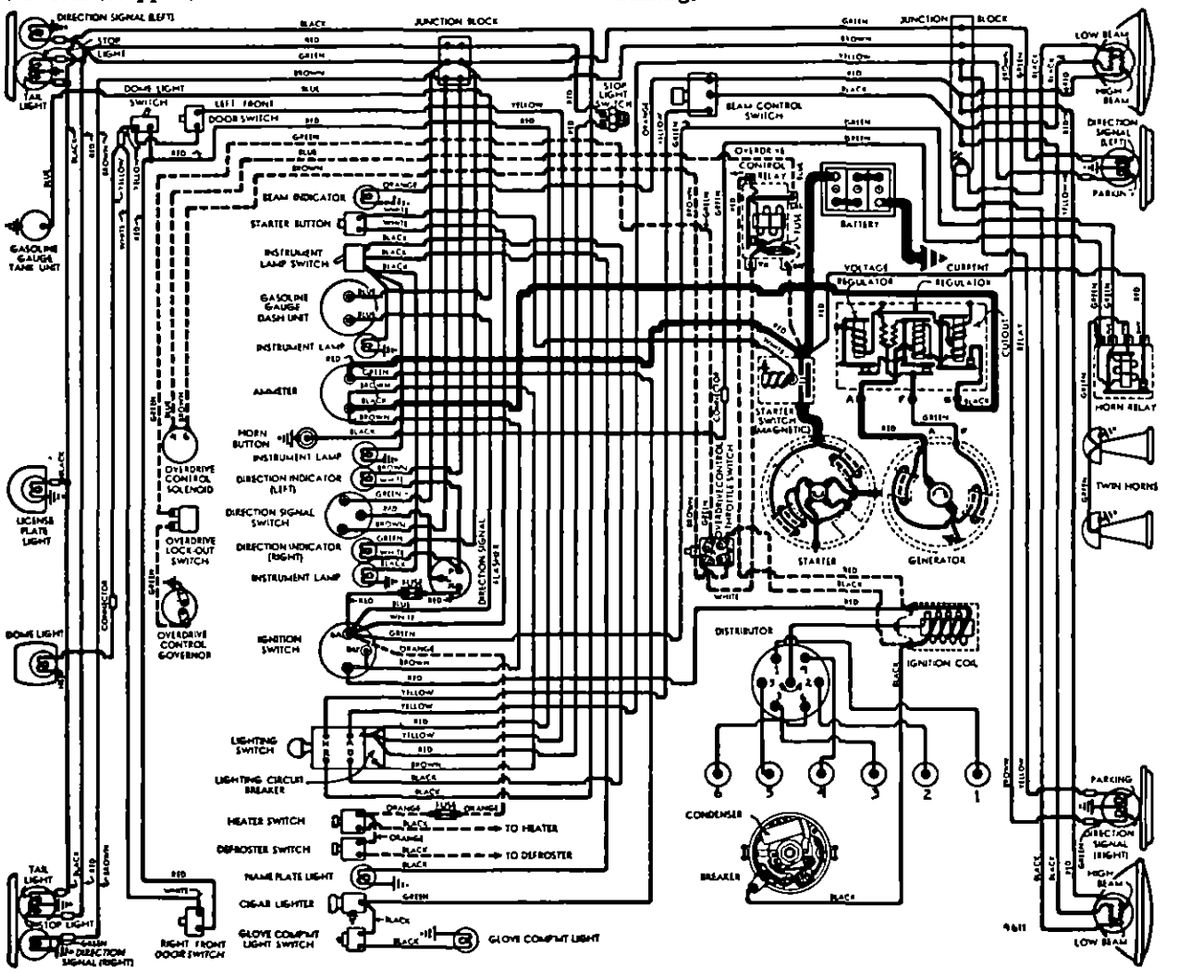
►**Adjustment Procedure**—*See Frazer Special Data.*
NOTE—Remove splash shield under right front fender for convenience in adjusting valves.
Valve Timing Check—*See Valve Timing.*

STARTING: *See Battery, Starter, Generator, Regulator.*

IGNITION

IGNITION SWITCH: Douglas or Mitchellock. Frazer No. 201354 (Before Frazer No. F47-36877, Manhattan No. F47C-1033604), No. 203186 (After Above Nos.).
Lock Cylinder—Kaiser-Frazer No. 201898 (with key).

COIL: Auto-Lite Model IG-4093. On left side of engine opposite distributor.
Ignition Current—3 amperes idling, 5 amperes at 6.4 volts (stopped).



CONDENSER: Auto-Lite No. IG-2671K.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite Model IGS-4211. Full automatic advance type with auxiliary vacuum spark control and octane selector adjustment.
IGS-4214 (Used on late '48 Cars)—*See "1949-50 Fraser" for data on this Distributor.*
Breaker Gap—.020" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGS-4211

Distributor Degrees	RPM.	Engine Degrees	R.P.M.
Start	350	0	700
1	365	2	730
3	400	6	800
7	1150	14	2300
10	1700	20	3400

Octane Selector—Manual adjustment at distributor providing 10° advance and retard. See Ignition Timing.

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance—IGS-4211

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	8"
4°	8°	11¼"
7.5°	15°	14"

Distributor Removal: On cylinder head between #4 and #5 cylinders. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING

Std. Setting ..... At TDC.

TIMING MARK NOTE—Timing mark located on flywheel (before Eng. No. 17160), on vibration dampener (Eng. No. 17160 up). Consists of "DC" mark or "0" mark at top dead center with 1° graduations

Timing (with Timing Light C-693)—Mark "DC" or "0" top dead center mark on flywheel (before Eng. No. 17160), on vibration dampener (Eng. No. 17160 Up) with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine at 400 RPM. (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen clampscrew in end of arm under distributor, rotate distributor until timing mark appears in line with pointer, tighten clampscrew. Check octane selector setting.

►*CAUTION—Reset engine idling speed at 550 RPM.*

Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

CARTER WA-1

Carter WA1 Type 622SB superseding 622S & 622SA *(All Models).* 1¼" Single Barrel, Downdraft type

►NOTE—622S carburetor can be converted to 622SA by installing new Float and Inlet Valve assembly and changing float level.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle (WA1 Carburetors): Carter Single Barrel type.

See Carburetion Equipment Section for data.

Setting—⅝" clearance between choke valve and air horn (Gauge T109-85) with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset (Tool T109-41).

Automatic Choke (WA1 Carburetors): Carter Climatic Control (Single Carburetor Type).

See Carburetion Equipment Section for complete data.

Setting—Centered (coil housing at index mark).

CARBURETOR

CARTER WCD

Carter WCD Type 685S superseded by 685SA (Opt. on Manhattan F-486). 1¼" Dual (double barrel), Downdraft type with Fast Idle and Climatic Control.

►NOTE—685S carburetor can be converted to 685SA by installing new intake Needle & Valve Assembly and resetting float level to 685SA specifications.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle (WCD Carburetors): Carter Dual (WCD) type.

See Carburetion Equipment Section for complete data.

Setting—.016" throttle opening with choke valve held closed and throttle lever stopscrew backed off

Automatic Choke (WCD Carburetors): Carter Climatic Control (Dual Carburetor Type).

See Carburetion Equipment Section for data.

Setting—Centered (coil housing at index mark).

CARBURETOR

CARTER W1

Carter W1 Type 574S. 1¼" **Single Barrel, downdraft type with manual choke.**

NOTE—This carburetor used for part production starting with following numbers: **F-47 30,770; F-47C 1021118.**

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

CARB. EQUIPMENT

Air Cleaner: AC. Oil-bath type. Kaiser-Frazer No. 200618 (All models with WA1 or W1 Carbs.), No. 203372 (F-486 Manhattan with WCD Carb.).

Servicing—Empty and clean reservoir, wash cleaner in kerosene, refill to indicator line with approx. 1 pint SAE No. 50 engine oil (No. 20 for below freezing tem.) at 1000 mile intervals or when engine tuned

Fuel Pump (Early type—mounted at rear of engine): AC No. 1539057, K-F No. 200281. Diaphragm type.

►*CAUTION—Install this pump with rocker arm OVER camshaft eccentric.*

See Carburetion Equipment Section for data.

Pressure—3½-4½ lbs. maximum.

Fuel Pump (Later type—mounted at front of engine): AC No. 1539073 (K-F No. 201509) Diaphragm type fuel pump or AC No. 1539074 (K-F No. 202319) combination Fuel-and-Vacuum Pump.

Replacement Pump—AC No. 574 (for 1539073), No. 582 (for 1539074 fuel-and-vacuum pump).

►*CAUTION—Install these pumps with rocker arms UNDER camshaft eccentric.*

See Carburetion Equipment Section for data.

Pressure—3-4¼ lbs.

Gasoline Gauge: Auto-Lite electric type.

Dash Unit—A-L No. NG-11104D, Frazer No. 200471.

Tank Unit—A-L No. NG-10987T, Frazer No. 200468.

See Carburetion Equipment Section for data.

BATTERY

Auto-Lite Type 1M-100D. 6 Volt, 15 Plate, 105 Ampere Hour capacity (20 hour rate).

Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.

Location—In engine compt. on left side.

STARTER

Auto-Lite Model MAW-4043. Armature MAW-2128.

Drive—Barrel type Bendix Drive No. A1792.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
2.75 "	1480	5.0	200
5.75 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
18.0 "	Lock	4.0	670

Starting Switch: Auto-Lite Model SS-4001 magnetic switch. Mounted on starter and controlled by push-button on instrument panel.

See Electrical Equipment Section for complete data.

Removal: Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out flange mounting screws.

GENERATOR

Auto-Lite Model GDZ-4818A. Armature GDZ-2006F. Two brush type with voltage and current regulation.

Maximum Charging Rate—35 amperes, 8.0 volts, 1900 RPM. or approximately 20 MPH.

Charging Rate Adjustment—None (see Regulator).

Performance Data					
Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
5	6.65	1060	5	6.65	1150
10	6.85	1200	10	6.85	1290
15	7.05	1340	15	7.05	1430
20	7.3	1480	20	7.3	1590
25	7.55	1620	25	7.55	1750
30	7.8	1760	30	7.8	1980
35①	8.0	1900	35	8.0	2250

①—Current Regulator setting. See Regulator data.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35-53 ozs. (new brushes).

Field Current—1.60-1.78 amperes at 6.0 volts.

Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal: Pivot mounting at left front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts. NOTE—Remove battery for access.

Belt Adjustment: ⅛" belt deflection midway between generator and fan pulleys (adjust by pulling generator out with 15 lb. force with all mounting bolts loose).

REGULATOR

Auto-Lite Model VRP-4004F-2. Vibrating type Voltage and current regulators with Cutout Relay.

See Electrical Equipment Section for complete data.

NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).

Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).

Contact Gap—.015" minimum.

Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.

Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*

Contact Gap—.012" min. (armature against stop pin).

Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).

Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*

Contact Gap & Air Gap—Same as Voltage Regulator.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch. *See Electrical Equipment Section for complete data.*
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Red jewel on left side of instrument panel (above starter button). Lighted when upper (country beams) in use.

Direction Signal: Mitchell (United Specialties) type. *See Electrical Equipment Section for complete data.*
Direction Indicators—Right and Left indicator lights above instrument dials. Lighted when direction signal on same side of car in operation.

Switches

Lighting—Kaiser-Frazer No. 200819.
Beam Selector—Kaiser-Frazer No. 200863 (Frazer before No. F485-1838), No. 201605 (Frazer after above Nos. & All Manhattans).
Direction Signal—Kaiser-Frazer No. 201467 (Frazer before No. F485-1838), No. 202692 (Frazer after above Nos. & All Manhattans).
Instrument (Rheostat Type)—K-F No. 200821.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	4030
Park & Direc. Signal	21-3	1154
Beam Ind., Ign. Switch	1	51
Dir. Sig. Ind. & Clock	1	51
Instrument & Nameplate	1½	55
Rear Direc. Signal	21	1129
Stop & Tail	21-3	1154
License Plate, Rear Compt.	3	63
Dome, Glove Compt.	21	1129
Courtesy	6	81

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type. On back of lighting switch.

FUSES: Clock—2 ampere. In clock lead.
Overdrive—20 amperes. On relay on dash.
Direction Signal—9 ampere. In flasher lead under instrument panel to left of steering column.

HORNS: Auto-Lite. Model HT-4021 or HT-4023 (Low Note), HT-4022 or HT-4024 (High Note). Twin horns.

Horn Relay: Auto-Lite Model HRL-4101. Relay connected through ignition switch (horns operative only with ignition switch "on").
Contacts Close—1.5-3.0 volts (seal to core with 4.0 volts maximum).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16". **Stroke**—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3.
Developed Horsepower—100 at 3600 RPM.
Compression Ratio—6.86-1 (First Cars), 7.3-1 (All Cars after Eng. No. 304305—Detroit, 66125—Muskegon).
NOTE—7.3-1 Heads marked by "73" stamped on left front directly above engine number on block.
Compression & Vacuum Reading—*See Tune Up data.*

TIGHTENING TORQUES: *See Fraser Shop Notes.*
CYLINDER HEAD INSTALLATION: *See Fraser Shop Notes.*
ENGINE REMOVAL: *See Fraser Shop Notes.*
PISTONS: Two types used. Aluminum alloy, Cam-ground, Tin-plated, strut type with split skirt, or T-slot type. Length 3 9/16" (both types).
NOTE—Pistons can be identified by drilled oil drain holes in fourth ring groove and strut within skirt at each pin boss (Strut Type), or by horizontal slot in fourth ring groove and short vertical slot on one side of skirt (T-slot Type).
▷*CAUTION—Piston weight different on each type.*
Original Bore & Piston Sizes—*See Fraser Special Data.*
Weight—15.58 ozs. (strut type), 14.28 ozs. (T-slot).
Clearance—.0255-.0315" (Top Land). See Fitting new pistons.
Removal—Pistons and rods removed from above.
Fitting New Pistons: Use .0015" feeler stock ½" wide inserted on side opposite slot. Pull to withdraw feeler must be 5-10 lbs.
Replacement Pistons: *See Fraser Shop Notes.*
Installing Pistons: Slot in skirt toward left or away from camshaft (all types). NOTE—On pistons marked by arrow on head, arrow toward front of car.
PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled for oil drainage (all types), fourth groove drilled (strut type pistons), slotted (T-slot pistons).

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0925-.0935"	.008-.016"	.0025-.004"
Compr. (#2)	.0925-.0935"	.008-.016"	.0015-.0035"
Oil (#3, 4)	.1550-.1545"	.008-.016"	.001-.0025"

Installing Rings: Side marked "TOP" (compression rings) upward.
Replacement Rings: *See Fraser Shop Notes.*
PISTON PIN: Diameter—.55/64". **Length**—2 13/16". Floating type, with lock ring at each end.
Pin Fit in Piston—Tight fit (—.0003" clearance), or push fit with piston heated to 212°F. (heat piston in water at 212°F. to install new pins).
Pin Fit in Rod Bushing: +.0003" clearance. When installing oversize pins or new bushings, ream bushings for this clearance with DD-82-2 Reamer (used also to ream piston pin bore in piston).
Replacement Pins: Std. size and .003", .005" Oversize.
CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".
▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Fraser Shop Notes.*
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0023". **Sideplay**—.006-.010".
Bearing Adjustment: None. Replace bearings. Do not file rods or bearing caps.
Replacement Bearings: Furnished Std. Size and .001", .002", .010", .012" Undersize.
Installing Rods: Rods and bearing caps marked. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).
CRANKSHAFT: Four bearing, counterweighted type with vibration dampener on forward end.
Journal Diameters—2.3744-2.3752". All bearings.
▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Fraser Shop Notes.*
Bearings—Removable, steel-backed babbitt-lined.
Clearance—.0015-.002".
Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. Upper main bearing shells can be "rotated" out by installing tool KF-8 in crankshaft journal hole (lug on tool engages edge of bearing when crankshaft rotated).
Filler Block (Front & Rear) Removal & Installation *See "Crankshaft & Main Bearings" in Fraser Shop Notes.*
Replacement Bearings: Furnished Std. size and .002", .004", .010" Undersize. NOTE—Two types of #1 bearings (flanged & unflanged). See Endplay data.
End Thrust: Taken by front (#1) bearing (special thrustwasher used with unflanged bearings). Controlled by shims installed between bearing journal and thrustwasher. **Endplay**—.004-.006".
Endplay Adjustment—*See "Crankshaft & Main Bearings" in Fraser Shop Notes.*
CAMSHAFT: Four bearing. Two-sprocket chain drive. NOTE—Two different camshafts used due to relocation of fuel pump. Camshaft No. 200113 (first cars—pump at rear), No. 203017 (later cars—pump at front).
Journal Diameters—#1, 1 7/8"; #2, 1 13/16"; #3, 1 3/4"; #4, 1 1/4".
Bearings—Steel-backed, babbitted bushings.
Clearance—.002-.004".
Bearing Adjustment: None. Replace bushings with camshaft removed.
End Thrust: Taken by thrust plate on front of engine (between front bearing journal and camshaft sprocket). **Endplay**—.003-.007".
Camshaft Removal: *See "Camshaft & Bearings" in Fraser Shop Notes.*
Timing Chain: Non-adjustable type. **Width** 1". **Pitch** .500", **Length** 23" or 46 links.
Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3395-.3387"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3481"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width—5/64-3/32" (Intake), 3/32-7/64" (Exhaust). Use KF-58 Relief Counterboring Set to remove high shoulder in block above valve head.
Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides for correct clearance using Reamer C-249.
Valve Guide Installation—Use Driver DD-849. Drive old guide down and out, drive new guide down into place (same height as old guide with mark on driver stem in line with top face of block). NOTE—Tapered end of guide must be upward.
Valve Springs: Check spring with tester C-647. Pressure should be 101±3 lbs. at 1⅜". Spring free length 1 15/16".

	Spring Pressure	Length
Valve Closed	51 lbs.	1 43/64"
Valve Open	113 lbs.	1 5/16"

Valve Lifters: Barrel type. NOTE—Lifters can be removed (some engines only) without disturbing cylinder head.
Clearance—.0005-.0018". With correct clearance, lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters—Furnished Std. size and .0005" .001", .0015", .002" Oversize.

VALVE TIMING

►**Tappet Clearance:** *CAUTION—Two settings used:* **Before Eng. No. 10769**—.010" Int., .014" Exh. Cold. **After Eng. No. 10769**—.014" All Valves, Cold.

►**Adjustment Procedure**—*See Fraser Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With tappet clearance set at .014" (running clearance), #1 exhaust valve should close with piston 10° or .045" after top dead center with the ten-degree mark after the dead center mark "DC" at indicator in flywheel housing inspection hole (before Eng. No. 17160). Beginning with Eng. No. 17160, marks located on dampener.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, exhaust valve lifters, timing chain. Oil pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Under plug on right side of crankcase between #4 & #5 cylinders. Opens at 35 lbs. Adjustable by adding or removing washer, No. 200272, between end of spring and plug.

Oil Pan Removal: *See Fraser Shop Notes.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe located on front valve cover plate on right side of engine.

Oil Pump: Gear Type. In crankcase.
Oil Pump Servicing—*See Fraser Shop Notes.*

Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.

COOLING

Cooling System: Sealed system (relief valve in filler cap) with positive circulation and thermostat.
Capacity (First 22" Radiator)—15 qts. (14 qts. at driving level). **(Later 17" Radiator)** 13½ qts. (13 qts. at driving level).
Pressure Valve—AC. No. 846740 (Radiator Filler Cap). Opens at 3¾ lbs. (3¼-4¼ lbs.).

Radiator: Two types used as follows:
First Cars—No. 200445 (22" wide). Service by installing later type (No. 202906) and installing Radiator Shroud Side Panel Extension No. 203100 (two required), using No. 576 screws (10 required).
Later Cars—Radiator No. 202906 (17" wide).
Radiator Removal—*See Fraser Shop Notes.*

Water Pump: Centrifugal type with ball bearing shaft.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only).
Setting (Std. type)—Begins to open at 148-155°F. Fully open at 173°F.

Temperature Gauge: Auto-Lite No. H-11103, Frazer No. 200453. Not electric.

CLUTCH

Borg & Beck.....**Model 9A7**
Auburn (Some Cars).....**Model 9251-15**
Clutch Identification—Types can be identified by number of pressure plate springs—3 (Auburn), 9 (Borg & Beck—cover also marked "951").
See Clutch Section for complete data.
Facings (Borg & Beck)—Woven asbestos, 2 required. I.D. 6". O.D. 9¼". Thickness ⅛".
Facings (Auburn)—Moulded metallic or Raybestos, 2 required. I.D. 6". O.D. 9¼. Thickness .135".

Pedal Adjustment: Pedal free travel ¾-1". To adjust, position nut on pedal assist spring link (at rear end of spring) so that it is lined up with spring adjusting gauge, KF-10, installed on spring.

Removal: Remove transmission (see Transmission Removal below), remove clutch housing underpan, disconnect clutch pedal cross-shaft from pedal linkage. Install Clutch Plate Aligning Arbor, C-360, to hold clutch parts in alignment, take out mounting screws in clutch cover flange (rotate flywheel so that all screws accessible through pan opening). Remove aligning arbor, remove clutch cover assembly and driven member through underpan opening.

TRANSMISSION

Warner Model AS11-T86E (Std.), Model AS12-T86E with new Type R10B Overdrive (Optl.). Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever mounted on steering column.
See Transmission Section for complete data.

Removal: Disconnect front propeller shaft at front universal joint (take out bolts in transmission companion flange), move shaft out of the way. Disconnect speedometer drive cable and transmission control levers at transmission case, free parking brake cable support bracket from frame cross-member. Remove four bolts mounting engine support on frame cross-member (support comes out with transmission). Loosen all four bolts mounting transmission on clutch housing, remove two lower bolts only (CAUTION—two upper bolts must support transmission until ready for removal). Remove flywheel housing underpan, raise rear end of engine (place jack under flywheel, use wood block between jack and flywheel) for sufficient clearance for transmission removal. Remove the two upper transmission mounting bolts, move transmission back until clear of clutch, slide tranmission clear of cross-member and remove from beneath car.

OVERDRIVE

Warner Type R10B (with special AS12-T86E Transmission). Optl Equipment. New Governor controlled type (no centrifugal pawls) with electrical solenoid operation and throttle controlled "kick-down".
See Transmission Section for complete data.
Overdrive Solenoid—Delco-Remy 1118132, Warner No. 3AR10B-62 Kaiser-Frazer No. 200911.
Governor—Kaiser-Frazer No. 200908.
Control Relay—Auto-Lite HRT-4001, Kaiser-Frazer No. 201636. On left side of dash.
Kick-down Switch—Kaiser-Frazer No. 201638. Adjust switch by means of nuts on threaded sleeve so switch actuating cam on accelerator lever just contacts plunger on switch at wide open throttle
Lock-out Switch—Kaiser-Frazer No. 200915.

Removal: Disconnect all wiring at control units on overdrive case, disconnect control cable and speedometer cable. Remove Overdrive and Transmission as a unit (see Transmission Removal above).

UNIVERSALS

Detroit Series 4200. Ball-and-trunnion type or Mechanics. Roller bearing type. Three used with intermediate universal at propeller shaft support

Propeller Shaft & Support Bearing: Two shafts used: **Propeller Shaft & Support Bearing Servicing**—*See "Propeller Shaft" in Fraser Shop Notes.*

REAR AXLE

Spicer (Salisbury) Model 41-2. Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratio (Without Overdrive)—4.09-1 Std., 3.73-1 Optl.
Ratio (With Overdrive)—4.27-1.
Backlash—.003-.006". Shim adjustment.

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers and sway eliminator links (when used) at spring seat, disconnect parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.
Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out

Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential shaft), adjust endplay at left wheel.
Endplay—.001-.006".

SHOCK ABSORBERS

Monroe. Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

	Front	Rear
Kaiser-Frazer No. (Std.)	201490	201493
Kaiser-Frazer No. (Exp.)	202864	202866

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—4¾—5¾° crosswise.
Caster—0° preferred (—1° to +1°).
Camber—¼° preferred (0° to ¾°).
Toe-In—1/16". Adjust by turning both tie rods
Steering Geometry (Toe-out): Inner wheel 23°. Outer wheel 20°. No adjustment.

STEERING GEAR

Gemmer Model 305. Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.
Drums—Composite (cast-iron & steel). Diameter 11"
Clearance—.008" at heel and toe of each shoe.
Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).

Hand Brake: See Service brake data (above).

MODEL IDENTIFICATION

SERIAL NUMBER: On left front door hinge post.
1949 Numbers—Frazer F-495—F-495-001000 and up, Frazer Manhattan F-496—F-496-001000 and up.
1950 Numbers—Prefixed by F-505 (Frazer), F-506 (Manhattan).
Body Number Note—Stamped on plate on right front face of dash in engine compartment.

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Name Plate on left side of crankcase.
NOTE—Numeral following Engine Model Designation (first part of Engine Number on Engine Name Plate) indicates Engine Plant: 4—Detroit, 8—Muskegon.

▷**Engine Number Symbol (Special Bore & Bearing Sizes)** *See "Original Bore & Pistons" & "Original Bearing Sizes" in Fraser Special Data.* NOTE—Symbol consists of 1 or 2 letters following engine number.

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. (7.3-1 Heads) at cranking speed of 70 RPM. (engine hot, all plugs out, throttle wide open). All cylinders must be equal within 10 lbs.
NOTE—7.3-1 Heads marked by "73" stamped on head directly above engine number pad on block.

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .032".
Plug Type—Auto-Lite A-5 or AR5.

DISTRIBUTOR: Breaker Gap—.022" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

IGNITION TIMING: 4° BTDC.
Timing Procedure—*See Ignition Timing.*
Timing Mark—4th. graduation before top dead center "0" mark on vibration dampener.

▷*CAUTION—Engine must be idling below 450 RPM when setting timing.*
Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION:
Idle Setting—1-1½ turns open—2 screws. Turn screws out for richer mixture.
Idle Speed—550 RPM.
Float Level—Flush to 1/32" from top of each float to gasket seat on cover with valve closed (bowl cover assembly inverted).
Accelerating Pump—Lower Hole (min.) Normal.

Choke Setting: Centered (coil housing at index mark).

Fuel Pump Pressure: 3-4¼ lbs.

▷*CAUTION—Pump pressure must not exceed 4½ lbs.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .014" All Valves, Cold.

▷**Adjustment Procedure**—*See Fraser Special Data.*
NOTE—Remove splash shield under right front fender for convenience in adjusting valves.
Valve Timing Check—*See Valve Timing.*

STARTING: *See Battery, Starter, Generator, Regulator.*

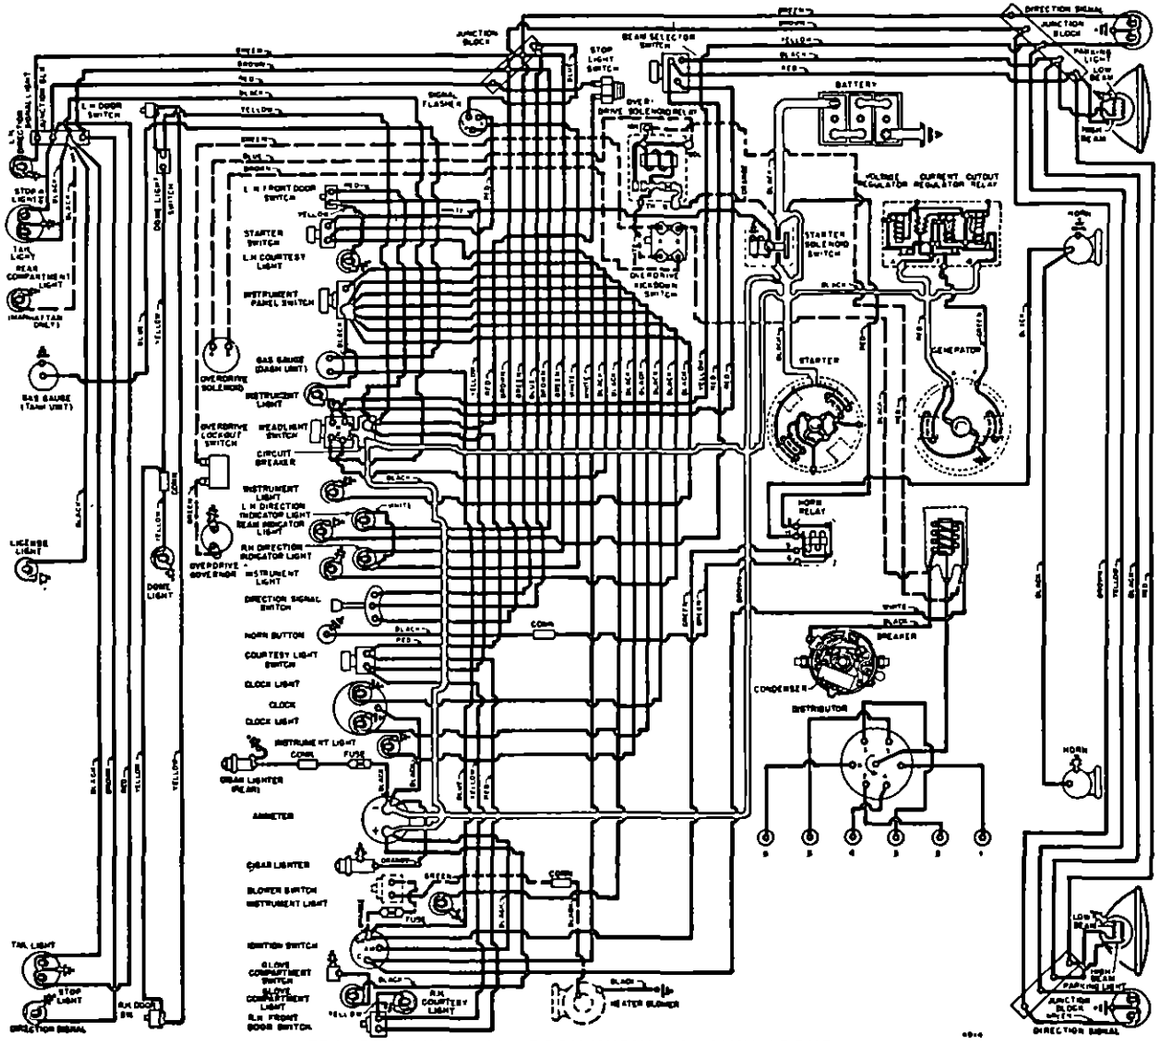
IGNITION

IGNITION SWITCH: Kaiser&Frazer No. 204485.
Lock Cylinder—Kaiser-Frazer No. 203885 (with key).

COIL: Auto-Lite IG-4093, IG-6001 or 9A. On left side of engine opposite distributor.
Ignition Current—4.8 amperes at 6.3 volts (stopped).

CONDENSER: Auto-Lite Part No. IG-2671K.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite Model IGS-4214. Full automatic advance type with auxiliary vacuum spark control and octane selector adjustment.
Breaker Plate Identification—Maximum vacuum advance limited by slot in plate. Plate marked #5.
Breaker Gap—.022" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.



Distr. Degrees	Automatic Advance Eng. R.P.M.	Eng. Degrees	R.P.M.
Start	325	0	650
1	450	2	900
6.5	1200	13	2400
8	1475	16	2950
9	1675	18	3350

Octane Selector—Manual adjustment at distributor providing advance and retard. See Ignition Timing.

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Distr. Degrees	Vacuum Advance Eng. Degrees	Vacuum (" of HG)
Start	0°	10"
3	6°	13"
5	10°	15"

Distributor Removal: On cylinder head between #4 and #5 cylinders. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

FRAZER MANHATTAN BODY WIRING SHOWN ABOVE

IGNITION TIMING

Std .Setting .....4° BTDC.

Timing Mark—Timing mark located on vibration dampener. Consists of "0" mark at top dead center with 1° graduations before and after this point.

Timing (with Timing Light C-693)—Mark fourth degree mark before "0" top dead center mark on vibration dampener with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine below 450 RPM. (back off throttle stopscrew to decrease normal idle speed of 550 RPM). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw in end of arm under distributor, rotate distributor until timing mark appears in line with pointer, tighten cap screw. Check octane selector setting.

►*CAUTION—Reset engine idling speed at 550 RPM.*

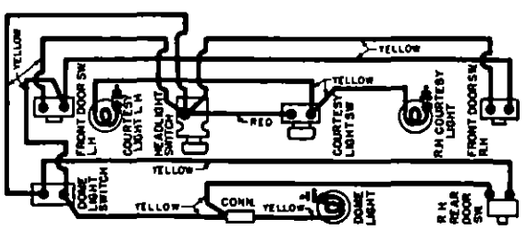
Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

Carter WCD Type 723S. 1¼" Dual (double barrel), Downdraft type with Fast Idle and Climatic Control.
Casting No. on Flange—550.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*



Fast Idle: Carter Dual (WCD) type.
See Carburetion Equipment Section for complete data.
Setting—.018" throttle opening with choke valve held closed and throttle lever stopscrew backed off.

Automatic Choke: Carter Climatic Control (Dual Carburetor Type).
See Carburetion Equipment Section for data.
Setting—Centered (coil housing at index mark).

CARB. EQUIPMENT

Air Cleaner: AC No. 1544539 Oil-bath type.
Element—AC No. 22.
Servicing—Empty and clean reservoir, wash cleaner in kerosene, refill to indicator line with SAE No. 50 engine oil (No. 20 for below freezing temp.) at 2000 mile intervals or when engine tuned.

Fuel Pump: AC No. 1539074 combination Fuel-and-Vacuum Pump.
Replacement Pump—AC No. 582.

FRAZER BODY WIRING

►*CAUTION—Install pump with rocker arms UNDER camshaft eccentric.*
See Carburetion Equipment Section for data.
Pressure—3-4¼ lbs.

Gasoline Gauge: Auto-Lite electric type.
Dash Unit—A-L No. 11586A.
Tank Unit—A-L No. 11571A.
See Carburetion Equipment Section for data.

BATTERY

Auto-Lite Type 1M-100D. 6 Volt, 15 Plate, 105 Ampere Hour capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.
Location—In engine compt. on left side.

STARTER

Auto-Lite Model MAW-4054. Armature MAW-2128.
Drive—Barrel type Bendix Drive No. A1792.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
2.75 "	1480	5.0	200
8.50 "	400	4.0	400
6.0 "	Lock	2.0	335

Starting Switch: Magnetic switch K-F Part No. 204752 on splash shield near starter and controlled by push-button on instrument panel.
See Electrical Equipment Section for complete data.

Removal: Flange mounted on left front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws.

GENERATOR

35 Amp.....Auto-Lite GDZ-4818A. Arm. GDZ-2006F.
45 Amp.....Auto-Lite GGU-6001B. Arm. GGU-2006F.
Two brush type with voltage and current regulation.
Charging Rate Adjustment—None (see Regulator).
Maximum Charging Rate—As given below.

Performance Data (GDZ-4818A)

Amperes	Volts	Cold—R.P.M.	Hot
0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Performance Data (GGU-6001B)

45	8.0	1550 Max.	

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—(GDZ) 1.60-1.78 amperes at 6.0 volts, (GGU) 1.6-1.8 —amperes at 6.0 volts.
Motoring Current—(GDZ) 4.16-4.60 amps. at 6.0 volts, (GGU) 5.5-6.5 amperes at 6.0 volts.

Removal: Pivot mounting at left front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts. NOTE—Remove battery for access.

Belt Adjustment: Adjust by pulling generator out with 15 lb. force in line with adjuster link with all mounting bolts loose. A 6 lb. adjustment for new belt is recommended.

REGULATOR

35 Amp.—Auto-Lite VRP-4004F-2.....for GDZ Gen.
45 Amp.—Auto-Lite VAV-4002C.....for GGU Gen.
Vibrating type voltage and current regulators.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay
Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—As follows:
VAV-4002C 44-46 amperes (marked '45' on cover).
VRP-4004F-2 34-36 amperes (marked '35' on cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Red jewel at bottom of speedometer dial. Lighted when upper (country beams) in use.

Direction Signal: Mitchell (United Specialties) type.
See Electrical Equipment Section for complete data.
Direction Indicators—Right and Left indicator lights on face of speedometer. Lighted when direction signal on same side of car in operation.

Switches
Lighting—Kaiser-Frazer No. 203830.
Beam Selector—Kaiser-Frazer No. 204545.
Instrument Panel—Kaiser-Frazer No. 203833.
Courtesy (on Instrument Panel)—K-F No. 200821.
Door—Kaiser-Frazer No. 204229.
Dome Lamp—Kaiser-Frazer No. 204779.
Stop Lamp—Kaiser-Frazer No. 201466.
Direction Signal—Kaiser-Frazer No. 204552.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type, 30 amperes. On back of lighting switch.

FUSES: Clock—2 ampere. In clock lead.
Overdrive—20 amperes. On control relay.
Cigar Lighter—30 amperes. In lead back of instrument panel.

HORNS: Auto-Lite or Sparton. A-L HW-4017 (Low Note), HW-4018 (High Note). Twin horns.
Horn Current—Approximately 15 amperes each at 6.2 volts.

Horn Relay: Auto-Lite Model HRL-4101. Relay connected through ignition switch (horns operative only with ignition switch "on").
Contacts Close—1.5-3.0 volts (seal to core with 4.0 volts maximum).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (between armature leg and yoke with armature sealed to core.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16" (3.3125-3.3145"). *See "Original Bore & Pistons" in Fraser Special Data.*
Stroke—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3.
Developed Horsepower—112 at 3600 RPM.
Compression Ratio—7.3-1.
NOTE—7.3-1 Heads marked by "73" stamped on left front directly above engine number on block.
Compression & Vacuum Reading—*See Tune-Up data.*

TIGHTENING TORQUES: *See Fraser Special Data.*

CYLINDER HEAD INSTALLATION: *See Fraser Special Data.*

ENGINE REMOVAL: *See Fraser Special Data.*

PISTONS: Aluminum alloy, Cam-ground. Tin-plated, T-slot type. Length 3 9/16".
Original Bore & Piston Sizes—*See Fraser Special Data.*
Clearance—See Fitting new pistons.
Removal—Pistons and rods removed from above.

▷*CAUTION—Mark piston and rod assemblies before removal to insure re-installation in same cylinder.*

Fitting New Pistons: Use .0015" feeler stock ½" wide inserted on side opposite slot. Pull to withdraw feeler must be 5-10 lbs.

Replacement Pistons: *See Fraser Special Data.*

Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled, fourth groove slotted for oil drainage.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0925-.0935"	.008-.016"	.0025-.004"
Comp. (#2)	.0925-.0935"	.008-.016"	.0015-.0035"
Oil (#3,4)	.1550-.1545"	.008-.016"	.001-.0025"

Installing Rings: Side marked "TOP" (compression rings) upward.

Replacement Rings: *See Fraser Special Data.*

PISTON PIN: Diameter—.8591-.8593". **Lgth.**—2 13/16". Floating type with lock ring at each end.
Pin Fit in Piston—Push fit with piston heated to 212°F. (heat piston in water at 212°F. to install new pins).
Pin Fit in Rod Bushing—Light press fit. When installing new bushings, ream bushings with DD-82-2 Reamer to inside diameter of .8593-.8595" for new std. pins.

▷**CAUTION**—Pin bushing must protrude 1/64" on each side of rod.

Replacement Pins: Std. size and .003", .005" Oversize.

CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".

▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Fraser Special Data.*
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0015". **Sideplay**—.006-.010".

Bearing Adjustment: None. Replace bearings. Do not file rods or bearing caps.

Replacement Bearings: Furnished Std. Size and .001", .002", .010", .012" Undersize.

CAUTION—Install bearings with tang engaging notch in rod and cap and oil hole aligned with oil spurt hole in rod.

Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).

CRANKSHAFT: Four bearing, counterweighted type with vibration dampener on forward end.
Journal Diameters—2.3744-2.3752". NOTE—Allowable taper or out-of-round .001".

▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Fraser Special Data.*
Bearings—Removable, steel-backed babbitt-lined.
Clearance—.0005-.0015".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. Upper main bearing shells can be "rotated" out by installing tool KF-8 in crankshaft journal hole (lug on tool engages edge of bearing when crankshaft rotated).
Filler Block (Front & Rear) Removal & Installation—*See "Crankshaft & Main Bearings" in Fraser Special Data.*

Replacement Bearings: Furnished Std. size and .001", .002", .010", .012" Undersize.

End Thrust: Taken by front (#1) bearing (special thrustwasher used with unflanged bearings). Controlled by shims installed between front crankshaft thrust washer (ahead of #1 bearing) and crankshaft thrust plate (behind crankshaft sprocket).
Endplay—.004-.006".
Endplay Adjustment—*See "Crankshaft & Main Bearings" in Fraser Special Data.*

CAMSHAFT: Four bearing. Two-sprocket chain drive.
Journal Diameters—#1, 1.8725-1.8735"; #2, 1.8095-1.8105"; #3, 1.7472-1.7485"; #4, 1.2475-1.2485".
Bearing Diameters (I.D.)—#1, 1.8745-1.8755"; #2, 1.8115-1.8125"; #3, 1.7495-1.7502"; #4, 1.2495-1.2505".
Bearings—Steel-backed, babbitted bushings.
Clearance—.002-.004".

Camshaft Removal: *See "Camshaft & Bearings" in Fraser Special Data.*

Bearing Adjustment: None. Replace bushings with camshaft removed.

Replacement Bushings: Replace as set (furnished finished line-bored and do not require reaming after installation). Use KF-4 Camshaft Bearing Remover & Replacer.

▷*CAUTION—Align oil hole in bushings and block.*

End Thrust: Taken by thrust plate on front of engine (between front bearing journal and camshaft sprocket **Endplay**—.003-.007".

Timing Chain: Non-adjustable type. Width 1". Pitch .500", Length 23" or 46 links.

▷*Timing Chain Caution—Morse and Link Belt chains used. Interchangeable only as complete sets with both sprockets.*

Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3382-.3390"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3481"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width—5/64-3/32" (Intake), 3/32-7/64" (Exhaust). Use KF-58 Relief Counterboring Set to remove high shoulder in block above valve head.

Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides for correct clearance using Reamer C-249.
Valve Guide Installation—Place guide (tapered end of guide toward top) in position in bore. Use Tool KF-27 when installing guides to correct position of 1 7/32" below top face of cylinder block.

Valve Springs: Check spring with tester C-647. Pressure should be 45 ± 2½ lbs. at 1 21/32".

	Spring Pressure	Length
Valve Closed	51 lbs.	1 43/64"
Valve Open	113 lbs.	1 5/16"

Valve Lifters: Barrel type. Two types used and are interchangeable. One type using tappet adjusting screw with locknut, other type is self-locking.
Clearance—Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters—Furnished Std. size and oversize. Oversize identified as follows: "A", .0005", "B", .001", "C", .0015", "D", .002", "K", .005", "S", .008".

VALVE TIMING

Tappet Clearance: .014" All Valves, Cold.

▷**Adjustment Procedure**—*See Fraser Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With .014" tappet clearance (running clearance), #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark after dead center "0" mark on dampener aligned with pointer at front of engine.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, exhaust valve lifters, timing chain. Oil pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35-40 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Located in right side of cylinder block below the valve chamber and toward the rear of engine. Adjustable by replacing spring or install washers No. 200272 between end of spring and plug.

Oil Pan Removal: *See Fraser Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe located on front valve cover plate on right side of engine. NOTE—Two types of valve cover and outlet pipe assemblies used—can be identified by angle of cut-off at lower end of tube: (Early 1949 Cars) angular cut-off faces **forward**, (Later 1949 Cars) angular cut-off faces **toward rear.**

▷*CAUTION—Do not install later valve cover & outlet pipe assembly on early cars (may cause loss of oil through tube).*

Oil Pump: Gear Type. In crankcase.

Oil Pump Servicing—*See Fraser Special Data.*

Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.

Oil Gauge—Auto-Lite No. 11585A.

COOLING

Cooling System: Sealed system (relief valve in filler cap) with positive circulation and thermostatic control.

Capacity—13½ qts. (13 qts. at driving level).

Pressure Valve—AC No. 850501 (Radiator Filler Cap). 3¼-4¼ lbs.

Radiator: No. 202906 (17" wide). Side mounted to shroud with six bolts.

Radiator Removal—*See Fraser Special Data.*

Water Pump: Centrifugal type with ball bearing shaft. *See Water Pump Section for complete data.*

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only). In water outlet elbow on cylinder head.

Setting (Std. type)—Begins to open at 149-156°F. Fully open at 176°F.

Temperature Gauge: Auto-Lite No. 11587A or 11775A. Not electric.

CLUTCH

Auburn Model 9251-15 or Borg & Beck Model 9A7.

►**Clutch Identification**—Types can be identified by number of pressure plate springs—3 (for Auburn), 9 (for Borg & Beck—cover marked "951").

See Clutch Section for complete data.

Facings (Borg & Beck)—Woven asbestos, 2 required. Inside Diam. 6". Outside Diam. 9¼". Thickness ⅛".

Facings (Auburn)—Moulded metallic or Raybestos. 2 required. I. D. 6". O. D. 9¼". Thickness .135".

Pedal Adjustment: Pedal free travel ⅝-¾". To adjust remove return spring, clevis pin and release clevis end of adjusting link from clutch pedal shaft bellcrank. Turn clevis end in or out to obtain correct pedal free movement. Install adjusting link clevis on bellcrank, insert clevis pin, cotter pin, and return spring.

Removal: Remove transmission (see Transmission Removal below), remove housing pan. Position of clutch on the flywheel must be marked before removal. Rotate flywheel, using Flywheel Turning Tool C-771 and loosen six bolts equally before removing. Remove clutch pressure plate and cover assembly and clutch disc.

TRANSMISSION

Warner Model AS23-T86E (Std.), Model AS24-T86E with new Type R10B Overdrive (Optl.)—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low and Reverse).

See Transmission Section for complete data.

Transmission Control: Remote control type with gear-shift lever mounted on steering column.

See Transmission Section for complete data.

Removal: Remove clutch pedal return spring, clevis pins at cross shaft coupling and slide coupling onto cross shaft. Disconnect gear shift rods at transmission levers. (If overdrive is installed disconnect overdrive shift rod at overdrive unit). Disconnect speedometer cable at transmission (plug hole in transmission to prevent loss of lubricant). Disconnect wiring to overdrive. Support rear of engine using Tool KF-47 or suitable jack under clutch housing, disconnect propeller shaft at front companion flange. Free engine rear support from cross-member by taking out two insulator bolts at transmission. Disconnect and remove master cylinder operating rod. Disconnect hand brake cable at equalizer and engine rear crossmember. Remove eight bolts at frame side rails and remove crossmember. Remove four bolts holding transmission to clutch housing and pull out the transmission. (If overdrive is installed it will be removed with transmission).

OVERDRIVE

Warner Type R10B (with special AS24-T86E Transmission). Optl. Equipment. New Governor controlled type (no centrifugal pawls) with electrical solenoid operation and throttle controlled "kick-down."

See Transmission Section for complete data.

Overdrive Solenoid—D-R 1118132, K-F No. 200911.

Governor—Kaiser-Frazer No. 200908.

Control Relay—Auto-Lite HRT-4001 or 1A. Has 20-ampere fuse on BAT terminal.

Kick-down Switch—Kaiser-Frazer No. 203451.

Lock-out Switch—Kaiser-Frazer No. 200915.

Removal: Remove drain plug in overdrive housing and drain lubricant. Disconnect wiring at shift fork rail switch terminals. Disconnect speedometer cable at overdrive housing, control wire at control shaft lever on overdrive housing and the tie-down clips. Disconnect front propeller shaft at front companion flange and move shaft away from housing. Remove Overdrive and Transmission as a unit (see Transmission Removal above).

UNIVERSALS

Detroit Series 4200. Ball-and-Trunnion. 3 used with intermediate universal at propeller shaft support.

Propeller Shaft & Support Bearing: Two shafts used with support bearing on frame crossmember at intermediate universal.

Propeller Shaft & Support Bearing Servicing—*See "Propeller Shaft" in Fraser Special Data.*

REAR AXLE

Spicer (Salisbury) Model 41-2. Semi-floating, Hypoid Gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratio (Without Overdrive)—3.91-1 Std., 3.73-1 or 4.09-1 Optl.

Ratio (With Overdrive)—4.27-1 or 4.55-1.

Backlash—.003-.006". Shim adjustment.

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers and sway eliminator links (when used) at spring seat, disconnect parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.

Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out.

Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential shaft), adjust endplay at left wheel.

Endplay—.001-.006".

SHOCK ABS RBERS

Monroe—Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs.

See Front Suspension Section for complete data.

Kingpin Inclination—5½° preferred (4¾-5¾° crosswise).

Caster—0° preferred (—1° to +1°).

Camber—¼° preferred (0° to ¾°).

Toe In—1/16". Adjust by turning both tie rods.

Steering Geometry (Toe-out)—Inner wheel 23°. Outer wheel 20°. No adjustment.

STEERING GEAR

Gemmer Model 305—Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes. *See Brake Section for complete data.*

►*SELF ADJUSTING BRAKE NOTE*—Used on a limited number of cars during 1949-50 production. *See "Wagner Lockheed" Brakes in Brake Section for complete data.*

Drums—Composite (cast-iron & steel). Diameter 11"

Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).

Clearance—.008" at heel and toe of each shoe.

Braking Power—56% Front wheels, 44% Rear.

Hand Brake: See Service Brake data (above).

MISC. MECHANICAL

Windshield Wiper: Vacuum type, cable operated.

See Miscellaneous Section for complete data.

M DEL IDENTIFICATION

SERIAL NUMBER: On plate located on left front pillar post.

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Name Plate on left side of crankcase.

NOTE—Numeral following Engine Model Designation (first part of Engine Number on Engine Name Plate) indicates Engine Plant: 4—Detroit, 8—Muskegon.

►**Engine Number Symbol (Special Bore & Bearing Sizes)** *See "Original Bore & Pistons" & "Original Bearing Sizes" in Fraser Special Data.* NOTE—Symbol consists of 1 or 2 letters following engine number.

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. (7.3-1 Heads) at cranking speed of 70 RPM. (engine hot, all plugs out, throttle wide open). All cylinders must be equal within 10 lbs.

NOTE—7.3-1 Heads marked by "73" stamped on head directly above engine number pad on block.

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .030".

Plugs—Auto-Lite Type A-5 (Early 1951), A-7 (Late 1951). *CAUTION*—Type A-7 is used for new car break-in. Type A-5 can be used for replacement if A-7 too hot for sustained high speed driving. Do not use A-7 for A-5 replacement unless required.

DISTRIBUTOR: Breaker Gap—.020" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

IGNITION TIMING: 4° BTDC.
Timing Procedure—*See Ignition Timing.*
Timing Mark—4th. graduation before top dead center "0" mark on vibration dampener.
►***CAUTION—Engine must be idling below 450 RPM when setting timing.***
Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION:
►*CARBURETOR CHANGE (to Correct Hard Starting & Flooding)—See Carburetor Section for complete data.*
Idle Setting—½ to 1 turn open—2 screws. Turn screws out for richer mixture.
Idle Speed—550-600 RPM (Std.), 425-450 RPM (Hydra-Matic).
Float Level—(Early Production, Spring Loaded Needle & Seat assembly)—7/64". (Later Production, Solid Needle & Seat assembly)—¼", measured from machined surface of bowl cover to top of float with bowl cover inverted.
►***CAUTION—When measuring float level do not depress float lip against spring in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm.***
Accelerating Pump—No seasonal adjustment. *See Carburetor Section for complete data.*

Choke Setting: Centered (coil housing at index mark).

Fuel Pump Pressure: 3-4½ lbs.

►***CAUTION—Pump pressure must not exceed 4½ lbs.***

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

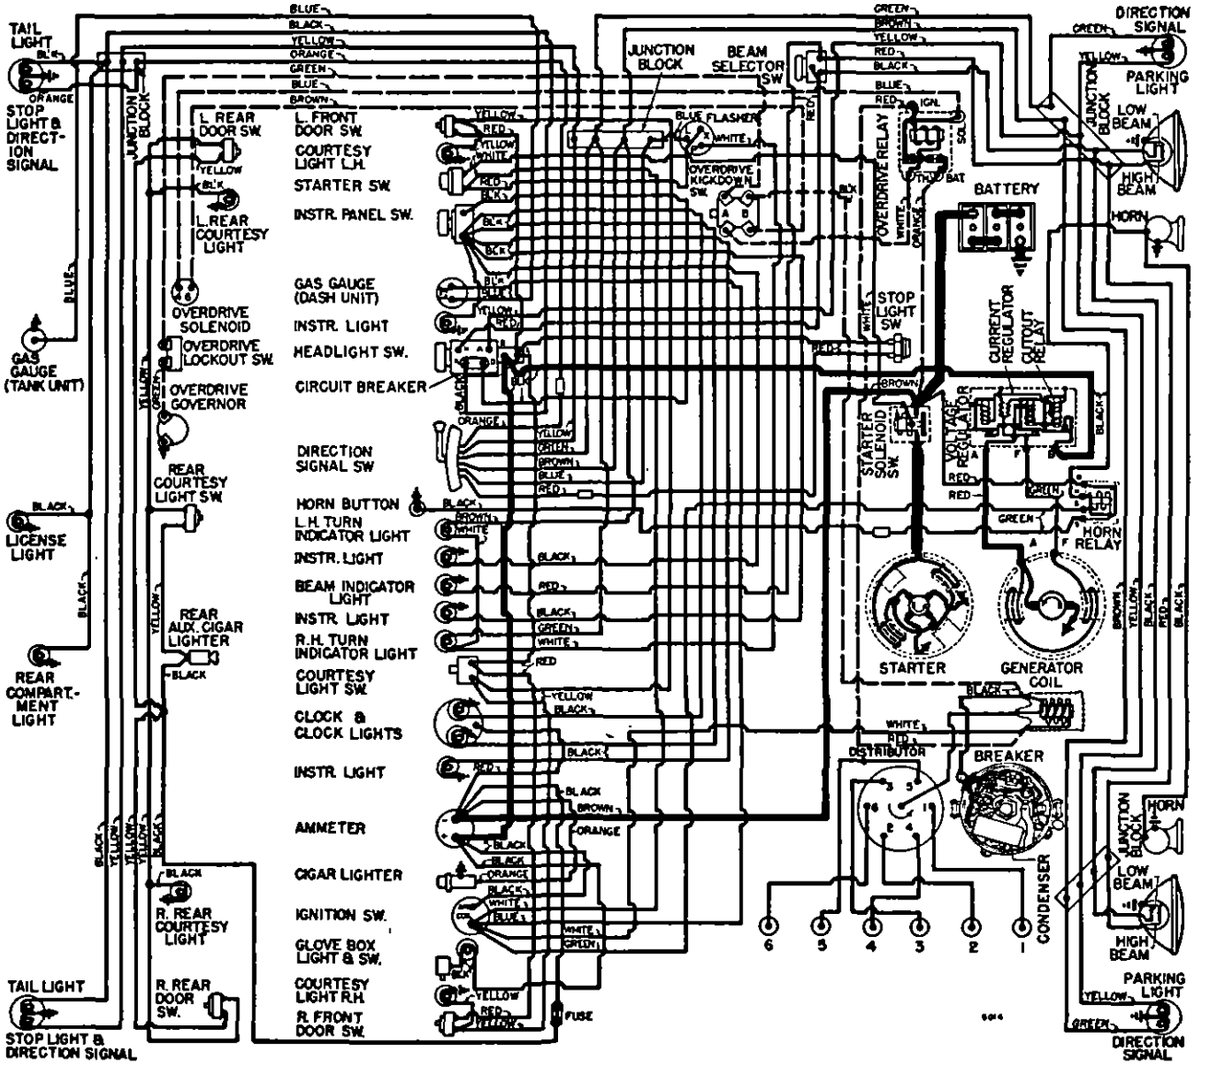
VALVE TAPPET CLEARANCE: .014" All Valves, Cold.
►**Adjustment Procedure**—*See Fraser Special Data.*
NOTE—Remove splash shield under right front fender for convenience in adjusting valves.

IGNITION

IGNITION SWITCH: Kaiser & Frazer No. 204485.
Lock Cylinder—Kaiser-Frazer No. 203885 (with key).

COIL: Auto-Lite IG-6009A (Early), CR-6009 (Late). On left side of engine opposite distributor.
Ignition Current—4.8 amperes at 6.3 volts (stopped).

CONDENSER: Auto-Lite Part No. IG-2671K.
Capacity—.20-.25 microfarad.



DISTRIBUTOR: Auto-Lite Model IGS-4214. Full automatic advance type with auxiliary vacuum spark control and octane selector adjustment.

Breaker Plate Identification—Maximum vacuum advance limited by slot in plate. Plate marked #5.
Breaker Gap—.020" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Distr. Degrees	Automatic Advance R.P.M.	Eng. Degrees	R.P.M.
Start	325	0	650
1	450	2	900
6.5	1200	13	2400
8	1475	16	2950
9	1675	18	3350

Octane Selector—Manual adjustment at distributor providing advance and retard. See Ignition Timing.

Vacuum Spark Control: Auto-Lite (integral type).

Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	10"
3	6°	13"
5	10°	15"

Distributor Removal: On cylinder head between #4 and #5 cylinders. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING

Std. Setting ..... **4° BTDC.**
Timing Mark—Timing mark located on vibration dampener. Consists of "0" mark at top dead center with 1° graduations before and after this point.
Timing (with Timing Light C-693)—Mark fourth degree mark before "0" top dead center mark on vibration dampener with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine below 450 RPM, (back off throttle stopscrew to decrease normal idle speed of 550 RPM). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw in end of arm under distributor, rotate distributor until timing mark appears in line with pointer, tighten capscrew. Check octane selector setting.
►*CAUTION*—Reset engine idling speed to 550 RPM on cars with synchro-mesh transmission.
Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

Carter WGD Type 813S. 1¼" Dual (double barrel), Downdraft type with Fast Idle and Climatic Control.
►*CARBURETOR CHANGE (to Correct Hard Starting & Flooding)—See Carburetor Section for complete data.*
Casting No. on Flange—774.
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*
Fast Idle: Carter Dual (WGD) type.
Setting—With thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed. There should now be .018" to .023" clearance (gauge T109-29) between throttle valve and bore of carburetor (side opposite idle port). Adjust by bending the choke connector rod at lower angle bend.
See Carburetion Equipment Section for complete data.
Automatic Choke: Carter Climatic Control (Dual Carburetor Type).
Setting—Centered (coil housing at index mark).
See Carburetion Equipment Section for data.

CARB. EQUIPMENT

Air Cleaner: AC No. 1544539 Oil-bath type.
Element—AC No. 22.
Servicing—Empty and clean reservoir, wash cleaner in kerosene, refill to indicator line with SAE No. 50 engine oil (No. 20 for below freezing temp.) at 2000 mile intervals or when engine tuned.
Fuel Pump: AC No. 1539074 combination Fuel-and-Vacuum Pump.
Replacement Pump—AC No. 582.
►*CAUTION—Install pump with rocker arm UNDER camshaft eccentric.*
Pressure—3-4¼ lbs.
See Carburetion Equipment Section for data.
Gasoline Gauge: Auto-Lite electric type.
Dash Unit—A-L No. 11586A.
Tank Unit—A-L No. 11571A.
See Carburetion Equipment Section for data.

BATTERY

Auto-Lite Type 1M-100D. 6 Volt, 15 Plate, 105 Ampere Hour capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.
Location—In engine compt. on left side.

STARTER

Auto-Lite Model MAW-4054 (Std.), MAW-4057 (Hydra-Matic). Armature MAW-2138.
Drive—Barrel type Bendix Drive No. A1792.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
2.75 "	1480	5.0	200
12.0 "	Lock	3.0	505
6.0 "	Lock	2.0	335

Starting Switch: Magnetic switch K-F Part No. 204752 on splash shield near starter and controlled by push-button on instrument panel.
See Electrical Equipment Section for complete data.

GENERATOR

35 Amp.....Auto-Lite GDZ-4818A. Arm. GDZ-2006F.
45 Amp.....Auto-Lite GGU-6001B. Arm. GGU-2006F.
Two brush type with voltage and current regulation.
Charging Rate Adjustment—None (see Regulator).
Maximum Charging Rate—As given below.

Performance Data (GDZ-4818A)

Amperes	Volts	Cold—R.P.M.	Hot
0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Performance Data (GGU-6001B)

Amperes	Volts	Cold—R.P.M.	Hot
45	8.0	1550 Max.	

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—(GDZ) 1.60-1.78 amperes at 6.0 volts, (GGU) 1.7-1.8 amperes at 6.0 volts.
Motoring Current—(GDZ) 4.16-4.60 amperes at 6.0 volts, (GGU) 5.5-6.2 amperes at 6.0 volts.
Belt Adjustment: Adjust by pulling generator out with 15 lb. force in line with adjuster link with all mounting bolts loose. A 6 lb. adjustment for new belt is recommended.

REGULATOR

Auto-Lite Regulator No.	For Generator No.
VRP-4004F-2 (Early)	GDZ-4818A
VRP-6001A (Late)	GDZ-4818A
VAV-4002C (Taxi)	GGU-6001B

Vibrating type voltage and current regulators.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay
Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—As follows:
VAV-4002C 44-46 amperes (marked '45' on cover).
VRP-4004F-2 34-36 amperes (marked '35' on cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Red jewel at bottom of speedometer dial. Lighted when upper (country beams) in use.
Direction Signal: Mitchell (United Specialties) type.
See Electrical Equipment Section for complete data.
Direction Indicators—Right and Left indicator lights on face of speedometer. Lighted when direction signal on same side of car in operation.

Switches
Lighting—Kaiser-Frazer No. 203830.
Beam Selector—Kaiser-Frazer No. 204545.
Instrument Panel—Kaiser-Frazer No. 203833.
Courtesy (on Instrument Panel)—K-F No. 200821.
Door—Kaiser-Frazer No. 204229.
Dome Lamp—Kaiser-Frazer No. 204779.
Stop Lamp—Kaiser-Frazer No. 201466.
Direction Signal—Kaiser-Frazer No. 204552.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type, 30 amperes. On back of lighting switch.
FUSES: Clock—2 ampere. In clock lead.
Overdrive—20 amperes. On control relay.
Rear Seat Cigar Lighter & Body Lights—30 ampere in lead back of instrument panel.
HORNS: Auto-Lite or Sparton. A-L HW-4017 (Low Note), HW-4018 (High Note). Twin horns.
Horn Current—Approximately 15 amperes each at 6.2 volts.
Horn Relay: Auto-Lite Model HRL-4101. Relay connected through ignition switch (horns operative only with ignition switch "on").
Contacts Close—1.5-3.0 volts (seal to core with 4.0 volts maximum).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (between armature leg and yoke with armature sealed to core.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16" (3.3125-3.3145"). *See "Original Bore & Pistons" in Frazer Special Data.*
Stroke—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3
Developed Horsepower—115 at 3650 RPM.
Compression Ratio—7.3-1.
NOTE—7.3-1 Heads marked by "73" stamped on left front directly above engine number on block.
Compression & Vacuum Reading—*See Tune-Up data.*

ENGINE REMOVAL: *See Frazer Special Data.*

CYLINDER HEAD AND TIGHTENING TORQUES: *See Frazer Special Data.*

PISTONS: Aluminum alloy, Cam-ground. Tin-plated, T-slot type. Length 3 17/32".
Original Bore & Piston Sizes—*See Frazer Special Data.*
Clearance—See Fitting new pistons.
Removal—Pistons and rods removed from above.
▷*CAUTION—Mark piston and rod assemblies before removal to insure re-installation in same cylinder.*

Fitting New Pistons: Use .0015" feeler stock (new pistons only—use .004" feeler for used pistons), ½" wide, insert feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 5-10 lbs. as 70°F.

Replacement Pistons: *See Frazer Special Data.*

Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled, fourth groove slotted for oil drainage.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0925-.0935"	.008-.016"	.002-.004"
Comp. (#2)	.0925-.0935"	.008-.016"	.0015-.0035"
Oil (#3,4)	.1550-.1545"	.008-.016"	.0025-.004"

Installing Rings: Side marked "TOP" (compression rings) upward. Chrome plated ring must be installed in top (#1) ring groove.

Replacement Rings: *See Frazer Special Data.*

PISTON PIN: Diameter—.8591-.8593". **Lgth.**—2 13/16". Floating type with lock ring at each end.
Pin Fit in Piston—Push fit with piston heated to 160°F. (heat piston in hot water to install pin).
Pin Fit in Rod Bushing—Light press fit. When installing new bushings, ream bushings with DD-82-2 Reamer to inside diameter of .8593-8595" for new std. pins.
▷*CAUTION*—Pin bushing must protrude 1/64" on each side of rod.

Replacement Pins: Std. size and .003", .005" Oversize.

CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".
▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Frazer Special Data.*
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0018". **Side Play**—.006-.010".

Bearing Adjustment: None. Replace bearings. Do not file rods or bearing caps.

Replacement Bearings: Furnished Std. Size and .001", .002", .010", .012" Undersize.
CAUTION—Install bearings with tang, engaging notch in rod and cap and oil hole aligned with oil spurt hole in rod.

Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).

CRANKSHAFT: Four bearing, counterweighted type with vibration dampener on forward end.
Journal Diameters—2.3744-2.3752". NOTE—Allowable taper or out-of-round .001".
▷*CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Frazer Special Data.*
Bearings—Removable, steel-backed babbitt-lined.
Clearance—.0007-.002".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. Upper main bearing shells can be "rotated" out by installing tool KF-8 in crankshaft journal hole (lug on tool engages edge of bearing when crankshaft rotated).
Filler Block (Front & Rear) Removal & Installation—*See "Crankshaft & Main Bearings" in Frazer Special Data.*

Replacement Bearings: Furnished Std. size and .001", .002", .010", .012" Undersize.

End Thrust: Taken by #4 (rear) bearing which is flanged type.
Endplay—.003-.006".

CAMSHAFT: Four bearing. Two-sprocket chain drive.
▷*CAUTION—TWO different camshafts used in production (steel & Cast Iron). See Frazer Special Data for identification and Oil Pump Drive Gear and Valve Lifter type used with each shaft.*
Journal Diameters—#1, 1.8725-1.8735"; #2, 1.8095-1.8105"; #3, 1.7472-1.7485"; #4, 1.2475-1.2485".
Bearing Diameters (I.D.)—#1, 1.8745-1.8755"; #2, 1.8115-1.8125"; #3, 1.7495-1.7502"; #4, 1.2495-1.2505".
Bearings—Steel-backed, babbited bushings.
Clearance—.002-.004".

Camshaft Removal: *See "Camshaft & Bearings" in Frazer Special Data.*

Bearing Adjustment: None. Replace bushings with camshaft removed.

Replacement Bushings: Replace as set (furnished finished line-bored and do not require reaming after installation). Use KF-4 Camshaft Bearing Remover & Replacer.
▷*CAUTION—Align oil hole in bushings and block.*

End Thrust: Taken by thrust plate on front of engine (between front bearing journal and camshaft sprocket. **Endplay**—.003-.007".

Timing Chain: Non-adjustable type. Width 1". Pitch .500", Length 23" or 46 links.
▷*Timing Chain Caution—Morse and Link Belt chains used. Interchangeable only as complete sets with both sprockets.*

Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3382-.3390"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3520"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width—5/64-3/32" (Intake), 3/32-7/64" (Exhaust). Use KF-58 Relief Counterboring Set to remove high shoulder in block above valve head.

Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides to inside diameter of .3432-.3422" using Reamer C-249. This will provide correct stem clearance.
Replacement Guides—Guides furnished .0005" Oversize (marked "A") and .0055" Oversize (marked "L") to insure correct .0005-.003" press fit.
Valve Guide Installation—Place guide (tapered end of guide toward top) in position in bore. Use Tool KF-27 when installing guides to correct position of 1 7/32" below top face of cylinder block.

Valve Springs: Check spring with tester C-647. Pressure should be 45 ± 2½ lbs. at 1 21/32". Free length 1 31/32".

	Spring Pressure	Length
Valve Closed	51 lbs.	1 43/64"
Valve Open	113 lbs.	1 5/16"

Valve Lifters: Mushroom type with self-locking tappet adjusting screws. **Diameter**—.6855-.6860".
▷*CAUTION—TWO types used in conjunction with different camshafts.* STEEL lifters used only with Cast Iron Camshaft, CAST IRON lifters can be used with both Steel and Cast Iron Camshafts. *See "Camshaft & Bearings" in Frazer Special Data.*
Clearance—Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters—Furnished Standard size and in following oversizes (marked as indicated): "B" .001", "D" .002", "K" .005".

VALVE TIMING

Tappet Clearance: .014" All Valves, Cold.
▷**Adjustment Procedure**—*See Frazer Special Data.*
Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With .020" tappet clearance, #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark after dead center "0" mark on dampener aligned with pointer at front of engine.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, exhaust valve lifters, timing chain. Oil pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35-40 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Located in right side of cylinder block below the valve chamber and toward the rear of engine. Adjustable by replacing spring or install washers No. 200272 between end of spring and plug.

Oil Pressure Gauge: Auto-Lite No. 11585A (Not elec.).

Oil Pan Removal: *See Frazer Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe located on front valve cover plate on right side of engine.

Oil Pump: Gear Type. In crankcase.
▷*OIL PUMP DRIVE GEAR CAUTION—Gear must be same material as camshaft (Cast Iron or steel). See "Camshaft & Bearings" in Frazer Special Data.*
Oil Pump Servicing—*See Frazer Special Data.*

Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.

COOLING

Cooling System: Sealed system (relief valve in filler cap) with positive circulation and thermostatic control.
Capacity—13½ qts. (13 qts. at driving level).
Pressure Valve—AC No. 850501 (Radiator Filler Cap). 3¼-4¼ lbs.

Form 158—1956-M

Radiator Removal: *See "Radiator" in Frazer Special Data.*

►*REPLACEMENT RADIATOR CAUTION: Both Harrison & Fedders Radiators furnished. If Harrison Radiator installed, ALL SIX MOUNTING HOLES MUST BE RELOCATED ¾" BELOW ORIGINAL HOLES. This will raise radiator and prevent fan striking underside of upper tank.*

Water Pump: Centrifugal type with ball bearing shaft.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only). In water outlet elbow on cylinder head.
Setting (Std. type)—Begins to open at 149-156°F. Fully open at 176°F.

Temperature Gauge: Auto-Lite No. 11775A (Not elec.).

CLUTCH

Auburn Model 9251-18 or Borg & Beck 9A7 No. 951. Single plate, dry disc type.

►**Clutch Identification**—Types can be identified by number of pressure plate springs—3 (for Auburn), 9 (for Borg & Beck). Borg & Beck cover marked 951.
See Clutch Section for complete data.
Facings (Borg & Beck)—Woven asbestos, 2 required. Inside Diam. 6". Outside Diam. 9¼". Thickness ⅛".
Facings (Auburn)—Molded metallic or Raybestos. 2 required. I. D. 6". O. D. 9¼". Thickness .135".

Pedal Adjustment: Pedal free travel ⅝-¾". To adjust remove return spring, clevis pin and release clevis end of adjusting link from clutch pedal shaft bellcrank. Turn clevis end in or out to obtain correct pedal free movement. Install adjusting link clevis on bellcrank, insert clevis pin, cotter pin, and return spring.

Removal: Remove transmission (see Transmission Removal below), remove housing pan. Position of clutch on the flywheel must be marked before removal. Rotate flywheel, using Flywheel Turning Tool C-771 and loosen six bolts equally before removing. Remove clutch pressure plate and cover assembly and clutch disc.

TRANSMISSION

Warner Model AS49-T86E (Std.), Model AS50-T86E with new Type R10B Overdrive (Optl.)—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low and Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gear-shift lever mounted on steering column.
See Transmission Section for complete data.

Removal: Remove clutch pedal return spring, clevis pins at cross shaft coupling and slide coupling onto cross shaft. Disconnect gear shift rods at transmission levers. (If overdrive is installed disconnect overdrive shift rod at overdrive unit.) Disconnect speedometer cable at transmission (plug hole in transmission to prevent loss of lubricant). Disconnect wiring to overdrive. Support rear of engine using Tool KF-47 or suitable jack under clutch housing, disconnect propeller shaft at front companion flange. Free engine rear support from cross-member by taking out two insulator bolts at transmission. Disconnect and remove master cylinder operating rod. Disconnect hand brake cable at equalizer and engine rear crossmember. Remove eight bolts at frame side rails and remove crossmember. Remove four bolts holding transmission to clutch housing and pull out the transmission. (If overdrive is installed it will be removed with transmission).

VERDRIVE

Warner Type R10B (with special AS50-T86E Transmission). Optl. Equipment. New Governor controlled type (no centrifugal pawls) with electrical solenoid operation and throttle controlled "kick-down."
See Transmission Section for complete data.
Overdrive Solenoid—D-R 1118132, K-F No. 200911.
Governor—Kaiser-Frazer No. 200908.
Control Relay—Auto-Lite HRT-4001A, K-F Part No. 201636. Has 20-ampere fuse on BAT terminal.
Kick-down Switch—Kaiser-Frazer No. 203451.
Lock-out Switch—Kaiser-Frazer No. 200915.

Removal: Remove drain plug in overdrive housing and drain lubricant. Disconnect wiring at shift fork rail switch terminals. Disconnect speedometer cable at overdrive housing, control wire at control shaft lever on overdrive housing and the tie-down clips. Disconnect front propeller shaft at front companion flange and move shaft away from housing. Remove Overdrive and Transmission as a unit (see Transmission Removal above).

HYDRA-MATIC DRIVE TRANSMISSION

Four-speed planetary type automatic transmission and fluid coupling.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level every 1000 miles. Add fluid as required, to maintain level at "F" mark on dipstick. Drain and refill every 25,000 miles. Use Hydra-Matic Fluid (Automatic Transmission Fluid Type "A").

Capacity—Approx. 11 qts. (refilling after draining). 12 qts. (when transmission disassembled).

Checking Fluid Level—Check only with transmission warm (set hand brake, run engine with selector in "N"). With transmission oil hot, idle engine for at least two minutes, then check with engine running and selector in "N". Dip stick located under inspection hole cover in floor pan under front floor mat. Add fluid as required to bring level up to "F" mark on stick.
CAUTION—Do not fill above "F" mark on dip stick.

Linkage Adjustment: *See "Hydra-Matic Drive Linkage Adjustment" in Transmission Section.*
Neutral Safety Switch Adjustment—(Hydra-Matic) No adjustment required.

►*OTHER HYDRA-MATIC DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit Series 4200. Ball-and-Trunnion. 3 used with intermediate universal at propeller shaft support.

Propeller Shaft & Support Bearing: Two shafts used with support bearing on frame crossmember at intermediate universal.
Propeller Shaft & Support Bearing Servicing—*See "Propeller Shaft" in Frazer Special Data.*

REAR AXLE

Spicer Model 41-2 (Early 1951), Model 44 (Late 1951). Semi-floating, Hypoid gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.

Ratio—(Std. & Overdrive Cars) 4.55-1, (Hydra-Matic Cars) 3.54-1.
Backlash—.003-.006". Shim adjustment.

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers and sway eliminator links (when used) at spring seat, disconnect parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.
Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out.

Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential shaft), adjust endplay at left wheel.
Endplay—.001-.006".

SHOCK ABS RBERS

Monroe—Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—5° crosswise desired (limits 4¾-5½°).
Caster—0° preferred (limits Neg. 1° to Pos. 1°).
Camber—Pos. ½° preferred (limits 0° to Pos. ¾°).
Toe-In—1/8" preferred (1/16-1/8"). Adjust by turning both tie rods.
Toe-out on Turns—Inner wheel 20°, outer wheel 17½°. No adjustment.

STEERING GEAR

Gemmer Model 305—Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.
Drums—Composite (cast-iron & steel). Diameter11"
Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).
Clearance—.010" between lining and drum at adjusting cam. *CAUTION*—Brake shoes should be "centered" by several brake applications before adjusting brakes and before checking for drag after adjustment.
Braking Power—55.5% Front wheels, 44.5% Rear.

Hand Brake: See Service Brake data (above).

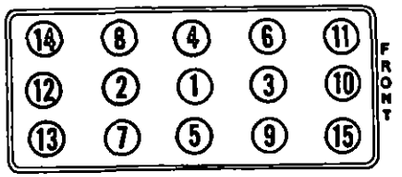
MISC. MECHANICAL

Windshield Wiper: Vacuum type, cable operated.
See Miscellaneous Section for complete data.

HOOD ASSEMBLY

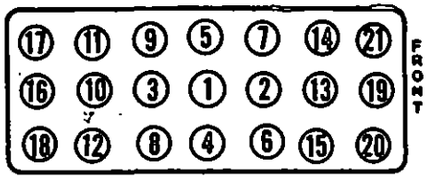
HOOD ALIGNMENT: Adjust hood by means of slotted holes provided for hood attaching bolts. Install shims between hood and hinge to raise hood. Install or remove shims between hinge and body to move hood sideways. The height and fit at front end is controlled by adjustment of hood latch and rubber bumper. See "Hood Latch Adjustment" following.

HOOD LATCH ADJUSTMENT: Hood latch bolts have slotted holes in both hood latch and radiator shroud to align latch with lock bolt. Lock bolt is also adjustable by turning bolt in plate to obtain proper height of closed hood.



FRONT END SHEET METAL

FRONT END SHEET METAL ASSEMBLY REMOVAL: Entire front assembly with exception of hood (front fenders, splash shields, radiator shroud, grille, radiator, and radiator support) can be removed as an assembly for work on front of engine. To remove assembly, take out six bolts at body front cowl and one bolt and insulator at radiator support, disconnect fender-to-cowl brace on each side.



CYLINDER HEAD

CYLINDER HEAD INSTALLATION: Use a Torque Indicating Wrench to tighten cylinder head nuts. Heads should be tightened cold and rechecked after engine reaches temperature of 150°F.

Tightening Torque—See Tightening Specifications.

4 CYLINDER

6 CYLINDER

TIGHTENING SPECIFICATIONS

	Ft.Lbs.	In.Lbs.
Cylinder Head Stud Nuts	60-65	780-792
Main Bearing Capscrews	65-70	780-840
Con. Rod Bolts (4 Cyl.)	50-55	600-660
Con. Rod Bolts (6 Cyl.)	25-30	300-360
Spark Plugs	30	360
Manifold Nuts	20-25	240-300

ENGINE REMOVAL

ENGINE REMOVAL: Disconnect hood-to-hinge bolts on each side and remove hood. Remove front bumper and supports from frame. Drain cooling system and disconnect radiator hoses at engine. Disconnect headlamps at junction block near hood latch. Remove battery and if car is equipped with air ducts, disconnect these at cowl. Remove front end sheet metal (see Front End Sheet Metal above) then proceed as follows:

1)—Raise car on hoist and disconnect the following: Propeller shaft from transmission companion flange. Transmission shift rods at transmission. Exhaust pipe support bracket, and hand brake cable from clutch housing. Overdrive control cable and wiring, and speedometer cable. Clutch cross shaft and bell-crank. Remove cross shaft to avoid damage. Remove rear engine mount (at transmission) to frame crossmember bolts.

2)—Lower car and disconnect heater hoses, electrical wiring at ignition coil, starter and generator, oil pressure gauge and temperature gauge engine units. Disconnect exhaust pipe from manifold, and throttle linkage at carburetor and remove bell-crank.

3)—Remove nuts and washers at forward engine mountings. Attach a sling or lifting hook approximately in center of block so front of engine is tilted up when lifting assembly out of car.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT SERVICING: Bearing Replacement—
▷*CAUTION*—4 Cyl. engine must be removed from car for bearing replacement (bearings "doweled" in case and crankshaft must be taken out to remove and install bearings). 6 Cyl. bearings not doweled in this manner.
Make certain that oil holes in bearings line up with oil holes in crankcase. On 4 cylinder, see that bearings fit snugly on dowel pins in crankcase and bearing caps.

Rear Bearing Oil Seal—Consists of a wick type packing installed in grooves in bearing cap and crankcase. To install new packing, insert packing in groove, use round piece of wood or steel to "roll" packing into groove, working from both ends toward center. With packing firmly seated in groove, cut off ends flush with surface. NOTE—Crankshaft must be removed to install packing in upper (crankcase) half of bearing.

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case. When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. CAUTION—Do not cut off this protruding portion of the packing.

Front (Timing Cover) Oil Seal—On all models, timing case cover (with double baffle and spring loaded leather seal) and crankshaft pulley (with polished surface for seal contact) used.

CHECKING CRANKSHAFT ALIGNMENT: Mount crankshaft in crankcase with all bearings in place except one. Mount dial indicator on crankcase with indicator button resting on bearing journal which has bearing removed. Slowly rotate crankshaft and note dial indicator reading. Install bearing and remove another bearing. Repeat operation with dial indicator until all journals are checked. The maximum allowable run-out is .002".

CAMSHAFT & BEARINGS

▷***1953 HENRY J 6 CYL. TIMING GEAR PRODUCTION CHANGE & 1951-53 REPLACEMENT PARTS CAUTION:*** Beginning 1953 Engine No. 3060100, new parts used as listed below and these parts can be used in previous engines with limitations noted.

	1st Part No.	Later Part No.
Camshaft	208798②	③214387
Camshaft Gear	208807④	⑤214388
Crankshaft Gear	208804⑥	⑦214389
Crankshaft Oil Slinger	208739⑧	⑨214390
Crankshaft Thrust Shim	208741	①214391

①—This new shim is .003" thick and when used with std. .002" shim (No. 208741) will make it possible to secure more precise adjustment of crankshaft endplay.
②—Gear mtg. trunnion length ⅞".
③—Gear mtg. trunnion length 1 7/32".
④—Tooth Width ⅞". ⑤—Tooth Width 1 1/16".
⑥—Tooth Width 29/32". ⑦—Tooth Width 1 5/32".
⑧—Diameter of flat face at center 2".
⑨—Diameter of flat face at center 1 13/16".

WHENEVER POSSIBLE, REPLACEMENT PARTS SHOULD MATCH ORIGINAL TYPE PARTS. Parts can be interchanged providing following combinations are maintained:

1) Old Camshaft and old Camshaft Gear.
2) New Camshaft and new Camshaft Gear.
3) Old Crankshaft Gear and old Slinger.
4) New Crankshaft Gear and new Slinger.
5) Any combination of new and old gears.

CAMSHAFT REMOVAL: Drain radiator and cylinder block, remove entire Front End Sheet Metal, or remove grille and radiator. Remove cylinder head, manifold, valves, and valve springs. Remove oil pump, fuel pump, fan blade assembly, and oil pan. Remove drive belt from water pump and crankshaft pulleys. Use puller W-175 to remove crankshaft pulley. Remove timing gear cover. Rotate camshaft gear until two thrust plate screws are visible through holes in timing gear. Remove screws from thrust plate. Retain all tappets in a raised position with wedges or wooden clothes pins and carefully remove camshaft.

Camshaft Front Bearing—Consists of a steel-backed, babbitt-lined bushing which takes thrust. When installing this bushing, make certain oil hole lines up with drilled oil hole in crankcase, stake bearing in place to prevent turning in service.

Camshaft Thrust Plate—Thrust plate is assembled on shaft behind camshaft gear with spacer between plate and camshaft front bearing journal. If required, thin shim can be installed behind spacer to increase clearance, or spacer can be dressed off to reduce clearance.

CAUTION—Install spacer with beveled inner edge toward rear.

VALVE SYSTEM

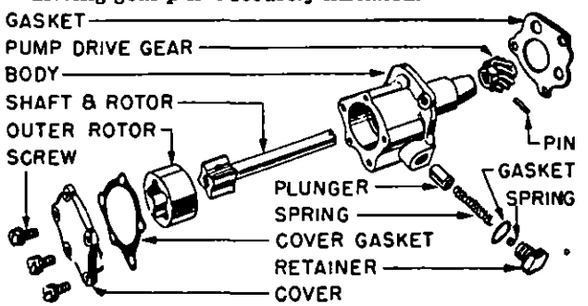
VALVE TAPPET ADJUSTMENT PROCEDURE: The following is the recommended order for adjusting tappets at room temperature. (Valves are counted from front of engine).

4-CYL. MODELS

Fully Raise Valve	Then ADJUST Valve
Nos. 1 and 3	Nos. 6 and 8
Nos. 2 and 5	Nos. 4 and 7
Nos. 6 and 8	Nos. 1 and 3
Nos. 4 and 7	Nos. 2 and 5

6-CYL. MODELS

Nos. 1 and 3	Nos. 10 and 12
Nos. 7 and 9	Nos. 4 and 6
Nos. 2 and 5	Nos. 8 and 11
Nos. 10 and 12	Nos. 1 and 3
Nos. 4 and 6	Nos. 7 and 9
Nos. 8 and 11	Nos. 2 and 5



OIL PUMP

ROTOR TYPE OIL PUMP: Pump mounted externally on left hand side of crankcase.

Pump Removal—Remove mounting screws in pump body flange, slide pump assembly out. To disassemble pump, remove cover screws and lockwashers, lift off cover, remove pump outer rotor. To remove shaft and rotor assembly, file off end of pin in drive gear hub, drive pin through shaft using a small drift, remove gear, withdraw shaft and rotor from housing. To remove oil regulator, remove hexagonal-headed plug on side of housing, withdraw regulator spring and plunger.

CAUTION—Do not lose adjusting shims located in plug above spring.

Pump Servicing & Assembly—Replace rotors if clearance between inner and outer rotor excessive, or if rotor clearance in housing excessive. Replace cover if rotor bearing surface is worn or scratched. Use new body and cover gaskets. Make certain that driving gear pin is securely installed.

HENRY J OIL PUMP

OIL PUMP INSTALLATION: Turn flywheel to #1 piston firing position with flywheel mark "IGN" centered in inspection hole in right front face of flywheel housing below starter. Turn distributor shaft to #1 firing position with distributor rotor finger opposite #1 terminal in distributor cap. Hold oil pump in same relative position as when installed on engine, turn pump shaft until tongue offset is upward (widest part of shaft down) and line up gear retaining pin with right hand side of slot in pump body. Slide pump into place on mounting studs, recheck rotor position. NOTE—If distributor rotor not at #1 terminal with pump installed, remove pump, turn shaft as required, and re-install.

OIL PAN REMOVAL

6 CYL. MODELS

OIL PAN REMOVAL: Drain radiator and remove upper and lower hoses. Remove nuts and washers securing engine front end plate to right and left front engine support insulators. Raise front of car, drain engine oil and remove tie rod from pitman arm. Loosen rear engine support insulator-to-crossmember bolts enough to prevent distortion of rear insulators when engine is raised. Attach hoist and raise front of engine until sufficient clearance is obtained between bottom of pan and front crossmember to remove pan. Remove right front engine support bracket and then remove oil pan.

OIL PAN INSTALLATION: Reverse removal procedure.

RADIATOR

RADIATOR REPLACEMENT: Drain cooling system and remove hoses. Take out three bolts at each side attaching radiator to cradle. On 4-Cyl. models, move fan shroud back out of way or remove this shroud. Lift radiator out.

►*ELECTRICAL EQUIPMENT CHANGE*—Delco-Remy used in place of Auto-Lite units beginning with Corsair Serial No. K-523-1203957. Inspect 1952 Vagabond models to identify equipment used. **Delco-Remy and Auto-Lite units are NOT interchangeable, even as complete sets.**

►*See Henry J 4 1952-53 following for data on Delco-Remy equipped cars. The following data pertains only to Auto-Lite equipped cars.*

HOOD ALIGNMENT: *See Henry J Special Data.*

FRONT END SHEET METAL ASSEMBLY REMOVAL: *See Henry J Special Data.*

MODEL IDENTIFICATION

	First Serial No.
1951 Models:	
All	1001 Up
1952 Models:	
K-523 Vagabond	K-523-1000001 Up
K-523 Corsair	K-523-1200001 Up

SERIAL NUMBER: On left front door hinge post. **Body Number Note**—Stamped on plate on right front upper firewall in engine compartment.

ENGINE NUMBER: Stamped on top of water pump boss at front of engine and on Engine Name Plate on right side of crankcase.

►*ENGINE NUMBER NOTE—Letters used with engine number are identified as follows:*

"A"—Denotes .010" Undersize main and connecting rod bearings.

"W"—.020" Oversize cylinder bore and pistons.

NOTE—Oversize bore engines were marked "N".

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. at cranking speed (Std. 7.0-1 Hd.). 10 lbs. max. variation between cylinders.

VACUUM READING: Steady 17-21" idling at 550 RPM.

FIRING ORDER: 1-3-4-2. See diagram.

SPARK PLUG GAP: .030".
Plug Type—Auto-Lite AN-7 (Std.). 14 mm. Tighten to 30 ft. lbs. torque.

DISTRIBUTOR: Auto-Lite No. IAT-4008 & 4008-A.
Breaker Gap—.020". Limits .018-.022".
Cam Angle—41°±1° closed.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

COIL: Auto-Lite No. CR-4009 & 4009A.
Ignition Current—2.5 amperes (idling), 4.8 amps. (stopped) at 6.3 volts.

CONDENSER: Auto-Lite No. IAT-3076L.
Capacity—.20-.25 microfarad.

IGNITION TIMING: 5° BTDC.
Timing Mark—(Early cars with Auto-Lite units). 5° mark before top dead center "TC" mark on flywheel.
(Later cars with Delco-Remy units). Notch on crankshaft pulley and two marks (TDC and 5° BTDC) on timing chain cover.

►*CAUTION*—Single timing chain cover mark on first Delco-Remy-equipped cars is TDC and is not used for timing. *See Ignition Timing for reworking of timing mark.*
Timing Procedure—*See Ignition Timing.*
CAUTION—Engine must be idling below 550 RPM. when setting timing.

CARBURETION: Carter YF-820S, SA, SB. 1¼" Single Barrel, Downdraft types. Identical in appearance with YF-814 & 833S (6 cyl.) but not interchangeable.
Idle Setting—½-1½ turns open. Turn screw out for richer mixture.
Idle Speed—550 RPM.
Float Level—9/32" from top of float at free end to bowl cover when needle is seated (assembly inverted).
Accelerating Pump—No seasonal adjustment.

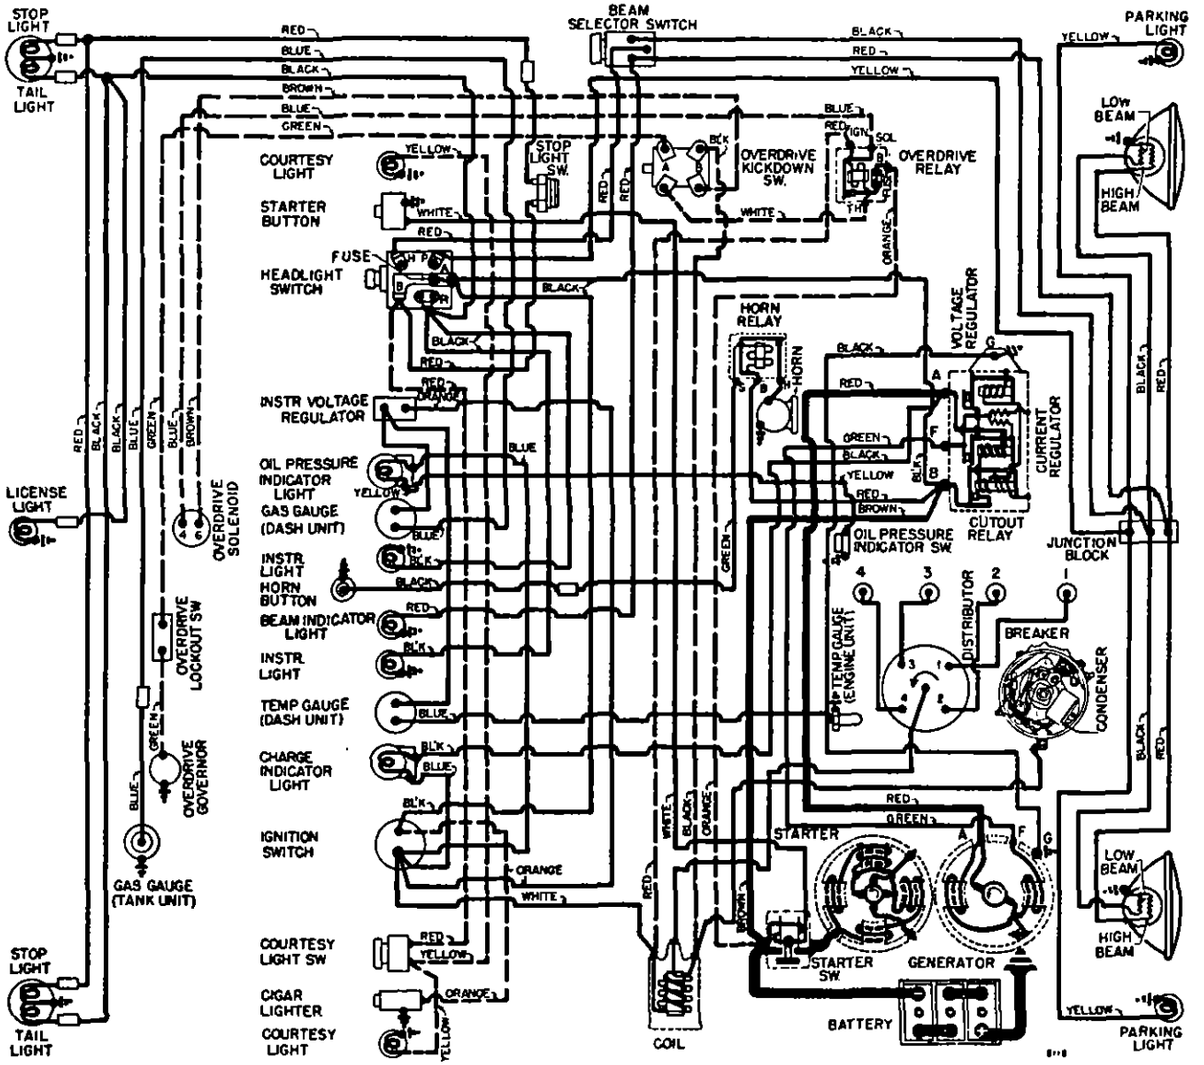
Fuel Pump Pressure: 3½-4½ lbs. fast idle.

CRANKCASE VENTILATOR: Remove and clean Vacuum Control Valve on manifold. *See Crankcase Ventilator (following CARB. EQUIPMENT) for data.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type.
See that valve operates freely.

VALVE TAPPET CLEARANCE: .016" All Valves, Cold.

►**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*
NOTE—Tappet adjusting screws self-locking. Remove left front wheel and access hole cover in splash shield for access when adjusting valves.



IGNITION

IGNITION SWITCH: K-F No. 212063

COIL: Auto-Lite CR-4009 & 4009A. On right side of engine to rear of distributor.
Ignition Current—2.5 amperes (idling). 4.8 amps. (stopped) at 6.3 volts.

CONDENSER: Auto-Lite Part No. IAT-3076L.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite IAT-4008 or IAT-4008A.
New "Pivoted Breaker Plate" type. Full automatic

advance with auxiliary vacuum spark control.
See Electrical Equipment Section for complete data.

Breaker Gap—.020". Limits .018-.022".
Cam Angle—41°±1° closed.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IAT-4008

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	300	0	600
1	400	2	800
4	650	8	1300
10	1800	20	3600
11	2000	22	4000

Automatic Advance—IAT-4008-A

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	350	0°	700
2°	560	4°	1120
5°	875	10°	1750
8°	1190	16°	2380
11°	1500	22°	3000

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance—IAT-4008

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4¾
1	2	5⅜
3	6	6¾
4	8	7⅜
5	10	8

Vacuum Advance—IAT-4008-A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Distributor Removal: Distributor located on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

►*CAUTION—If Oil Pump removed, refer to Oil Pump Installation directions in Henry J Special Data.*

IGNITION TIMING

Std. Setting ..... **5° BTDC.**
Timing Mark—(Early cars with Auto-Lite units)—Timing mark on flywheel. Consists of "TC" mark at top dead center with a 5° mark before this point.
Timing (Timing Light C-693): Connect light to #1 spark plug terminal and direct light at timing mark. Idle engine at lowest possible smooth idle speed (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw extending upward through 45° slot in arm under distributor. Advance or retard distributor until timing mark appears in line with index mark on edge of flash hole, tighten cap screw.

►*CAUTION—Reset engine idling speed at 550 RPM.*

CARBURETOR

Carter YF-820S, SA, SB—1¼" Single Barrel, Downdraft types. Identical in appearance with YF-814 & 833S (6 cyl.) but not interchangeable.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Carter Single Barrel.
See Carburetion Equipment Section for complete data.
Setting—With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.

CARB. EQUIPMENT

Air Cleaner: United Specialties. K-F No. 212749 Oil-wetted type Std., Oil-bath type Optl.

Fuel Pump (Std.): Carter M807S. Diaphragm type.
Optl.—Carter No. M809S combination Fuel-and-Vacuum Pump.
See Carburetion Equipment Section for complete data.
Pressure—3½-4½ lbs. fast idle. At 1000 RPM should be 3-4¼ lbs. If more than 4½ lbs., adjust by adding gaskets between pump and cylinder block.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 45574.
Tank Unit—K-S No. 45567.
See Carburetion Equipment Section for complete data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air Intake Pipe (from air cleaner to **oil filler pipe**) furnishes clean air to crankcase and Air Outlet Pipe (from valve chamber cover to intake manifold) allows fumes from crankcase to be sucked into intake manifold. There is a vacuum control valve at the manifold connection and this valve **must close at idling speed** for satisfactory engine idling performance.

Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. When vacuum control valve is clogged, pressure will build up in crankcase. When not seating, idle will be unsatisfactory. Remove and clean vacuum control valve and air outlet pipe when tuning engine or if system operating incorrectly.

Vacuum Control Valve—Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold. Disassemble valve by clamping in vise and removing top, withdraw valve and spring. Clean valve and valve seat thoroughly. Reassemble and re-install unit.

BATTERY

Auto-Lite Type IM-109D or Willard HW-1-100—6 volt, 15 plate, 100 ampere hour capacity (20 Hour Rate).
Grounded Terminal—Positive (+) terminal grounded at right front engine support. Engine ground cable connected at same point.
Location—In engine compt. on right side.

STARTER

Auto-Lite Model MZ-4163. Armature No. MZ-2237. Four field, 4 brush type with magnetic switch on starter.
Drive—Barrel type Bendix Drive No. A2089.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 "	Lock	2.0	280

Starting Switch: Auto-Lite No. SS-4014 solenoid operated, mounted on motor near starter and controlled by push-button on instrument panel.
Removal: Flange mounted on right front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws and bracket screw.

GENERATOR

Auto-Lite No. GDZ-6001-E. Armature No. GGY-2006F. Two-brush type with voltage and current regulation.
Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—35 amperes, cold, at 8.0 volts, 1800-2000 RPM.

Performance Data

Amperes	Volts	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.3-1.5 amperes at 5.0 volts.
Motoring Current—*3.9-4.4 amperes at 5.0 volts.*

Removal: Pivot mounting at right front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts.

Belt Adjustment: Loosen clamp and pivot bolts, swing generator out away from engine to 15 lbs. pull on scale in line with adjusting bracket.

Generator Indicator: Warning light (under RED plastic) burns red when ignition switch turned on and goes out when cutout relay closes.

REGULAT R

Auto-Lite Model VRP-6001-A. Vibrating type voltage and current regulator.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cuts In—6.4-6.9 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with arm against stop.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Air Gap—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Beam Indicator—Red jewel at top of speedometer dial. Lighted when upper (country beams) in use.

Direction Signal: (Optl.)—Guide Light Division make.
See Electrical Equipment Section for complete data.
Direction Indicators—Right and left indicator lights on lower face of speedometer. Lighted when direction signal on same side of car in operation.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Switches

Lighting—K-F No. 212091
Beam Selector—K-F No. 204545
Courtesy Light (Optl.)—K-F No. 200821

MISC. ELECTRICAL

FUSES: Lighting—30 ampere. On back of switch.
Overdrive—20 amperes. On control relay.
Heater—14 amperes.
Radio—14 amperes.

HORNS: Delco-Remy No. 1999639 (Low Note), 1999640 (High Note). Matched tone twin horns with relay.
Horn Relay—K-F No. 212080.

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter unit designed to maintain constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is connected in gauge feed circuit.

ENGINE

▷***ENGINE PARTS CHANGE*—(Models equipped with Delco-Remy units).** Cylinder block, rear end plate, flywheel and ring gear, clutch housing and fan were changed to adapt to new electrical units, and are NOT interchangeable with corresponding parts on Auto-Lite-equipped engines.

ENGINE SPECIFICATIONS: K-F Model 4L-134. Four cylinder Supersonic "L" head type.
Bore—3⅛" or 3.125".
Stroke—4⅜".
Displacement—134.2 cu. ins. **Rated HP**—15.63.
Developed Horsepower—68 at 4000 RPM.
Compression Ratio—7.0-1.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Henry J Special Data.*

ENGINE REMOVAL: *See Henry J Special Data.*

OIL PAN REMOVAL: *See Henry J Special Data.*

CYLINDER HEAD INSTALLATION: *See Henry J Special Data.*

PISTONS: Aluminum alloy, "T" slot, Cam ground, tin- or brass-plated type with heat insulation groove above top ring groove.
Length—3¾".
Weight—12.7 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top land .017-.019". Skirt .003".
CAUTION—Pistons must not be "lapped" in (will destroy tin-plated surface).

Replacement Pistons: Std. & .010", .020", .030", .040" oversize.

Fitting New Pistons: Use .0015" x ½" feeler gauge inserted between piston and cylinder wall on opposite side to "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70° F.

Fitting Used Pistons: Use .003" x ¾" feeler gauge inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Upper Comp.	3/32"	.007-.020"	.002-.004"
Lower Comp.	3/32"	.007-.020"	.003-.007"
Oil	3/16"	.007-.020"	.006-.010"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: Furnished in sets for following oversize ranges: Std.-to-.009", .010"-to-.029", .030"-to-.039", .040"-to-.049", .050"-to-.069".

PISTON PIN: Pin is locked in rod by clampscrew.
Diameter—.8118-.8120". **Length**—2.7813".
Pin Fit In Piston—.0002-.0006" clearance or light thumb push fit with piston and pin at 70°F.

Replacement Pins: No oversizes are available.

CONNECTING ROD: Length—9.1845-9.1905". **Weight**—39.41 ozs. NOTE—Rods are offset and are not interchangeable.

▷***CRANKSHAFT JOURNAL UNDERSIZE CAUTION*—*Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.***
Crankpin Journal Diameter—1.9375-1.9385".
Lower Bearing—Steel-backed, babbitt-lined, replaceable precision type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.
Clearance—.0005-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: None. (No shims.) Replace bearings. Do not file connecting rods or bearing caps.
NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: .001", .002", .010", .012" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in lower end of rod toward right of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type with removable counterweights.

▷***CRANKSHAFT JOURNAL UNDERSIZE CAUTION*—*Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.***
Journal Diameters—2.3331-2.3341" (all bearings).
Bearings—Steel-backed, babbitt-lined, replaceable precision type. Bearing shells are dowelled in bearing caps and crankcase.
Clearance—.0009-.0029".
NOTE—Replace bearings when clearance exceeds .008" or when endplay exceeds .018".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instructions in Henry J Special Data.*
NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing.

Replacement Bearings: .001", .002", .010" Undersize.

Oil Seals: Rear main bearing oil seal is wick type packing in groove in crankcase and rear main bearing cap.
Oil Seal Installation—*See Henry J Special Data.*

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft gear thrustwasher and shoulder on crankshaft at front of flanged front bearing.
NOTE—Crankshaft gear must be removed with a gear puller in order to make endplay adjustments.
Endplay—.004-.008".

CAMSHAFT: Four bearing, helical gear drive. Pressed-on type fibre gear.
Journal Diameters—(1) 2.1855-2.1860"; (2) 2.1215-2.1225"; (3) 2.0590-2.0600"; (4) 1.6225-1.6230".
Bearings—Removable steel-backed, babbitt-lined bushing (front), all others machined in block.
Clearance—.001-.0025" (front bearing).
Camshaft Removal—*See Henry J Special Data.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled between plate and camshaft journal.
Endplay—.003-.0055".

Timing Gears: Crankshaft gear cast iron. Camshaft gear fibre with steel hub.
Timing Gear Backlash—.000-.002".

Camshaft Setting: Mesh gears with marked tooth of camshaft gear opposite marked space between gear teeth on crankshaft gear.

VALVES:	Head Diam.	Stem. Diam.	Length
Intake	1 17/32"	.373"	5 57/64"
Exhaust	1 15/32"	.3725"	5 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.0025-.0045"

Valve Seat Width—1/16" to 5/64" (Intake). 3/32" to 7/64" (Exhaust).

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place to following dimensions:
Intake Guide—Top of guide 1 5/16" below top face of block. The shorter smaller-diameter section end of guide should be up. Ream to .3745-.3755" I.D.
Exhaust Guide—Top of guide 1" below top face of block. Taper end (counter-bored end) of guide should be up. Ream guide to .3745-.3755" I.D.

Valve Springs: Two close-wound coils toward top of block. Install springs with closed-coil end up toward cylinder block. Spring free length 2½".

	Spring Pressure	Length
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

Valve Lifters: Mushroom type with self-locking screws, operating in reamed holes in block. Access hole in cover in left front splash shield. Serviced by installing oversize lifters.
Lifter Diameter—.6240-.6245".
Lifter Clearance—Select Fit with slight drag.
NOTE—Camshaft must be removed for lifter removal. *See Camshaft Removal instructions in Henry J Special Data.*

VALVE TIMING

Tappet Clearance: .016" All Valves, Cold.

▷**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—With .020" tappet clearance on #1 intake valve. This valve should open with #1 piston at 9° or .039" BTDC. with flywheel mark "I.O." centered in inspection hole in right front face of flywheel housing. Reset tappet clearance at .016"

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, and to timing gears.
Crankcase Capacity—4 qts. refill.
Normal Oil Pressure—35 lbs. at 30 MPH.
Oil Pressure Regulator—Opens at 28-40 lbs. Located on oil pump cover. Adjustable by removing or adding shims between valve retainer and spring.

Oil Pan Removal: *See Henry J Special Data.*

Oil Pump: External Rotor type with floating oil intake. Mounted externally on left side of crankcase.
Oil Pump Servicing—*See Henry J Special Data.*

Oil Pressure Gauge: Indicator light on instrument panel. Controlled by King-Seeley Engine Unit. Light glows RED until oil pressure rises above 13 lbs.
Engine Unit—King-Seeley No. 47100. Pressure Switch. Contacts open at 13 lbs. (remain closed with lower oil pressure).

COOLING

Cooling System: Pressure type. Relief valve in cap optl. equipment.
Capacity—10½ qts. (11½ qts. with heater).
Pressure Cap (Optl.)—For high altitudes or extremely hot temperatures.

Radiator Removal: *See "Radiator" in Henry J Special Data.*

Water Pump: Centrifugal, belt-driven, packless type with sealed ball bearing shaft.
See Water Pump Section for complete data.
Removal—Loosen drive belt adjustment, remove belt, disconnect hose. Remove pump mounting screws and lift out pump and fan assembly.

Thermostat: Harrison. In outlet elbow on cylinder head. No by-pass.
Std.—Stamped '151'. Starts to open at 149-156°F. Fully open at 176°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) Electric type with voltage regulator.
Dash Unit—King-Seeley No. 45577.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-37 or Rockford Model 8½ RM with Borg & Beck Driven Member. Single plate dry disc type.
Clutch Identification—Types can be identified by number of pressure plate springs—3 (for Auburn), 6 (Rockford).
See Clutch Section for complete data.
Facings (Auburn)—Molded metallic or Raybestos. 2 required" I.D. 5⅜". O.D. 8½". Thickness .305".
Facings (B&B on Rockford Clutch)—Woven Asbestos. 2 required. I.D. 5⅜". O.D. 8½". Thickness .132-138".

Pedal Adjustment: Free travel 1" measured at pedal rod. Adjust as follows: (1) Clearance between rounded forward end of release fork adjusting rod and clutch housing when release bearing just contacting clutch levers should be ⅝". If less than ½", adjust to ⅝" by changing release fork adjusting rod length (more accessible by removing bellcrank from pivot with rod attached—grease bellcrank pivot before re-installing). (2) Connect and adjust length of pedal rod at trunnion end on bellcrank for required 1" free pedal travel.

Removal: Remove transmission (see Transmission Removal). Free clutch pedal adjusting rod at trunnion end of bellcrank. Remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws to clutch cover flange (turn all screws out evenly). remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS40-T96. Model AS41-T96 with new Type R10B Overdrive (Optl.). Constant-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever mounted on steering column.

Removal: Support car on stands, drain transmission case (and overdrive case). Disconnect both shift rods at levers on transmission case (on overdrive cars, disconnect control cable from lever on overdrive case and electrical wiring at solenoid and lockout switch). Remove two capscrews and washers attaching clutch cross-shaft support bracket to transmission and remove bracket. Disconnect speedometer cable. Disconnect propeller shaft by taking off four nuts attaching front universal joint to yoke (CAUTION—tape needle bearing retainers in place to prevent entry of dirt or loss of bearings), tie propeller shaft up out of the way. Remove two capscrews attaching rear mounting insulator to cross-member, support rear end of engine (Support Tool KF-104) and raise engine just enough to remove weight from cross-member. Disconnect clutch realease bearing return spring from transmission (accessible through opening in right side of clutch housing). Remove four nuts attaching transmission to clutch housing, pull transmission straight back and remove from beneath car.

OVERDRIVE

Warner Type R10B (with special AS41-T96 Transmission)—Optl. equipment. New solenoid operated, governor controlled with throttle "kick-down."
NOTE—Overdrive is new "centered ring gear" type with one rear bearing only.
Control Relay—K-F No. 207923
Overdrive Governor—K-F No. 212385
Kick-down Switch—K-F No. 207924
Overdrive Solenoid—Warner 4AR10B-62.
See Transmission Section for complete data.

Removal: Overdrive and transmission are removed as a unit. See Transmission Removal above.

UNIVERSALS

Spicer Model with needle bearing.
Spicer No. 10275-1SF. Needle bearing type.

REAR AXLE

Spicer (Salisbury) Model 23-6, Part No. 2125-1; or Model 23-6, Part No. 2125-2 with O.D.—Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratios—4.55 (Early Std.), 4.27-1 (Later Std.), 4.55-1 (Overdrive).
Backlash—.001-.005".

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers at spring seat, disconnect parking brake cables. Take out "U" spring bolts, disconnect both springs at rear shackle, remove axle from beneath car.

Axle Shaft Removal: Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out, using Axle Shaft Puller KF-15 (with Adapter SP-341 required).

SHOCK ABSORBERS

Monroe—Direct Acting, hydraulic two-way type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—4½° preferred. Limits 4-4¾°.
Caster—0° preferred (±1°). Adjust by adding half shim under upper control arm at frame mounting bolt (rear bolt for Pos., front bolt for Neg. caster).
Camber—½° preferred (¼°-1° Pos. limits). Adjust by adding or removing whole shim under upper control arm at frame mounting bolts.
Toe-In—¼" (3/16-1/4" limits). Adjust by turning sleeve at outer end of each tie rod equally.
Steering Geometry (Toe-out)—Inner wheel 20°. Outer wheel 17°31'. No adjustment.

STEERING GEAR

Own Make (Gemmer 305 Type)—Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.
Drums—Composite (cast-iron & steel). Diameter 9".
Lining—Molded type. Width 2". Thickness 3/16". Length per Shoe—9.87" (Forward Shoe—all wheels), 7.62" (Rear Shoe—all wheels).
Clearance—Shoe eccentric backed off to point where wheel turns freely.

Hand Brake: See Service Brake data (above).

MISC. MECHANICAL

Windshield Wiper: Vacuum type.
See Miscellaneous Section for complete data.

▷*ELECTRICAL EQUIPMENT CHANGE*—Delco-Remy units used in place of Auto-Lite units beginning with Corsair deLuxe Serial No. K-524-1205339. Inspect 1952 Vagabond deLuxe models to identify equipment used. **Delco-Remy and Auto-Lite units are NOT interchangeable, even as complete sets.**

▷*See Henry J 6 1952-53 following for data on Delco-Remy equipped cars. The following data pertains only to Auto-Lite equipped cars.*

HOOD ALIGNMENT: *See Henry J Special Data.*

FRONT END SHEET METAL ASSEMBLY REMOVAL: *See Henry J Special Data.*

MODEL IDENTIFICATION

1951 Models:	First Serial No.
All	1001 Up
1952 Models:	
K-524 Vagabond deLuxe	K-524-1000001 Up
K-524 Corsair deLuxe	K-524-1200001 Up

SERIAL NUMBER: On left front door hinge post.
Body Number Note—Stamped on plate on right front firewall in engine compartment.

ENGINE NUMBER: Stamped on pad on right front upper corner of cylinder block and on Engine Name Plate on right side of crankcase.

▷*ENGINE NUMBER NOTE—Letters used with engine number are identified as follows:*
"A"—Denotes .010" Undersize main and connecting rod bearings.
"W"—.020" Oversize cylinder bore and pistons.
NOTE—Oversize bore engines were marked "N".

TUNE-UP

COMPRESSION PRESSURE: 130-140 lbs. at cranking speed (Std. 7.0-1 Hd.). 10 lbs. max. variation between cylinders.

VACUUM READING: Steady 18-21" idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAP: .030".
Plug Type—Auto-Lite AN-7 (Std.). 14 mm. Tighten to 30 ft. lbs. torque.

DISTRIBUTOR: Auto-Lite No. IAT-4007.
Breaker Gap—.020". Limits .018-.022".
Cam Angle—38° ± 1° closed.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*

COIL: Auto-Lite No. CR-4009 & 4009A.
Ignition Current (Auto-Lite)—2.5 amperes (idling), 4.8 amperes (stopped) at 6.3 volts.

CONDENSER: Auto-Lite IAT-3076L.
Capacity—.020-.25 microfarad.

IGNITION TIMING: 5° BTDC. *This setting supersedes former TDC setting. See FINAL SETTING below.*
Timing Mark—Crankshaft dampener marked with "0" at TDC. and there are 20—1° graduations BTDC, and 5—1° graduations ATDC.

▷*CAUTION—Disconnect distributor vacuum advance tube when checking timing.*

Timing Procedure—*See Ignition Timing.*

Final Setting—After setting timing at 5° BTDC., road test car and check for excessive ping under low speed, full throttle conditions. If ping excessive, retard ignition timing to point where only faint ping noted under these conditions.

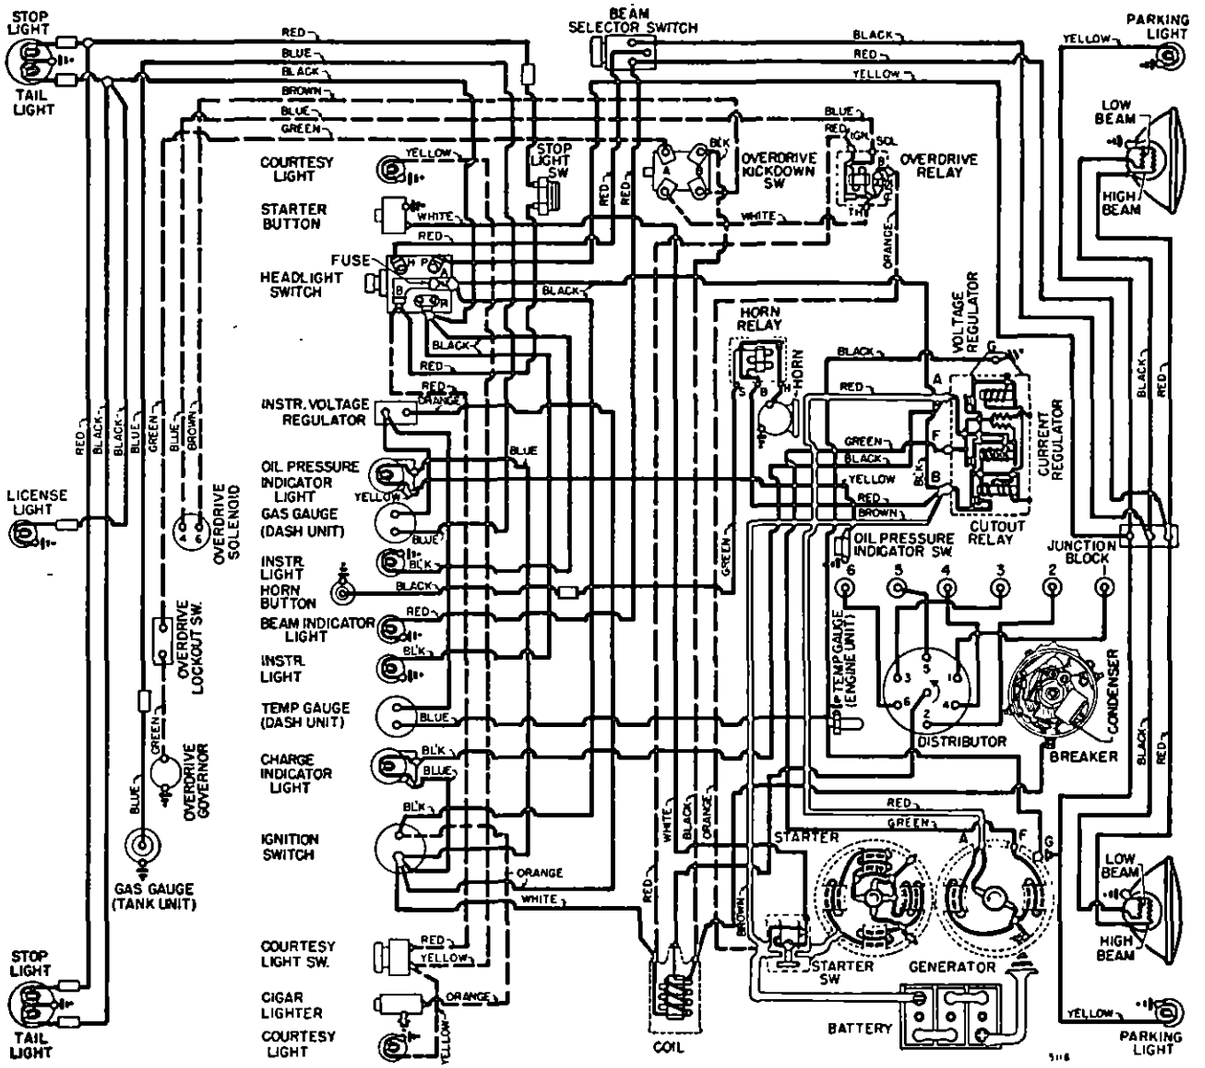
CARBURETION: Carter YF No. 814S (First Cars), No. 833S, SA, SB (Late Cars). 1¼" Single Barrel, Downdraft types. Identical in appearance with YF-820S, SA, SB (4 cyl.) but not interchangeable.
Idle Setting—1-2 turns open. Turn screw out for richer mixture.
Idle Speed—550 RPM.
Float Level—9/32" from top of float at free end to bowl cover when needle is seated (assembly inverted).
Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 3½-4½ lbs. fast idle.

CRANKCASE VENTILATOR: Remove and clean Vacuum Control valve on manifold. *See Crankcase Ventilator (following CARB. EQUIPMENT) for data.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .016" All Valves, Cold.



▷**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*
NOTE—Tappet adjusting screws self-locking. Remove left front wheel and access hole cover in splash shield for access when adjusting valves.
Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: K-F No. 212063

COIL: Auto-Lite No. CR-4009, 4009A. On right side of engine to rear of distributor.
Ignition Current—2.5 amperes (idling). 4.8 amps. (stopped) at 6.3 volts.

CONDENSER: Auto-Lite No. IAT-3076L.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite No. IAT-4007. New "Pivoted Breaker Plate" type. Full automatic advance with auxiliary vacuum spark control.
See Electrical Equipment Section for data.
Breaker Gap—.020". Limits .018-.022".
Cam Angle—38° ± 1° closed (at 300 RPM).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	350	0°	700
1°	380	2°	760
7°	550	14°	1100
11°	1300	22°	2600
12°	1500	24°	3000

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
1°	2°	5½"
3°	6°	9¼"
5°	10°	13"
6°	12°	15"

Distributor Removal: Distributor located on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.
►*CAUTION—If Oil Pump removed, refer to Oil Pump Installation directions in Henry J Special Data.*

IGNITION TIMING

Std. Setting (See Change Note).....5° BTDC.
►*IGNITION TIMING CHANGE—Setting above (5°BTDC) supersedes former setting (TDC) and should be checked by road-testing car. See FINAL SETTING.*
Timing Mark—Crankshaft dampener marked with "O" at TDC. and there are 20—1° graduations BTDC and 5—1° graduations ATDC.
Timing with Timing Light (C-693)—Mark correct graduation on vibration dampener with chalk or paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine at lowest possible smooth idle speed (back off throttle stopscrew to decrease normal idle speed of 550 RPM). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw extending upward through 45° slot in arm under distributor. Advance or retard distributor until timing mark appears in line with pointer at front of engine. Tighten cap screw and recheck timing.
Final Setting—After setting timing at 5° BTDC., road test car and check for excessive ping under low speed, full throttle conditions. If ping excessive, retard ignition itiming to point where only faint ping noted under these conditions.
►*CAUTION—Reset engine idling speed at 550 RPM.*

CARBURETOR

Carter YF No. 814S (First Cars), No. 833S, SA, SB (Late Cars). 1¼" Single barrel. Downdraft types. Identical in appearance with YF-820S, SA, SB (4 Cyl.) but not interchangeable.
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*
Fast Idle: Carter Single Barrel.
See Carburetion Equipment Section for complete data.
Setting—With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.

CARB. EQUIPMENT

Air Cleaner: United Specialties. K-F No. 212749 Oil-wetted type Std., Oil-bath type Optl.
Fuel Pump (Std.): Carter No. M807S Diaphragm type.
Optl.—Carter No. M809S combination Fuel-and-Vacuum Pump.
See Carburetion Equipment Section for complete data.
Pressure—3½-4½ lbs. fast idle. At 1000 RPM should be 3-4½ lbs. If more than 4½ lbs., adjust by adding gaskets between pump and cylinder block.
Vacuum—Not less than 6" at fuel pump inlet while cranking engine. 8" at 120 fuel pump RPM or 10½" at 1800 RPM.
Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 45574.
Tank Unit—K-S No. 45567.
See Carburetion Equipment Section for complete data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air Intake Pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase and Air Outlet Pipe (from valve chamber cover to intake manifold) allows fumes from crankcase to be sucked into intake manifold. There is a vacuum control valve at the manifold connection and this valve must close at idling speed for satisfactory engine idling performance.
Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. When vacuum control valve is clogged, pressure will build up in crankcase. When not seating, idle will be unsatisfactory. Remove and clean vacuum control valve and air outlet pipe when tuning engine or if system operating incorrectly.
Vacuum Control Valve—Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold. Disassemble valve by clamping in vise and removing top, withdraw valve and spring. Clean valve and valve seat thoroughly. Reassemble and re-install unit.

BATTERY

Auto-Lite Type IM-100D & Willard HW-1-100—6 volt, 15 plate, 100 Ampere Hour Capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal grounded at right front engine support. Engine ground cable connected at same point.
Location—In engine compt. on right side.

STARTER

Auto-Lite Model MZ-4163. Armature No. MZ-2237. Four-field, 4-brush type with magnetic switch in starter.
Drive—Barrel type Bendix Drive No. A2089.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 "	Lock	2.0	280

Starting Switch: Auto-Lite No. SS-4014 solenoid operated, mounted on motor near starter and controlled by push-button on instrument panel.
Removal: Flange mounted on right front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws and bracket screw.

GENERAT R

Auto-Lite No. GDZ-6001-E. Armature No. GGY-2006F. Two-brush type with voltage and current regulation.
Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—35 amperes, cold, at 8.0 volts, 1800-2000 RPM.

Performance Data

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 950-1050
35	8.0	1800-2000 2150-2350

Rotation—Counter-clockwise at commutator end.
***Brush Spring Tension**—35-53 ozs. (new brushes).*
Field Current—1.3-1.5 amperes at 5.0 volts.
Motoring Current—3.9-4.4 amperes at 5.0 volts.
Removal: Pivot mounting at right front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts.
Belt Adjustment: Loosen clamp and pivot bolts, swing generator out away from engine to 15 lbs. pull on scale in line with adjusting bracket.
Generator Indicator: Warning light (under RED plastic) burns red when ignition switch turned on and goes out when cutout relay closes.

REGULAT R

Auto-Lite Model VRP-6001-A. Vibrating type voltage and current regulator.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cut In—6.4-6.9 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015"minimum.
Air Gap—.031-.034" with arm against stop.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Air Gap—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch. **Adjustment**—Aim upper beam straigh ahead (hot spot center 3" below lamp center height at 25 ft.). **Beam Indicator**—Red jewel at top of speedometer dial. Lighted when upper (country beams) in use.
Direction Signal: (Optl.)—Guide Light Division make.
See Electrical Equipment Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Direction Indicators—Right and left indicator lights on lower face of speedometer. Lighted when direction signal on same side of car in operation.

Switches

Lighting—K-F No. 212091
Beam Selector—K-F No. 204545
Courtesy Light (Optl.)—K-F No. 200821

MISC. ELECTRICAL

FUSES: Lighting—30 ampere on back of switch.
Overdrive—20 amperes. On control relay.
Heater—14 amperes.
Radio—14 amperes.

HORNS: Delco-Remy No. 1999639 (Low Note), 1999640 (High Note). Matched tone twin horns with relay.
Horn Relay—K-F No. 212080.

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter unit designed to maintain constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is connected in gauge feed circuit. See wiring diagram.

ENGINE

▷*ENGINE PARTS CHANGE*—**(Models equipped with Delco-Remy units).** Cylinder block rear end plate, flywheel, ring gear and clutch housing were changed to adapt to new electrical units, and are NOT interchangeable with corresponding parts on Auto-Lite-equipped engines.

ENGINE SPECIFICATIONS: K-F Model 6L-161. Six cylinder Supersonic "L" head type.
Bore—3⅛" or 3.125".
Stroke—3½".
Displacement—161.0 cu. ins. **Rated HP.**—23.44.
Developed Horsepower—80 at 3800 RPM.
Compression Ratio—7.0-1.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Henry J Special Data.*

CYLINDER HEAD INSTALLATION: *See Henry J Special Data.*

ENGINE REMOVAL: *See Henry J Special Data.*

OIL PAN REMOVAL: *See Henry J Special data.*

PISTONS: Aluminum alloy, "T" slot, cam ground, tin-plated type with heat insulation groove above top ring groove.

▷*PISTON OVERSIZE NOTE—The letter "W" included with engine number indicates that all pistons are .020" OVERSIZE. See "Engine Number Note."*
Length—3".
Weight—10.8 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top land .018-.021". Skirt .0021".
CAUTION—Pistons must not be "lapped" in (will destroy tin-plated surface).

Replacement Pistons: Std. & .010", .020", .030", .040" oversize.

Fitting New Pistons: Use .0015" feeler stock, ½" wide, inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Fitting Used Pistons: Use .004" x ½" feeler gauge inserted between piston and cylinder wall on opposite side of "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Upper Comp.	3/32"	.007-.020"	.002-.004"
Lower Comp.	3/32"	.007-.020"	.003-.007"
Oil	3/16"	.007-.020"	.006-.010"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: Furnished in sets for following oversize ranges: Std.-to-.009", .010"-to-.029", .030"-to-.039", .040"-to-.049", .050"-to-.069".

PISTON PIN: Pin clamped in rod by clampscrew.
Diameter—.7494-.7496". **Length**—2.6563".
Pin Fit in Piston—.0002-.006". clearance, or light thumb press fit with piston and pin at 70°F.

Replacement Pins: No Oversizes are available.

CONNECTING ROD Length—6.345". **Weight** 22.5 ozs.
NOTE—Rods are not offset and are interchangeable.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main and connecting rod journals are .010" UNDERSIZE.*
Crankpin Journal Diameter—1.874-1.875".
Lower Bearing—Steel-backed, babbit-lined, replaceable precision type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.
Clearance—.0005-.0025". **Sideplay**—.002-.008".

Bearing Adjustment: None (no shims). Replace bearings. Do not file connecting rods or bearing caps. NOTE—Replace Bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: .001", .002", .010", .012" Undersize.

Installing Rods: Rods not offset. Install with oil spray hole in lower end toward right (away from camshaft) on all rods.

CRANKSHAFT: Four-bearing type with integral counter-weights. Vibration dampener on forward end.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main and connecting rod journals are .010" UNDERSIZE.*
Journal Diameters—2.249-2.250" (all bearings).
Bearings—Steel-backed, babbit-lined, replaceable precision type.
NOTE—Bearing shells are NOT dowelled on 6 cylinder engine. They can be removed and replaced without removing crankshaft.
Clearance—.0009-.0030".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instruction in Henry J Special Data.*

Replacement Bearings: .001", .002", .010" Undersize.

Oil Seals: Rear main bearing oil seal is wick type packing in groove in crankcase and rear main bearing cap.
Oil Seal Installation—*See Henry J Special Data.*

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft gear thrust washer and shoulder on crankshaft at front of flanged front bearing.

▷*ENDPLAY ADJUSTMENT CAUTION: See "Camshaft & Bearings" in Henry J Special Data for new timing gear, oil slinger, and adjusting shims used with new type camshaft and gear used for replacement.*
Endplay—.004-.008".

CAMSHAFT: Four-bearing, helical gear drive. Pressed-on type fibre gear.

▷*CAMSHAFT REPLACEMENT PARTS CAUTION—See "Camshafts & Bearings" in Henry J Special Data for new type camshaft and timing gear and non-interchangeability of parts.*
Journal Diameters—#1, 1.8755-1.8760"; #2, 1.8425-1.8435", #3, 1.8110-1.8120"; #4, 1.6245-1.6250".
Bearings—Removable steel-backed, babbit-lined bushing (front), machined in crankcase (all others).
Clearance—.001-.0025".
Camshaft Removal—*See Henry J Special Data.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled between plate and camshaft journal.
Endplay—.003-.0055".

Timing Gears: Crankshaft gear cast iron. Camshaft gear fibre with steel hub.

▷*TIMING GEAR REPLACEMENT PARTS CAUTION*—**See "Camshaft & Bearings" in HenryJ SpecialData for new gears used with later type camshaft and interchangeability of parts.**
Timing Gear Backlash—.000-.002".

Camshaft Setting: Mesh gears with marked tooth of camshaft gear opposite marked space between gear teeth on crankshaft gear.

VALVES:	Head Diam.	Stem. Diam.	Length
Intake	1 3/8"	.3410"	4 9/16"
Exhaust	1 9/32"	.3400"	4 9/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.284"	.0015-.00325"
Exhaust	45°	.300"	.0025-.0045"

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place. Upper end 7/8" below upper edge of valve seat (taper end up).

Valve Springs: Springs can be installed with either end up. Free length 1 57/64".

	Spring Pressure	Length
Valve Closed	50 lbs.	1 5/8"
Valve Open	105 lbs.	1 21/64"

Valve Lifters: Mushroom type with self-locking screws, operating in reamed holes in block. Serviced by installing oversize lifters.
NOTE—Camshaft must be removed for lifter removal. *See Camshaft Removal instructions in Henry J Special Data.*
Lifter Diameter—.597-.605". **Length**—2".
Clearance in Block—.0005-.002".

VALVE TIMING

Tappet Clearance: .016" All Valves, Cold.

▷**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—With .020" tappet clearance on #1 intake valve, this valve should open with piston 5° before top dead center with five-degree mark before dead center "0" mark on dampener aligned with pointer at front of engine. Reset tappet clearance at .016".

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, and to timing gears.

Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—30-40 lbs. at 30 MPH.

Oil Pressure Regulator—Opens at 40 lbs. Located on oil pump cover. Adjustable by removing or adding shims between valve retainer and spring.

Oil Pan Removal: *See Henry J Special Data.*

Oil Pump: External Rotor type with floating oil intake. Mounted externally on left side of crankcase.

Oil Pump Servicing—*See Henry J Special Data.*

Oil Pressure Gauge: Indicator light on instrument panel. Controlled by King-Seeley Engine Unit. Light glows RED until oil pressure rises above 13 lbs.
Engine Unit—King-Seeley No. 47100. Pressure Switch. Contacts open at 13 lbs. (remain closed with lower oil pressure).

COOLING

Cooling System: Pressure type. Relief valve in cap optl. equipment.

Capacity—9 qts. (10 qts. with heater).
Pressure Cap (Optl.)—For high altitudes or extremely hot temperatures.

Radiator Removal: *See "Radiator" in Henry J Special Data.*

Water Pump: Centrifugal, belt-drive, packless type with sealed ball bearing shaft. NOTE—Seal not same as that on 4 cylinder.

Removal—Loosen drive belt adjustment, remove belt, disconnect hose. Remove pump mounting screws and lift out pump and fan assembly.
See Water Pump Section for complete data.

Thermostat: Harrison. In outlet elbow on cylinder head. No by-pass.
Std.—Stamped '151'. Starts to open at 149-156°F. Fully open at 176°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) Electric type with voltage regulator.
Dash Unit—King-Seeley No. 45577.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-37 or Rockford Model 8½ RM with Borg & Beck Driven Member. Single plate dry disc type.

Clutch Identification—Types can be identified by number of pressure plate springs—3 (for Auburn), 6 (Rockford).

See Clutch Section for complete data.

Facings (Auburn)—Molded metallic or Raybestos. 2 required. I.D. 5⅜". O.D. 8½". Thickness .305".
Facings (B&B on Rockford Clutch)—Woven Asbestos, 2 required. I.D. 5⅜". O.D. 8½". Thickness .132-.138".

Pedal Adjustment: Free travel 1" measured at pedal rod. Adjust as follows: (1) Clearance between the rounded forward end of release fork adjusting rod and clutch housing when release bearing just contacting clutch levers should be ⅝". If less than ½", adjust to ⅝" by changing release fork adjusting rod length (more accessible by removing bellcrank from pivot with rod attached—grease bellcrank pivot before re-installing). (2) Connect and adjust length of pedal rod at trunnion end on bellcrank for required 1" free pedal travel.

Removal: Remove transmission (see Transmission Removal). Free clutch pedal adjusting rod at trunnion end of bellcrank. Remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws to clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS40-T96. Model AS41-T96 with Type R10B Overdrive (Optl.). Constant-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever mounted on steering column.

Removal: Support car on stands, drain transmission case (and overdrive case). Disconnect both shift rods at levers on transmission case (on overdrive cars, disconnect control cable from lever on overdrive case and electrical wiring at solenoid and lockout switch). Remove two capscrews and washers attaching clutch cross-shaft support bracket to transmission and remove bracket. Disconnect speedometer cable. Disconnect propeller shaft by taking off four nuts attaching front universal joint to yoke (CAUTION—tape needle bearing retainers in place to prevent entry of dirt or loss of bearings), tie propeller shaft up out of the way. Remove two capscrews attaching rear mounting insulator to cross-member, support rear end of engine (Support Tool KF-104) and raise engine just enough to remove weight from cross-member. Disconnect clutch realease bearing return spring from transmission (accessible through opening in right side of clutch housing). Remove four nuts attaching transmission to clutch housing, pull transmission straight back and remove from beneath car.

OVERDRIVE

Warner R10B (with special AS41-T96 Transmission)—Optl. equipment. New solenoid operated, governor controlled with throttle "kick-down."

NOTE—Overdrive is new "centered ring gear" type with one rear bearing only.

Control Relay—K-F No. 207923
Overdrive Governor—K-F No. 212385
Kick-down Switch—K-F No. 207924
Overdrive Solenoid—Warner 4AR10B-62.
See Transmission Section for complete data.

Removal: Overdrive and transmission are removed as a unit. See Transmission Removal above.

UNIVERSALS

Spicer No. 10275-1SF. Needle bearing type.

REAR AXLE

Spicer (Salisbury) Model 23-6, Part No. 2125-1; or Model 23-6, Part No. 2125-2 with O.D.—Semi-floating, Hypoid Gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratio—4.10-1 (Std.), 4.55-1 (with O.D.).

Backlash—.001-.005".

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers at spring seat, disconnect parking brake cables. Take out "U" spring bolts, disconnect both springs at rear shackle, remove axle from beneath car.

Axle Shaft Removal—Remove rear wheel and drum using Puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out, using Axle Shaft Puller KF-15 (with Adapter SP-341 required).

SHOCK ABSORBERS

Monroe—Direct Acting, hydraulic two-way type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs.

See Front Suspension Section for complete data.

Kingpin Inclination—4½° preferred. Limits 4-4¾°
Caster—0° preferred (±1°). Adjust by adding half shim under upper control arm at frame mounting bolt (rear bolt for Pos., front bolt for Neg. caster).

Camber—½° preferred (¼-1° Pos. limits). Adjust by adding or removing whole shim under upper control arm at frame mounting bolts.

Toe-In—¼" (3/16-1/4" limits). Adjust by turning sleeve at outer end of each tie rod equally.

Steering Geometry (Toe-out)—Inner wheel 20°. Outer wheel 17°31'. No adjustment.

STEERING GEAR

Own Make (Gemmer 305 Type). Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Drums—Composite (cast iron & steel). Diameter 9".

Lining—Molded type. Width 2". Thickness 3/16". Length per Shoe—9.87" (Forward Shoe—all wheels), 7.62" (Rear Shoe—all wheels).

Clearance—Shoe eccentric backed off to point where wheel just turns freely.

Hand Brake: See Service Brakes (above).

MISC. MECHANICAL

Windshield Wiper: Vacuum type.

See Miscellaneous Section for complete data.

HOOD ALIGNMENT: *See Henry J Special Data.*

FRONT END SHEET METAL ASSEMBLY REMOVAL: *See Henry J Special Data.*

►*1952 ELECTRICAL EQUIPMENT CHANGE:* Delco-Remy units used in place of Auto-Lite units beginning with Corsair Serial No. K-523-1203957. Inspect 1952 Vagabond models to identify equipment used. Delco-Remy and Auto-Lite units are NOT interchangeable, even as complete sets.

►*See Henry J 4 1951-52 preceding for data on Auto-Lite equipped cars. The following data pertains only to Delco-Remy equipped cars.*

M DEL IDENTIFICATION

1952 Models:	First Serial No.
K-523 Vagabond	K-523-1000001
K-523 Corsair	K-523-1200001
1953 Models:	
K-533 Corsair	K-533-001001
1954 Models:	
K-543 Corsair	①

①—1954 Serial numbers are a continuation of 1953 numbers.

SERIAL NUMBER: On left front door hinge post.
Body Number Note—Stamped on plate on right front upper firewall in engine compartment.

ENGINE NUMBER: Stamped on top of water pump boss on front of engine and on Engine Name Plate on right side of crankcase.

►*ENGINE NUMBER NOTE—Letters used with engine number are identified as follows:*
"A"—Denotes .010" Undersize main and connecting rod bearings.
"W"—.020" Oversize cylinder bore and pistons.
NOTE—Oversize bore engines were marked "N".

TUNE-UP

COMPRESSION PRESSURE: 115-120 lbs. at 185 RPM. cranking speed. Maximum variation between cylinders 10 lbs.

VACUUM READING: Steady 17-21" idling at 550 RPM.

FIRING ORDER: 1-3-4-2. See diagram.

SPARK PLUG GAP: .030".
Plugs—Auto-Lite A-7. 14 mm. Tighten to 30 ft.lbs.

DISTRIBUTOR: Delco-Remy No. 1110230.
Breaker Gaps—.022". Limits .018-.024".
Cam Angle Range—Test limits with .022" gap, 31-37°
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

COIL: Delco-Remy No. 1115328. Mounted on right side of engine.
Ignition Current—1.3 amps. idling. 5 amps. stopped at 6.3 volts.

CONDENSER: Delco-Remy No. 1869704.
Capacity—.18-.23 microfarad.

IGNITION TIMING: 5° BTDC.
Timing Mark—Notch in crankshaft pulley aligned with 5° mark on timing gear cover.

►*CAUTION*—Single timing chain cover mark on first Delco-Remy-equipped cars is TDC and is not used for timing. *See Ignition Timing for reworking of timing mark.*
Timing Procedure—*See Ignition Timing.*

►*CAUTION—Disconnect distributor vacuum advance tube when checking timing.*

CARBURETION: Carter YF, No. 820SB. Single barrel downdraft carburetor with manual choke control.
Idle Setting—½-1½ turns open. Turn screw out for richer mixture.
Idle Speed—550 RPM.
Float Level—9/32" from top of float at free end to bowl cover when needle is seated (assembly inverted).
Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 3½-4½ lbs. fast idle.

CRANKCASE VENTILATOR: Remove and clean Vacuum Control Valve on manifold. *See Crankcase Ventilator (following CARB. EQUIPMENT) for data.*

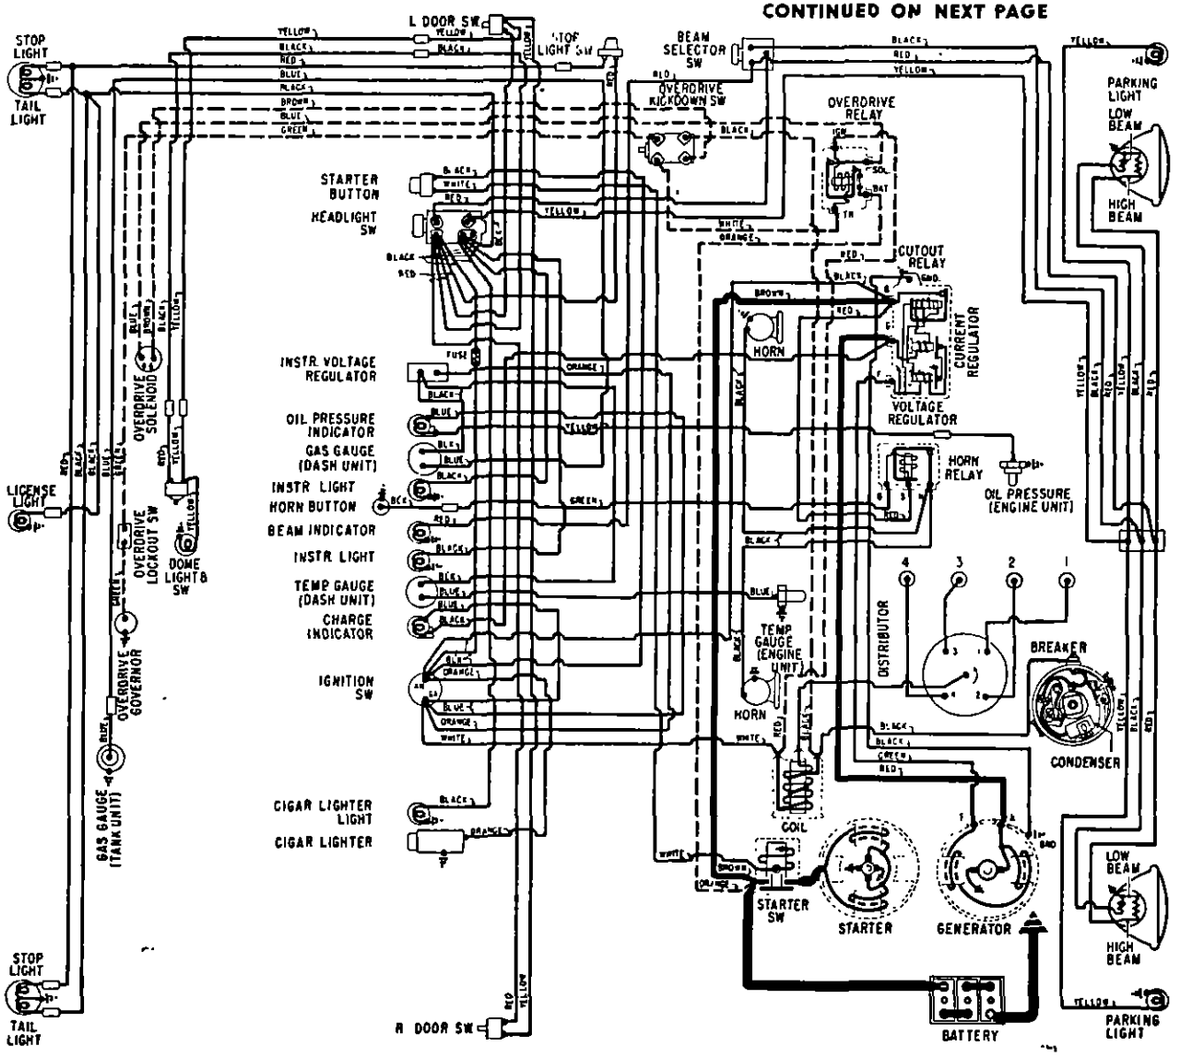
MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .016" All Valves, Cold.

►**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*

NOTE—Tappet adjusting screws self-locking. Remove left front wheel and access hole cover in splash shield for access when adjusting valves.

IGNITION



IGNITION SWITCH: K-F No. 212083.

COIL: Delco-Remy No. 1115328. On right side of engine directly above starter.
Ignition Current—1.3 amperes (idling), 5 amperes (stopped) at 6.3 volts.

CONDENSER: Delco-Remy No. 1869704.
Capacity—.18-.23 microfarad.

DISTRIBUTOR: Delco-Remy No. 1110230. Full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—.022". Limits .018-.024".
Cam Angle—Test limits with .022" gap, 31-37° closed.
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from above.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Distr. Degrees	Automatic Advance R.P.M.	Eng. Degrees	R.P.M.
Start	450	0-4	900
5-7	975	10-14	1950
10-12	1500	20-24	3000

Vacuum Spark Control: Delco-Remy No. 1116066. Integral type linked directly to breaker plate.
Plunger Travel—11/64-13/64".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	2.5-4.5
9-11	18-22	14-16

Distributor Removal: Distributor located on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

►*CAUTION—If oil pump removed, refer to Oil Pump Installation directions in Henry J Special data.*

IGNITION TIMING

Std. Setting.....5° BTDC
Timing Mark—V notch on crankshaft pulley and TDC and 5° BTDC marks on timing chain cover.

CAUTION—Do not use TDC mark on Delco-Remy-equipped engines for timing. Timing cover on first Delco-Remy-equipped engines have only TDC mark and must be reworked. See method of reworking timing mark below.

►**Reworking TDC mark on first Delco-Remy-equipped engines.** Single timing chain cover mark on first Delco-Remy-equipped engines is TDC and is not used for timing. To permit timing engine 5° BTDC, the TDC mark must be reworked as follows: Scribe line along center-line of TDC mark. Measure 7/32" to the left of the scribed line (viewed from front of engine) and scribe second line parallel to the first. The second line locates No. 1 piston at 5° BTDC when V notch on crankshaft pulley is lined up with it.

Timing (Timing Light C-693): Connect light to #1 spark plug terminal and direct light at timing mark. Idle engine at lowest possible smooth idle speed (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw extending upward through 45° slot in arm under distributor. Advance or retard distributor until notch on crankshaft pulley appears in line with correct (5°) mark on timing gear cover.

►*CAUTION—Reset engine idling speed at 550 RPM.*

CARBURETOR

Carter YF, No. 820SB. 1¼" Single barrel, downdraft type with manual choke control.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Carter Single Barrel.
See Carburetion Equipment Section for complete data.
Setting—With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.

CARB. EQUIPMENT

Air Cleaner: United Specialties, K-F No. 212749 Oil-wetted type Std., Oil-bath type Optl.
Fuel Pump (Std.): Carter M807S. Diaphragm type. **Optl.**—Carter No. M809S combination Fuel-and-Vacuum Pump.
See Carburetion Equipment Section for complete data.
Pressure—3½-4½ lbs. fast idle. At 1000 RPM should be 3-4½ lbs. If more than 4½ lbs., adjust by adding gaskets between pump and cylinder block.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. (1952) 45574, (1953-54) 46037.
Tank Unit—K-S No. 45567.
See Carburetion Equipment Section for complete data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air Intake Pipe (from air cleaner to oil filler pipe) furnishes clean air to crankcase and Air Outlet Pipe (from valve chamber cover to intake manifold) allows fumes from crankcase to be sucked into intake manifold. There is a vacuum control valve at the manifold connection and this valve **must close at idling speed** for satisfactory engine idling performance.

Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. When vacuum control valve is clogged, pressure will build up in crankcase. When not seating, idle will be unsatisfactory. Remove and clean vacuum control valve and air outlet pipe when tuning engine or if system operating incorrectly.

Vacuum Control Valve—Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold. Disassemble valve by clamping in vise and removing top, withdraw valve and spring. Clean valve and valve seat thoroughly. Reassemble and re-install unit.

BATTERY

Auto-Lite Type IM-100D or Willard HW-1-100—6 volt, 15 plate, 100 ampere hour capacity (20 Hour Rate).
Grounded Terminal—Positive (+) terminal grounded at right front engine support. Engine ground cable connected at same point.
Location—In engine compt. on right side.

STARTER

Delco-Remy No. 1107131. Armature No. 1917855.
Drive—Solenoid pinion shift with overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	5500	5.65	70
12 ft. lbs.	Lock	3.25	550

Starting Switch—Solenoid switch (without relay) mounted on starter and controlled by push-button on instrument panel.
See Electrical Equipment Section for complete data.

GENERATOR

Delco-Remy No. 1102789. Armature No. 1921235. Two-brush type with current and voltage regulation.
Charging Rate Adjustment—None. *See Regulator.*
Maximum Charging Rate—38 amperes.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	2050

①—Not maximum output. *See Current Regulator.*
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—28 ounces (new brushes).
Field Current—1.75-1.95 amperes at 6 volts.
Belt Adjustment: Move generator out for ½" deflection with thumb pressure midway between generator and water pump pulleys.
Generator Charge Indicator: Red warning light on instrument panel. Lights when switch turned on, goes out when generator begins to charge.

REGULATOR

1952-53 MODELS

Delco-Remy No. 1118731. Vibrating type voltage and current regulator.
See Electrical Equipment Section for complete data.
CAUTION—Check generator for grounded field coils and leads, check regulator ground before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay
Cuts In—5.9-6.7 volts hot (set to 6.4 volts hot).
Contact Gap—.020" (same for both contacts).
Air Gap—.020" (with contacts just closed).

Voltage Regulator
Setting—7.0-7.7 volts hot (set to 7.4 volts hot). Regulator should be checked with cover in place and hot.
Air Gap—.075" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—*See Elec. Equip. Section.*

Current Regulator
Setting—34-42 amperes hot (set at 38 hot).
Air Gap—.075" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—*See Elec. Equip. Section.*

1954 MODELS

Delco-Remy No. 1118841. New "1118825 Series" regulator.
►*REGULATOR NOTE: Checking procedure is different than for previous models. See "Delco-Remy 1118825 Series Regulator" in Electrical Equipment Section. All Specifications below are for "Normal" settings.*

Cutout Relay
Cuts In—6.4 volts.
Contact Gap—.020" (same for both contacts).
Air Gap—.020" (with contacts just closed).

Voltage Regulator
Setting—7.3 volts (hot).
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator
Setting—38 amperes (hot).
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Beam Indicator—Red jewel at top of speedometer dial. Lighted when upper (country beams) in use.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Direction Signal: (Optl.)—Guide Light Division make. *See Electrical Equipment Section for complete data.*

Direction Indicators—Right and left indicator lights on lower face of speedometer. Lighted when direction signal on same side of car in operation.

Switches

Lighting—K-F No. 212091.
Beam Selector—K-F No. 204545.

MISC. ELECTRICAL

FUSES: Lighting—30 ampere. In lighting switch lead behind instrument panel.
Overdrive—20 amperes. On control relay.
Heater—14 amperes.
Radio—14 amperes.

HORNS: Delco-Remy No. 1999639 (Low Note), 1999640 (High Note). Matched tone twin horns wth relay.
Horn Relay—K-F No. 212080.

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter unit designed to maintain constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is connected in gauge feed circuit.

ENGINE

▷*1952 ENGINE PARTS PRODUCTION CHANGE (To adapt engines to Delco-Remy Electrical Units): Cylinder block, rear end plate, flywheel and ring gear, clutch housing, and fan were changed and are NOT INTERCHANGEABLE with corresponding parts on earlier Auto-Lite equipped engines.*

ENGINE SPECIFICATIONS: K-F Model 4L-134. Four cylinder Supersonic "L" head type.
Bore—3⅛" or 3.125".
Stroke—4⅜".
Displacement—134.2 cu. ins. **Rated HP**—15.63.
Developed Horsepower—68 at 4000 RPM.
Compression Ratio—7.0-1.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Henry J Special Data.*

CYLINDER HEAD INSTALLATION: *See Henry J Special Data.*

FRONT END SHEET METAL REMOVAL (For Engine Work): *See Henry J Special Data.*

ENGINE REMOVAL: *See Henry J Special Data.*

OIL PAN REMOVAL: *See Henry J Special Data.*

PISTONS: Aluminum alloy, "T" slot, Cam ground, tin-plated type with heat insulation groove above top ring.

▷*PISTON OVERSIZE NOTE—The letter "W" included with engine number indicates that all pistons are .020" OVERSIZE. See "Engine Number Note."*
Length—3¾".
Weight—12.7 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top land .017-.019". Skirt .003".
CAUTION—Pistons must not be "lapped" in (will destroy tin-plated surface).

Replacement Pistons: Std. & .010", .020", .030", .040" oversize.

Fitting New Pistons: Use .0015" x ½" feeler gauge inserted between piston and cylinder wall on opposite side to "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Fitting Used Pistons: Use .004" x ½" feeler gauge inserted between piston and cylinder wall on opposite side to "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Upper Comp.	3/32"	.007-.020"	.002-.004"
Lower Comp.	3/32"	.007-.020"	.003-.007"
Oil	3/16"	.007-.020"	.006-.010"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: Furnished in sets for following oversize ranges: Std.-to-.009", .010"-to-.029", .030"-to.039", .040"-to-.049", .050"-to-.069".

PISTON PIN: Pin is locked in rod by clampscrew.
Diameter—.8118-.8120". **Length**—2.7813".
Pin Fit In Piston—.0002-.0006" clearance or light thumb push fit with piston and pin at 70°F.

CONNECTING ROD: Length—9.1845-9.1905". **Weight**—39.41 ozs. NOTE—Rods are offset and are **not** interchangeable.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.*
Crankpin Journal Diameter—1.9375-1.9385".
Lower Bearing—Steel-backed, babbitt-lined, replaceable precision type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.
Clearance—.0005-.0025". **Sideplay**—.004-.010".

Bearing Adjustment: *None. (No shims.)* Replace bearings. Do not file connecting rods or bearing caps. NOTE—Replace bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: .001", .002", .010", .012" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), toward rear (#2, 4). Oil spray hole in lower end of rod toward right of engine (away from camshaft) on all rods.

CRANKSHAFT: Three bearing type with removable counter-weights.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.*
Journal Diameters—2.3331-2.3341" (all bearings).
Bearings—Steel-backed, babbitt-lined, replaceable precision type. Bearing shells are dowelled in bearing caps and crankcase.
Clearance—.0009-.0029".
NOTE—Replace bearing when clearance exceeds .006" or when endplay exceeds .018"

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instruction in Henry J Special Data.*
NOTE—Engine must be removed from chassis for bearing replacement and crankshaft servicing.

Replacement Bearings: .001", .002", .010" Undersize.

Oil Seals: Rear main bearing oil seal is wick type packing in groove in crankcase and rear main bearing cap.
Oil Seal Installation—*See Henry J Special Data.*

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft gear thrustwasher and shoulder on crankshaft at front of flanged front bearing. NOTE—Crankshaft gear must be removed with a gear puller in order to make endplay adjustments.
Endplay—.004-.008".

CAMSHAFT: Four bearing, helical gear drive. Pressed on type fibre gear.
Journal Diameters—(1) 2.1855-2.1860"; (2) 2.1215-2.1225"; (3) 2.0590-2.0600"; (4) 1.6225-1.6230".
Bearings—Removable steel-backed, babbitt-lined bushing (front), all others machined in block.
Clearance—.001-.0025" (front bearing).
Camshaft Removal—*See Henry J Special Data.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled between plate and camshaft journal.
Endplay—.003-.0055".

Timing Gears: Crankshaft gear cast iron. Camshaft gear fibre with steel hub.
Timing Gear Backlash—.000-.002".

Camshaft Setting: Mesh gears with marked tooth of camshaft gear opposite marked space between gear teeth on crankshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5 57/64"
Exhaust	1 15/32"	.3725"	5 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.351"	.0015-.00325"
Exhaust	45°	.351"	.0025-.0045"

Valve Seat Width—1/16" to 5/64" (Intake). 3/32" to 7/64" (Exhaust).

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place to following dimensions:
Intake Guide—Top of guide 1 5/16" below top face of block. The shorter smaller-diameter section end of guide should be up. Ream to .3545-.3755" I.D.
Exhaust Guide—Top of guide 1" below top face of block. Taper end (counter-bored end) of guide should be up. Ream guide to .3745-.3755" I.D.

Valve Springs: Two close-wound coils toward top of block. Install springs with closed-coil end up toward cylinder block. Spring free length 2½".

	Spring Pressure	Length
Valve Closed	53 lbs.	2 7/64"
Valve Open	120 lbs.	1 3/4"

Valve Lifters: Mushroom type with self-locking screws, operating in reamed holes in block. Access hole in cover in left front splash shield. Serviced by installing oversize lifters.
Lifter Diameter—.6240-.6245".
Lifter Clearance—Select fit with slight drag.
NOTE—Camshaft must be removed for lifter removal. *See Camshaft Removal instructions in Henry J Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

Tappet Clearance: .016" All Valves, Cold.

►**Adjustment Procedure**—*See "Valve System" in Henry J Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, and to timing gears.
Crankshaft Capacity—4 qts. refill.
Normal Oil Pressure—30-40 lbs. at 30 MPH.
Oil Pressure Regulator—Opens at 35 lbs. Located on oil pump cover. Adjustable by removing or adding shims between valve retainer and spring.

Oil Pan Removal: *See Henry J Special Data.*

Oil Pump: External Rotor type with floating oil intake. Mounted externally on left side of crankcase.
Oil Pump Servicing—*See Henry J Special Data.*

Oil Pressure Gauge: Indicator light on instrument panel. Controlled by King-Seeley Engine Unit. Light glows RED until oil pressure rises above 13 lbs.
Engine Unit—*King-Seeley No. 47100.* Pressure Switch Contacts open at 13 lbs. (remain closed with lower oil pressure).

COOLING

Cooling System: Pressure type. Relief valve in cap optl. equipment.
Capacity—10½ qts. (11½ qts. with heater).
Pressure Cap (Optl.)—For high altitudes or extremely hot temperatures. Opens at 3½-4½ lbs.

Radiator Removal: *See "Radiator" in Henry J Special Data.*

Water Pump: Centrifugal, belt-driven, packless type with sealed ball bearing shaft.
See Water Pump Section for complete data.

Removal—Loosen drive belt adjustment, remove belt, disconnect hose. Remove pump mounting screws and lift out pump and fan assembly.

Thermostat: Harrison. In outlet elbow on cylinder head. No by-pass.
Std.—Stamped '151'. Starts to open at 149-156°F. Fully open at 176°F.
Optl. (for permanent Anti-freeze)—Starts to open at 166-174°F., fully open at 194°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) Electric type with voltage regulator.
Dash Unit—King-Seeley No. 45577.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-37 or Rockford Model 8½ RM with Borg & Beck Driven Member. Single plate dry disc type.

Clutch Identification—Types can be identified by number of pressure plate springs—3 (for Auburn), 6 (Rockford).
See Clutch Section for complete data.

Pedal Adjustment: Free travel 1" measured at pedal rod. Adjust as follows: (1) Clearance between rounded forward end of release fork adjusting rod and clutch housing when release bearing just contacting clutch levers should be ⅝". If less than ½", adjust to ⅝" by changing release fork adjusting rod length (more accessible by removing bellcrank from pivot with rod attached—grease bellcrank pivot before re-installing). (2) Connect and adjust length of pedal rod at trunnion end of bellcrank for required 1" free pedal travel.

Removal: Remove transmission (see Transmission Removal). Free clutch pedal adjusting rod at trunnion end of bellcrank. Remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws to clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS40-T96. Model AS41-T96 with new Type R10B Overdrive (Optl.). Constant-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever mounted on steering column.

Removal: Support car on stands, drain transmission case (and overdrive case). Disconnect both shift rods at levers on transmission case (on overdrive cars, disconnect control cable from lever on overdrive case and electrical wiring at solenoid and lockout switch). Remove two capscrews and washers attaching clutch cross-shaft support bracket to transmission and remove bracket. Disconnect speedometer cable. Disconnect propeller shaft by taking off four nuts attaching front universal joint to yoke (CAUTION—tape needle bearing retainers in place to prevent entry of dirt or loss of bearings), tie propeller shaft up out of the way. Remove two capscrews attaching rear mounting insulator to cross-member, support rear end of engine (Support Tool KF-104) and raise engine just enough to remove weight from cross-member. Disconnect clutch release bearing return spring from transmission (accessible through opening in right side of clutch housing). Remove four nuts attaching transmission to clutch housing, pull transmission straight back and remove from beneath car.

OVERDRIVE

Warner Type R10B (with special AS41-T96 Transmission)—Optl. equipment. New solenoid operated, governor controlled with throttle "kick-down."

NOTE—Overdrive is new "centered ring gear" type with one rear bearing only.
See Transmission Section for complete data.

Removal: Overdrive and transmission are removed as a unit. See Transmission Removal above.

UNIVERSALS

Std.—Spicer. Needle bearing type.
Overdrive Cars. Detroit. Ball-and-trunnion type.

REAR AXLE

Spicer (Salisbury) Model 23-6, Part No. 2125-1; or Model 23-6, Part No. 2125-2 with O.D.—Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.

Ratios—4.55-1 (Early Std.), 4.27-1 (Later St.), 4.55-1 (Overdrive).
Backlash—.003-.006".

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers at spring seat, disconnect parking brake cables. Take out "U" spring bolts, disconnect both springs at rear shackle, remove axle from beneath car.

Axle Shaft Removal: Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out, using Axle Shaft Puller KF-15 (with Adapter SP-341 required)

SHOCK ABS RBERS

Monroe—Direct Acting, hydraulic two-way type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.

Kingpin Inclination—4½° preferred. Limits 4-4¾°.

Caster—0° preferred (±1°). Adjust by adding half shim under upper control arm at frame mounting bolt (rear bolt for Pos., front bolt for Neg. caster).

Camber—½° preferred (¼°-1° Pos. limits). Adjust by adding or removing whole shim under upper control arm at frame mounting bolts.

Toe-In—¼" (3/16-1/4" limits). Adjust by turning sleeve at outer end of each tie rod equally.

Toe-Out on Turns—Inner wheel 20°. Outer wheel 17½°. No adjustment.

STEERING GEAR

Own Make (Gemmer 305 Type)—Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.

Drums—Composite (cast-iron & steel). Diameter 9".

Lining—Molded type as follows:

	Width	Thickness	Length per Shoe
Primary	2"	3/16"	9.87"
Secondary	1¾"	3/16"	7.62"

Clearance—Shoe eccentric backed off to point where wheel turns freely.

Hand Brake: See Service Brake data (above).

MISC. MECHANICAL

Windshield Wiper: Vacuum type.
See Miscellaneous Section for complete data.

HOOD ALIGNMENT: *See Henry J Special Data.*

FRONT END SHEET METAL ASSEMBLY REMOVAL: *See Henry J Special Data.*

►*1952 ELECTRICAL EQUIPMENT CHANGE:* Delco-Remy units used in place of Auto-Lite units beginning with Corsair Serial No. K-524-1205339. Inspect 1952 Vagabond models to identify equipment used. Delco-Remy and Auto-Lite units are NOT interchangeable, even as complete sets.

►*See Henry J 6 1951-52 preceding for data on Auto-Lite equipped cars. The following data pertains only to Delco-Remy equipped cars.*

MODEL IDENTIFICATION

1952 Models:	First Serial No.
K-524 Vagabond deLuxe	K-524-1000001
K-524 Corsair deLuxe	K-524-1200001
1953 Models:	
K-534	K-534-001001
1954 Models:	
K-544 Corsair DeLuxe	①

①—1954 Serial numbers are a continuation of 1953 numbers.

SERIAL NUMBER: On left front door hinge post.
Body Number Note—Stamped on plate on right front firewall in engine compartment.

ENGINE NUMBER: Stamped on pad on right front upper corner of cylinder block and on Engine Name Plate on right side of crankcase.

►*ENGINE NUMBER NOTE—Letters used with engine number are identified as follows:*
"A"—Denotes .010" Undersize main and connecting rod bearings.
"W"—.020" Oversize cylinder bore and pistons.
NOTE—Oversize bore engines were marked "N".

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. at 185 RPM. cranking speed. Maximum variation between cylinders 10 lbs.

VACUUM READING: Steady 18-21" idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

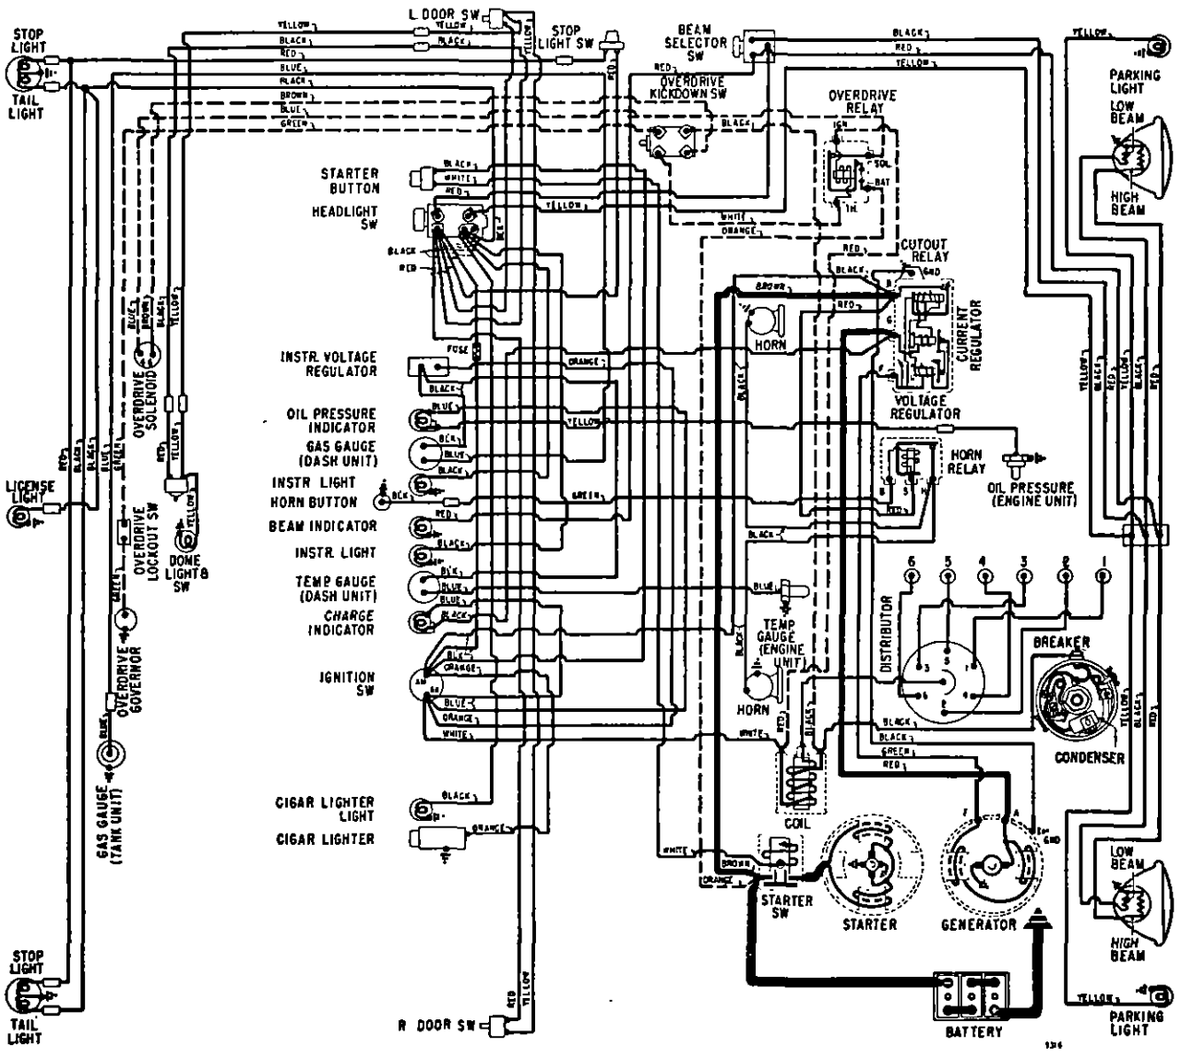
SPARK PLUG GAP: .030".
Plugs—Auto-Lite A-7. 14 mm. Tighten to 30 ft.lbs. torque.

DISTRIBUTOR: Delco-Remy No. 1110231.
Breaker Gap—.022". Limits .018-.024".
Cam Angle Range—Test limits with .022" gap, 31-37°
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

COIL: Delco-Remy No. 1115328. Mounted on right side of engine.
Ignition Current—1.3 amps. idling. 5 amps. stopped at 6.3 volts.

CONDENSER: Delco-Remy No. 1869704.
Capacity—.18-.23 microfarad.

IGNITION TIMING: 5° BTDC. *This setting supersedes former TDC setting. See FINAL SETTING below.*
Timing Mark—Crankshaft dampener marked with "0" at TDC. and there are 20—1° graduations BTDC, and 5—1° graduations ATDC.



►*CAUTION—Disconnect distributor vacuum advance tube when checking timing.*

Timing Procedure—*See Ignition Timing.*
Final Setting—After setting timing at 5° BTDC., road test car and check for excessive ping under low speed, full throttle conditions. If ping excessive, retard ignition timing to point where only faint ping noted under these conditions.

CARBURETION: Carter YF, No. 833SB. Single barrel, downdraft type with manual choke control.
Idle Setting—1-2 turns open. Turn screw out for richer mixture.
Idle Speed—550 RPM.
Float Level—9/32" from top of float at free end to bowl cover when needle is seated (assembly inverted).
Accelerating Pump—No seasonal adjustment.

Fuel Pump Pressure: 3½-4½ lbs. fast idle.

CONTINUED ON NEXT PAGE

CRANKCASE VENTILATOR: Remove and clean Vacuum Control valve on manifold. *See Crankcase Ventilator (following CARB. EQUIPMENT) for data.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .016" All valves, Cold.

►**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*

NOTE—Tappet adjusting screws self-locking. Remove left front wheel and access hole cover in splash shield for access when adjusting valves.

CONTINUED FROM PRECEDING PAGE

IGNITION

IGNITION SWITCH: K-F No. 212063.

COIL: Delco-Remy No. 1115328. On right side of engine directly above starter.
Ignition Current—1.3 amperes (idling), 5 amperes (stopped) at 6.3 volts.

CONDENSER: Delco-Remy No. 1869704.
Capacity—.18-.23 microfarad.

DISTRIBUTOR: Delco-Remy No. 1110231. Full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—.022". Limits .018-.024".
Cam Angle—Test limits with .022" gap, 31-37° closed.
Breaker Arm Spring Tension—17-21 ounces.
Rotation—Counter-clockwise viewed from above.

Distr. Degrees	Automatic Advance R.P.M.	Eng. Degrees	R.P.M.
Start	375	0-4	750
5-7	500	10-14	1000
8-10	1000	16-20	2000
11-13	1500	22-26	3000

Vacuum Spark Control: Delco-Remy No. 1116067. Integral type. **Plunger Travel**—7/64-1/8".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4-6
4¼-7	8½-14	14-16

Distributor Removal: Distributor located on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

►*CAUTION—If Oil Pump removed, refer to Oil Pump Installation directions in Henry J Special Data.*

IGNITION TIMING

Std. Setting (See Change Note).....5° **BTDC.**

►*IGNITION TIMING CHANGE—Setting above (5°BTDC) supersedes former setting (TDC) and should be checked by road-testing car. See FINAL SETTING.*

Timing Mark—Crankshaft dampener marked with "O" at TDC. and there are 20—1° graduations BTDC and 5—1° graduations ATDC.

Timing with Timing Light (C-693)—Mark correct graduation on vibration dampener with chalk or paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine at lowest possible smooth idle speed (back off throttle stopscrew to decrease normal idle speed of 550 RPM). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw extending upward through 45° slot in arm under distributor. Advance or retard distributor until timing mark appears in line with pointer at front of engine. Tighten cap screw and recheck timing.

Final Setting—After setting timing at 5° BTDC., road test car and check for excessive ping under low speed, full throttle conditions. If ping excessive, retard ignition timing to point where only faint ping noted under these conditions.

►*CAUTION—Reset engine idling speed at 550 RPM.*

CARBURETOR

Carter YF No. 833SB. 1¼" Single barrel. Down-draft type with manual choke control.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Carter Single Barrel.
Setting—With choke held in wide open position, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Fuel Pump (Std.): Carter No. M807S Diaphragm type.
Optl.—Carter No. M809S combination Fuel-and-Vacuum Pump.
See Carburetion Equipment Section for complete data.
Pressure—3½-4½ lbs. fast idle. At 1000 RPM should be 3-4½ lbs. If more than 4½ lbs., adjust by adding gaskets between pump and cylinder block.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with voltage regulator.
Dash Unit—K-S No. 46037.
Tank Unit—K-S No. 45567.
See Carburetion Equipment Section for complete data.

CRANKCASE VENTILATOR

Sealed Positive Ventilation Type. Air Intake Pipe (from air cleaner to **oil filler pipe**) furnishes clean air to crankcase and Air Outlet Pipe (from valve chamber cover to intake manifold) allows fumes from crankcase to be sucked into intake manifold. There is a vacuum control valve at the manifold connection and this valve **must close at idling speed** for satisfactory engine idling performance.

Servicing—Make certain that connecting pipes are tight and that oil filler cap gasket seals cap tightly. When vacuum control valve is clogged, pressure will build up in crankcase. When not seating, idle will be unsatisfactory. Remove and clean vacuum control valve and air outlet pipe when tuning engine or if system operating incorrectly.

Vacuum Control Valve—Remove control valve by disconnecting pipe at valve chamber cover and unscrewing valve from manifold. Disassemble valve by clamping in vise and removing top, withdraw valve and spring. Clean valve and valve seat thoroughly. Reassemble and re-install unit.

BATTERY

Auto-Lite Type IM-100D & Willard HW-1-100—6 volt, 15 plate, 100 Ampere Hour Capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal is grounded at right front engine support. Engine cable connected at same point.
Location—In engine compartment on right side.

STARTER

Delco-Remy No. 1107131. Armature No. 1917855.
Drive—Solenoid pinion shift with overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load	5500	5.65	70
12 ft. lbs.	Lock	3.25	550

Starting Switch—Solenoid switch (without relay)
See Electrical Equipment Section for complete data.

GENERATOR

Delco-Remy No. 1102789. Armature No. 1921235.
Charging Rate Adjustment—None. *See Regulator.*
Maximum Charging Rate—38 amperes.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	2050

①—Not maximum output. *See Current Regulator.*
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—28 ounces (new brushes).
Field Current—1.75-1.95 amperes at 6 volts.

Belt Adjustment: Move generator out for ½" deflection with thumb pressure midway between generator and water pump pulleys.

Generator Charge Indicator: Red warning light on instrument panel. Lights when switch turned on, goes out when generator begins to charge.

REGULATOR

1952-53 MODELS

Delco-Remy No. 1118731. Vibrating type voltage and current regulator.
See Electrical Equipment Section for complete data.

CAUTION—Check generator for grounded field coils and leads, check regulator ground before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cut In—5.9-6.7 volts hot (set to 6.4 volts hot).
Contact Gap—.020" (same for both contacts).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.0-7.7 volts hot (set to 7.4 volts hot). Regulator should be checked with cover in place.
Air Gap—.075" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—*See Elec. Equip. Section.*

Current Regulator

Setting—34-42 amperes hot (set at 38 hot).
Air Gap—.075" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—*See Elec. Equip. Section.*

1954 MODELS

Delco-Remy No. 1118841. New "1118825 Series" regulator.

►*REGULATOR NOTE: Checking procedure is different than for previous models. See "Delco-Remy 1118825 Series Regulator" in Electrical Equipment Section. All Specifications below are for "Normal" settings.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cutout Relay

Cuts In—6.4 volts.
Contact Gap—.020" (same for both contacts).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.3 volts (hot).
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

Setting—38 amperes (hot).
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
Direction Signal: (Opti.)—Guide Light Division make.
See Electrical Equipment Section for complete data.

MISC. ELECTRICAL

FUSES: Lighting—30 ampere. In lighting switch lead behind instrument panel.
Overdrive—20 amperes. On control relay.
Heater—14 amperes.
Radio—14 amperes.

HORNS: Delco-Remy No. 1999639 (Low Note), 1999640 (High Note). Matched tone twin horns with relay.
Horn Relay—K-F No. 212080.

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45557. Thermo-bimetal interrupter unit designed to maintain constant voltage of 5 volts (regardless of generator charging voltage fluctation) on gauge feed circuit. Unit is connected in gauge feed circuit. See wiring diagram.

ENGINE

▷*1952 ENGINE PARTS PRODUCTION CHANGE (To adapt engines to Delco-Remy Electrical Units): Cylinder block, rear end plate, flywheel and ring gear, clutch housing, and fan were changed and are NOT INTERCHANGEABLE with corresponding parts on earlier Auto-Lite equipped engines.*

ENGINE SPECIFICATIONS: K-F Model 6L-161. Six cylinder Supersonic "L" head type.
Bore—3⅛" (3.125"). **Stroke**—3½".
Displacement—161.0 cu. ins. **Rated HP.**—23.44.
Developed Horsepower—80 at 3800 RPM.
Compression Ratio—7.0-1.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Henry J Special Data.*

CYLINDER HEAD INSTALLATION: *See Henry J Special Data.*

FRONT END SHEET METAL REMOVAL (For Engine Work): *See Henry J Special Data.*

ENGINE REMOVAL: *See Henry J Special Data.*

OIL PAN REMOVAL: *See Henry J Special Data.*

PISTONS: Aluminum alloy, "T" slot, cam ground, tin-plated type with heat insulation groove above top ring groove.

▷*PISTON OVERSIZE NOTE—The letter "W" included with engine number indicates that all pistons are .020" OVERSIZE. See "Engine Number Note."*
Length—3".
Weight—10.8 ozs. without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top land .018-.021". Skirt .0021".

▷CAUTION—Pistons must not be "lapped" in (will destroy tin-plated surface).

Replacement Pistons: Std. & .010", .020", .030", .040" oversize.

Fitting New Pistons: Use .0015" x ½" feeler gauge inserted between piston and cylinder wall on opposite side from "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Fitting Used Pistons: Use .004" x ½" feeler gauge inserted between piston and cylinder wall on opposite side to "T" slot. Pull required to withdraw feeler must be within 5-10 lbs. at 70°F.

Installing Pistons: "T" slot toward valve (left) side of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON RINGS: Two compression, one oil control ring per piston, all above pin (piston has narrow heat insulation groove above top ring groove). Oil ring groove drilled with oil drainage holes.

Ring	Width	End Gap	Side Clearance
Upper Comp.	3/32"	.007-.020"	.002-.004"
Lower Comp.	3/32"	.007-.020"	.003-.007"
Oil	3/16"	.007-.020"	.006-.010"

Installing Rings: Install compression rings with mark "TOP" (on side) toward top. Rings have taper face and must be installed correctly. Top ring inner bevel edge must be up.

Replacement Rings: Furnished in sets for following oversize ranges: Std.-to-.009", .010"-to-.029", .030"-to.039", .040"-to-.049", .050"-to-.069".

PISTON PIN: Pin clamped in rod by clampscrew.
Diameter—.7494-.7496". **Length**—2.6563".
Pin Fit in Piston—.0002-.0006" clearance or light thumb press fit with piston and pin at 70°F.

CONNECTING ROD: Length—6.345". **Weight** 22.5 ozs.
NOTE—Rods are not offset and are interchangeable.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.*
Crankpin Journal Diameter—1.874-1.875".
Lower Bearing—Steel-backed, babbit-lined, replaceable precision type. CAUTION—Oil spray hole in upper half of bearing must line up with oil spray hole in rod.
Clearance—.0005-.0025". **Sideplay**—.002-.008".

Bearing Adjustment: None (no shims). Replace bearings. Do not file connecting rods or bearing caps.
NOTE—Replace Bearings when clearance exceeds .005" or sideplay exceeds .013".

Replacement Bearings: .001", .002", .010", .012" Undersize.

Installing Rods: Rods not offset. Install with oil spray hole in lower end toward right (away from camshaft) on all rods.

CRANKSHAFT: Four-bearing type with integral counterweights and vibration dampener.

▷*CRANKSHAFT JOURNAL UNDERSIZE CAUTION—Letter "A" in Engine Number indicates that main & connecting rod journals are .010" UNDERSIZE.*
Journal Diameters—2.249-2.250" (all bearings).
Bearings—Steel-backed, babbit-lined, replaceable precision type.
NOTE—Bearing shells are NOT dowelled on 6 cylinder engine. They can be removed and replaced without removing crankshaft.
Clearance—.0014-.0030".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. *See Crankshaft Servicing instruction in Henry J Special Data.*

Replacement Bearings: .001", .002", .010" Undersize.

Oil Seals: Rear main bearing oil seal is wick type packing in groove in crankcase and rear main bearing cap.
Oil Seal Installation—*See Henry J Special Data.*

End Thrust: Taken by flanged faces of #1 (front) bearing. Adjustable by adding or removing shims between crankshaft gear thrust washer and shoulder on crankshaft at front of flanged front bearing.

▷*ENDPLAY ADJUSTMENT CAUTION: See "Camshaft & Bearings" in Henry J Special Data for new timing gear, oil slinger, and adjusting shims used with new type camshaft and gear used on later cars.*
Endplay—.004-.008".

CAMSHAFT: Four-bearing, helical gear drive. Pressed-on type fibre gear.

▷*CAMSHAFT PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION: See "Camshaft & Bearings" in Henry J Special Data for new type camshaft and timing gear and non-interchangeability of parts.*
Journal Diameters—#1, 1.8755-1.8760"; #2, 1.8425-1.8435", #3, 1.8110-1.8120"; #4, 1.6245-1.6250".
Bearings—Removable steel-backed, babbit-lined bushing (front), machined in crankcase (all others).
Clearance—.001-.0025".
Camshaft Removal—*See Henry J Special Data.*

End Thrust: Taken by thrust plate assembled behind gear with a spacer assembled between plate and camshaft journal.
Endplay—.003-.0055".

Timing Gears: Crankshaft gear cast iron. Camshaft gear fibre with steel hub.

▷*TIMING GEAR PRODUCTION CHANGE: See "Camshaft & Bearings" in Henry J Special Data for new gears used with later type camshaft and interchangeability of parts.*
Timing Gear Backlash—.000-.002".

Camshaft Setting: Mesh gears with marked tooth of camshaft gear opposite marked space between gear teeth on crankshaft gear.

VALVES:	Head Diam.	Stem. Diam.	Length
Intake	1 3/8"	.3410"	4 9/16"
Exhaust	1 9/32"	.3400"	4 9/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.284"	.0015-.00325"
Exhaust	45°	.300"	.0025-.0045"

Valve Seat Width—1/16" to 5/64" (Intake), 3/32" to 7/64" (Exhaust).

Valve Guides: Removable type. Remove guides from above with puller, install new guides with driver or press guides down in place. Upper end 7/8" below upper edge of valve seat (taper end up). Ream new guides to inside diameter of .343-.344".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Springs: Spring can be installed with either end up. Free length 1 57/64".

	Spring Pressure	Length
Valve Closed	50 lbs.	1 5/8"
Valve Open	105 lbs.	1 21/64"

Valve Lifters: Mushroom type with self-locking screws, operating in reamed holes in block. Serviced by installing oversize lifters.

NOTE—Camshaft must be removed for lifter removal. *See Henry J Special Data.*

Lifter Body Diameter—.6240-.6245".

Lifter Clearance—Select fit with slight drag.

VALVE TIMING

Tappet Clearance: .016" All Valves, Cold.

►**Adjustment Procedure**—*See "Valve System" in Henry J Special data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
Valve Timing Check—With .020" tappet clearance on #1 intake valve, this valve should open with piston 5° before top dead center with five-degree mark **before** dead center "0" mark on dampener aligned with pointer at front of engine. Reset tappet clearance at .016".

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, and to timing gears.
Crankcase Capacity—5 qts. refill.
Normal Oil Pressure—30-40 lbs. at 30 MPH.
Oil Pressure Regulator—Opens at 35 lbs. Located on oil pump cover. Adjustable by removing or adding shims between valve retainer and spring.

Oil Pan Removal: *See Henry J Special Data.*

Oil Pump: External Rotor type with floating oil intake. Mounted externally on left side of crankcase.
Oil Pump Servicing—*See Henry J Special Data.*

Oil Pressure Gauge: Indicator light on instrument panel. Controlled by King-Seeley Engine Unit. Light glows RED until oil pressure rises above 13 lbs.
Engine Unit—King-Seeley No. (1952) 47100, (1953) 47130. Pressure Switch. Contacts open at 13 lbs. (remain closed with lower oil pressure).

COOLING

Cooling System: Pressure type.
Capacity—9½ quarts (10½ quarts with heater).
Pressure Cap (Optl.)—For high altitudes or extremely hot temperatures. Opens at 3½-4½ lbs.

Radiator Removal: *See Henry J Special Data.*

Water Pump: Centrifugal, belt-drive, packless type with sealed ball bearing shaft. NOTE—Seal not same as that on 4 cylinder.
Removal—Loosen drive belt adjustment, remove belt, disconnect hose. Remove pump mounting screws and lift out pump and fan assembly.
See Water Pump Section for complete data.

Thermostat: Harrison. In outlet elbow on cylinder head. No by-pass.
Std.—Stamped '151'. Starts to open at 149-156°F. Fully open at 176°F.
Optl.. (for permanent Anti-freeze)—Starts to open at 166-174°F.. fully open at 194°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) Electric type with voltage regulator.
Dash Unit—King-Seeley No. (1952) 45577, (1953) 46041.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 8501-37 or Rockford Model 8½ RM with Borg & Beck Driven Member. Single plate
Clutch Identification—Types can be identified by number of pressure plate springs—3 (for Auburn), 6 (Rockford).
See Clutch Section for complete data.

Pedal Adjustment: Free travel 1" measured at pedal rod. Adjust as follows: (1) Clearance between the rounded forward end of release fork adjusting rod and clutch housing when release bearing just contacting clutch levers should be ⅝". If less than ½", adjust to ⅝" by changing release fork adjusting rod length (more accessible by removing bellcrank from pivot with rod attached—grease bellcrank pivot before re-installing). (2) Connect and adjust length of pedal rod at trunnion end on bellcrank for required 1" free pedal travel.

Removal: Remove transmission (see Transmission Removal). Free clutch pedal adjusting rod at trunnion end of bellcrank. Remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation, take out mounting screws to clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

TRANSMISSION

Warner Model AS40-T96. Model AS41-T96 with Type R10B Overdrive (Optl.). Constant-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever mounted on steering column.

Removal: Support car on stands, drain transmission case (and overdrive case). Disconnect both shift rods at levers on transmission case (on overdrive cars, disconnect control cable from lever on overdrive case and electrical wiring at solenoid and lockout switch). Remove two capscrews and washers attaching clutch cross-shaft support bracket to transmission and remove bracket. Disconnect speedometer cable. Disconnect propeller shaft by taking off four nuts attaching front universal joint to yoke (CAUTION—tape needle bearing retainers in place to prevent entry of dirt or loss of bearings), tie propeller shaft up out of the way. Remove two capscrews attaching rear mounting insulator to cross-member, support rear end of engine (Support Tool KF-104) and raise engine just enough to remove weight from cross-member. Disconnect clutch release bearing return spring from transmission (accessible through opening in right side of clutch housing). Remove four nuts attaching transmission to clutch housing, pull transmission straight back and remove from beneath car.

OVERDRIVE

Warner R10B (with special AS41-T96 Transmission)—Optl. equipment. New solenoid operated, governor controlled with throttle "kick-down."

NOTE—Overdrive is new "centered ring gear" type
See Transmission Section for complete data.

Removal: Overdrive and transmission are removed as a unit. See Transmission Removal above.

UNIVERSALS

Std.—Spicer. Needle bearing type.
Overdrive Cars—Detroit. Ball-and-trunnion type.

REAR AXLE

Spicer (Salisbury) Model 23-6, Part No. 2125-1; or Model 23-6, Part No. 2125-2 with O.D.—Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.

Ratios—4.10-1 (Std.), 4.55-1 (Overdrive).

Backlash—.003-.006".

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers at spring seat, disconnect parking brake cables. Take out "U" spring bolts, disconnect both springs at rear shackle, remove axle from beneath car.
Axle Shaft Removal—Remove rear wheel and drum using Puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out, using Axle Shaft Puller KF-15 (with Adapter SP-341 required).

SHOCK ABSORBERS

Monroe—Direct Acting, hydraulic two-way type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.

Kingpin Inclination—4½° preferred. Limits 4-4¾°
Caster—0° preferred (±1°).
Camber—½° preferred (¼-1° Pos. limits).
Toe-In—¼" (3/16-1/4" limits).
Toe-out on Turns—Inner wheel 20°. Outer wheel 17½°. No adjustment.

STEERING GEAR

Own Make (Gemmer 305 Type). Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

Drums—Composite (cast iron & steel). Diameter 9".

Lining-	Width	Thickness	Length per Shoe
Primary	2"	3/16"	9.87"
Secondary	1¾"	3/16"	7.62"

Clearance—Shoe eccentric backed off to point where wheel just turns freely.

MISC. MECHANICAL

Windshield Wiper: Vacuum type.
See Miscellaneous Section for complete data.

TIGHTENING SPECIFICATIONS

1946-47 MODELS

	Ft. Lbs.	In. Lbs.
Cylinder Head Stud Nuts (6)	40	480
Cylinder Head Stud Nuts (8)	50	600
Spark Plugs (14 MM. Type)	28	336
Main Bearing Bolts	75	920
Connecting Rod Bolt Nuts	40	480
Flywheel to Crankshaft	45	540
Water Jacket Cover Bolt	15	180
Front Engine Support Bolt	45	540
Clutch Cover Mounting Bolts	22	264
Differential Carrier Nuts	37	444
Axle Shaft Nut	95	1140

1948-52 MODELS

Cylinder Head Capscrews (6)	70-75	840-900
Cylinder Head Stud Nuts (8)	45-50	540-600
Main Bearing Capscrews (6)	75-80	900-960
Main Bearing Capscrews (8)	70-80	840-960
Connecting Rod Bolts	40-45	480-540
Camshaft Gear Bolt	20-30	240-360
Intake Manifold Stud Nuts	12-15	144-180
Exhaust Manifold Stud Nuts	20-30	240-360
Engine Mounting Bolts	40-45	480-540
Vibration Dampener Screw	100-120	1200-1440
Clutch Cover Bolts	20-25	240-360
Differential Carrier Bolts	35-40	420-480
Rear Axle Shaft Nut	125-200	1500-2400

1953-55 6 CYL. MODELS

	Hornet Foot Lbs.	Wasp
Cylinder Head	①75-80	①60-65
Intake Manifold	12-15	12-15

Upper Valve Tappet Cover	15-18
Rocker Arm Cover	15-18
Water Pump Manifold	25-30
Water Pump Mounting	15-18
Oil Pump Mounting	25-30

①—Fuel pump eccentric retaining screw.

ENGINE

1946-47 MODELS

ENGINE ASSEMBLY REMOVAL: All engines can be removed as follows: Remove bonnet (see Hood Removal), front seat cushion, accelerator pedal, front floor mat, transmission hole cover, clutch housing to engine bolts, engine ground strap, radiator core (see Radiator Core Removal), radiator stay rods and horns. Disconnect generator, starter, temperature gauge, and oil check valve wires and remove wiring harness from clips on left side of engine. Disconnect flexible fuel pump feed line and remove fuel line to carburetor. Disconnect throttle linkage leading from accelerator cross shaft and remove cross shaft (pull shaft toward spring and slip shaft out of opposite bracket). Disconnect windshield wiper hose at manifold. Remove spark plug wires and bracket, distributor cap, carburetor and air cleaner. Disconnect exhaust pipe at manifold. Remove front engine support bolts and nuts. Hoist engine out of car (use Tool J-917 attached to engine) move engine forward carefully to disconnect from transmission mainshaft. Finally, remove distributor, generator, fuel pump and clutch.

Installation—Reverse procedure listed above and note following point. Wrap a piece of soft wire around clutch throwout bearing oil seal with ends of wire extending up through clutch housing, lower engine in place (use care not to damage clutch driving plate assembly when engaging transmission mainshaft), pull wire out (this will prevent edge of seal from curling over).

1948-53 MODELS

ENGINE REMOVAL: ***(NOTE—Engine and transmission are removed as one unit with electrical units and carburetor attached to engine).*** Remove the two hood-to-hood hinge attaching, hood prop bolts. Lift and remove hood. Drain cooling system, removing plug at left rear of engine to drain block. Disconnect throttle linkage. Disconnect fuel line flex hose at main gas line. Disconnect exhaust pipe from manifold. Remove radiator hoses. Disconnect remote shift cable by removing hairpin lock at steering column. Leave cable attached to transmission. Disconnect wires from starter, starter solenoid, battery, water temperature cylinder block unit, oil gauge check light, generator and coil. Disconnect windshield wiper tube. Remove crankcase breather, and remove radiator. Remove two front engine mounting bolts. Drain transmission and leave drain plug out. Drain engine oil. Remove propeller shaft center bearing support bolts and disconnect front propeller shaft at transmission companion flange. Remove bolt and bracket attaching exhaust pipe to engine rear plate. Remove two bolts from clutch cross shaft bracket, and remove cross shaft. Remove remote control shifter rod from transmission. Remove engine rear mounts. Attach motor lift bracket J-2782 and raise engine up and out fo chassis.

▷*ENGINE REMOVAL (CARS WITH HYDRA-MATIC DRIVE): Remove Hydra-Matic Transmission before removing engine, then proceed as indicated above.*

1954 MODELS

ENGINE REMOVAL: Remove the two hood hinge bolts (each side). Raise and support hood then remove hood prop bolts, and fuel line at flexible tube. Disconnect exhaust pipe from manifold and remove radiator hoses. Disconnect transmission controls at transmission. Disconnect battery, starter solenoid, starter, temperature gauge and oil gauge wires at engine. Disconnect windshield wiper hoses, generator and coil wires. On all models except Hornet, remove fan and water pump assembly. Disconnect hood lock wire, then remove radiator (see Radiator Removal), and remove the two front engine mounting bolts. Drain transmission (torus cover on Hydra-Matic also), and engine oil.. Remove propeller shaft. Remove bracket attaching exhaust pipe to engine rear plate. Remove clutch cross shaft and bracket. Disconnect engine rear mounting bolts. Attach motor lift bracket J-2782, then remove engine rear mounting bolts (on Hydra-Matic cars, remove the No. 3 cross-member). Carefully remove engine.

ENGINE MOUNTINGS

1946-54 MODELS

ENGINE FRONT SUPPORT REMOVAL: Drain cooling system. Remove generator, fan belt, radiator outlet hose and raise front end of car. Remove radiator lower tank shield, vibration dampener (see Vibration Dampener Removal) and timing gears (see Timing Gear Removal). Block up front end of engine and remove front engine mounting bolts and nuts. Take out engine support bolt and locks and remove plate.

Installation—Reverse procedure listed above, note the following points: Clean front face of cylinder block thoroughly and use new gaskets. When replacing engine mounting bolts, tighten nuts until upper and lower plates are against spacer.

1946-54 MODELS

ENGINE FRONT INSULATOR REMOVAL: Can be removed without removing support plate (above) by taking off self-locking nuts on insulator bolts and raising engine sufficiently to clear bolt threads from insulators. When installing insulators, tighten bolt nuts to 40-45 ft. lbs.

1946-54 MODELS

ENGINE REAR MOUNTING ADJUSTMENT & REMOVAL:

▷***CAUTION—Mounting must be kept properly tightened or engine roughness and noise will result.***

Adjustment—Remove nuts, lockwashers, and bolts attaching rear mount to cross-member, jack up engine using block of wood between jack and oil pan (to avoid damage to pan) for one-inch clearance between base of mount and cross-member, insert box wrench or short socket through this clearance space and engage head of screw attaching mount to clutch housing (in hole in center of mount). Tighten screw, then lower engine re-install mount bolts in cross-member, tighten bolt nuts to 40-50 ft. lbs.

Removal—Proceed as for adjustment (above), use box wrench or short socket to remove attaching screw from center hole in mount, remove mount from clutch housing.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OIL PAN

1946-54 6 CYL. MODELS

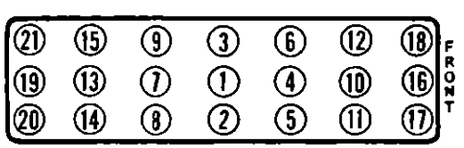
OIL PAN REMOVAL: Raise front end of car and place jack stands under #2 cross-member. Take out three bolts attaching center steering arm support bracket to #2 cross-member and drop center steering arm and tie rods. Take out two bolts attaching flywheel dust cover, remove cover. Drain oil pan. Take out oil pan attaching screws and lockwashers, lower pan and slide it out to rear.

►***CAUTION—Do not lose round rubber gasket at oil outlet tube.***

1948-52 8 CYL. MODELS

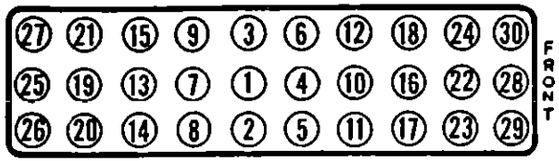
OIL PAN REMOVAL: Raise front of car and place jacks under each side of #3 crossmember. Drain oil and re-install plug. Place jack under center of #2 crossmember and raise jack until pressure is exerted against #2 crossmember enough to hold member in place against coil spring expansion pressure when attaching studs are removed. Remove one bolt (and loosen the second bolt) in each shock absorber anchor plate, which will allow the shock absorbers to slide out of the anchor plates. Remove the outer bolt (each side) of #2 crossmember at front of coil springs and insert ½"-20x6" studs. Remove two bolts (each side) from #2 crossmember at rear of coil springs and insert ½"-20x6" studs. Remove four bolts holding crossmember at front of coil springs. Release pressure of jack slowly and allow cross-member to settle on the heads of the six special studs. Remove two bolts from flywheel dust cover and remove cover. Remove bolts from oil pan and remove pan.

CYLINDER HEAD & MANIFOLD



1946-54 MODELS

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head stud nuts, tighten in the sequence shown in the diagram.



Cast Iron Heads—With engine cold, tighten all nuts evenly to correct tension. Then run engine until it is thoroughly warmed up and recheck all nuts.

Aluminum Heads—With the engine cold, tighten all nuts to correct tension. Run engine until thoroughly warm, allow engine to cool off, and then recheck all nuts. Do not tighten aluminum heads when warm.

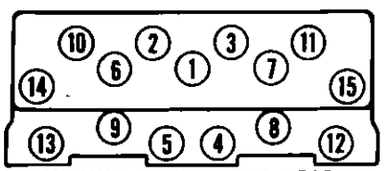
Tightening Torque—See Tightening (Torque Wrench) Specifications.

6 CYL. ENGINE CYLINDER HEAD

8 CYLINDER IN-LINE CYLINDER HEAD

1946-54 MODELS

CYLINDER HEAD GASKET INSTALLATION: Observe following precautions when installing gaskets:
1) With straight edge, check top surface of cylinder block for bulge or slightly raised metal around stud holes. Dress off raised points with fine mill file. A cylinder head that is warped in excess of .010" should be milled or planed off just enough to clean up over entire surface.
2) Examine gasket for broken spots, check water hole alignment. Wipe both cylinder head and block face with clean cloth. Cap screw threads must be clean and turn freely in threaded block openings. Use two J-2969 Locating Studs to properly position gasket and cylinder head.
3) Though cylinder head gasket has been treated by manufacturer with effective sealing agent, Hudson Perfect Seal Gasket Paste, Part No. 164848 may be used without detrimental effect on this sealer.



1955 6 CYL. MODELS

CYLINDER HEAD INSTALLATION: Use torque indicating wrench to tighten cylinder head capscrews in sequence shown in diagram.

CYLINDER HEAD GASKET INSTALLATION: Inspect the mating surfaces of cylinder head and block for cleanliness and squareness with a straight edge. Use guide pins 3" x ½"-13 (Hornet) 3" x 7/16"-14 (Wasp) to properly locate gasket on cylinder block. Use non-hardening gasket paste on gasket and a sealing compound on all cylinder head capscrews.

1955 V8 MODELS

CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up and holding position of cylinder head and gasket during installation. Coat gasket with a non-hardening gasket compound. Install Cylinder Head Lifter J-4159 in the front and rear spark plug holes and install head over dowels (dowels are drilled for oil return from rocker arm chamber). Install pushrods, rocker arm assembly, and the cylinder head capscrews. Tighten all head bolts in the sequence indicated in diagram.

HORNET V8 CYLINDER HEAD

INTAKE & EXHAUST MANIFOLD ASSEMBLY REMOVAL (Wasp, With Twin H-Power, and Hornet 6 Cyl. Models): Remove nut from top of front engine supports and loosen rear engine supports. Disconnect fuel and vacuum lines to carburetors and intake manifold. Disconnect throttle linkage (leave carburetors mounted). Remove exhaust pipe at attaching point to manifold. Remove all manifold-to-engine attaching nuts and clamps. Place a porto-power or suitable jack between front and right hand corner of block or on water pump casting and just below upper wheelhouse-to wheelhouse crossmember and wheelhouse panel. Move engine upward and to the left to provide clearance to remove manifold assembly.

ORIGINAL BORE & PISTONS

1946-55 MODELS (EXC. V8)

ORIGINAL BORE & REPLACEMENT PISTON SIZES: Original production (new engines) bore size indicated by code mark (see below) stamped on lower edge of valve chamber opposite cylinder. A code letter (see below) and the piston weight is stamped on the head of each piston (weight is indicated in ounces and quarter ounces; top figure ounces, lower figure quarters).

►*NOTE: See Replacement Pistons (following) for code marks and oversizes.*

1955 6 CYL. MODELS

ORIGINAL BORE LETTER CODE: A three letter code stamped adjacent to engine number indicates as follows:

Letter Sequence Code

First letter ..... Size of Bore
Second letter ..... Size of Main Bearings
Third letter .....Size of Con Rod Bearings

Letter Size Code

Letter "A" ..... Standard
Letter "B" ..... .010" Undersize.
Letter "C" ..... .010"Oversize.
Letter "D" ..... .001" Undersize

► *ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD.*

PISTONS

1946-55 MODELS (EXC. V8)

►**1949 SIX CYL. REPLACEMENT PISTON CAUTION (Piston Production Change beginning Car No. 491-95958):** Different pistons (see Identification Note below) must be used on engines after this number. These engines have new block with recess in top face between valve seat chamfer and cylinder bore. **Piston Identification**—Pistons used with new block (above) marked by number 302562 cast inside skirt near piston pin boss and have piston ring locating pin 20° from center-line of pin boss (44° on previous type pistons).

►***PISTON NON-INTERCHANGEABILITY CAUTION—Pistons are not interchangeable between engines due to difference of piston height between pin center and top of piston. See Car Model pages for dimensions.***

REPLACEMENT PISTONS: Standard and oversize pistons furnished for service replacement in the following finished sizes (see table below).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Code	Oversize	Code	Oversize	Code	Oversize
(B)	Std.	(P)	.007"	(BB)	.020"
(D)	.001"	(BO)	.010"	(DD)	.021"
(F)	.002"	(DO)	.011"	(FF)	.022"
(J)	.004"	(FO) ①	.0115"	(B000)	.030"
(L)	.005"	(LO) ②	.0145"	(E000)	.0315"

①—(Wasp). Hornet .012" ②—(Wasp). Hornet .015"

Piston Markings: Code marks stamped on head of piston indicate the following: **Letter** indicates piston size (see table below). **Number** Indicates piston weight in ounces (if two numbers used—one over the other—top number indicates weight in ounces, bottom number indicates additional weight in ¼ ounces). All pistons in one engine should be of same weight (carry same weight marks on head). NOTE—Original factory installed pistons have two additional numbers indicating which cylinder piston installed. and cylinder block number.

▷**Piston Measuring Note**—Piston size given above is the major diameter at top of skirt just below chamfer under No. 3 ring, at right angles to pin.

PISTON PINS

1946-55 MODELS (EXC. V8)

PISTON PIN REPLACEMENT: When replacing pins, manufacturer recommends that oversize piston pins be fitted to the piston boss and new piston pin bushings be installed in rod. Piston pin bosses are diamond-bored and should not be reamed.

Replacement Piston Pins—Furnished in standard size and .002", .005", .010" oversize.

Fitting Pins—Piston pins should be a hand press when piston heated to 200°F. Heat piston in boiling water (DO NOT HEAT PISTON WITH TORCH). After pins fitted in piston, check piston pin in connecting rod bushing. Ream bushing to .0003" larger than pin diameter. Check fit by holding piston with rod in horizontal position. Rod should just turn on pin under its own weight. See Connecting Rod Bushing Replacement (below).

1955 V8 MODELS

PISTON PIN BUSHING (IN CONNECTING ROD) INSTALLATION: After pressing old bushing out with an arbor press, install new bushing so that it is flush with both sides of rod. Position Burnisher Tool J-6055 in bushing, then applying plate of tool under rod, push burnisher through bushing with an arbor press. Make sure oil hole in bushing lines up with oil hole in rod. *NOTE*—If bushing not drilled for an oil hole, drill a 3/16" hole before reaming bushing.

PISTON RINGS

1946-55 MODELS (EXC. V8)

REPLACEMENT PISTON RINGS: Piston rings for service replacement are furnished in Standard size, and the following Oversizes: .003", .005", .010", .015", .020".

Piston Ring Sets—Cast-iron, Steel Segment, or Kromex piston ring sets furnished in Standard size, and .020" oversize.

ORIGINAL BEARING SIZES

1946-54 M DELS

CRANKSHAFT SIZE CODE: Engines built with undersize parts are identified by following marks stamped on crankshaft or engine block (see Location data below).
PU—.010" undersize connecting rod crank pins.
MU—.010" undersize main bearing journals.
PMU—.010" undersize main and connecting rod pins.

Location of Marks

Crankshaft Mark (Six Cyl. Engines through 1947, All Eight Cyl. Engines)—On left front corner of cylinder block on bottom face beside oil pan gasket (visible from below without removing oil pan).

Crankshaft Mark (Six Cyl. Engine 1948 on)—Stamped on front face of crankshaft #1 counterweight.

Bearing Marks—Undersize Main Bearings marked by green paint and part number stamped on back for Eight Cylinder engines, stamped on back of bearing shells only on Six Cylinder engines.

1955 6 CYL. MODELS

ORIGINAL BEARING LETTER CODE: A three letter code stamped adjacent to engine number indicates as follows:

Letter Sequence Code	
First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code	
Letter "A"	Standard
Letter "B"	.010" Undersize
Letter "C"	.010" Oversize
Letter "D"	.001" Undersize

ENGINES MARKED "AAA" OR UNMARKED ARE STANDARD.

CONNECTING ROD & BEARINGS

1946-54 MODELS

▷**1948 SIX CYL. CONNECTING ROD PRODUCTION CHANGE:** Three different type connecting rods used in production as listed below.

CAUTION—See Rod interchangeability Caution below.

(1) No. 300044 (Drilled Type)—Used on all engines before Car No. 482-108180 (Oct. 1948) except for 563 engines on which type (2) rods used. These rods have drilled hole in rod web extending up to pin bushing for pressure lubrication of pin from crankshaft in addition to oil-spray hole in lower end for cylinder wall lubrication.

(2) No. 302293 (Non-drilled Type)—Used on all engines beginning Car No. 482-108180 and on 563 engines before this number. These rods are same forging as type (1) rods above but do not have drilled hole for pressure lubrication of pin. Pin lubrication is provided by a drilled hole in upper end of rod through pin bushing and rod has oil-spray hole in lower end for cylinder wall lubrication.

(3) No. 302601 (Non-drilled Type)—Used on later engines. These rods same as type (2) above except that forging changed (different design I-beam section).

▷**CONNECTING ROD INTERCHANGEABILITY CAUTION:** All three types of six cyl. connecting rods (see Production Change Note above) are interchangeable but **must be matched for weight with rod being replaced.** All rods installed in engine must be uniform in weight.

NOTE—Where undrilled rod (type 2 or 3) used to replace drilled rod (type 1), the undrilled rod may be slightly heavier (fraction of an ounce) than the drilled rod it replaces. This difference will be compensated for by weight of oil in drilled rod.

Rod Installation—All types of rods should be installed with oil spray hole in lower end toward valve side of engine.

1946-55 MODELS (EXC. V8)

CONNECTING ROD BUSHING REPLACEMENT: Press out old bushing by supporting bushing end of connecting rod on Burnisher Block J-2950 (Cars with 31/32" Piston Pin), J-2951 (Cars with ¾" Piston Pin) and press bushing out using J-2790 (Use with J-2950); J-2948 (use with J-2951). Press new bushing in connecting rod using same tools as for removal. Burnish bushing in place with Burnisher J-2791 (Cars with 31/32" Piston Pin) and Burnisher Block J-2950; Burnisher J -2949 (Cars with ¾" Piston Pin) and Burnisher Block J-2951. This burnishing operation swages bushing into eye of rod and prevents bushing working out of Rod. Ream bushing for .0003" clearance. Check pin fit by holding piston and rod assembly with connecting rod horizontal. Rod should just turn on piston pin under its own weight.

CRANKSHAFT & MAIN BEARINGS

1946-47 MODELS

CRANKSHAFT REMOVAL: Crankshaft can be removed with engine in chassis as follows: Remove bonnet (see Hood (Bonnet) Removal above), radiator (see Radiator Core Removal following), vibration dampener (see Vibration Dampener Removal following), timing gears (see Removal instructions following), transmission and clutch (see Hudson 6 and 8 Car articles for data). Remove flywheel and engine oil pan and tray. Remove connecting rod bearing caps and push rods up clear of crankshaft. Remove front and rear main bearing caps with Puller Tool J-377. Remove center main bearing cap with care and take out crankshaft.

Installation—Reverse removal procedure listed above. Install new oil seals at front and rear main bearing cap (see Front and Rear Main Bearing Cap Installation following) and new palnuts on main and connecting rod bolts (see Connecting Rod and Main Bearing Palnut Installation above).

1948-54 MODELS

CRANKSHAFT REMOVAL: ***Can be removed with engine in car but manufacturer recommends that engine be removed first. Then proceed as follows:***
Remove transmission and clutch assembly, remove flywheel, crankshaft oil thrower, oil pan, and oil pan baffle. Remove vibration dampener (use puller J-676-C). Remove gear case cover, lift out camshaft thrust plunger (8 cyl. only). On six cyl. engines,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

remove camshaft gear and timing chain. On all engines, use puller J-471 to remove crankshaft gear. Remove all piston and connecting rod assemblies. Use puller J-2955 to remove front & rear main bearing caps, remove other bearing caps and remove crankshaft with a rope sling.

Installation Note (8 Cyl.)—Before installing flywheel, make certain that lower half of oil retainer fits squarely on upper half and that gaskets are in good condition. If contacting faces nicked, install new retainer. NOTE—Screw holes in oil retainer half mounted on bearing cap are slotted to permit adjustment for good contact with upper half.

►***CAUTION—Oil leaks may result if oil retainer joint not tight.***

ALL 1946-47 MODELS
1948-52 8 CYL. MODELS

MAIN BEARINGS: Removal and Installation (with engine in car). Bearing halves are retained in crankcase and caps by a machine screw in each half, requiring removal of crankshaft for access to screw in upper half. Remove crankshaft (see Crankshaft Removal above), take out machine screw in each bearing half in crankcase and caps, remove bearings. Install by reversing this procedure.

Replacement Bearings—Hudson replacement bearings furnished reamed (standard size or .010" undersize) and not reamed (see Line-Reaming data below). Reamed bearings carry punch marks on one side and when installed these marks should be together and on the same side for all bearings so that they will be in the same position as when reamed.

IMPORTANT—Lower half of bearing shell extends .002" above surface of cap (allows bearing to seat in cap and crankcase when stud nuts tightened).

Fitting Bearings—See Replacement Bearings above. Bearings can be fitted with shims (do not file caps) as follows: Install bearing shells in caps and case and oil bearing surface. Fit each bearing separately. Install crankshaft and bearing cap (on front and rear bearings, caps should be centralized on studs by inserting ¼" drill rod in vertical packing holes on each side of cap), tighten stud nuts to 75 ft. lbs. Test bearing fit by using two hand pull on crankshaft, shaft should start hard but be able to be turned over. If shaft cannot be moved, insert .005" shim between cap and case (trim shim flush with bearing shell). Repeat test until shaft turns easily. Shims are furnished .003" and .005" thick.

Line-Reaming Bearings—See Replacement Bearings above. Semi-finished bearings available for service which must be line-reamed on engine as follows: Place bearing shells in place in caps and crankcase, and secure with machine screws (see that screws are seated in countersink hole in shells), bearing shell in cap should project .002" above cap while shell in case should be flush, tighten caps to 75 ft. lbs. (front and rear caps should be centralized on studs by inserting ¼" drill rod in vertical packing holes on each side of cap). Line-ream bearings for .001" maximum clearance on crankshaft and face flange on center bearing for .006" shaft endplay.

Front and Rear Main Bearing Cap Removal and Installation—These caps fit in machined openings in crankcase. Front cap has vertical and horizontal grooves, rear cap vertical grooves only, with packing installed in these grooves to seal caps in place. When removing these caps a special removing Tool J-377 must be used to pull caps out of engine. After caps removed, grooves in caps and crankcase must be cleaned of all old packing. If old packing not removed from crankcase, oil passages may be clogged. When installing main bearing caps, insert new cotton wicking (use Crankshaft Bearing Packing Tool J-392) in vertical grooves on each side of front and rear caps, then install packing in horizontal grooves in upper end of front cap (horizontal grooves not used on rear cap). Lower half of oil retainer on rear cap should be a tight fit against upper half to prevent oil leaks at this point.

1946-54 6 CYL. MODELS
(EXCEPT JET)

CRANKSHAFT OIL SEAL REPLACEMENT (Except Jet Models): If replacement of oil seal in bearing cap required, carefully clean out old packing material, crowd new material into outer groove of bearing cap by hand, then use Installer Tool J-2779 to drive seal tightly into groove (large diameter of tool should be toward front of bearing with smaller diameter compressing seal), tap tool handle with soft hammer to compress seal. After seal properly seated and before removing tool, cut seal end off flush with top of cap (*CAUTION*—DO NOT cut seal off too short and do not leave frayed ends which may prevent cap seating). Seal must entirely fill groove to prevent oil leaks.

Front & Rear Bearing Cap Seals: (1946-47)—***NOTE—See Production Change for 1948 & Later models below.*** Seal consists of vertical grooves on each side of cap, and additional horizontal grooves on each side of front bearing cap only, for installation of special wood seals. Install seals in following order:

Vertical Seals No. BM300093—Now furnished with 1/32" saw slot approximately 2/3 length of seal. Dip seal in engine oil, start sawed end in bearing cap groove, drive seal in until bottomed securely.

Horizontal Seals No. 300093 (Front Cap only)—Install only after vertical seals have been installed. Dip seals in engine oil, drive in grooves in bearing cap until bottomed against vertical seals.

Front & Rear Bearing Cap Seals: (1948 & Later Models)—***NOTE—This method of sealing front and rear bearing caps supersedes previous wooden seals.***

Front Bearing Cap—After bearing cap installed and bearing cap bolts tightened, install wick packing in vertical holes using a blunt punch with a diameter slightly smaller than the packing groove and at least 4" long, to pack wicking solidly into grooves. (CAUTION—packing must be compressed so that it bottoms in groove and forms a solid seal flush with face of bearing cap.) After vertical grooves packed, install packing similarly in horizontal holes in bearing cap.

Rear Bearing Cap—Pack vertical grooves in bearing cap in same manner as on front bearing cap (above). Horizontal grooves are not used in the rear bearing cap.

1953-54 JET MODELS

CRANKSHAFT REAR OIL SEAL REPLACEMENT (Jet Models): A "Brummer" type oil seal is used. Clean main bearing cap and channel at crankcase rear flange. Apply a liberal amount of liquid soap to both ends and along groove of "Brummer" type oil seal. Insert the end of seal in crankcase and work the seal carefully around crankshaft until end appears on opposite side. (*CAUTION*—Take extreme care not to scuff the soft center sealing cushion at bottom of seal groove). Install the new seal in the bearing cap being careful that flange on cap fits groove in seal. Apply oil liberally between seal flange and crankshaft journal and install rear bearing cap. Tighten bolts to 75-80 ft.lbs. torque.

1948-49 6 CYL. M DELS

FRONT BEARING CAP LOCK PLATE INSTALLATION: New lock plates, BM303799, furnished for installation on front bearing cap screws to replace split lockwashers formerly used. NOTE—These lockplates will prevent oil leakage or seepage which might occur when regular lockwashers used.

Lockplate Installation—Install lockplate under screw head with lock tabs pointing straight forward. After screws properly tightened to 75-80 ft. lbs., use pointed punch to bend center tab up, then use V-shaped drift to secure tab firmly against cap screw head.

1955 6 CYL. M DELS

CRANKSHAFT FRONT & REAR MAIN BEARING SEALS: Metal backed neoprene lined seal (two identical halves), plus cotton waste for vertical and horizontal packing holes in cap.

Removal—Upper half can be removed without removing crankshaft by using ¼" brass rod to drive old seal from around shaft while rotating shaft.

Installation—Coat groove of seal with non-hardening sealer. Use 4" punch with diameter smaller than vertical holes to force cotton waste into vertical holes, leaving enough waste protruding to seal between pan gasket and bearing cap.

1955 V8 M DELS

►*CRANKSHAFT REAR MAIN BEARING OIL LEAK CORRECTION (Cars before Engine No. P-15629):* If seepage of oil exists between milled surface of rear main bearing cap and crankcase, file a notch approximately 3/32" deep, with a three cornered file, on the top outer edge of each side of the bearing cap approximately 1/8" forward of the oil pan gasket seal groove. Install a new oil seal as indicated below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Apply Lubriplate to groove in bearing cap and install oil seal, using Oil Seal Installer J-3048-A and a hammer, drive seal into place. With seal installed and tool still in place, trim ends of seal flush with surface of cap. To install upper half of seal in crankcase, remove crankshaft and install seal in same manner as for bearing cap. **NOTE**—At time of pan installation, place a generous bead of non-hardening Permatex along edge of bearing cap and crankcase to insure a perfect seal.

VIBRATION DAMPENER

1946-54 MODELS (EXC. JET)

VIBRATION DAMPENER REMOVAL: Dampener can be removed from beneath car without removing radiator louvre panel or radiator (radiator must be removed on Eight only) as follows: Remove radiator louvre panel center moulding, front bumper bracket bolts permitting bumper to drop down, and fan belt. On Eight only, remove radiator (see Radiator Core removal data above). Unscrew crankshaft starting jaw from end of crankshaft. Install jaw of special vibration dampener removal tool over dampener and place screw of tool through starting crank hole. Withdraw dampener by turning screw of dampener tool and remove from beneath car (6), or above (8).

1948-49 MODELS

▷**VIBRATION DAMPENER PRODUCTION CHANGE:** Dampener No. 300098 used on first cars, superseded by No. 301934 which has front face machined at angle for balance drilling in production. **These dampeners are interchangeable** (see replacement caution below).

Dampener Alignment Marks—Center-punch marks on front end of hub and adjacent mark on pulley indicate relative position of parts when dampener assembled and balanced. If dampener disassembled, **assemble dampener with these two marks together.**

▷**Six Cylinder Balanced Crankshaft & Dampener Replacement Caution**—On special balanced engines, where crankshaft and dampener matched for proper balance, engine is marked by "B" stamped on front machined face of block beside water pump housing. When replacing crankshaft on these engines, install new No. 301934 Dampener.

▷***CAUTION—Do not re-install dampener used with original specially balanced crankshaft.***

▷**INOPERATIVE VIBRATION DAMPENER (Causing Engine Roughness & Vibration at 24-26 MPH.):** May be caused by inner and outer members being locked together by mounting capscrew in crankshaft. Inspect capscrew and locking washer for contact with outer member. If clearance not noted at this point, remove screw, chamfer outer corners of hexagonal head of screw at 45° angle, re-install screw and tighten to 100-120 ft. lbs. torque, bend **all lips** of locking washer over capscrew flats.

1955 6 CYL. MODELS

VIBRATION DAMPENER: **Removal**—Remove radiator core for puller clearance, remove retaining capscrew. **Hornet** vibration dampener has two punch marks for alignment to maintain proper balance when dampener is disassembled for replacement of rubber discs. **Wasp** vibration dampener has an offset screw location to insure proper reassembly for balance. Use pulley Remover J-676-C and Replacer J-483 for **Hornet** and Remover J-5371 and Replacer J-5369 for **Wasp**. Tighten retaining screw to specifications shown in table above.

1955 V8 MODELS

VIBRATION DAMPENER: **Removal**—Drain cooling system. Remove radiator core and fan assembly. Remove vibration dampener retainer screw and lockwasher and if car is equipped with Power Steering or Air Conditioning, remove the drive pulleys by prying them off dampener assembly. Install center adapter J-5992-2 in threads of crankshaft. Install screw assembly J-5992-3 in remover body J-5992-1 and remove dampener.

Installation: Lubricate oil seal in engine front cover and position dampener over crankshaft and tap it into place with a rawhide hammer. Assemble Vibration Dampener Installer J-5992 by placing the ⅜" nut on screw assembly J-5992-3 and slide spacer J-5992-4 over screw assembly. Start screw in end of crankshaft and tighten until it bottoms in the threads. With one end of spacer against dampener, turn nut on screw until dampener hub bottoms the crankshaft oil slinger against a shoulder on crankshaft. Install Power Steering and/or Air Conditioning pulleys, retainer washer, and screw. Tighten retainer screw to 130-150 ft. lbs.

ENGINE FRONT COVER

1955 6 CYL. MODELS

ENGINE FRONT COVER: **Removal**—Remove Vibration Dampener (see above), remove retaining screws attaching cover to block and remove cover.

Installation: Reverse removal procedure, cover alignment is automatically made during assembly.

ENGINE FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Remove engine front cover (see above). Use Tool J-2776 to remove and install seal. Insert collar so that slot in collar engages depression in cover. Support cover when driving out seal with straight side of driver. Use tapered side of driver for installing seal. *NOTE*—Apply coating of white or red lead in well in timing cover and recheck to make sure that lip of leather is in good condition and not curled over.

1955 V8 MODELS

ENGINE FRONT COVER: **Removal**—Remove vibration dampener (see above), and water pump manifold assembly. Disconnect and remove fuel pump. Remove screws attaching front cover to block and remove cover.

Installation: Using a new gasket, install engine front *cover in place and start capscrews in threads,* **but do not tighten.** Lubricate oil seal in cover and install vibration dampener assembly, using hub on dampener as a pilot to align front cover. Complete installation by reversing removal procedure.

ENGINE FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Remove engine front cover (see above), drive out old seal with a hammer and punch, being careful not to damage cover. Install a new seal using tool J-5983, pressing seal into place with an arbor press.

CAMSHAFT & BEARINGS

1946-47 MODELS

CAMSHAFT SERVICING: Camshaft Remov'l. Remove bonnet (see Hood (Bonnet) Removal above), radiator (see Radiator Core Removal following), radiator louvre panel, vibration dampener (see Vibration Dampener Removal above), fan blades, fan belt, timing gear cover and gasket, vibration dampener spacer, camshaft gear (3 bolts and lockwire), valve chamber cover, valves, tappets, oil pump, fuel pump, and distributor. Camshaft with thrust button and spring can then be withdrawn from engine by pressing down on radiator lower tank shield.

Camshaft Installation—See Timing Gear data below (note CAUTION on cover bolt installation).

Camshaft Bearings—New thin type steel-backed, babbitt-lined bushings used (cannot be used for service on earlier cars). Factory reamed bearings available for replacement which require no reaming or scraping. Standard bearings with extra wall thickness permitting line-reaming on engine also available (line-ream for .001" bearing clearance).

Camshaft Bearing Removal & Installation—Bearings can be removed as follows: Remove camshaft (see Camshaft Removal above), remove oil pan and tray, press old bearings out. New bearings can be installed as follows: Press new bearings in place with locating notch on front edge at top (back of bearing has 1/16" chamfer so that bearings can be readily installed in crankcase, bearing material on front of bearing has light chamfer at front). Coat bearings with light engine oil, install camshaft.

1948-54 MODELS

CAMSHAFT REMOVAL: Remove radiator, cylinder head, right front wheel, fender side shield. Disconnect vacuum pump line, windshield wiper, hose and fuel pump. Remove distributor and oil pump. Remove grille center support cover, upper baffle and right hand moulding, remove grille intermediate baffle and moulding. Place block of wood between oil pan and head of jack, raise engine 1½". Remove vibration dampener, screw lock and dampener, dampener key and gear case cover. Remove coil and valve covers. Remove valve and valve springs (use Tool KMO-484). On Six Cyl. raise and secure tappets enough to permit camshaft removal. On Eight Cyl. remove tappet retainer screws, plates, washers, and lockwashers, tappets and guides. Align sprocket or gear markings and remove camshaft sprocket or gear. Remove camshaft and thrust washer.

1955 6 CYL. MODELS

CAMSHAFT REMOVAL: Remove radiator, radiator grille, fan assembly, intake and exhaust manifolds. Remove vibration dampener, (see above). Remove engine front cover, (see above). Cut sprocket mounting bolt safety wire, rotate engine to bring timing marks on chain to

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

marks on sprockets, remove camshaft sprocket and chain assembly (Puller J-471). Remove valve side covers, raise valves and install tools J-1612-3-A to hold lifters out of way. Remove oil spout on Wasp, spout and chain silencer on Hornet. Remove thrust plate and camshaft.

1955 V8 MODELS

CAMSHAFT: Removal—Remove cylinder head covers, ignition wires, rocker arm assemblies, intake manifold, and carburetor. Remove water pump and manifold assembly. Remove upper oil breather and tappet assembly cover. Remove inner oil baffle cover. Remove pushrods, keeping them in their relative operational positions. Remove hydraulic tappets and keep in their relative operational positions. Remove fuel pump, vibration dampener, and engine front cover. Crank engine until timing marks on camshaft and crankshaft sprockets line up with shaft centers. Remove oil shedder from crankshaft and fuel pump eccentric from camshaft. Timing chain, camshaft, and crankshaft sprockets can be pried off. Remove camshaft retainer and thrust plate and end plate thrust spacer. Remove camshaft.

Installation: Reverse removal procedure and note the following: Install camshaft gear about 1/16" beyond a position flush with camshaft end to allow mounting of fuel pump eccentric.

TIMING GEARS

1946 MODELS

REPLACEMENT TIMING GEARS: Aluminum Type. A new aluminum Camshaft Gear has been used on all models beginning with 1946 engines (later cars only—first cars have laminated fibre type gear). This gear (and cast iron crankshaft gear used with it) have 20° pressure angle teeth and in addition, teeth have slight crown or curvature to improve quietness. These gears furnished for service in Matched Sets only. See Installation data below for changes necessary when aluminum camshaft gear used to replace the laminated fibre type.

Identification Marking—Both gears marked by figure "20" on front face of gear. Crankshaft gear has additional marking "FRONT" to insure correct installation.

Camshaft Gear Installation (Aluminum Type): When using aluminum gear to replace laminated fibre type, additional clearance must be provided for this gear as follows:

Support Plate Screws—With camshaft gear out, remove front support plate (see Engine Front Support Removal), countersink the two screw holes in the plate behind the camshaft gear, and the corresponding holes in the cylinder block, to take special countersunk head screws and lockwashers furnished for use at this point.

Support Plate Cutout—The cutout in the plate adjacent to the camshaft flange should be increased in size or chamfered to provide adequate clearance when aluminum gear installed.

1946-47 MODELS

1948-52 8 CYL. MODELS

TIMING GEAR REMOVAL: Drain cooling system. Remove fan belt, radiator outlet hose, vibration dampener (see Vibration Dampener Removal), timing gear cover bolts, cover, cover gasket and vibration dampener spacer. Turn engine over until timing marks (2 teeth mark on camshaft gear, 1 tooth mark on crankshaft gear) coincide. Remove camshaft gear (retained by 3 capscrews and lock wire). Remove crankshaft gear using Puller Tool J-471. Gear Installation—Reverse removal procedure above (use Tool J-483 to replace camshaft gear). Use new timing cover gasket and check leather oil seal in timing gear cover. If new seal to be installed, coat seal seat in cover with red or white lead and press seal securely in place. Do not curl edge of seal over when cover installed.

Replacement Camshaft Gear:—A special .008" oversize camshaft gear (marked with daub of yellow paint on front face of gear) available for service.

TIMING CHAIN

1948-55 MODELS (EXC. V8)

TIMING CHAIN: Removal—Drain cooling system, disconnect hoses and remove radiator. Remove fan blade, pulley and fan belt. Remove dampener screw, lock and dampener (Use Puller J-676-C for Hornet Models, and J-5371 for Jet and other models to pull dampener from crankshaft). Remove timing gear cover and gasket. Crank engine until timing marks on sprocket line up with marks on timing chain then remove camshaft sprocket and chain.

Installation: If engine has not been rotated with chain removed, line up timing chain marks and sprocket marks and install camshaft gear and chain, at the same time engaging chain with crankshaft gear. Complete installation by reversing removal procedure outlined above.

►*TIMING CAUTION:* If engine rotated with camshaft and chain removed, place No. 1 piston on TDC., with marks on sprocket 14 pitches apart, and install chain and camshaft gear.

1955 V8 MODELS

TIMING CHAIN: Removal—Remove engine front cover (see above). Pry off oil slinger from end of crankshaft and remove fuel pump eccentric. Rotate engine to line up marks on sprockets with marks adjacent and in line across shaft centers. Remove sprockets by alternately prying on them and slide chain and sprocket assembly off the shafts.

Installation: Install camshaft and crankshaft sprocket keys being sure that they are properly seated in keyways. Rotate engine or crankshaft to bring No. 1 cylinder to firing position. Slide crankshaft sprocket part way on the crankshaft and assemble camshaft sprocket in chain, locating and lining up the "O" marks on the sprockets in line with camshaft and crankshaft centers. Position chain on crankshaft sprocket and start camshaft sprocket on camshaft. Using a rawhide hammer, alternately tap both sprockets into proper position. Camshaft gear must be installed about 1/16" beyond a position flush with end of camshaft for installation of fuel pump eccentric. Complete installation by reversing removal procedure.

VALVE SYSTEM

1946-47 MODELS

1948-52 8 CYL. MODELS

VALVE LIFTER REMOVAL: Valve lifters may be removed without removing cylinder head, although it is recommended that if two or more lifters are to be removed, the cylinder head should be removed. Remove right front fender shield and valve cover, and crankcase breather pipe. Use KMO-484 valve lifter and remove keepers, valves and springs. Remove tappet guide clamp bolts, washers, clamps, and remove tappet and guide assemblies.

Installation—Reverse removal procedure and note the following: Tappet guides must be accurately aligned with cams on camshaft. Position of guides is controlled by guide clamps, the inner side of which should be in full contact with matching flat surface on front face of each pair of tappet guides within .0015". To obtain this alignment, tighten clamp nuts just less than snug, then bump outer face of clamps sharply inward using a brass drift punch and hammer. This will jar tappets into alignment with clamps. When clamps are tightened, it should not be possible to insert a .002" feeler gauge at any point between inner edge of clamp and mating face of tappet guide.

VALVE TAPPET ADJUSTMENT

1955 V8 MODELS

VALVE TAPPET ADJUSTMENT: *(NOTE—Checking must be done with no oil in compression chamber of tappet and plunger completely bottomed, with tappet on base circle of cam).* With piston on compression stroke and both valves closed, press downward on the pushrod end of rocker arm to compress plunger spring and force plunger to bottom position. While still holding down on rocker arm, measure the lash. The clearance between valve stem end and rocker arm tip should be .050" to .210".

VALVE GUIDES

1955 V8 MODELS

CHECKING VALVE STEM CLEARANCE: After valves have been removed from head, and with valve stems and guides clean, install valve in respective guide bore and measure side-to-side play crosswise to the cylinder head using a dial indicator or thin strips of feeler gauge material placed between stem and guide bore. If clearance is excessive, guides should be reamed and valves with oversize stems installed.

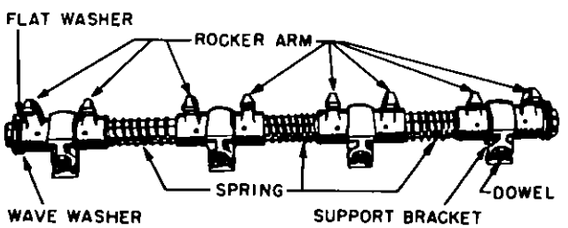
VALVE GUIDE REAMING: Four oversize reamers are available in Valve Guide Set J-6042 which will provide the desired clearance of .001-.002" (Intake), and .002-.003" (Exhaust) between stem and guide. After checking clearance, select the proper oversize reamer and pilot for the oversize valve to be installed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ROCKER ARMS

1955 V8 MODELS



►*IMPROVED OIL CONTROL ROCKER ARM SHAFT PRODUCTION CHANGE & CORRECTION ON EARLY CARS:* For improved oil control at the intake valve stems, THREE types of rocker arm shafts have been used in production with different number and size of rocker arm oil holes as follows:

1) **First Cars before Engine No. P-9038**–All oil holes in shafts were .094" diameter. On some cars, the eight holes in each shaft **toward the pushrod** were plugged in the field with 3/32" x 9/16" pins made from brass welding rod and swedged in place. If trouble experienced on these cars, install third type rocker shaft (below).

2) **Cars from Engine No. P-9038 to P-17288**–Rocker arm shafts did not have the eight holes **toward the pushrod** (holes omitted in production). If trouble experienced on these cars, install third type rocker shaft (following).

3) **Cars beginning Engine No. P-17288**–Rocker arm shafts have the eight holes **toward the pushrod** but these holes are .062" diameter (reduced from .094" diameter size used on first type shaft). All other holes in shaft were .094" prior to Engine No. P-17830 when ALL holes in shaft were changed to .062" diameter. *This latest type shaft is furnished for service on all cars and should be installed if trouble experienced with either previous type shaft.*

►ROCKER ARM SQUEAK CORRECTION *(Caused by insufficient oil reaching rocker arm shafts):* Determine if sufficient oil is getting to the rocker arm shaft by removing rocker arm covers and examining shaft for presence of oil while engine is running. If no oil is found it will be necessary to remove the cylinder head and drill out the oil passages as follows: Remove the 1/8" pipe plug at rear end of right hand cylinder head (or oil filter connection at front of left hand cylinder head). Using a 21/64" drill, drill out the oil passage to intersect the rocker shaft support bracket **rear** attaching bolt hole **(right hand head)**, or the rocker shaft support bracket **front** attaching bolt hole **(left hand head)**. Make sure that all chips are removed from holes and passages.

HORNET V8 ROCKER ARM ASSEMBLY

ROCKER ARM AND SHAFT DISASSEMBLY: Remove rocker arm and shaft assembly from cylinder head. Remove pins and wave washers from end of shaft. Remove rocker arms, springs and supports, keeping all parts in order so they can be reassembled in original position.

Inspection: Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem ends, and if worn replace the rocker arm. Inspect plugs at each end of shaft for tightness.

Reassembly: Reverse disassembly procedure and note the following: Rocker arm shaft must be assembled with the grooved oil hole in the downward position, or facing the cylinder head.

►*CAUTION: There is a right and left rocker arm and if reversed in assembly they will not contact the valve stem properly.*

HYDRAULIC LIFTERS

1955 V8 MODELS

HYDRAULIC VALVE LIFTERS: Removal–Remove valve rocker covers and rocker arm shaft mounting bracket bolts and lift off rocker arm assembly. Remove upper valve tappet cover and breather tube and then remove lower tappet cover. Remove pushrods and hydraulic valve lifters keeping pushrods and lifters in sequence so they can be replaced in same relative position.

Disassembly: Press down on valve pushrod socket and use a pair of needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger being careful not to lose the small flat valve and coil spring. *(CAUTION–Disassemble one lifter at a time to avoid mixing plungers and bodies. These parts are selectively fitted and must not be interchanged).* Use clean solvent and thoroughly wash all parts. Remove all varnish and gum deposits.

Inspection: Inspect the plunger and wall of body for scratches (if plunger or body is scratched, replace complete unit). Try the plunger for fit in body. If check valve removed from plunger, inspect flat disc valve, spring and seat.

Reassembly: Reverse disassembly procedure. See illustration for correct sequence.

Testing: Use a clean container deep enough to cover the lifter assembly (in an upright position). Fill container with clean kerosene. Remove the pushrod socket and place lifter in kerosene in an upright position, allowing it to fill up. Remove lifter and replace pushrod socket. Place lifter assembly between jaws of checking tool J-5978. Check leakdown by depressing the tool. A decided resistance should be felt. If plunger collapses immediately, the lifter should be checked again. Replace if no resistance felt.

OILING SYSTEM

1948-53 MODELS

►**OIL LEAKAGE AT MACHINING LOCATING HOLE IN CRANKCASE FLANGE CORRECTION**—Locating hole in crankcase flange at left rear of engine behind starter opens into oil pan and is sealed by a special cup shaped plug. If this plug loose or dislodged, oil may be thrown out or dirt and water allowed to enter oil pan. Check this plug, and similar plugged opening at right front of engine and install new plugs as follows:

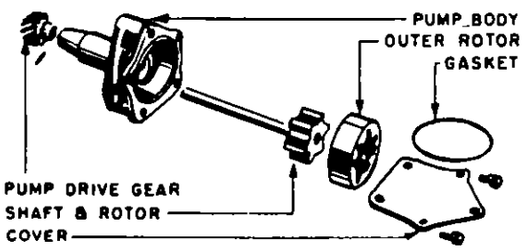
Plug Installation—Plug can be installed from above (after starter removed) or from below (if oil pan off). Use plug No. 171091 (cup shaped plug 9/16" in diameter), coat outer rim with white lead or sealer, drive plug into hole, entering closed end of plug first (handle of J-483 vibration dampener installer tool can be used as a driver).

OIL PUMP

1948-55 6 CYL. MODELS

OIL PUMP: Removal– Lift off distributor cap, rotate engine crankshaft until distributor is in firing position for No. 6 cylinder. **Do not** disturb this position of engine while oil pump is removed. Remove oil pump to block attaching screws, remove oil pump.

Overhaul: Remove pump cover and mark one lobe of inner rotor and corresponding point on outer rotor to insure reassembling in same relative position. With rotors meshed in this position, measure clearance between inner and outer rotors at point diametrically opposite marks. Replace rotors and shaft if clearance exceeds .010". Rotor end clearance (measure between rotors and straightedge laid across cover flange on body) must not exceed .004" Outer rotor clearance in body (press rotor against body and measure clearance on opposite side) must not exceed .008". Inner surface of cover must not be worn more than .002".



Installation: If crankshaft inadvertently turned while pump removed, install pump as follows to insure correct timing:

1) **Hornet**–Crank engine to TDC position (exhaust stroke No. 1 Cyl., firing position No. 6 Cyl.). **Other Models**–Crank engine to TDC position (firing position No. 1 Cyl.).

2) Install Aligning Tool J-2794 in distributor mounting hole so that guide pin indexes with distributor mounting screw hole.

3) Install oil pump, turn pump shaft so that slot in shaft indexes with tang on aligning tool (tool will be pushed out as pump installed).

4) Install distributor with rotor turned to No. 6 cylinder terminal in cap (Hornet), No. 1 cylinder terminal (Wasp).

6 CYL. ENGINE OIL PUMP

1948-52 8 CYL. MODELS

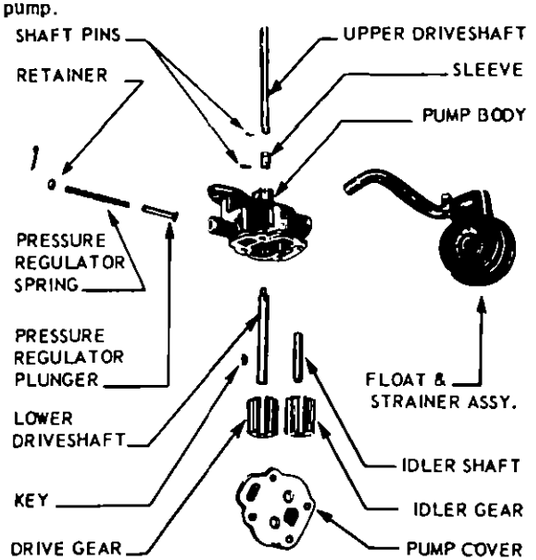
OIL PUMP: Oscillating plunger type oil pump driven by an integral gear on camshaft. Reciprocating motion of plunger allows slots to line up with inlet and outlet openings of pump, performing the function of a double acting piston.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Disconnect inlet and outlet lines from pump and remove the two attaching bolts and remove oil pump.

Disassembly: Remove hex plug and gaskets from either end of pump. Remove oil pump shaft and bushing retaining screw, and remove shaft and plunger. Wash all parts and blow dry with air.



Reassembly: Dip pump shaft and plunger in engine oil, install shaft and bushing and align hole of bushing with hole in pump body and ball of shaft in hole in plunger. Make sure that all connections are leakproof.

Installation: Reverse removal procedure.

1955 V8 MODELS

OIL PUMP: Removal—Remove engine oil pan and remove the two screws attaching oil pump to rear main bearing cap and remove oil pump and strainer assembly.

Disassembly: Remove screws attaching pump cover to pump and remove the cover. Remove idler gear. Remove pin from shaft and drive off sleeve. Remove upper and lower oil pump driving shafts and gear. If necessary, press shaft out of gear. If necessary to remove the float assembly, the tube can be unscrewed from pump.

HORNET V8 OIL PUMP

Inspection: Wash all parts in clean solvent and blow dry with air. Inspect float for leaks. Inspect strainer. Inspect pump shaft for wear, scores or pits. Check clearance between pump housing and gears (opposite point of gear mesh). This clearance should not be greater than .008". Check gear endplay using a straightedge across gears and housing. Endplay should not exceed .004". Inspect relief valve piston for scores.

Reassembly & Installation: Reverse disassembly and removal procedure indicated above.

COOLING SYSTEM

1946-53 MODELS

RADIATOR CORE REMOVAL: Drain cooling system, remove upper and lower hoses. Disconnect hood lock conduit and pull wire at lower hood lock support. Remove nine capscrews from fender tie panel and hook lock support panel, remove panel. Remove four bolts attaching radiator core to channel (NOTE—remove nuts located inside radiator channel). Lift radiator core up and forward out of channel.

1954 MODELS

RADIATOR REMOVAL: On Hornet Model 7D, disconnect hood lock pull wire and remove Phillips head screw at top of front ornament. Remove eight hexhead screws attaching grille upper louvre to front fender tie panel (located under louvre), and two screws attaching front fender tie panel feeler to tie panel. Remove eight screws from fender tie panel and hood lock support panel and remove tie panel (NOTE—On other models disconnect hood support prop). Remove four bolts attaching radiator to channel (remove the nuts located inside radiator channel), remove radiator.

CLUTCH NOTES

1946-54 MODELS (EXC. JET)

►***CLUTCH STICKING CORRECTION: Flushing instructions below will correct clutch sticking due to gum and oxidation deposits in clutch.***

FLUSHING OF CLUTCH: Engine must be run for sufficient length of time to warm up clutch to approximately 100° before flushing. Then proceed as follows:

1) Remove flywheel dust pan, turn flywheel until one drain plug in front face of flywheel is downward, remove plug and drain out old clutch compound.

2) Turn flywheel until filler hole visible in timing opening in left side of rear engine plate, inject one pint of solvent (20% carbon tetrachloride plus 80% commercial acetone), replace plug.

3) Use pedal depressor or stick to hold pedal down and clutch disengaged. Allow car to stand for about 10 minutes.

4) After 10 minute interval, turn flywheel 90° or ¼ turn and again allow car to stand for 10 minutes.

5) Repeat step (4) at 10 minute intervals until flywheel has been turned through entire revolution so that entire clutch mechanism has been exposed to solvent action.

6) Drain solvent, making certain that drain plug hole at extreme lower position so that all solvent is removed.

7) Install ⅓ pint Hudson Compound. See Refilling data below.

DRAINING & REFILLING CLUTCH: At 5000 mile intervals, proceed as follows:

Draining: Turn flywheel until drain plug on front face of flywheel visible through timing inspection hole on left side of rear engine plate, remove plug. Turn flywheel until star on flywheel is aligned with pointer in timing inspection hole. This will place drain hole at bottom of flywheel and allow old compound to drain out.

Refilling: After draining completed, turn flywheel until drain hole is again visible in timing inspection plate in engine rear plate, inject ⅓ pint of Hudsonite Clutch Compound using J-485 Clutch Filler gun (fluid can be measured with J-486 Measuring Cup or "one shot" ⅓ pint can used). Replace drain plug.

PROPELLER SHAFT NOTES

1948-54 MODELS

PROPELLER SHAFT CENTER BEARING REPLACEMENT: Remove nuts, lock plates, and "U" bolts from universal joint at front end of rear shaft and lower shaft support. Remove nut and washer attaching flange to rear of front propeller shaft. Use puller J-820 to pull companion flange from splined shaft. Remove bolt attaching center bearing and housing assembly to cushion frame support, remove center bearing and housing assembly from shaft. Remove lock rings from either side of bearing and press bearing from housing.

Installation—Reverse procedure above.

SUSPENSION NOTES

1952 PACEMAKER M DELS

►*1952 PACEMAKER "OFFSET" REAR SPRING SHACKLES (To minimize possibility of shackle noise):* Shackles with threaded ends offset ⅛" (instead of being parallel) were used on later cars and can be used as replacement on earlier cars as follows:

Shackle No.	First Type	Later "Offset" Type
Right	161005①	②307501
Left	161006①	③307502

①—Marked by two ribs at top.

②—Has left-hand thread on lower shank.

③—Marked by single rib on back.

BRAKE NOTES

1955 MODELS

►*SPONGY BRAKE PEDAL CORRECTION (EXCEPT POWER BRAKES):* The small hole of the keyhole slot in master cylinder-to-pedal shaft brace may not fully engage groove at outer end of pedal shaft allowing the pedal shaft to flex within the keyhole. Correct as follows: Remove master cylinder-to-pedal shaft brace and elongate the master cylinder attaching hole as necessary to provide a full engagement of small hole of keyhole slot to groove in outer end of pedal shaft. Replace brace using two "bite" washers in place of the regular lockwashers on the master cylinder attaching screws.

HOOD LOCK: Hood is Reverse Alligator type hinged at radiator. To raise hood, press in on lock handle to left of steering column, raise rear end of hood.

MODEL IDENTIFICATION

	Super 6 Model	Ser.No.	Commodore 6 Model	Ser.No.	Bus. Cars Model	Ser.No.
1946	51	31-101	52	32-101	58	38-101
1947	171	171-101	172	172-101	178	178-101

SERIAL & ENGINE NUMBER: See model notation above for First No. and prefix (first two figures indicate model thus: 31-101). Stamped on plate on right front door hinge pillar post and on top of engine block between #1 and #2 exhaust flanges.

TUNE-UP

COMPRESSION: Pressure—120 lbs. at 125 RPM.

VACUUM READING: Steady 18-21" idling 7½-8 MPH.

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUGS: Champion Special J-9 Hudson. 14 mm. **Gaps**—.032"

IGNITION: See Coil, Condenser, and Distributor.
Breaker Gap .020". **Cam Angle** 35° (closed).
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance See tables following.

IGNITION TIMING: See Ignition Timing.
Std. Setting—½" on flywheel before TDC.
Timing Mark—Flywheel marked "UDC.1-6/" with four graduations ¼" apart ahead of this mark. Set timing with the 3rd white line aligned with pointer in inspection hole in motor support above starter, then adjust Fuel Compensator as follows:
Fuel Compensator Setting—Advance spark (loosen *vacuum unit link screw on distributor quadrant*) until slight ping noted accelerating with wide open throttle between 10-15 MPH. **Final setting must not be more than 1" before "UDC.1-6/".**

CARBURETION: See Carburetor & Carb. Equipment.
Idle Setting—Set both idle adjusting screws for smooth running and highest steady vacuum gauge reading (each screw ½-1½ turns open—turn screws in for leaner mixture). Idle speed 7½-8 MPH.
Float Level—⅛" from top of float to gasket seat on cover with valve seated (invert to check).
Accelerating Pump—Outer hole (max.) Normal.

Fuel Pump Pressure: 3-4 lbs. (AC. mechanical type), 2½-3 lbs. (Autopulse electrical type).

MANIFOLD HEAT CONTROL: Automatic thermostatic type (no adj.). Valve must operate freely.

VALVES: See Valve Timing.
Tappet Clearance—*.008" Int., .010" Exh. Hot.*
NOTE—This supersedes earlier data.

IGNITION

IGNITION SWITCH: Mitchellock 24-B, No. E8996.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—H601 to H1100. **Groove**—No. 1.

COIL: Auto-Lite Model IG-4098. Service Coil IG-4098S. Mounted on dash. NOTE—Coil connections are reversed (breaker connection at base of coil).
Ignition Current—2½ amperes idling, 5 stopped.

CONDENSER: Auto-Lite Part No. IGW-3075C.
Capacity—.20-.25 microfarad.

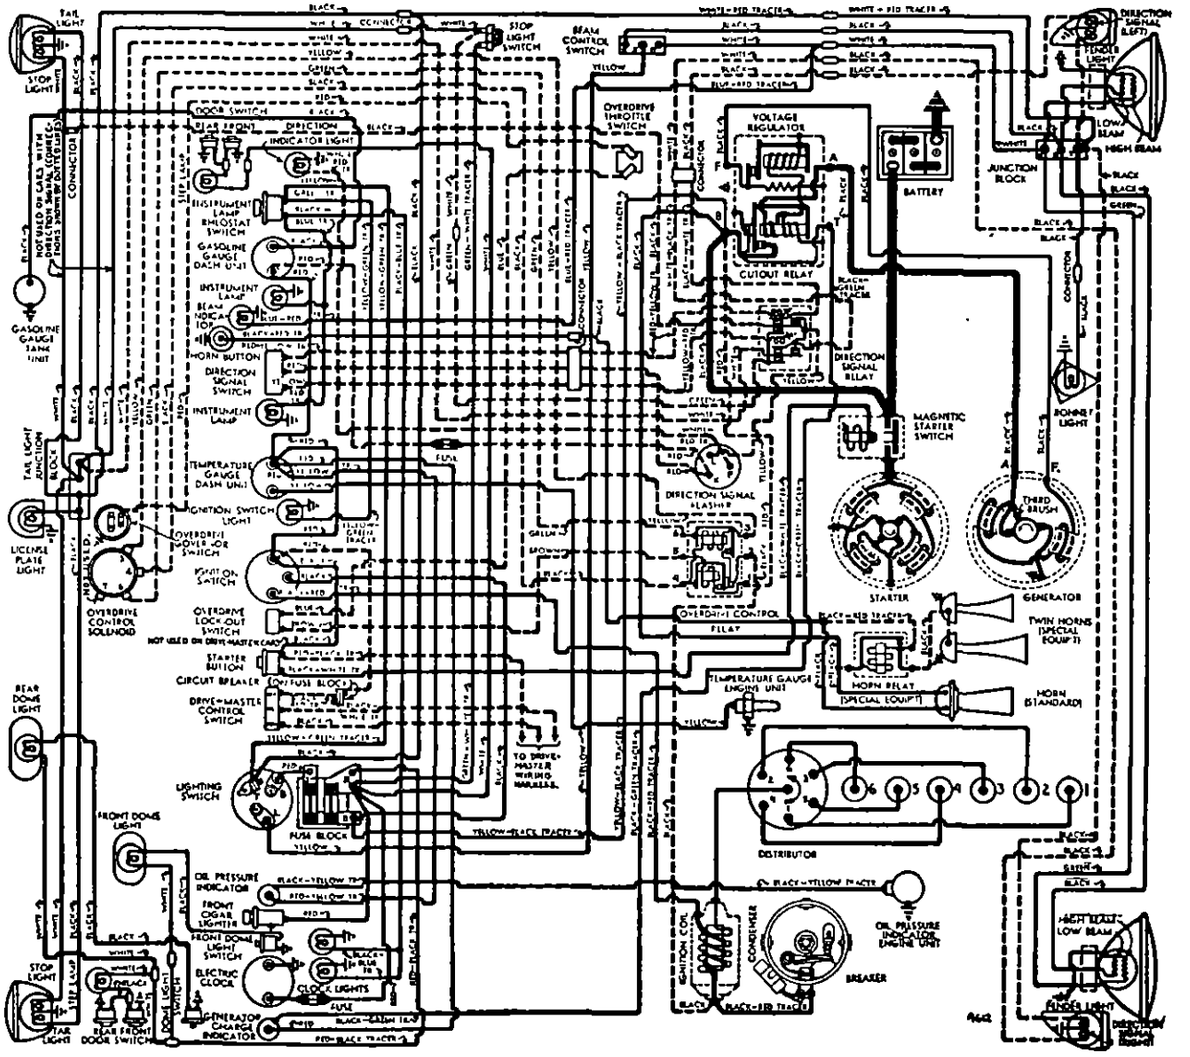
DISTRIBUTOR: Auto-Lite Model IGW-4203-A with *separate* VC-3060ES Vacuum unit. Full automatic advance type with auxiliary vacuum spark control and Fuel Compensator adjustment.

Breaker Gap—.020". Limits .020-.024".

Cam Angle or Dwell—35° closed, 25° open.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.



Distributor Degrees	R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	400	0	800
3	700	6	1400
6	1000	12	2000
9	1300	18	2600
11.75	1570	23.5	3140

Fuel Compensator—Manual adjustment for octane *rating of fuel used. See Ignition Timing for setting.*

Vacuum Spark Control: Auto-Lite No. VC-3060ES Unit. Separate unit mounted on distrib. hold-down plate, linked to quadrant scale on distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring within unit).

Distr. Degrees	Vacuum Advance Eng. Degrees	Vacuum (" of HG)
Start	0°	5⅞"
4°	8°	9¼"
7.5°	15°	11¼"

Distributor Removal:—Mounted at top rear of cylinder head. To remove, disconnect vacuum line, take out cyl. head stud nuts on hold-down plate.

IGNITION TIMING

Std. Setting .....⅛" On Flywheel BTDC This setting correct for fuel of approximately 72 Octane Rating. See Fuel Compensator Setting for fuel and operating condition correction.

Flywheel Marks—'UDC.1-6/' at TDC with 4 white graduations (¼" apart) ahead of this mark.

Timing—With #1 piston on compression, turn engine over until second graduation before flywheel mark 'UDC.1-6/' lines up with pointer on left front face of rear motor support above starter. Loosen vacuum advance diaphragm screw on quadrant scale, rotate distributor counter-clockwise to limit of slot, then slowly rotate clockwise until contacts begin to open, tighten diaphragm screw securely. Check Fuel Compensator Setting below.

Timing (Using Synchroscope)—Recommended by car manufacturer. Mark flywheel with white chalk or paint. Idle engine, adjust distributor (above).

Fuel Compensator Setting—Road test car (engine warm). When running at 8 MPH slight ping should occur between 10-15 MPH when accelerating with wide open throttle. To adjust, loosen vacuum unit link screw on distributor quadrant, rotate distributor one graduation on quadrant scale clockwise (if no ping), counter-clockwise (if ping too severe).

Final setting must not be more than 1" (4th graduation) before 'UDC.1-6/' flywheel mark.

CARBURETOR

Carter Model WDO, Type 501S. 1" Dual (double barrel) downdraft type with Carter Climatic Control.
See Carburetor Section for complete data.
Idle Adjustment—With engine warm (Fast Idle and Automatic Choke inoperative), set throttle stop-screw for idle speed of 7½-8 MPH. Adjust both idle adjusting screws (two used—one for each barrel), in succession until engine fires smoothly. Final setting of each screw should be ½-1½ turns open from inner seated position (turn screws in for leaner mixture). Recheck idle speed.
Accelerating Pump Setting—Pump lever (under dust cover at top of bowl cover) has two holes for pump link engagement. Set as follows:
Outer Hole (Max. stroke)—Normal setting.
Inner Hole (Min. stroke)—If less charge required.
Float Level—⅛" from top of float to bowl cover with valve seated (remove gasket, invert to check).
Metering Rods & Jets—*Refer to Carburetor Index for Carter Downdraft Carburetor Jet Specification Table.*

Fast Idle:—Integral type (part of carburetor).
See Carburetion Equipment Section for data.
Setting—With choke valve closed and fast idle screw on high lobe of fast idle cam, turn fast idle screw in until throttle opening is .045".

Automatic Choke: Carter Climatic Control.
See Carburetion Equipment Section for data.
Setting—1 Point Lean.

CARB. EQUIPMENT

Air Cleaner: AC. Oil-wetted type Std., United Oil-bath type Optl.
Servicing (Oil-wetted type)—Clean and re-oil filter element (use same grade engine oil used in crankcase) at 2000 mile intervals or more often if required by operating conditions.
Servicing (Oil-bath type)—Remove filter element, clean sump with kerosene (clean filter element with kerosene also if necessary), refill with 1 Pint engine oil (service same as for Oil-wetted type).

Fuel Pump: AC. Type AK Diaphragm type mechanical pump or Autopulse electric pump Std., AC. Type AJ combination fuel and vacuum pump Optl.
See Carburetion Equipment Section for data.
Pressure—3-4 lbs. (Type AK), 2½-3 (Autopulse).

Gasoline Gauge: King-Seeley Electric type. K-S Nos. 41050 (dash unit), 7550 (tank unit).
See Carburetion Equipment Section for data.

BATTERY

National Type HT-17. 6 Volt, 17 Plate, 96 Ampere Hour Capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.24 volts.
Grounded Terminal—Positive (+) to frame. **Engine Ground**—Strap (rear motor support to frame).
Dimensions—Lgth. 10 9/16". W. 7¼". Hght. 7 13/16".
Location—On left side under engine hood.

STARTER

Auto-Lite Model MZ-4092. Armature MZ-2138.
Drive—Inboard Bendix type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 125 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Removal:—On left front face of rear motor support. To remove, take out flange mounting screws.

Starting Switch:—A-L Model SS-4001. Magnetic type. Mounted on starter, controlled by switch on instrument panel. Operative only with ignition on (and clutch disengaged on cars with Vacumotive Drive or Drive-Master).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GEC-4801A. Armature GDZ-2006F.
SEE 1946-47 HUDSON 8 CAR PAGES FOR DATA

REGULATOR

Auto-Lite Model VRR-4001A. Voltage Regulator.
SEE 1946-47 HUDSON 8 CAR PAGES FOR DATA

LIGHTING

Headlamps: Hall "Sealed Beam" type with upper lower beams controlled by Beam Selector Switch on toeboard.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).
Beam Indicator—Red pilot bulb on speedometer dial. Lighted with Country (upper) beam in use.

Direction Signal: *See Electrical Equipment Section.*
Direction Signal Indicator—At extreme left hand side of instrument panel. Flashes whenever Right or Left Direction Signal is operating.

Switches
Lighting—Hudson No. 200417.
Beam Selector—Hudson No. 164439.
Instrument—Hudson No. 160092.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	35-45 watts	Sealed Beam

MISC. ELECTRICAL

GENERATOR CHARGE SIGNAL: Red indicator on right hand side of instrument panel (to right of clock). Should light when ignition turned on and should go out when generator begins to charge.
See Electrical Equipment Section for complete data.

OIL PRESSURE SIGNAL: Red indicator on right hand side of instrument panel (to left of clock). Should light when ignition turned on and go out as soon as engine is started.
See Electrical Equipment Section for complete data.

FUSES: Lighting—30 ampere. Bottom fuse on fuse block to right of steering column behind instrument panel. **Accessory**—30 ampere. Top fuse on fuse block. NOTE—Silver-plated fuses used.
Direction Indicator—10 ampere. Near flasher.
Electric Clock—3 ampere. In lead behind clock.
Weathermaster—14 ampere.
Radio—20 ampere.

CIRCUIT BREAKER: Drive-Master Cars only. Thermostatic type. Mounted on fuse block. Protects Drive-Master circuits only.

HORNS: Sparton. Twin type air electric horns operated by horn relay.
Air Gap—.026-.030" high pitch (short horn), .032-.035" low pitch (long horn).

Horn Relay:—R-B-M Model 6004. On dash. **Contacts Close 3-4 volts** (relay upright, terminals down).

ENGINE

ENGINE SPECIFICATIONS: Own Make. Six Cylinder, "L" Head type.
Bore—3". **Stroke**—5".
Displacement—212 cubic inches.
Rated Horsepower—21.6.
Developed Horsepower—102 at 4000 RPM.
Compression Ratio—6.5-1 Std. Cast Iron Head.
Compression & Vacuum Reading—*See Tune-up data.*

ENGINE REMOVAL: *See Hudson Shop Notes.*

ENGINE FRONT SUPPORT REMOVAL & INSTALLATION: *See Hudson Shop Notes.*

TIGHTENING TORQUES: *See Hudson Shop Notes.*

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

CYLINDER HEAD: Tightening Torque & Cylinder Head Diagram—*See Hudson Shop Notes.*

PISTONS: Aluminum alloy, Cam ground, T-slot type. Use finished replacement pistons.
Original Bore & Pistons—*See Hudson Special Data.*
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .0005-.001". See Fitting New Pistons below.

Replacement Pistons: *See Hudson Shop Notes.*

Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs. Use Tool J-888-A Piston Feeler Scale to measure pull.

Installing Pistons:—Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap).

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil (upper)	3/16"	.009-.011"	.001"
Oil (lower)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN: Diameter—¾". **Length**—2 7/16".
Floating type with diamond-drilled pin holes in piston and bronze bushing in connecting rod. Pin retained by lock ring at each end.
Piston Pin Servicing—*See Hudson Shop Notes.*
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.

Replacement Pins:—Std., .002", .005", .010" oversize.

CONNECTING ROD: Weight 29.75 ozs. **Length** 8 3/16"
Crankpin Journal Diameter—1.936" (1.935-1.936").
See Crankshaft Size Code Note in the Hudson Shop Notes for Original Connecting Rod Bearing sizes.
Lower Bearing—Babbitt lined, spun type.
Clearance—.001". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Install replacement rods furnished on exchange basis. Do not file rods or bearing caps. Palnuts used on bolt nuts.

Replacement Rods: Exchange rods furnished Std. size and .010" Undersize.

Installing Rods:—Lower end of rods offset. Install rods with widest half of bearing toward the rear (#1,2,4), toward front (#3,5,6). Oil scoop on lower end of rod toward camshaft.

CRANKSHAFT: Three bearing type with integral counterweights and vibration dampener on forward end.
Vibration Dampener Removal—*See Hudson Shop Notes.*
Crankshaft & Main Bearing Removal & Installation—*See Hudson Shop Notes.*
Journal Diameters—#1, 2.342" (2.341-2.342"), #2, 2.374" (2.373-2.374"), #3, 2.405" (2.404-2.405").
See Crankshaft Size Code Note in the Hudson Shop Notes for original Main Bearing Sizes.
Bearings—Bronze backed, babbitt lined type. Bearings secured in cap and crankcase by brass screws.
Clearance—.001".

Bearing Adjustment:—None (no shims). Do not file bearing caps. Palnuts used on bearing cap bolt nuts.

▷*CAUTION—Replacement of main bearings requires removal of crankshaft. Bearings retained by brass screws.*

Replacement Bearings: *See Hudson Shop Notes.*

End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. NOTE—If new unfinished bearings installed, thrust face for center bearing must be faced for proper endplay.
Endplay—.006-.012".

CAMSHAFT: Three bearing type. Helical gear drive. New design camshaft used. *See Hudson Shop Notes for Replacement Camshaft data.*
CAUTION—Special tappet clearance required for this camshaft. *See Tappet Clearance in "Tune-up" and "Valve Timing".*
Camshaft Removal—*See Hudson Shop Notes.*
Bearing Diameters—#1, 2"; #2, 1 31/32":, #3 1 9/16".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.001-.002".

Bearing Removal & Installation: *See Hudson Shop Notes.*

End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover. NOTE—Service thrust washer available which can be split and installed without removing camshaft.

Timing Gears:—Crankshaft gear cast-iron, camshaft gear Laminated Fibre (first cars), Aluminum (Later Cars). All gears have 20° pressure angle teeth. Aluminum gears (and crankshaft gear used with them) have teeth slightly crowned to improve quietness.
NOTE—Gears have figure 20 on front face (crankshaft gear carries additional FRONT mark to insure correct installation). NOTE—Camshaft gear available in .008" oversize and can be distinguished from std. size by spot of yellow paint on front face.
Replacement Gear Caution—Aluminum Camshaft Gear furnished in Matched Sets only with crankshaft gear (aluminum gear has slight crown or curvature of teeth for quietness and must be used with similarly crowned teeth type crankshaft gear).
Backlash—.002-.004".
Timing Gear Removal & Installation—*See Hudson Shop Notes.*

Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
All Valves	1⅜"	11/32"	5 11/32"
	Seat Angle	**Lift**	**Stem Clearance**
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Valve Guides: Removable type pressed in block.
Servicing—Use Tool J-1188 to drive guides out. Install guides with Tool J-883-A with top of guide 1 1/16" below top of cylinder block. With guides installed, ream guides with Tool J-129-2 to .3437" (11/32") which will provide proper valve stem-to-guide clearance. NOTE—Car manufacturer recommends that guides be cleaned with Tool KMO-122

Valve Springs:—Cadmium plated springs are used. Use tool J-587-A to install valve spring and seat
Spring Free Length—2 17/64".

	Spring Pressure	Spring Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—When springs removed, test for pressure (Tool U-15). Replace if pressure below 34 lbs. at 2".

Valve Lifters:—Roller shoe type, fitted in removable guides in cylinder block.
Valve Lifter Removal—*See Hudson Shop Notes.*

VALVE TIMING

Tappet Clearance—.008" Int., .010" Exh. Hot.
NOTE—This supersedes earlier data.
CAUTION—This tappet clearance required by new camshaft. See Camshaft data above.

Valve Timing:—See Camshaft Setting above.
Intake Valves Open 27°30'BTDC. Close 68°10' ALDC.
Exhaust Valves—Open 51°50' BLDC. Close 32°10' ATDC. *These figures correct with .010" tappet clear.*
Valve Timing Check—With .010" tappet clearance No. 1 intake valve opens 27°30' BTDC. with point on flywheel approximately 10½ teeth before top dead center mark "UDC. 1-6/" in line with indicator in inspection hole in flywheel housing above starter.

LUBRICATION

Engine Oiling System: Duo-flow (pressure and positive splash) system. Pump delivers oil to front and rear ends of upper tray in oil reservoir. Connecting rod bearings are lubricated by dippers on caps which dip into troughs in this upper tray and also splash oil inside crankcase. Part of this oil is caught in channels inside crankcase and fed into reservoirs directly over each camshaft and crankshaft bearing from which it flows into the bearings.
NOTE—Lower end of oil reservoir suction pipe (from oil pan to crankcase wall) now extends to center of oil reservoir to insure constant oil supply to pump.
Crankcase Capacity—5½ qts. (dry), 4½ (refill).
Servicing Note—When changing oil without removing oil pan, refill with 4½ quarts. If oil pan removed, place 1½ quarts in upper tray before oil pan installed, then 4 quarts through filler with pan in place.
Normal Oil Pressure—4-12 lbs. with hot oil. No gauge used (see Oil Pressure Indicator below).

Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.

Oil Filter: Special Hudson type. Optl. equipment.
Servicing—Replace filter cartridge at 5000 mile intervals.

Oil Check Valve:—Located on right side of crankcase at rear. Opens at 4-12 lbs. with hot oil. Operates dash signal to indicate oil flow.

Oil Pressure Indicator:—Hudson Teleflash Oil Pressure Indicator. Consists of signal light on instrument panel operated by switch mounted on oil check valve.
See Electrical Equipment Section for complete data.

COOLING

Cooling System: *Positive circulation type with the water pump at water inlet on front of engine.*
Capacity—13 quarts.

Water Pump:—Centrifugal, belt-driven, packless type with single outlet (no by-pass). Grease fitting provided for front and rear bearing lubrication.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat:—Fulton Choke type. In cyl. head outlet. **Setting**—Starts to open 150-155°F. Fully open 185°.

Temperature Gauge:—King-Seeley Electric. K-S Nos. 41053 (dash unit), No. 41085 (engine unit).

See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member operating in oil). 9" Type Std. on Passenger Cars, 10" Type Std. on Commercial (Business) Cars and all Passenger Cars with Vacumotive Drive, Overdrive, or Drive-Master.

See Clutch Section for complete data.

Facings—Cork Insert type as follows:

	No. Corks	Inside Diam.	Outside Diam.
9" Type	90	5¼"	9"
10" Type	108	6⅜"	10"

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin in throw-out lever at lower end of connector link, turn clevis in or out of link, tighten locknut after re-connecting clevis. CAUTION—Make certain that clevis pin inserted in same hole in lever.

Clutch Oil Servicing:—See Hudson Shop Notes.

►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*

Removal:—Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate above starter, remove plug, turn engine over ⅓ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive:—Automatic clutch control. Optl.

See Clutch Section for complete data.

TRANSMISSION

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.

See Transmission Section for complete data.

NOTE—External shift rail lock accessory kits available for installation on cars operated in mountainous regions where long 2nd gear operation required.

Transmission Control: Handy-Shift remote control type with shift lever mounted on steering column.

See Transmission Section for complete data.

Removal:—Transmission can be removed from inside car as follows: Take off accelerator pedal by removing cotter pins in anchor bracket and bell crank link clevis pins. Move steering column rubber hole cover up out of way. Remove floor mat by taking out screws at kick pads on dash and mat trim clips. Remove front seat cushion and transmission floor opening cover (CAUTION—Accelerator pedal operating rod should be secured so as not to drop on starter switch). Disconnect front universal by taking out four nuts and lock plates on U-bolts. Release clutch pedal return spring. Remove two cross shaft bracket bolts, clutch control link clevis pin and clutch pedal assisting spring. Remove Handy Shift control tube-to-transmission shift rod cotter pin, washer and grommet; transmission casing lower anchor bracket screws and bracket, shift shaft outer lever nut, washer and lever. Remove two flywheel guard-to-clutch housing screws and two rear engine mounting bolts (CAUTION—Do not remove rear engine mounting-to-clutch housing bolt). Jack rear of engine up ½" off frame. Remove clutch housing to transmission bolts. Disconnect speedometer cable from transmission. Pull transmission back and lift out.

Installation Note—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed (twist wire with end extending up through clutch housing so it will come off after transmission installed).

OVERDRIVE

Warner Model AS2-R9B. Optl. equipment, used with Hudson Transmission. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated "kick-down".

See Transmission Section for complete data.

Overdrive Solenoid—Delco-Remy. Hudson #163305.

Throttle Switch—R-B-M. Hudson No. 164438. On toeboard under accelerator pedal. Not adjustable.

Governor Switch—Auto-Lite Model TGA-4002 (two terminal type), Model TGB-4002 (five terminal type used on cars with Hudson Drive-Master transmsn.).

Removal: Same as standard transmission removal (above) except that overdrive control and wiring connections must be disconnected. Special Tool J-1502-H (hoist and dolly) should be used to lift transmission and lower onto dolly for removal.

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).

See Transmission Section for complete data.

UNIVERSALS

Spicer. Needle bearing type. Two used.

	Front — Spicer Model — Rear	
Standard	1261-101X	1268-101X
With Overdrive	1261-101X	1278-101X
Commercial	1281-101X	1278-101X
" with OD.	1261-101X	1268-101X

REAR AXLE

Own Make. Semi-floating type with Spiral Bevel Gears and Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratios	Pass. Cars	Comm'l.
Standard	4 1/9-1	4 5/9-1
Optl.	4 5/9-1	
Std. with Overdrive	4 5/9-1	4 5/9-1
Optl. with Overdrive	4 1/9-1	
Std. with Drive-Master	4 5/9-1	4 5/9-1
Optl. with Drive-Master	4 1/9-1	

Backlash—.0005-.003". Screw adjustment.

Removal:—Disconnect rear universal by taking out four nuts and lock plates on U-bolts, drop rear end of propeller shaft. Remove axle shafts (see instructions below). Remove bolt nuts on carrier flange, pull carrier assembly out of axle housing.

Axle Shaft Removal:—Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer (use Tool J-351). Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used, if knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, push bolts out of backing plate, remove bearing cap and shims (without disturbing hand brake link). Take out rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal aseembly in housing.

Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft). **Endplay**—.004-.010".

SHOCK ABSORBERS

Delco or Monroe. Direct acting, hydraulic type.
Delco Model 1037-C (front), 1041-S (rear).
Monroe Model 18076 (front), 18077 (rear).

FRONT SUSPENSION

Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control.

See Front Suspension Section for complete data.

Kingpin Inclination—4°36' crosswise.

Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.

Camber—Positive ¼° to Positive ¾°. Adjustable.

Toe In—0-1/16". Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tubes equally (to increase toe-in turn rods in direction of wheel travel, to decrease, turn in opposite direction).

Steering Geometry (Toe-out on Turns)—With outer wheel turned 25°, inner wheel turn should be 30°.

STEERING GEAR

Gemmer Model 305. Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, 4-wheel, Duo-servo, Single anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.

See Brake Section for complete data.

Drums—Centrifuse type. Diameter 10" (Std. on Pass. Cars), 11" (Comm'l Cars & Optl. for Police Car & Taxicab).

Lining—Multibestos molded (primary), Ferodo woven (secondary). Width 1¾". Thickness 7/32". Length per wheel 22⅛" (10" type), 23 15/16" (11" type).

Clearance—.0075" at each end of each shoe. (.015" at each end of secondary or rear shoe with primary shoe forced out against drum).

Mechanical Follow-up (Reserve): Over-running linkage between brake pedal and parking (hand-brake) linkage which causes rear wheel brakes to be applied mechanically by pedal if hydraulic system not operating.

See Brake Section for complete data.

Setting—1¼" clearance between face of pedal pushrod and end of actuating tube with brakes released.

Hand Brake: See Service Brakes above..

MISC. MECHANICAL

CONVERTIBLE TOP CONTROL: Hydraulic (hydro-electric) type with hydraulic power cylinders actuated by motor driven hydraulic pump.

See Miscellaneous Section for complete data.

HOOD LOCK: Hood is Reverse Alligator type hinged at radiator. To raise hood, press in on lock handle to left of steering column, raise rear end of hood.

MODEL IDENTIFICATION

	Super Eight Model	Ser. No.	Commodore Eight Model	Ser. No.
1946	53	33-101	54	34-101
1947	173	173-101	174	174-101

SERIAL & ENGINE NUMBER: See model notation above for first No. and prefix (first two figures indicate model thus: 33-101). Stamped on plate on right front door hinge pillar post and on top of engine block between #1 and #2 exhaust flanges.

TUNE-UP

COMPRESSION: Pressure—120 lbs. at cranking speed of 125 RPM.

VACUUM READING: Steady 18-21" idling 7½-8 MPH.

FIRING ORDER: 1-6-2-5-8-3-7-4.

SPARK PLUGS: Champion Special J-9 Hudson. 14 mm.. **Gaps**—.032"

IGNITION: See Coil, Condenser, and Distributor.
Breaker Gap—.017" **Cam Angle** 31° (closed).
Breaker Arm Spring Tension—17-20 ozs.
Automatic Advance—Starts at 300 RPM., 3° at 400 RPM., Maximum 17.5° at 1700 RPM (Distr. ° & RPM)

IGNITION TIMING: See Ignition Timing.
Std. Setting—At Top Dead Center.
Timing Mark—Flywheel marked "UDC.1-8" with four graduations ¼" apart ahead of this mark. Set timing with first white line aligned with pointer in inspection hole in motor support above starter, then adjust Fuel Compensator as follows:
Fuel Compensator Setting—Advance spark (loosen hold-down screw and rotate distributor) until slight ping noted when accelerating with wide open throttle between 10-15 MPH. **Final setting must not be more than ¾" before "UDC.1-8/".**

CARBURETION: See Carburetor & Carb. Equipment.
Idle Setting—Set both idle adjusting screws for smooth running and highest steady vacuum gauge reading (each screw ½-1½ turns open—turn screws in for leaner mixture). Idle speed 7½-8 MPH.
Float Level—⅛" from top of float to gasket seat on cover with valve seated (invert to check).
Accelerating Pump—Outer hole (max.) Normal.

Fuel Pump Pressure: 3-4 lbs. (AC. mechanical type), 2½-3 lbs. (Autopulse electrical type).

MANIFOLD HEAT CONTROL: Automatic thermostatic type (no adj.). Valve must operate freely.

VALVES: See Valve Timing.
Tappet Clearance—.008" Intake, .010" Exhaust, engine idling at normal operating temperatures.
NOTE—This supersedes earlier data.

IGNITION

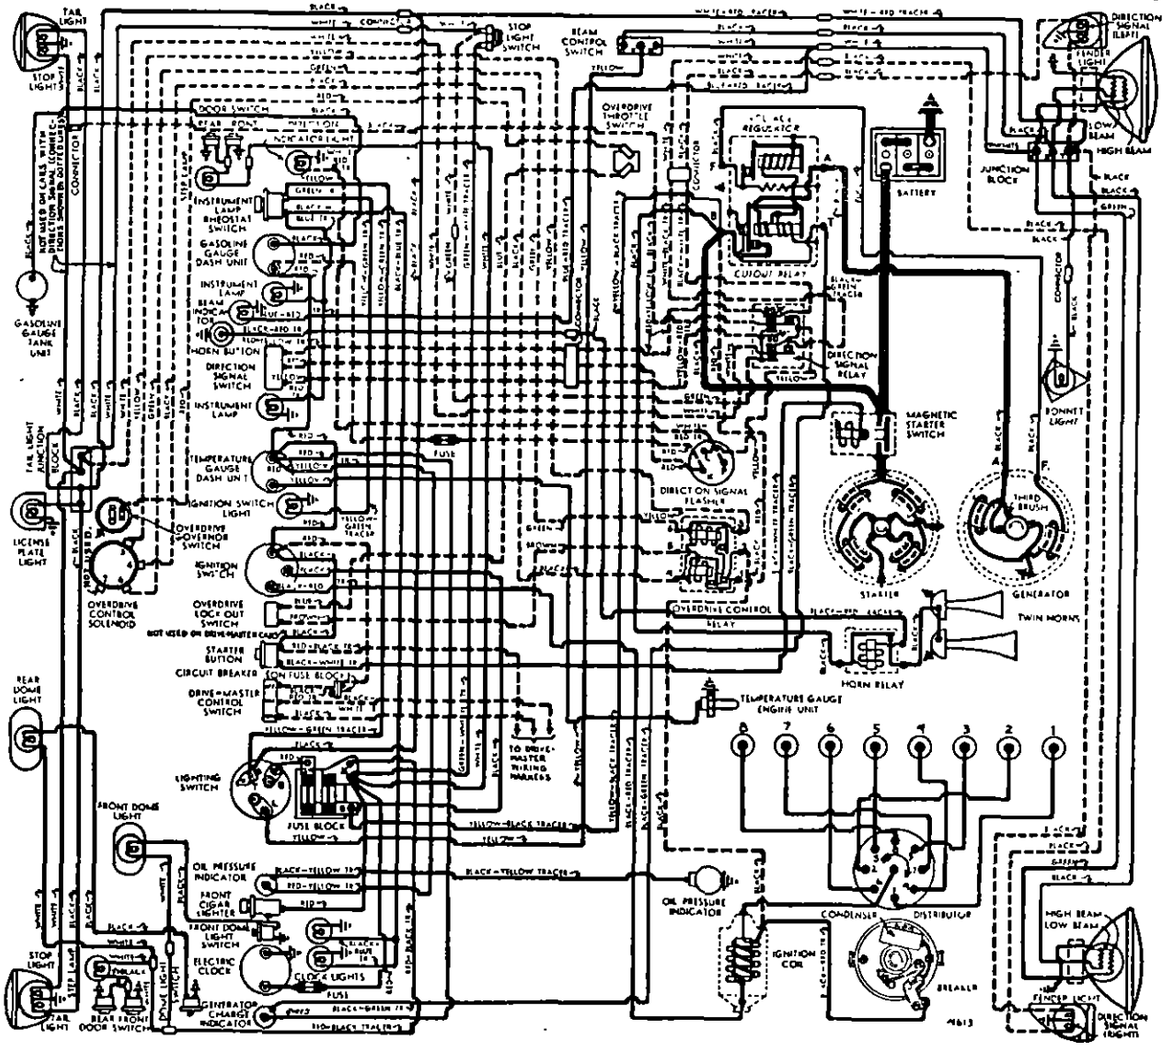
IGNITION SWITCH: Mitchellock 24-B, No. E8996.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—H601 to H1100. **Groove**—No. 1.

COIL: Auto-Lite Model CE-4029. Service Coil CE-3224JS. Mounted on the dash.
Ignition Current—2½ amperes idling, 5 stopped.

CONDENSER: Auto-Lite Part No. IG-2671.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite Model IGP-4008-A or IGP-4008-B. Full automatic advance type (no vacuum control) with Fuel Compensator adjustment.
Breaker Gap—.017".
Cam Angle or Dwell—31° closed, 14° open.
Breaker Arm Spring Tension—18-20 ozs.
Rotation—Clockwise viewed from above.

Distributor Degrees	Automatic Advance R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
8	850	16	1700
13	1300	26	2600
17.5	1700	35	3400



Fuel Compensator—Manual adjustment for octane rating of fuel used. See Ignition Timing for setting.
Removal:—Mounted on right side of crankcase. To remove take out hold-down screws in advance arm.

IGNITION TIMING

Std. Setting.....At Top Dead Center
This setting correct for fuel of approximately 72 Octane Rating. See Fuel Compensator Setting for fuel and operating condition correction.

Flywheel Marks—'UDC.1-8/' at TDC with 4 graduations (¼" apart) ahead of this mark.

Timing—With #1 piston on compression, turn engine over until piston reaches top dead center when flywheel mark 'UDC.1-8/' lines up with pointer in left front face of rear motor support. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw. Check Fuel Compensator setting.
Timing (Using Synchroscope)—Recommended by

manufacturer. Mark flywheel with white chalk or paint, connect at #1 spark plug. Idle engine and adjust distributor as directed above.

Fuel Compensator Setting—Road test car (engine warm). When running at 8 MPH slight ping should occur between 10-15 MPH when accelerating with wide open throttle. To adjust, loosen hold-down screw, rotate distributor one graduation on scale counter-clockwise (if no ping), clockwise (if ping too severe). **Final setting must not be more than ¾" (3rd graduation) before 'UDC.1-8/' mark.**

CARBURETOR

Carter Model WDO, Type 502S. 1¼" Dual (double barrel), downdraft type with Carter Climatic Control.
See Carburetor Section for complete data.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7½-8 MPH. idling speed. Adjust both idle adjusting screws (2 used, one for each barrel) in succession until engine fires smoothly. Final setting should be ½-1½ turns open for each screw (turning screws in gives leaner mixture) to give highest reading on vacuum gauge. Recheck idle speed.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has two holes for pump link engagement. Set as follows:
Outer Hole (Max. stroke)—Normal setting.
Inner Hole (Min. stroke)—If less charge required.

Float Level—⅛" from top of float to bowl cover with valve seated (remove gasket, invert to check).

Metering Rods & Jets—*Refer to Carburetor Index for Carter Downdraft Carburetor Jet Specification Table.*

Fast Idle:—Integral (built-in each carburetor).
See Carburetion Equipment Section for complete data.

Fast Idle Setting—With choke valve closed and fast idle screw on high lobe of fast idle cam, turn fast idle screw in until throttle valve opening is .053".

Automatic Choke:—Carter Climatic Control.
See Carburetion Equipment Section for complete data.

Setting—Set coil housing 1 Notch Lean.

CARB. EQUIPMENT

Air Cleaner: AC. Oil-wetted type Std., United Oil-bath type Optl.

Servicing (Oil-wetted type)—Clean and re-oil filter element (use same grade engine oil used in crankcase) at 2000 mile intervals or more often if required by operating conditions.

Servicing (Oil-bath type)—Remove filter element, clean sump with kerosene (clean filter element with kerosene also if necessary), refill with 1 Pint engine oil of same grade used in crankcase at 2000 mile intervals or more often if required by operating conditions.

Fuel Pump: AC. Type AK Diaphragm type mechanical pump or Autopulse electric pump Std., AC. Type AJ combination fuel and vacuum pump Optl.
See Carburetion Equipment Section for data.

Pressure—3-4 lbs. (AC. Type AK), 2½-3 lbs. (Autopulse type).

Gasoline Gauge: King-Seeley Electric type. K-S Nos. 41050 (dash unit), 7550 (tank unit).
See Carburetion Equipment Section for complete data.

BATTERY

National Type HT-19. 6 Volt, 19 Plate, 108 Ampere Hour Capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes. Five second voltage—4.43 volts.
Grounded Terminal—Positive (+) to frame. **Engine Ground**—Strap (rear motor support to frame).
Dimensions—Lgth. 11¾". Width 7¼". Hght. 7 13/16".
Location—On left side under engine hood.

STARTER

Auto-Lite Model MAB-4100. Armature MAB-2113.
Drive—Inboard Barrel type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 120-125 amperes, 5 v.

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	3700	5.5	60
0.6	"	1910	5.5	100
3.4	"	1100	5.0	200
6.6	"	695	4.5	300
10.15	"	420	4.0	400
15.2	"	Lock	3.0	575
21.5	"	Lock	4.0	750

NOTE—Lock torque figures correct with switch.

Removal:—On left front face of rear motor support. To remove, take out flange mounting screws.

Starting Switch:—A-L Model SS-4001. Magnetic type. Mounted on starter, controlled by switch on instrument panel. Operative only with ignition on (and clutch disengaged on cars with Vacumotive Drive or Hudson Drive-Master).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GEC-4801A. Armature No. GDZ-2006F. Third brush control with voltage regulation. Ventilated by fan on drive pulley.
Maximum Charging Rate—44 amperes (Cold), 38 amperes (hot), 35 MPH. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. See Regulator data. When checking generator output, ground "F" terminal.
Charging Rate Adjustment—See Regulator data. Third brush setting 1 commutator bar minimum, 1 commutator bar plus 1 mica strip maximum, from nearest (insulated) main brush. Setting adjustable

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280
12	6.85	1280	12	6.95	1440
16	7.0	1400	16	7.15	1600
20	7.15	1550	20	7.35	1820
24	7.25	1700	24	7.55	2090
28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
36	7.8	2375	34	8.0	3800
41	8.0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.85-5.4 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Swing generator out until possible belt deflection midway between generator and fan pulley is ¾" (use straightedge across pulleys).

REGULATOR

Auto-Lite Model VRR-4001A. Voltage Type. Cutout Relay and Voltage Regulator in case on dash.
NOTE—Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control.
See Electrical Equipment Section for complete data.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts, 825 RPM. 9.4 MPH.
Cuts Out—4.2-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min. ground contacts closed (ground contacts open when main contacts close).
Air Gap—.031-.034" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Setting—7.1-7.4 volts at 70°F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between this terminal and ground. Warm up generator by running engine at speed of 20 MPH for 15 minutes. Then increase speed to 30 MPH charging battery until voltage is constant. Voltmeter reading should be within limits of 7.1-7.4 volts at 70°F. See Electrical Equipment Section for voltages at other temperatures.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop).
Air Gap—.043-.052" with contacts just opening.

LIGHTING

Headlamps: Hall "Sealed Beam" type with upper lower beams controlled by Beam Selector Switch.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).
Beam Indicator—Red pilot bulb at upper center of speedometer dial. Lights with Upper Beam "on".

Direction Signal: *See Electrical Equipment Section.*
Direction Signal Indicator—At extreme left hand side of instrument panel. Flashes whenever Right or Left Direction Signal is operating.

Switches

Lighting—Hudson No. 2004[illegible].
Beam Selector—Hudson No. 164439.
Instrument—Hudson No. 160092.

Bulb Specifications

Position	Candlepower	Mazda No.

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

GENERATOR CHARGE SIGNAL: Red indicator on right hand side of instrument panel (to right of clock). Should light when ignition turned on and should go out when generator begins to charge.
See Electrical Equipment Section for complete data.

OIL PRESSURE SIGNAL: Red indicator on right hand side of instrument panel (to left of clock). Should light when ignition turned on and go out as soon as engine is started.
See Electrical Equipment Section for complete data.

FUSES: Lighting—30 ampere. Bottom fuse on fuse block to right of steering column behind instrument panel. **Accessory**—30 ampere. Top fuse on fuse block. NOTE—Silver-plated fuses used.
Direction Indicator—10 ampere. Near flasher.
Electric Clock—3 ampere. In lead behind clock.

CIRCUIT BREAKER: Drive-Master Cars only. Thermostatic type. Mounted on fuse block. Protects Drive-Master circuits only.

HORNS: Sparton. Twin type air electric horns operated by horn relay.
Air Gap—.026-.030" high pitch (short horn), .032-.035" low pitch (long horn).

Horn Relay:—R-B-M Model 6004. On engine dash.
Contacts Close—3 volts min., 4 volts, max.
Open—2 volts min. (relay upright, terminals down).

ENGINE

ENGINE SPECIFICATIONS: Own Make. Eight Cylinder "L" Head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches. **Rated HP**—28.8.
Developed Horsepower—128 at 4200 RPM.
Compression Ratio—6.50-1 cast-iron head.
Compression & Vacuum Reading—*See Tune-up data.*

ENGINE REMOVAL: *See Hudson Shop Notes.*

ENGINE FRONT SUPPORT REMOVAL & INSTALLATION: *See Hudson Shop Notes.*

TIGHTENING TORQUES: *See Hudson Shop Notes.*

CYLINDER HEAD: Tightening Torque & Cylinder Head Diagram—*See Hudson Shop Notes.*

PISTONS: Aluminum alloy, Cam ground, T-slot type. Use finished replacement pistons.
Original Bore & Pistons—*See Hudson Special Data.*
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Piston & rod removed from above or below. **Clearance**—Top .016". Skirt .0005-.001".

Replacement Pistons: *See Hudson Shop Notes.*

Fitting New Pistons:—Use .0015" feeler ½" wide (Piston Feeler Scale Tool J-888-A) inserted between piston and cylinder wall on side opposite slot 90° from pin. Pull to withdraw feeler 3-4 lbs.

Installing Pistons:—Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one oil ring above piston, second ring on skirt below pin). All rings are positioned by pin in ring groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil (upper)	3/16"	.009-.011"	.001"
Oil (lower)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN: Diameter—⅞". **Length**—3 7/16". Floating type with diamond-drilled pin holes in piston and bronze bushing in connecting rod. Pin retained by lock ring at each end.
Piston Pin Servicing—*See Hudson Shop Notes.*
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.

Replacement Pins:—Std., .002", .005", .010" oversize.

CONNECTING ROD: Weight 29.75 oz. **Length** 8 3/16".
Crankpin Journal Diameter—1.935-1.936".
See Crankshaft Size Code Note in Hudson Shop Notes for Original Connecting Rod Bearing sizes.
Lower Bearing—Babbitt lined, spun type.
Clearance—.001". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Install replacement rods furnished on exchange basis. Do not file rods or bearing caps. Palnuts used on bolt nuts.

Replacement Rods: Exchange rods furnished Std. size and .010" Undersize.

Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT: Five bearing type with integral counterweights and vibration dampener on forward end.
Vibration Dampener Removal—*See Hudson Shop Notes.*
Crankshaft & Main Bearing Removal & Installation—*See Hudson Shop Notes.*
Journal Diameters—#1, 2.279-2.280", #2, 2.311-2.312", #3, 2.341-2.342", #4, 2.373-2.374", #5, 2.404-2.405".
See Crankshaft Size Code Note in Hudson Special Data for original bearing size.
Bearings—Bronze backed, babbitt lined type. Bearings secured in cap and crankcase by brass screws.
Clearance—.001".

Bearing Adjustment:—None (no shims). Do not file bearing caps. Palnuts used on bolt nuts.

▷*CAUTION—Replacement of main bearings requires removal of crankshaft. Bearings retained by brass screws.*

Replacement Bearings: *See Hudson Shop Notes.*

End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. **Endplay**—.006-.012".

CAMSHAFT: Five bearing type. Helical gear drive.
Camshaft Removal—*See Hudson Shop Notes.*
Bearing Diameters—#1, 2 1/32"; #2, 2"; #3 1 31/32"; #4, 1 15/16"; #5, 1½".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.001-.002".

Bearing Removal & Installation—*See Hudson Shop Notes.*

End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover.

Timing Gears: Crankshaft gear Cast Iron, camshaft gear Laminated Fibre (first cars), Aluminum (later cars). All gears have 20° pressure angle teeth. Aluminum gears (and crankshaft gears used with them) have teeth slightly crowned to improve quietness. NOTE—Gears have figure "20" on front face for identification (crankshaft gear also marked "FRONT" to insure correct installation).
Replacement Gear Caution—Aluminum Camshaft Gear furnished in Matched Sets only with crankshaft gear (aluminum gear has slight crown or curvature of teeth for quietness and must be used with similarly crowned teeth type crankshaft gear).
Backlash—.002-.004".
Timing Gear Removal & Installation—*See Hudson Shop Notes.*

Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1½"	11/32"	5 3/32"
Exhaust	1⅜"	11/32"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Valve Guides: Removable type pressed in block.
Servicing—Use Tool J-1188 to drive guides out. Install guides with Tool J-883-A with top of guide 15/16" below top of cylinder block. With guides installed, ream guides with Tool J-129-2 to .3437" (11/32") which will provide proper valve stem-to-guide clearance. NOTE—Car manufacturer recommends that guides be cleaned with Tool KMO-122

Valve Springs: Cadmium plated springs are used. Use tool J-587-A to install valve spring and seat assembly. **Spring Free Length**—2 17/64".

	Spring Pressure	Spring Length
Valve Closed	40 lbs	2"
Valve Open	80 lbs	1 21/32"

NOTE—When springs removed, test for pressure (Tool U-15). Replace if pressure below 34 lbs. at 2".

Valve Lifters: Roller shoe type, fitted in removable guides in cylinder block.
Valve Lifter Removal—*See Hudson Shop Notes.*

VALVE TIMING

Tappet Clearance—.008" Int., .010" Exh., Hot.
NOTE—This supersedes earlier data.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44'ATDC.
Above figures correct with .010" tappet clearance.
Valve Timing Check—With .010" tappet clearance #1 intake valve should open with piston 10°40' or .0494" BTDC when a point on the flywheel approximately 3.97 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole above starter. Reset tappet clearance at .008" hot and idling.

LUBRICATION

Engine Oiling System: Duo-flow (pressure and positive splash) system. Pump delivers oil to front and rear ends of upper tray in oil reservoir. Connecting rod bearings are lubricated by dippers on caps which dip into troughs in this upper tray and also splash oil inside crankcase. Part of this oil is caught in channels inside crankcase and fed into reservoirs directly over each camshaft and crankshaft bearing from which it flows into the bearings.
NOTE—Lower end of oil reservoir suction pipe (from oil pan to crankcase wall) now extends to center of oil reservoir to insure constant oil supply
Crankcase Capacity—9 qts. (dry), 7 (refill).
Servicing Note—Whenever pan removed, install 2 qts. in upper tray before pan installed, then 7 qts. through oil filler after pan in place on engine.

Oil Filter: Special Hudson type. Optl. equipment.
Servicing—Replace filter cartridge at 5000 mile intervals.
Normal Oil Pressure—4-12 lbs. with hot oil. No gauge used (see Oil Pressure Indicator below).

Oil Check Valve:—Located on right side of crankcase at rear. Opens at 4-12 lbs. with hot oil. Operates dash signal to indicate oil flow.

Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.

Oil Pressure Indicator:—Hudson Teleflash Oil Pressure Indicator. *For data, refer to Elec. Equip. Index.*

COOLING

Cooling System: Positive circulation type with water pump at water inlet on front of engine. On Commodore Eight only, by-pass passage between outlet elbow on head and water pump inlet provides recirculation of water through block with thermostat closed.

Capacity—18 quarts.

Water Pump: Centrifugal, belt driven, packless type.

NOTE—Pump used on Commodore Eight has double inlet (for by-pass).

See Water Pump Section for complete data.

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Fulton. Choke type (Super Eight), By-pass type (Commodore Eight). In cylinder head water outlet elbow.

Setting—Starts to open 150-155°F. Fully open 185°F.

Temperature Gauge:—King-Seeley Electric. K-S Nos. 41053 (dash unit), No. 41085 (engine unit).

See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member operating in oil). 10" type used on all models.

See Clutch Section for complete data.

Driven Member—Cork insert type. Inside Diam. 6⅜". Outside Diam. 10". Facing 108 corks, .203" thick.

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin in throw-out lever at lower end of connector link, turn clevis in or out of link, tighten locknut after re-connecting clevis. CAUTION—Make certain that clevis pin inserted in same hole in throw-out lever from which removed.

Clutch Oil Servicing:—*See Hudson Shop Notes.*

►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*

Removal:—Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate above starter, remove plug, turn engine over ½ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

NOTE—See Installation Note following Transmission Removal for Clutch Throwout Bearing Oil Seal.

VACUMOTIVE DRIVE

Vacumotive Drive:—Automatic clutch control. Optl.

See Clutch Section for complete data.

TRANSMISSION

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.

See Transmission Section for complete data.

Transmission Control: Handy-Shift remote control type with shift lever mounted on steering column.

See Transmission Section for complete data.

Removal:—Transmission can be removed from inside car as follows: Take off accelerator pedal by removing cotter pins in anchor bracket and bell crank link clevis pins. Move steering column rubber hole cover up out of way. Remove floor mat by taking out screws at kick pads on dash and mat trim clips. Remove front seat cushion and transmission floor opening cover (CAUTION—Accelerator pedal operating rod should be secured so as not to drop on starter switch). Disconnect front universal by taking out four nuts and lock plates on U-bolts. Release clutch pedal return spring. Remove two cross shaft bracket bolts, clutch control link clevis pin and clutch pedal assisting spring. Remove Handy Shift control tube-to-transmission shift rod cotter pin, washer and grommet; transmission casing lower anchor bracket screws and bracket, shift shaft outer lever nut, washer and lever. Remove two flywheel guard-to-clutch housing screws and two rear engine mounting bolts (CAUTION—Do not remove rear engine mounting-to-clutch housing bolt). Jack rear of engine up ½" off frame. Remove clutch housing to transmission bolts. Disconnect speedometer cable from transmission. Pull transmission back and lift out.

Installation Note—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed (twist wire with end extending up through clutch housing so that it will come off the seal after transmission installed).

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).

See Transmission Section for complete data.

OVERDRIVE

Warner Model AS2-R9B. Optl. equipment, used with Hudson Transmission. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated "kick-down".

See Transmission Section for complete data.

Overdrive Solenoid—Delco-Remy. Hudson #163305.

Throttle Switch—R-B-M. Hudson No. 164438. On toeboard under accelerator pedal. Not adjustable.

Governor Switch—Auto-Lite Model TGA-4002 (two terminal type), Model TGB-4002 (five terminal type used on cars with Hudson Drive-Master transmsn.).

Removal: Same as standard transmission removal (above) except that overdrive control and wiring connections must be disconnected. Special Tool J-1502-H (hoist and dolly) should be used to lift transmission and lower onto dolly. Transmission and overdrive assembly can then be rolled out from beneath car.

UNIVERSALS

Spicer. Needle bearing type. Two used.

	Front—Spicer Model—Rear
Std.	1261-101X—1268-101X
With Overdrive	1261-101X—1278-101X

REAR AXLE

Own Make. Semi-floating, Spiral Bevel gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

Ratio—	Standard	Optional
Std. Transmission	4 1/9-1	4 5/9-1
With Overdrive	4 5/9-1	4 1/9-1
With Drive-Master	4 1/9-1	4 5/9-1

FOR OTHER REAR AXLE DATA SEE 1946-47 HUDSON SIX CAR PAGES

SHOCK ABS RBERS

Delco Model 1037-C (front), Model 1041-S (rear). Direct acting, hydraulic types.

FRONT SUSPENSION

Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control.

See Front Suspension Section for complete data.

Kingpin Inclination—4°36' crosswise.

Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.

Camber—Positive ¼° to Positive ¾°. Adjustable.

Toe In—0-1/16". Loosen clamps at ends of each tie rod (adjust rods equally with steering arm centered).

Steering Geometry—Inner wheel 30°, Outer 25°.

STEERING GEAR

Gemmer Model 335. Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, 4-wheel, Duo-servo, Single anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.

See Brake Section for complete data.

Drums—Centrifuse. Diameter 11".

Lining—*Multibestos molded (primary), Ferodo* woven (secondary). Width 1¾". Thickness 7/32". Length per wheel 23 15/16".

Clearance—.0075" at each end of each shoe. (.015" at each end of secondary or rear shoe with primary shoe forced out against drum).

Mechanical Follow-up (Reserve): Over-running linkage between brake pedal and parking (hand-brake) linkage which causes rear wheel brakes to be applied mechanically by pedal if hydraulic system not operating.

See Brake Section for complete data.

Setting—1¼" clearance between face of pedal pushrod & end of actuating tube with brakes off.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

CONVERTIBLE TOP CONTROL: Hydraulic (hydro-electric) type with hydraulic power cylinders actuated by motor driven hydraulic pump.

See Miscellaneous Section for complete data

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on plate on right front door hinge pillar post and stamped vertically on upper right front corner of block.

	Super 6 Serial No.	Commodore 6 Serial No.
1948	481101 Up	482101 Up
1949	491101 Up	492101 Up

Identification—First three figures of number indicate model.

TUNE-UP

COMPRESSION PRESSURE: 119 lbs., min. at 125 RPM. but not less than 100 lbs. min., and not over 10 lbs. max. variation between cylinders.

VACUUM READING: 17-18" idling at 540-560 RPM. (Std.), 580-600 RPM (Vacumotive or Drive-Mstr.).

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .032".
Plugs for Cast-iron Head—Champion J-7. 14 mm.
Plugs for Aluminum Head—Champion H-10. 14 mm.

DISTRIBUTOR: **Breaker Gap**—.020". Limits .018-.022".
Cam Angle—38° Closed. 22° Open.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.25-.28 microfarad.

IGNITION TIMING: TDC (top dead center).
Timing Procedure—*See Ignition Timing.*
Flywheel Mark—"UDC-1-6/" (1948-49) aligned with pointer in rear engine support plate opening behind starter.
plate opening behind starter.
Fuel Compensator Setting—Slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.

CARBURETION:
Idle Setting (647S, SA)—1¼-1¾ turns open, (776S) ½-1 turn open. Turn screws out for richer mixture.
Idle Speed (Std.)—540-560 RPM. or 7½-8 MPH. (Vacumotive or Drive-Master)—580-600 RPM.
Float Level—3/16". Measured from top of float to gasket seat (machined surface) on bowl cover with needle valve seated. 776S NOTE—Measured from center highest point of float.
Accelerating Pump—Outer hole, max. (Normal).
776S Note—No seasonal pump adjustment.

Choke Setting: Coil housing one mark lean.

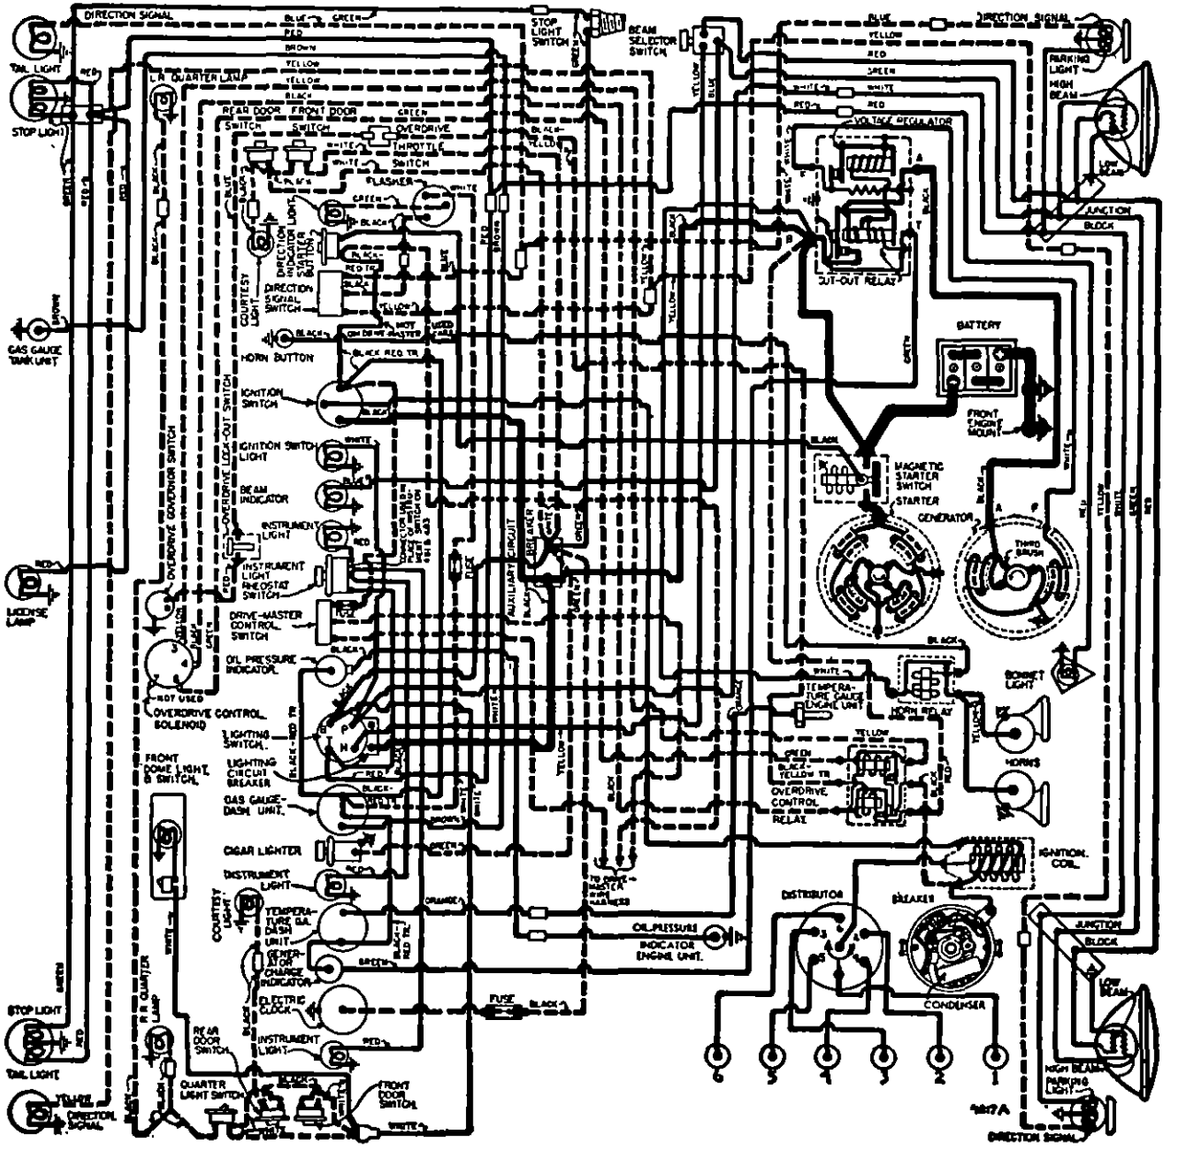
Fuel Pump Pressure: (Carter)—4-5 lbs. at carburetor, (AC)—3-4 lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve must operate freely.

VALVE TAPPET CLEARANCE: .008" Int., .010" Exh. Hot.

►*CAUTION—This figure supersedes earlier data.*
NOTE—Self-locking tappet adjusting screws used. Remove apron in right front fender for access.
Valve Timing Check—*See Valve Timing.*

IGNITION



IGNITION SWITCH: Mitchellock.

COIL: Auto-Lite No. CE-6006A (Early), CR-6012A (Late).
Location—Left side of engine above distributor.
Ignition Current—2½ amperes idling, 4½ stopped.

CONDENSER: Auto-Lite IG-3927G.
Capacity—.25-.28 microfarad.

►**1949 DISTRIBUTOR PRODUCTION CHANGES:** Vacuum advance changed on first (IGS-4213-1) distributor, and new (IGS-4213A-1) distributor with different advance used on later cars.
IGS-4213-1 (8.5° Vacuum Adv.)....Up to No. 49133913
IGS-4213-1 (3.5 or 4° Vac. Adv.) ①After No. 49133913
IGS-4213A-1 .....Beginning No. 49176984
①—May be found on cars before this no. (identify these distributors by number on breaker plate.

DISTRIBUTOR: *See Production Change Note above.*
Auto-Lite IGS-4213-1 (1948-49 to Car No. 49176984).
IGS-4213A-1 ('49) (beginning with Car #49176984).
Automatic advance type with Vacuum Spark Control and Fuel Compensator adjustment.
Breaker Plate Identification—No. stamped on plate (at breaker arm pivot pin) indicates max. vacuum advance:
8.5°.....①First IGS-4213-1 Distributors
3.5° or 4°.....①Later IGS-4213-1 Distributors
4°..... IGS-4213A-1 Distributors
①—See Distributor Production Change Note above.
Breaker Gap—.020". Limits .018-.022".
Cam Angle—38° Closed, 22° Open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Automatic Advance—IGS-4213-1

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	400	0	800
3	800	6	1600
6	1200	12	2400
9	1600	18	3200
12	2000	24	4000

Automatic Advance—IGS-4213A-1

Start	500	0	1000
1	670	2	1340
4	1150	8	2300
8	1825	16	3650
9	2000	18	4000

Fuel Compensator: 10° advance or retard adjustment at distrbutor. See Ignition Timing.

Vacuum Spark Control: Auto-Lite. Integral type.
►***PRODUCTION CHANGE CAUTION***—Vacuum advance changed on IGS-4213-1 distributor, and different advance also used on IGS-4213A-1 distributors:

IGS-4213-1 Vacuum Advance
►Marked "8.5"—Up to Car No. 49133913

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	9½"
2°	4°	10½"
4°	8°	11⅝"
6°	12°	12⅝"
8.5°	17°	14"

IGS-4213-1 Vacuum Advance
►Marked "3.5" or "4"—After Car No. 49133913

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	12½"
1°	2°	13¼"
2°	4°	14"
3°	6°	14¾"
4°	8°	15¾"

Vacuum Advance—IGS-4213A-1
►Beginning Car No. 49176984

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	13⅜"
1°	2°	14"
2°	4°	14¾"
3°	6°	15⅜"
3.75°	7.50°	16"

Distributor Removal: On left side of engine. Disconnect vacuum line, take out hold-down screw in advance arm. Lift off.
►***INSTALLATION CAUTION—If oil pump removed, refer to Oil Pump Installation in Hudson Special Data.***

IGNITION TIMING

Std. Setting.....At Top Dead Center
NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.
Flywheel Mark—"UDC-1/" (#1 and #6 piston top dead center position) with 4 short marks (¼" apart) ahead of this mark (opening behind starter).
NOTE—Early flywheels marked "UDC-1-6/", later flywheels marked "UDC-1/".
Timing—With #1 piston on compression stroke, crank engine until long line of flywheel mark "UDC-1/" lines up with pointer in rear engine support plate behind starter. Loosen hold-down screw in quadrant, rotate distributor clockwise to limit of quadrant slot, then rotate distributor counter-clockwise until contacts open, tighten quadrant screw. Check Fuel Compensator setting.
Timing (with Neon Timing Light)—Mark long line of "UDC-1/" flywheel mark with white paint, connect timing light to #1 spark plug. Idle engine below 800 RPM., adjust distributor (as directed above) until mark lines up with lower edge of opening.
Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. with wide open throttle. To adjust, loosen hold-down screw, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping). **Final setting must not be more than 1" (4th short line) ahead of "UDC-1/" flywheel mark.**

CARBURETOR

Carter WDO No. 647S, 647SA. 1¼" dual downdraft with Carter Climatic Control.
Casting No. on Flange (647S, SA)—542.
See Carburetor Section for complete data.
►**Difficult Starting & Carburetor loading and stalling Correction on 1948 & Early 1949 Cars**—***See Carter "WDO" Carburetor in Carburetor Section for installation of new Intake Manifold (with angle mounting flange) and other necessary carburetor parts.***
►**1949 Intake Manifold & Carburetor Production Changes**—***See Carter "WDO" Carburetor in Carburetor Section for new manifold and new 647SA carburetor used on later 1949 cars.***
►**Lean Condition at 20 MPH. correction on 647S carburetors**—***See Carter WDO carburetors in Carburetor Section.***
►**ACCELERATION "STUMBLE" CORRECTION**—***See "Carter WDO" in Carburetion Section.***
Settings (Idle Setting, Float Level, and Accelerating Pump: ***See Tune-Up data.***
Metering Rods & Jets—***See Carter Jet Table in Carburetor Section.***
Fast Idle: Carter Dual (WDO) Carburetor type.
See Carburetion Equipment Section for complete data.
Setting (WDO Carb.)—.054" throttle opening with choke valve closed. Adjust by turning fast idle screw on high step of cam.
Automatic Choke: Carter Climatic Control (Dual Carbs.).
See Carburetion Equipment Section for complete data.
Setting—Set coil housing 1 point lean.

CARB. EQUIPMENT

Air Cleaner (std.): AC 1544265 (1544297 for Dr.-Mstr.).
(Optl. oil bath)—1544266 (1544298 Drive-Master).
Filter Element—(std.) #5, (oil bath) #7-S.
Fuel Pump (Std.): (1948-49) AC Type AH #1539109.
Optl. (Fuel-&-Vacuum)—AC Type AJ No. 1539108.
Replacement Pump—No. 584.
Pressure—4-5 lbs. at carburetor.
See Carburetion Equipment Section for complete data.
Gasoline Gauge: King-Seeley Electric.
Dash Unit—K-S No. 42120 ('48-49 Super), 42135 ('48-49 Commander).
Tank Unit—K-S No. 41765.
See Carburetion Equipment Section for complete data.

BATTERY

National S17-2HF, 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to frame and engine by a single strap.
Location—On left side under engine hood.

STARTER

Auto-Lite Model MCL-6006.
Armature—Auto-Lite MCH-2023.
Drive—Bendix No. A-1806. Inboard Barrel type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—Approx. 160 amperes at 150 RPM.

Performance Data (MCL-6006)

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	4900	5.0	65
8.0 "	Lock	2.0	410

Removal: On left front face of rear motor support. To remove, take off Drivemaster mounting bracket bolts (on cars equipped with Drivemaster), disconnect linkage, and pull bracket out and forward, disconnect cables from solenoid switch, remove two starter mounting stud nuts and remove starter
Starting Switch: Auto-Lite No. SS-4001. On starter with pushbutton on instrument panel. Operative only with ignition "on" (and clutch disengaged on cars with Vacumotive Drive, Drive-Master or Super-Matic).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GEC-4801A. Armature GDZ-2006F. Third brush control with voltage regulation.
Maximum Charging Rate—43 amperes (Cold), 37 amperes (Hot), at approx. 35 MPH. Ground "F" terminal when checking generator output.
Charging Rate Adjustment—See Regulator data. Third brush setting 1 commutator bar minimum, 1 commutator bar plus 1 mica strip maximum, from nearest (insulated) main brush. Adjust 3rd brush.

Cold Amperes	Cold Volts	Performance Data R.P.M.	Hot Amperes	Hot Volts	Hot R.P.M.
0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280
12	6.85	1280	12	6.95	1440
16	7.0	1400	16	7.15	1600
20	7.15	1550	20	7.35	1820
24	7.25	1700	24	7.55	2090
28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
41	8.0	3350	34	8.0	3800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.85-5.4 amps. at 6.0 volts.
Belt Adjustment: ¾" belt deflection between generator and pump. Loosen clamp, swing generator out.

REGULAT R

Auto-Lite Model VRR-4001A. Voltage type.
NOTE—Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min., ground contacts closed (ground contacts open when main contacts close).
Air Gap—.031-.034" at hinge end of core with contacts open (ground contacts closed).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Voltage Regulator

Voltage Setting—7.1-7.4 volts at 70°F.
Contact Gap—.012" Min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

LIGHTING

Headlamps: Hall "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when Upper Beam "on".

Direction Signal: Optl. *See Electrical Equipment Section.*
Direction Signal Indicator—At left end of instrument panel. Flashes when Signal in use.
Direction Signal Flasher—Hudson No. 300877.

Switches

Lighting—Hudson No. 300641 (with Circuit Breaker), No. 300642 (switch only).
Beam Selector—Hudson No. 300799.
Instrument (Commodore)—Hudson No. 160092.
Door Switch—Hudson No. 300796.
Front Dome Light—Hudson No. 211312.
Rear Quarter Pillar—Hudson No. 160091.
Direction Signal—Hudson No. 300875 (with wires).

MISC. ELECTRICAL

CIRCUIT BREAKERS: Vibrating thermostatic types.
Lighting Hudson 300643. 30 amp. On light switch.
Misc. Lighting—Hudson No. 301853. 20 ampere. On steering support bracket behind instrument panel.
Convertible Top & Hydraulic Window Regulators—Hudson No. 300626. 30 ampere. On steering support bracket behind instrument panel.

FUSES: **Electric Clock**—3 ampere. Behind clock.
Direction Signal—10 ampere. On Direction Signal Harness behind instrument panel.
Weather Control—14 ampere. On heater.
Drive-Master—15 ampere (supersedes 10 ampere type used on 1948 & early 1949 cars). On back of Drive-Master Control Switch.

GENERATOR CHARGE SIGNAL: Red indicator on instrument panel (to right of temperature gauge). Should light when ignition turned on and should go out when generator begins to charge.
See Electrical Equipment Section for complete data.

OIL PRESSURE SIGNAL: Red indicator on instrument panel (to left of gas gauge). Should light with ignition on, go out as soon as engine started.
Oil Pressure Warning Switch—Carter No. A658S. Hudson No. 300828. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch sealed. Not adjustable. *See Electrical Equip. Section for data.*

HORNS: *See 1948-49 Hudson Eight car pages for data.*

ENGINE

ENGINE SPECIFICATIONS: **Own Make.** Six cylinder, "L" head type.
Bore—3 9/16". *See "Original Bore & Pistons" in Hudson Special Data.*
Stroke—4⅜".
Displacement—262 cu. ins. **Rated HP**—30.4.
Developed Horsepower—121 at 4000 RPM.
Compression Ratio (Std.)—6.50-1, cast iron head.
Compression Ratio (Optl.)—7.00-1, aluminum head.
Compression & Vacuum Reading—*See Tune-Up.*

ENGINE REAR MOUNTING ADJUSTMENT: *See Hudson Special Data.*

▷**1949 CYLINDER BLOCK & PISTON PRODUCTION CHANGE**—Beginning Car No. 491-95958 (April, 1949), blocks have tapered depresssion ⅛" deep extending from valve seat chamfers to cylinder bores. **Special pistons (with cast 302562 identification number must be used in these blocks.**
See "Pistons" in Hudson Special Data.

TIGHTENING TORQUES: *See Hudson Shop Notes.*

CYLINDER HEAD DIAGRAM: *See Hudson Shop Notes.*

ENGINE REMOVAL: *See Hudson Special Data.*

OIL PAN REMOVAL: *See Hudson Shop Notes.*

PISTONS: Aluminum alloy, Cam ground, T-slot type.
▷*CAUTION*—DIFFERENT PISTONS used starting car no. 491-95958. Change required due to change in finishing cylinder top face.
Weight—18 ± ⅛ ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0015 to .002" (skirt).
Original Bore & Pistons—*See Hudson Special Data.*
Piston Fitting—Insert piston in cylinder with .0015" feeler gauge. Pull to withdraw feeler 3 to 4 lbs.

Replacement Pistons: *CAUTION*—Two different types required. *See Hudson Special Data.*

Installing Pistons: Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap.

Ring	Width	End Gap	Side Clearance
Compression	5/64"	.007-.012"	.001"
Oil (upper)	3/16"	.007-.012"	.001"
Oil (lower)	5/32"	.007-.012"	.001"

Installing Rings—Three top rings have offset pin notch (in relation to gap). Install rings so that alternate gaps offset.

Replacement Rings: *See Hudson Shop Notes.*

PISTON PIN: Dia.—.9684-.9687". **Length**—2.9375".
Floating type with diamond-drilled pin holes in piston and rolled steel babbitt faced bearing in connecting rod. Pin retained by lock ring at each end.
Pin Fit in Piston—.0000-.0003" at 70°F. or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—.0003" clearance. Hand push fit at 70°F.
Piston Pin Servicing—*See Hudson Special Data.*

Replacement Pins: Std., .002", .005", .010" oversize. Select pin to fit piston. **Do not ream pin hole in piston.**

CONNECTING ROD: Length—8⅛".

▷**1948 CONNECTING ROD PRODUCTION CHANGE:** New non-drilled rods used beginning Car No. 482-108180 (and some cars before this no.). *See "Connecting Rod & Bearings" in Hudson Special Data.*
Weight—34.23 ozs. (without bearings).
Crankpin Journal Diameter—2.1244-2.1254".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Lower Bearing—Steel-backed, babbitt-lined type with upper and lower halves alike. No shims.
Clearance—.0005-.0015". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.
Palnuts—Tighten finger tight, plus 1/3 turn.

Replacement Bearings: Furnished Std. ("Large" & "Small"), & .001", .002", .010", .012" Undersize.

Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward valve side of engine.

CRANKSHAFT: Four bearing type with integral counterweights. Vibration dampener on front end.

▷**INOPERATIVE VIBRATION DAMPENER (Causing Engine Roughness at 24-26 MPH.)**—*See "Vibration Dampener" in Hudson Special Data.*
Journal Diameter—2.4988-2.4998".
Bearing Diameter—2.4993-2.5013".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Bearings—Removable steel-backed, babbitt-lined Upper and lower halves of each bearing alike.
Clearance—.0005-.0015".
Front & Rear Oil Seals—*See "Crankshaft & Main Bearings" in Hudson Special Data.*

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.
NOTE—Bearing shells positioned in cap and crankcase by tang on edge of shell. Can be rotated out without removing crankshaft with Tool KMO-734.
Palnuts—Tighten finger tight, plus 1/3 turn.

▷**Front Main Bearing Lock Plates:** Used beginning 1950, can be installed 1948-49 cars (instead of lockwashers) to eliminate oil leakage or seepage. *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Crankshaft & Main Bearing Removal: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Replacement Bearings: Furnished Std. & .001", .002", .010", .012" Undersize.

End Thrust: Taken by #3 bearing. Replace bearing if endplay excessive. **Endplay**—.003-.009".

CAMSHAFT: 4 bearing type. Non-adjustable chain
▷**Oil Pump & Camshaft Gear Change**—Camshaft driving gear & mating oil pump gear have "Granoseal" finish to reduce wear (may be identified by black velvety appearance).
Bearing Diameter—#1, 2.375-2.3755"; #2, 1.997-1.9975"; #3, 1.965-1.9655"; #4, 1.497-1.4975".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.002".
Camshaft Removal—*See Hudson Special Data.*

Replacement Bearings: Furnished as follows:
Finished Reamed—Will be proper dimension when pressed in place (.0026-.0055" press fit) and no reaming required.
Unfinished—Press in place (.0026-.0055" press fit) and line ream to .001" larger than individual camshaft journals.
▷*CAUTION*—Install all bearings with notch at top.

End Thrust: Steel thrust plate fitted between front end of camshaft and sprocket. Plate attached to crankcase by two capscrews and locks.

Timing Chain: Morse. 60 links, ⅜" pitch. Width—1¼".
Chain Tension Shoe—Fibre shoe backed by synthetic rubber plunger mounted inside timing chain cover at top. Holds chain in close mesh with sprockets and prevents whip.

Camshaft Setting: Sprockets marked. Two chain guide links marked with center holes. Mesh chain with center hole in each link opposite "O" mark on each sprocket with #1 piston at top dead center (crankshaft sprocket keyway at top with #1 piston at TDC). NOTE—With this setting, there should be 6 full links plus two half-links between marks on sprockets (half-links opposite sprocket marks).

ENGINE

CONTINUED FROM PRECEDING PAGE

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 53/64"	.3402-.3412"	5.730"
Exhaust	1 9/16"	.3402-.3412"	5.730"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

NOTE—Stem clearance worn limit .005" max.

Valve Guides: Removable, one-piece, cast-iron Exhaust guides counterbored at upper end. Install guides as follows:
Intake Guide—Upper end 1 7/16" below top of valve seat. Finish ream to .3432-3442".
Exhaust Guides—Upper end 1 3/32" below top of valve seat. Finish ream to .3432-.3442". Counterbored 9/16" deep to diameter of 25/64".

Valve Springs: Cadmium plated springs are used. Install springs with closely coiled end up.

	Spring Pressure	Length
Valve Closed	77 lbs.	2 3/16"

NOTE—Reject springs if pressure less than 60 lbs. Free length 2.500".

Valve Lifters: Mushroom type fitted directly in crankcase. Removed from below with camshaft out. Service by installing oversize lifter.
Clearance—.00075-.00175".
Replacement Lifters—.002", .004", .010" Oversize.

VALVE TIMING

Tappet Clearance: .008" Intake, .010" Exhaust. Hot.
►*CAUTION—This figure supersedes earlier data.*
Self-locking tappet screws are used. Remove right front fender apron for access to valve compartment.
Valve Timing: See Camshaft Setting above.
Intake Valves—Open 7°18' BTDC. Close 53°42' ALDC.
Exhaust Valves—Open 53°18' BLDC. Close 7°42' ATDC. These figures correct with .010" tappet clear.
Valve Timing Check—Adjust #1 intake tappet to .010" hot. Insert .002" feeler gauge between valve and tappet and turn engine in direction of rotation until exhaust valve begins to close, then continue to turn engine until a slight drag is felt on feeler gauge. The first of the five timing marks on flywheel (the one furthest from UDC mark) will be 5/8" above lower edge of opening in engine plate. One tooth out of time is equivalent to approximately 1½" on flywheel. Reset valve tappet clearance to .008" hot.

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, piston pins (Cars before No. 482-108180—see Connecting Rod production change note), valve lifters & timing chain.
►**Oil Leakage (through machining locating hole in crankcase flange) Correction**—*See "Oiling System" in Hudson Special Data.*

Crankcase Capacity—7 qts. (refill), 7½ qts. (dry).
Normal Oil Pressure—40 lbs. at 30 MPH. No gauge used. See Oil Pressure Indicator below.
Oil Pressure Relief Valve—Non-adjustable release valve and spring under plug on left side of engine ahead of starter
Oil Pan Removal: *See Hudson Shop Notes.*
Oil Pump: Rotor type consisting of inner and outer rotor, shaft, body, and cover. Angle mounted on right side of crankcase and driven from camshaft.
►*CAUTION*—New granoseal type oil pump gear must be installed on cars with previous type steel gear or when installing new camshaft.
Removal & Overhaul—*See "Oil Pump" in Hudson Special Data.*
Oil Pressure Indicator: Hudson Signal Light with new Oil Pressure Warning Switch. Consists of light on instrument panel operated by switch as follows:
Oil Pressure Warning Switch—Carter No. A658S. Hudson No. 300828. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch sealed. No adjustment. *See Electrical Equip. Section for data.*
Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.
Servicing—Wash filter element in gasoline and re-oil when changing oil.

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass type thermostat, and brass water distribution tube in cylinder block.
Capacity—17 quarts.
Radiator Removal: *See "Radiator" in Hudson Special Data.*
Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*
Thermostat: Hudson No. 166272. By-pass type in water outlet on cylinder head.
Setting—Starts to open 150-155°F. Fully open 185°.
Temperature Gauge: King-Seeley Electric.
Dash Unit—K-S 42125 ('48-49 Super), 42140 ('48-49 Commander).
Engine Unit—K-S No. 41085.
See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member operating in Hudsonite oil. 10" type used on all models.
See Clutch Section for complete data.
Facings—Cork insert type. Inside Diameter 6⅜". Outside Diam. 10". 108 corks, .203" thick.
Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.
Clutch Oil Servicing: *See Hudson Shop Notes.*
►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*
Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over ⅓ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive: Automatic clutch control. Optl.
See Clutch Section for complete data.

TRANSMISSI N

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.
See Transmission Section for complete data.
Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.65:1 (Std.) 1948-49, 1.82-1 (cars with Drive-Master). NOTE—1.65 ratio discontinued in production and only 1.82 ratio gears furnished.
►**Transmission Main Drive Gear Stop Ring Production Change**—New Main Drive Gear with Stop Ring used on 1.65-1 Ratio Transmissions beginning Dec. 29, 1948 (after first 22645 "490 Series" cars) and on other transmissions after Jan. 18, 1949, to correct overshift in high gear position resulting in premature wear of Shift Sleeve & Fork.
See "Hudson Transmission" in Transmission Section for Stop Ring installation.
►**High Gear Overshift Correction (1948 & Early 1949 Cars)**—See Main Drive Gear Stop Ring Production Change above for correction of overshift in high gear resulting in wear of Shift Sleeve & Fork.
Transmission Control: Handy-shift remote control type with shift lever mounted on steering column.
See Transmission Section for complete data.
Transmission Removal: Remove front seat cushion, disconnect front seat from track, disconnect seat adjusting lever and remove seat back from car. Disconnect accelerator pedal at accelerator rod, brake pedal rod at lever. Remove floor mat, remove Weather Control blower unit (2 screws each side), disconnect bowden wire at control valve at cylinder head. Remove floor opening cover over transmission. Disconnect front universal joint at transmission (wire bearings on universal joint spider). Remove bolts attaching center bearing support bracket, move propeller shaft to rear to clear companion flange at transmission. Disconnect clutch pedal lever return spring, remove clutch cross-shaft and bracket, disconnect clutch control link clevis. Disconnect Handy Shift by removing shifter shaft outer lever, nut, and washer. Remove flywheel guard from bottom of clutch housing. Remove two engine rear mounting bolts and nuts, jack up rear end of engine about ½" off frame cross-member (CAUTION—use block of wood on jack to prevent damage to oil pan). Disconnect speedometer cable at transmission case, plug hole with wood plug. Remove two top screws attaching clutch housing to engine, install guide studs (headless screws) in these holes to support transmission, remove remaining screws. Remove breather pipe bracket from clutch housing and bolt attaching breather pipe and rear valve cover. Pull transmission straight back on guide studs, lift transmission out through floor opening (NOTE—Hoist J-1502 can be used to lift transmission out).

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).
See Transmission Section for complete data.
Identification—Metal tag attached by a cover bol' screw carries second speed ratio 1.82:1.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►**Drive-Master Fuse Change**—15 ampere fuse, No. 71406, used on late 1949 & 1950 cars. **Replace previous type 10 ampere fuse with new 15 ampere fuse on earlier cars.**

Power Cylinder Lubrication—Must be lubricated at 10,000 mile intervals. *See "Hudson Drive-Master" in Transmission Section.*

SUPER-MATIC DRIVE TRANSMISSION

Own Make—Four-speed automatic transmission (3-speed automatic shift plus ultra-low). Optl.
See Transmission Section for complete data.

OVERDRIVE

Warner Model AS2-R9B (1948), AS1-R10D (1949)—Optl. equip. used with the Hudson Transmission. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated "kick-down."
See Transmission Section for complete data.

►**OVERDRIVE FUSE INSTALLATION**—On 1948 & early 1949 cars without overdrive fuse, 30 ampere fuse (in Holder Assy. 302566) should be connected in overdrive circuit at regulator "B" terminal. **Install this fuse in all instances where short-circuits have caused damage to relay or solenoid.**

Overdrive Fuse—30 ampere. In lead from regulator "B" terminal on left front side of dash. NOTE—See fuse installation note above for first cars where fuse not used.

Overdrive Solenoid—Hudson No. 301757.

Lock-Out Switch—Hudson No. 301755.

Throttle Switch—Hudson No. 164438.

Governor—Hudson No. 165829 (standard), Hudson No. 165831 (cars with Drive-Master).

Relay—Hudson No. 165826. On left fender shield.

Removal: Same as standard transmission removal (above) except that overdrive control cable and wiring must also be disconnected.

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**
Spicer No. 1268-102X.....**Intermediate**
Needle bearing types.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint). 2) Rear shaft with slip joint at forward end.

Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.

Center Bearing Removal & Installation—*See Hudson Special Data.*

REAR AXLE

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
See Rear Axle Section for complete data.

Ratios	Std.	Optl.
1948-49 Std. & Drive-Master	4.1-1	4.59-1
1948-49 With Overdrive	4.95-1	4.1-1

Backlash—.004-.006". Screw adjustment.

Removal: Support car on stands under body frame just forward of rear springs, remove fender shields and rear wheels. Disconnect brake line at tee on axle housing, remove tee. Disconnect brake cables at equalizer bar clevis and unscrew end fittings, loosen nuts on cable conduit brackets, on cross-member and free conduits from brackets, disconnect cable conduit clips on rear springs, pull cables and conduits out through guides and clamps. Disconnect rear universal joint and lower propeller shaft. Disconnect lower end of shock absorbers, disconnect and remove rear stabilizer. Disconnect each rear spring at axle housing, and at rear shackle, lower rear end of springs, slide axle out toward rear.

Axle Shaft Removal: Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer. Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used, if knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, remove bearing cap and shims (without disturbing brake backing plate). Pull rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal assembly

Wheel Bearing Adjustment: Controlled by shims (.003", .005", or .015" thick) under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft).

Endplay—.001-.004".

SHOCK ABSORBERS

Delco or Monroe. Direct acting, hydraulic types.

Make	Front	Rear
Light Scale		
Monroe	300350	300351
Delco	301240	301241
Heavy Scale		
Monroe	301767	301768
Delco	301769	301770
Extra Heavy Scale		
Delco	301637	301638

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.
See Front Suspension Section for complete data.

Kingpin Inclination—3°36' crosswise.

Caster—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Camber—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Toe In—1/32" ± 1/32". Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tubes equally (to increase toe-in turn rods in direction of wheel travel, to decrease, turn in opposite direction).

Steering Geometry—Inner wheel 30°. Outer 25°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

Wheel Cylinders—Diameters: Front wheel 1⅛", Rear wheel 15/16".

Drums—11" centrifuse type.

Lining Molded. Width 2¼" (front whl.), 1¾" (rear). Length per shoe 11" (exc. 11 1/16" rear secondary).

Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand-brake) linkage which applies rear wheel brakes by pedal mechanically if hydraulic system not operating.
See Brake Section for complete data.

Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders. *See Miscellaneous Section for complete data.*

Windshield Wiper: Cable Operated—Vacuum type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on plate on right front door hinge pillar post and stamped on top of cylinder block between No. 1 and No. 2 exhaust manifold flanges.

	Super 8 Serial No.	Commodore 8 Serial No.
1948	483101 Up	484101 Up
1949	493101 Up	494101 Up

Identification—First three figures of number indicate model.

TUNE-UP

COMPRESSION PRESSURE: 119 lbs. min. at 125 RPM. Minimum 100 lbs. with not more than 10 lbs. variation between cylinders.

VACUUM READING: 18-21" idling at 540-560 RPM. (Std.), 580-600 RPM (Vacumotive or Drive-Mstr.).

FIRING ORDER: 1-6-2-5-8-3-7-4. See diagram.

SPARK PLUG GAPS: .032".
Plugs for Cast-Iron Head—Champion J-7, 14 mm.
Plugs for Aluminum Head—Champion H-10, 14 mm.

DISTRIBUTOR: Breaker Gap—.017". Limits .015-.019".
Cam Angle—27° closed with .017" gap.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

IGNITION TIMING: TDC (top dead center).
Timing Procedure—*See Ignition Timing.*
Flywheel Mark—"UDC-1-6/" (1948-49) aligned with pointer in rear engine support plate opening behind starter.
Fuel Compensator Setting—Slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.

CARBURETION:
Idle Setting—(648S) 1-1½ turns open. Turn screws out for richer mixture.
Idle Speed (Standard)—540-560 RPM., 7½-8 MPH.
(Vacumotive or Drive-Master)—580-600 RPM.
Float Level—(648S) 13/64" measured from top of float gasket seat (machined surface) on bowl cover with needle valve seated (invert to check).
Accelerating Pump—(648S) Outer hole—Normal, Inner hole if less charge required.

Choke Setting: Center at index.

Fuel Pump Pressure: (Carter)—4-5 lbs., (AC)—3-4 lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve must operate freely.

VALVE TAPPET CLEARANCE: .008" Intake, .010" Exhaust at normal operating temperature.

►*CAUTION—This setting supersedes earlier data.*

NOTE—Remove apron in right front fender for access to valve compartment.
Valve Timing Check—*See Valve Timing.*

IGNITION

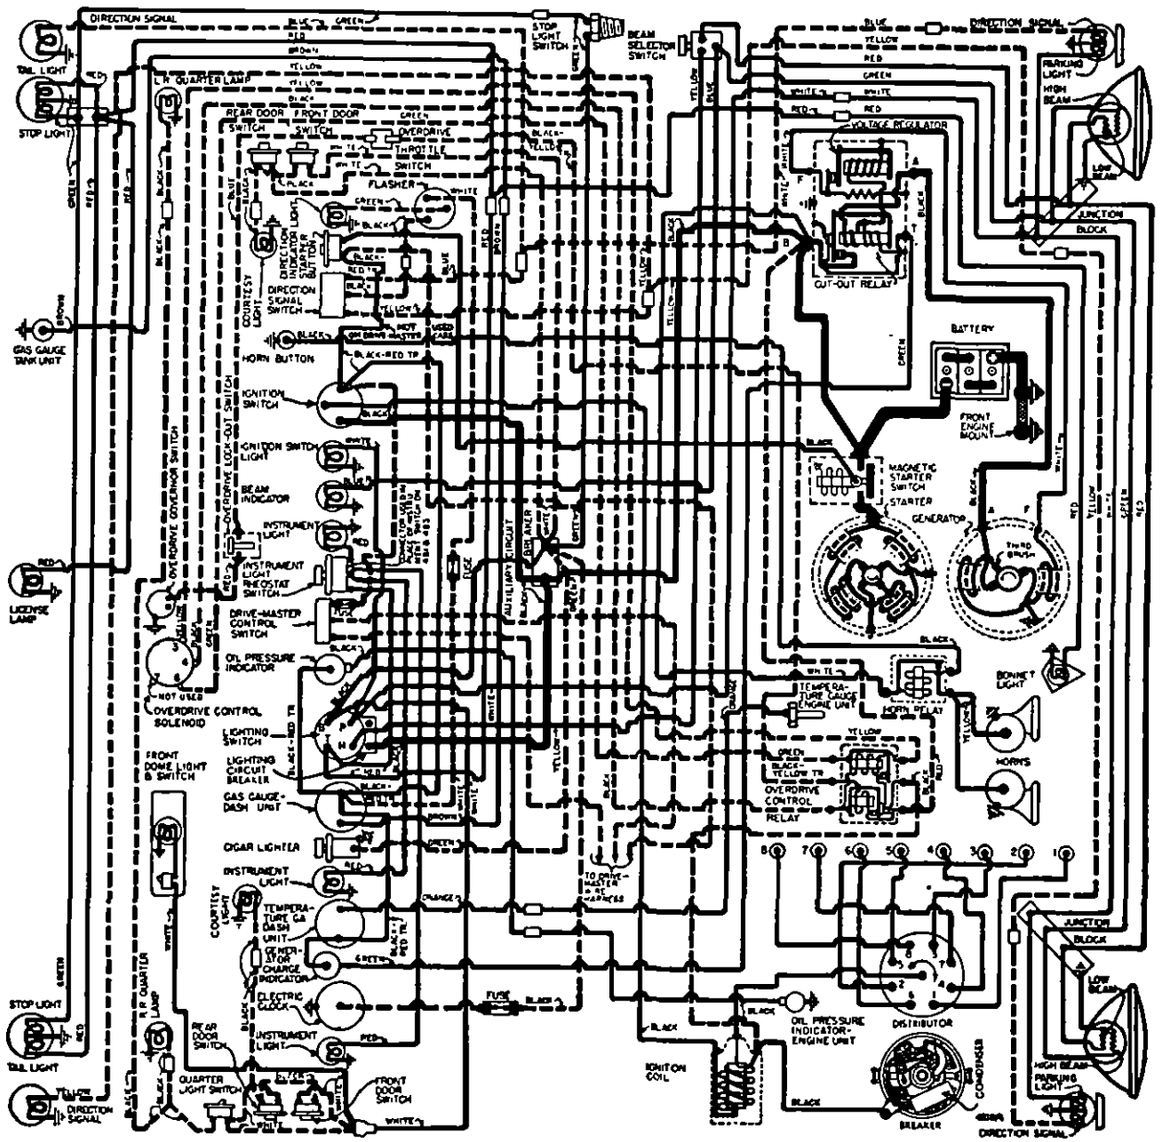
IGNITION SWITCH: Mitchellock.

COIL: Auto-Lite CE-6006A (Early), CR-6012A (late).
Location—Right side of engine above distributor.
Ignition Current—2½ amperes idling, 4½ stopped.

CONDENSER: Auto-Lite No. IG-2671G.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite Model IGT-4204A-1 (1948-49 to car No. 494114018), IGT-4204B-1 (1949 Beginning car No. 494114018), Automatic advance type with Vacuum Spark Control & Fuel Compensator adjustment.

Breaker Plate Identification—No. stamped on plate (opposite vacuum control unit) indicates maximum vacuum advance: 8.5 (IGT-4204A-1), 4 (IGT-4204B-1).



Breaker Gap—.017". Limits .015-.019".
Cam Angle—27° closed with .017" gap.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Automatic Advance
(IGT-4204A-1 & IGT-4204B-1)

Degrees Start	Distr. R.P.M.	Degrees Eng.	R.P.M.
0	300	0	600
3	400	6	800
8	850	16	1700
13	1300	26	2600
17.5	1700	35	3400

Fuel Compensator: 10° adjustment at distributor. See Ignition Timing for adjustment and setting.
Vacuum Spark Control: Auto-Lite. Integral type. Linked directly to breaker plate. Provides additional

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance—IGT-4204A-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	9½"
2°	4°	10½"
4°	8°	11⅝"
6°	12°	12⅝"
8.5°	17°	14"

Vacuum Advance—IGT-4204B-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	12½"
1°	2°	13¼"
2°	4°	14"
3°	6°	14¾"
4°	8°	15¾"

Distributor Removal: On right side of engine. Disconnect vacuum line, take out hold-down screw in advance arm. Lift off.

IGNITION TIMING

Std. Setting.....At Top Dead Center
NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.
Flywheel Mark—"UDC-1/" (#1 and #8 piston top dead center position) with 4 short marks (¼" apart) ahead of this mark (opening behind starter). *NOTE*—Early flywheels marked "UDC-1-8/", later flywheels marked "UDC-1/".
Timing—With #1 piston on compression stroke, crank engine until long line of flywheel mark "UDC-1/" lines up with pointer in rear engine support plate behind starter. Loosen hold-down screw in quadrant, rotate distributor clockwise to limit of quadrant slot, then rotate distributor counter-clockwise until contacts open, tighten quadrant screw. Check Fuel Compensator setting.
Timing (with Neon Timing Light)—Mark long line of "UDC-1/" flywheel mark with white paint, connect timing light to #1 spark plug. Idle engine below 600 RPM., adjust distributor (as directed above) until mark lines up with lower edge of opening.
Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. with wide open throttle. To adjust, loosen hold-down screw, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping). **Final setting must not be more than 1" (4th short line) ahead of "UDC-1/" flywheel mark.**

CARBURETOR

(1948-49) Carter WDO, No. 648S. (Casting No. 542). 1¼" dual barrel downdraft type with Carter Climatic Control.
See Carburetor Section for complete data.
►**ACCELERATION "STUMBLE" CORRECTION**—*See "Carter WDO" in Carburetion Section.*
Settings (Idle Setting, Float Level, and Accelerating Pump: *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*
Fast Idle: Carter Dual (WDO) Carburetor type.
See Carburetion Equipment Section for complete data.
Setting (WDO Carb.)—.054" throttle opening with choke valve closed. Adjust by turning fast idle screw on high step of cam.
Automatic Choke: Carter Climatic Control (Dual).
See Carburetion Equipment Section for complete data.
Setting—Coil housing centered (at index).

CARB. EQUIPMENT

Air Cleaner (std.): AC 1544265 (1544297 for Dr.-Mstr.).
(Opti. oil bath)—1544266 (1544298 Drive-Master).
Filter Element—(std.) #5, (oil bath) #7-S.
Fuel Pump (std.): AC Type AH No. 1539109.
Opti. (Fuel-&-Vacuum)—AC Type AJ No. 1539108.
Replacement Pump—No. 584 (for AH), 583 (AJ).
Pressure—(Carter) 4-5 lbs., (AC)—3-4 lbs.
See Carburetion Equipment Section for complete data.
Gasoline Gauge: King-Seeley Electric.
Dash Unit—K-S No. 42120 ('48-49 Super), 42135 ('48-49 Commander).
Tank Unit—K-S No. 41765 ('48-49).
See Carburetion Equipment Section for complete data.

BATTERY

National S17-2HF, 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to frame and engine by a single strap.
Location—On left side under engine hood.

STARTER

Auto-Lite Model MCL-6006. Armature MCH-2023.
Drive—Bendix No. A-1806. Inboard Barrel type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—Approx. 160 amperes at 150 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.0	65
8.0 "	Lock	2.0	410

Removal: On left front face of rear motor support. To remove, take out flange mounting bolts.
Starting Switch: Auto-Lite Magnetic type SS-4001 on starter with pushbutton (Hudson No. 300646) on instrument panel. Operative only with ignition "on" (clutch disengaged on Vacumotive or Drive-Mstr).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GEC-4801A. Armature GDZ-2006F. Third brush control with voltage regulation.
Maximum Charging Rate—43 amperes (Cold), 37 amperes (Hot), at approx. 35 MPH. Ground "F" terminal when checking generator output.
Charging Rate Adjustment—See Regulator data. Third brush setting 1 commutator bar minimum, 1 commutator bar plus 1 mica strip maximum, from nearest (insulated) main brush. Adjust 3rd brush.

Cold Performance Data			Hot Performance Data		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280
12	6.85	1280	12	6.95	1440
16	7.0	1400	16	7.15	1600
20	7.15	1550	20	7.35	1820
24	7.25	1700	24	7.55	2090
28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
36	7.8	2375	34	8.0	3800
41	8.0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.85-5.4 amps. at 6.0 volts.
Removal: Pivot mounted at left front of engine. To remove, take out pivot and clamp screws and nuts.
Belt Adjustment: ¾" belt deflection between generator and pump. Loosen clamp, swing generator out

REGULATOR

Auto-Lite Model VRR-4001A. Voltage type.
NOTE—Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.)
Contact Gap—.015" min., ground contacts closed (ground contacts open when main contacts close)
Air Gap—.031-.034" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Voltage Setting—7.1-7.4 volts at 70°F.
Contact Gap—.012" Min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

Current Regulator

Setting—34-36 amperes (marked '35' on the cover)
Contact Gap—.012" min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

LIGHTING

Headlamps: Hall "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.)
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when Upper Beam "on".
Direction Signal: Opti. *See Electrical Equipment Section*
Direction Signal Indicator—At left end of instrument panel. Flashes when Signal in use.
Direction Signal Flasher—Hudson No. 300877.

Switches

Lighting—Hudson No. 300641 (with Circuit Breaker), No. 300642 (switch only).
Beam Selector—Hudson No. 300799.
Instrument (Commodore)—Hudson No. 160092.
Door Switch—Hudson No. 300796.
Front Dome Light—Hudson No. 211312.
Rear Quarter Pillar—Hudson No. 160091.
Stop Light—Auto-Lite 100810K.
Direction Signal—Hudson No. 300875 (with wires).

MISC. ELECTRICAL

CIRCUIT BREAKERS: Vibrating thermostatic types.
Lighting Hudson 300643. 30 amp. On light switch.
Misc. Lighting—Hudson No. 301853. 20 ampere. On steering support bracket behind instrument panel.
Convertible Top & Hydraulic Window Regulators—Hudson No. 300626. 30 ampere. On steering support bracket behind instrument panel.

FUSES: Electric Clock—3 ampere. Behind clock.

Direction Signal—10 ampere. On Direction Signal Harness behind instrument panel.

Weather Control—14 ampere. On heater.

Drive-Master—15 ampere (supersedes 10 ampere type used on 1948 & early 1949 cars). On back of Drive-Master Control Switch.

Overdrive—30 ampere. In insulated fuse holder in overdrive relay feed wire on left front side of dash.

►*OVERDRIVE FUSE INSTALLATION NOTE*—This fuse not used on 1948 & early 1949 cars but should be installed if damage caused by short-circuits.

GENERATOR CHARGE SIGNAL: Red indicator on instrument panel (to right of temperature gauge). Should light when ignition turned on and should go out when generator begins to charge.
See Electrical Equipment Section for complete data.

OIL PRESSURE SIGNAL: Red indicator on instrument panel (to left of gas gauge). Should light with ignition on, go out as soon as engine started.
See Electrical Equipment Section for complete data.

HORNS: Sparton or Auto-Lite Model HW-4021 (Low HW-4022 (High). Dual horns operated by relay.
Air Gap—.027-.029" for high pitch (short horn), .032-.034" low pitch (long horn).

Horn Relay: Hudson No. 164401. On engine dash.
Contacts Close—3 volts min., 4 volts max.
Open—2 volts min. (relay upright, terminals down).

ENGINE

ENGINE SPECIFICATIONS: Own Make. 8 cylinder, "L" head type.
Bore—3". *See "Original Bore & Pistons" in Hudson Special Data.*
Stroke—4½".
Displacement—254 cubic inches. **Rated HP**—28.8.
Developed Horsepower—128 at 4200 RPM.
Compression Ratio (Std.)—6.50-1, cast iron head.
Compression Ratio (Optl.)—7.00-1, aluminum head.
Compression & Vacuum Reading—*See Tune-Up.*

TIGHTENING TORQUES: *See Hudson Shop Notes.*

CYLINDER HEAD DIAGRAM: *See Hudson Shop Notes.*

ENGINE REMOVAL: *See Hudson Special Data.*

OIL PAN REMOVAL: *See Hudson Shop Notes.*

ENGINE REAR MOUNTING ADJUSTMENT: *See Hudson Special Data.*

PISTONS: Aluminum alloy, Cam ground, T-slot type.
Weight—10¼ ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above or below.
Clearance—.002-.0025" (skirt).
Original Bore & Pistons—*See Hudson Special Data.*

Replacement Pistons: *See Hudson Shop Notes.*

Fitting New Pistons: Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs. Use Tool J-888-A Piston Feeler Scale to measure pull.

Installing Pistons: Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.004-.009"	.001"
Oil (upper)	3/16"	.004-.009"	.001"
Oil (lower)	5/32"	.004-.009"	.001"

Installing Rings—Three top rings have offset pin notch (in relation to gap). Install rings so that alternate gaps offset.

Replacement Rings: *See Hudson Shop Notes.*

PISTON PIN: Dia.—.7497-.750". **Lgth.**—2.4375". Floating type with diamond-drilled pin holes in piston and bronze bushing (with oil grooves at sides) in connecting rod. Lock ring used at each end of pin.
Pin Fit in Piston—.0000-.0003" at 70°F., or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—.0003" clearance. Hand push fit at 70°F.
Piston Pin Servicing—*See Hudson Special Data.*

Replacement Pins: *Std., .002", .005", .010" oversize.* Select pin to fit piston. **Do not ream pin hole in piston.**

CONNECTING ROD: Length—8 3/16".
Weight—31.36 ozs. (with bearings).
Crankpin Journal Diameter—1.935-1.936".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Lower Bearing—Babbitt-lined, spun type.
Clearance—.0003-.0006". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Install replacement rods furnished on exchange basis. Do not file rods or caps. Palnuts used on bolt nuts.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.
Palnuts—Tighten finger tight, plus 1/3 turn.

Replacement Rods: Std. size and .010" undersize.

Installing Rods: Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT: Five bearing type with integral counterweights and vibration dampener on forward end.

►**INOPERATIVE VIBRATION DAMPENER (Causing Engine Roughness at 24-26 MPH.)**—*See "Vibration Dampener" in Hudson Special Data.*

►*CAUTION—Crankshaft not interchangeable with earlier 8 cylinder shaft. 1948-49 shaft longer at rear end between oil slinger and flywheel flange.*
Journal Diameter—#1, 2.279-2.280"; #2, 2.311-2.312"; #3, 2.341-2.342"; #4, 2.373-2.374"; #5, 2.404-2.405".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Bearing Diameter—#1, 2.2805-2.2815"; #2, 2.3125-2.3135"; #3, 2.3425-2.3435"; #4, 2.3745-2.3755"; #5, 2.4055-2.4065".
Bearings—Bronze backed, babbitt lined type. Bearings secured in cap and crankcase by brass screws.
Clearance—.001".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.

►*CAUTION—Replacement of main bearings requires removal of crankshaft (bearings retained by screws).*

Crankshaft & Main Bearing Removal: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Replacement Bearings: Reamed bearings furnished standard size and .010" Undersize. Unfinished bearings also supplied. *For Line-Reaming of Unfinished Replacement Bearings, see "Crankshaft & Main Bearings" in Hudson Shop Notes.*

End Thrust: Taken by center (#3) bearing. Replace bearing if endplay excessive.
Endplay—.006-.012".

CAMSHAFT: Five bearing type. Helical gear drive.
Bearing Diameter—#1, 2.028-2.030"; #2, 1.997-1.999"; #3, 1.965-1.967"; #4, 1.9345-1.9365"; #5, 1.497-1.499".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.002".
Camshaft Removal—*See Hudson Special Data.*

Replacement Bearings: Furnished as follows:
Finished Reamed—Will be proper dimension when pressed in place (.0026-.0055" press fit) and no reaming required.
Unfinished—Press in place (.0026-.0055" press fit and line ream to .001" larger than individual camshaft journals.

►*CAUTION*—Install all bearings with notch at top.

End Thrust: Bakelite thrust washer between gear and crankcase. Spring loaded button in front end of camshaft bears against hardened plate on gear cover.

Timing Gears: Crankshaft gear Cast-iron, camshaft gear Aluminum. Teeth have 20° pressure angle and are slightly crowned for quiet operation.
Identification of Gears—Figure "20" on front face of gears (crankshaft gear also marked "FRONT").
Replacement Gear Caution—Camshaft gear not furnished singly (set only). Crankshaft gear furnished singly or in matched set.
Backlash—.002-.004".
Timing Gear Removal & Installation—*See Hudson Special Data.*

Camshaft Setting: Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 1/2"	.3402-.3412"	5.094"
Exhaust	1.380"	.3402-.3412"	5.094"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	.346"	.003-.005"

NOTE—Stem clearance worn limit .005" max.

Valve Guides: Removable type pressed in block.
Guide Removal & Installation—Use Tool J-1188 to drive guides out. Install guides with Tool J-883-A with top of guide 15/16" below top of cylinder block. With guides installed, ream guides with Tool J-129-3 to .3437" (11/32") which will provide proper valve stem-to-guide clearance. NOTE—Car manufacturer recommends that guides be cleaned with Tool KMO-122 to remove carbon and scale out of guides (pay particular attention to carbon in counterbore at top of exhaust guide).

Valve Springs: Cadmium plated springs are used. Install springs with closely coiled end up.

	Spring Pressure	Length
Valve Closed	46 lbs.	2"
Valve Open	80 lbs.	1.656"

NOTE—Reject springs if pressure less than 34 pounds. Free length 2.343".

Valve Lifters: Roller-shoe type, fitted in removable guides in cylinder block.
Lifter Removal & Installation—*See "Valve System" in Hudson Special Data.*

VALVE TIMING

Tappet Clearance: .008" Int., .010" Exh. at normal operating temperature. *This setting supersedes earlier data.*
NOTE—Removable apron in right front fender.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
Above figures correct with .010" tappet clearance.
Valve Timing Check—Adjust #1 intake tappet to .010" hot. Insert .002" feeler gauge between valve and tappet and turn engine in direction of rotation until exhaust valve begins to close, then continue to turn engine until a slight drag is felt on feeler gauge. The first of the five timing marks on flywheel (the one furthest from UDC mark) will be 9/16" above lower edge of opening in engine plate. One tooth out of time is equivalent to approximately 1½" on flywheel. Reset valve tappet clearance to .008" hot.

LUBRICATION

Engine Oiling System: Duo-flow (pressure and positive splash) system. Pump delivers oil to front and rear ends of upper tray in oil reservoir. Connecting rod bearings are lubricated by dippers on caps which dip into troughs in this upper tray and also splash oil inside crankcase. Part of this oil is caught in channels inside crankcase and fed into reservoirs directly over each camshaft and crankshaft bearing from which it flows into the bearings.

▷**Oil Leakage (through machining locating hole in crankcase flange) Correction**—*See "Oiling System" in Hudson Special Data.*

Crankcase Capacity—9 quarts.
Oil Filling Note—Whenever pan removed, install 2 quarts in upper tray before pan installed, then 7 quarts through oil filler after pan in place on engine.

Oil Pan Removal: *See Hudson Shop Notes.*
Normal Oil Pressure—4-12 lbs. with hot oil. No gauge used (see Oil Pressure indicator below).

Oil Check Valve:—Located on right side of crankcase at rear. Opens at 4-12 lbs. with hot oil. Operates dash signal to indicate oil flow.

Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.

Oil Pressure Indicator:—Hudson Teleflash Oil Pressure Indicator. *See Electrical Equipment Section for complete data.*

Checking Oiling System:—*See Hudson Shop Notes.*

Crankcase Ventilation: Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

Cooling System: Positive circulation with pump on front of engine and by-pass type thermostat.
Capacity—18 quarts.

Radiator Removal: *See "Radiator" in Hudson Special Data.*

Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Hudson No. 166272. By-pass type in water outlet on cylinder head.
Setting—Starts to open 150-155°F. Fully open 185°.

Temperature Gauge: King-Seeley Electric.
Dash Unit—K-S 42125 ('48-49 Super), 42140 ('48-49 Com'dre), 42918 (All 1950).
Engine Unit—K-S No. 41085.
See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member operating in Hudsonite oil. 10" type used on all models.
See Clutch Section for complete data.
Facings—Cork insert type. Inside Diameter 6⅜". Outside Diam. 10". 108 corks, .203" thick.

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.

Clutch Oil Servicing: *See Hudson Special Data.*

▷*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over ⅓ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive: Automatic clutch control. Optl.
See Clutch Section for complete data.

TRANSMISSION

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.
Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.65:1 (Std.) 1948-49, 1.82:1 (cars with Drive-Master 1948-49) and all 1950 cars. NOTE—1.65 ratio discontinued in production and only 1.82 ratio gears furnished.

▷**Transmission Main Drive Gear Stop Ring Production Change**—New Main Drive Gear with Stop Ring used on 1.65-1 Ratio Transmissions beginning Dec. 29, 1948 (after first 22645 "490 Series" cars) and on other transmissions after Jan. 18, 1949, to correct overshift in high gear position resulting in premature wear of Shift Sleeve & Fork.
See "Hudson Transmission" in Transmission Section for Stop Ring installation.

▷**High Gear Overshift Correction (1948 & Early 1949 Cars)**—See Main Drive Gear Stop Ring Production Change above for correction of overshift in high gear resulting in wear of Shift Sleeve & Fork.
See Transmission Section for complete data.

Transmission Control: Handy-shift remote control type with shift lever mounted on steering column.
See Transmission Section for complete data.

Transmission Removal: Remove front seat cushion, disconnect front seat from track, disconnect seat adjusting lever and remove seat back from car. Disconnect accelerator pedal at accelerator rod, brake pedal rod at lever. Remove floor mat, remove Weather Control blower unit (2 screws each side), disconnect bowden wire at control valve at cylinder head. Remove floor opening cover over transmission. Disconnect front universal joint at transmission (wire bearings on universal joint spider). Remove bolts attaching center bearing support bracket, move propeller shaft to rear to clear companion flange at transmission. Disconnect clutch pedal lever return spring, remove clutch cross-shaft and bracket, disconnect clutch control link clevis. Disconnect Handy Shift by removing shifter shaft outer lever, nut, and washer. Remove flywheel guard from bottom of clutch housing. Remove two engine rear mounting bolts and nuts, jack up rear end of engine about ½" off frame cross member (CAUTION—use block of wood on jack to prevent damage to oil pan). Disconnect speedometer cable at transmission case, plug hole with wood plug. Remove two top screws attaching clutch housing to engine, install guide studs (headless screws) in these holes to support transmission, remove remaining screws. Remove breather pipe bracket from clutch housing and bolt attaching breather pipe and rear valve cover. Pull transmission straight back on guide studs, lift transmission out through floor opening

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).
Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.82:1.
See Transmission Section for complete data.

▷**Drive-Master Fuse Change**—15 ampere fuse, No. 71406, used on late 1949 & 1950 cars. **Replace previous type 10 ampere fuse with new 15 ampere fuse on earlier cars.**

Power Cylinder Lubrication—Must be lubricated at 10,000 mile intervals. *See "Hudson Drive-Master" in Transmission Section.*

SUPER-MATIC DRIVE TRANSMISSION

Own Make—Four-speed automatic transmission (3-speed automatic shift plus ultra-low). Optl.
See Transmission Section for complete data.

OVERDRIVE

Warner Model AS2-R9B (1948), Model AS1-R10D (1949)—Optl. equip. used with the Hudson Transmission. Overdrive is solenoid operated type (no centrifugal pawls) with Governor control and throttle operated "kick-down."
See Transmission Section for complete data.

▷**OVERDRIVE FUSE INSTALLATION**—On 1948 & early 1949 cars without overdrive fuse, 30 ampere fuse (in Holder Assy. 302566) should be connected in overdrive circuit at regulator "B" terminal. **Install this fuse in all instances where short-circuits have caused damage to relay or solenoid.**

Overdrive Fuse—30 ampere. In lead from regulator "B" terminal on left front side of dash. NOTE—See fuse installation note above for first cars where fuse not used.

Overdrive Solenoid—Hudson No. 301757.
Lock-Out Switch—Hudson No. 301755.
Throttle Switch—Hudson No. 164438.
Governor—Hudson No. 165829 (standard), Hudson No. 165831 (cars with Drive-Master).
Relay—Hudson No. 165826. On left fender shield.

Removal: Same as standard transmission removal (above) except that overdrive control cable and wiring must also be disconnected.

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**
Spicer No. 1268-102X.....**Intermediate**
Needle bearing types.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint). 2) Rear shaft with slip joint at forward end.
Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.
Center Bearing Removal & Installation—*See Hudson Special Data.*

REAR AXLE

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
See Rear Axle Section for complete data.

Ratios	Std.	Optl.
1948-49 Std. & Drive-Master	4.1-1	4.59-1
1948-49 With Overdrive	4.95-1	4.1-1

Backlash—.004-.006". Screw adjustment.

Removal: Support car on stands under body frame just forward of rear springs, remove fender shields and rear wheels. Disconnect brake line at tee on axle housing, remove tee. Disconnect brake cables at equalizer bar clevis and unscrew end fittings, loosen nuts on cable conduit brackets on cross member and free conduits from brackets, disconnect cable conduit clips on rear springs, pull cables and conduits out through guides and clamps. Disconnect rear universal joint and lower propeller shaft. Disconnect lower end of shock absorbers, disconnect and remove rear stabilizer. Disconnect each rear end of springs, slide axle assembly out toward rear of car.

Axle Shaft Removal: Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer. Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used, if knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, remove bearing cap and shims (without disturbing brake backing plate). Pull rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal assembly

Wheel Bearing Adjustment: Controlled by shims (.003", .005", or .015" thick) under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft).

Endplay—.001-.004".

SHOCK ABSORBERS

Delco or Monroe. Direct acting, hydraulic types.

Make	Front	Rear
Light Scale		
Monroe	300350	300351
Delco	301240	301241
Heavy Scale		
Monroe	301767	301768
Delco	301769	301770
Extra Heavy Scale		
Delco	301637	301638

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.
See Front Suspension Section for complete data.

Kingpin Inclination—3°36' crosswise.
Caster—½-1½°. Eccentric adjustment. Both wheels alike within ½°.
Camber—½-1½°. Eccentric adjustment. Both wheels alike within ½°.
Toe In—1/32" ± 1/32". Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tubes equally (to increase toe-in turn rods in direction of wheel travel, to decrease, turn in opposite direction).
Steering Geometry—Inner wheel 30°. Outer 25°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

Wheel Cylinders Diam. front wh'l. 1⅛", rear 15/16".

Drums—11" centrifuse type.

Lining Molded. Width 2¼" (front whl.), 1¾" (rear). Length per shoe 11" (exc. 11 1/16" rear secondary).

Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand-brake) linkage which applies rear wheel brakes by pedal mechanically if hydraulic system not operating.
See Brake Section for complete data.

Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders. *See Miscellaneous Section for complete data.*

Windshield Wiper: Cable Operated—Vacuum type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on plate on right front door hinge pillar post and stamped vertically on upper right front end of block. 1951 model designation (4A) appears only in the separate space above the serial number.

1950 Numbers—500101 Up.

Identification—First three figures of number indicate Series and Model: 500101 Pacemaker Six.

1951 Numbers—1001 Start. Cars will be consecutively numbered regardless of model or body type.

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. min. Compression between cylinders should not vary more than 10 lbs.

VACUUM READING: 17-18" idling at 540-560 RPM. (Std.), 580-600 RPM. (Vacumotive, Drive-Master or Super-Matic).

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .032".
Plugs (Early 1950)—Champion J-7 (Cast-iron Head), H-10 (Aluminum Head), 14 mm.
Plugs (1950-51)—Champion H8 14 mm. (All heads).

DISTRIBUTOR: Breaker Gap—.020".
Cam Angle—38° Closed, 22° Open.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

IGNITION TIMING: TDC (top dead center).
Timing Procedure—*See Ignition Timing.*
Flywheel Mark—"UDC.1/" aligned with lower edge of rear engine support plate opening behind starter.
Fuel Compensator Setting—Slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.

CARBURETION:
Idle Setting—½-1½ turns open. Turn screw out for richer mixture.
Idle Speed (Std.)—540-560 RPM., or 7½-8 MPH.
Idle Speed (with Vacumotive, Drive-Master or Super-Matic Drive)—580-600 RPM.
Float Level—½" from top of projection on underside of bowl cover to top of seam on free end of float (invert bowl cover and float to check level).
Accelerating Pump—Outer hole (Normal). Inner hole if less charge required.

Choke Setting: Centered at index.

Fuel Pump Pressure: (Carter)—3½-4½ lbs. at carburetor, **(AC)**—3-4 lbs.

MANIFOLD HEAT CONTROL: Automatic thermostatic type.

VALVE TAPPET CLEARANCE: .008" Int., .010" Exh., Hot.
NOTE—Self-locking tappet adjusting screws used. Remove apron in right front fender for access.
Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: Mitchellock.

COIL: Auto-Lite No. CR-6012-A. Located on left side of engine above distributor.

Ignition Current—1.5-2.0 amperes idling, 5 stopped.

CONDENSER: Auto-Lite No. IAT-3076R.
Capacity—.20-.25 microfarad.

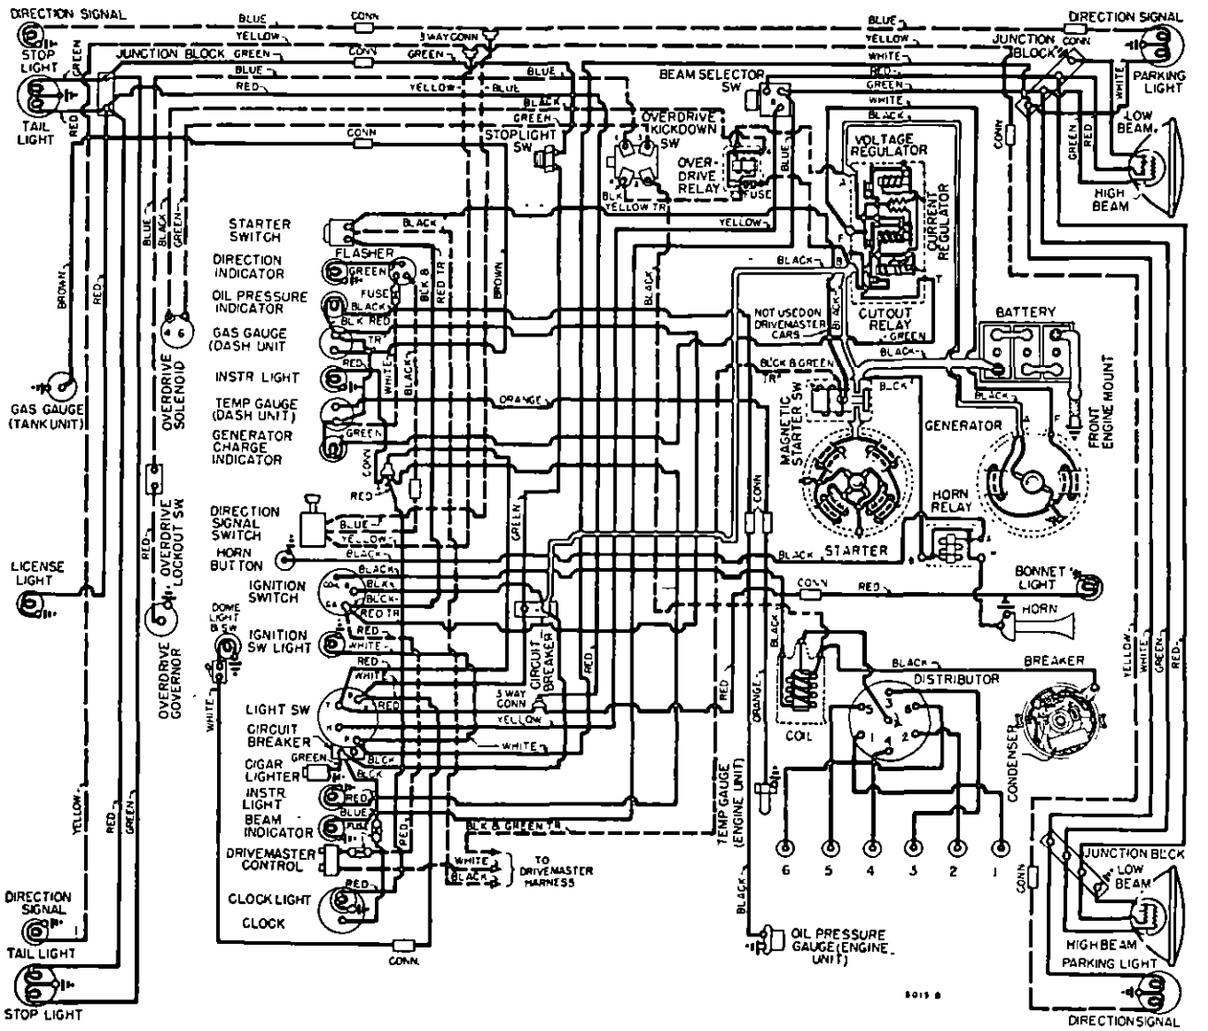
DISTRIBUTOR: (1950) Auto-Lite Model IAT-4002. (1951) Auto-Lite Model IAT-4009. New "Pivoted Breaker Plate" type with automatic advance, Vacuum Spark Control and Fuel Compensator adjustment.
See Electrical Equipment Section for data.

▷**Breaker Plate Binding Correction on First Cars**—*See Electrical Equipment Section for data.*

Breaker Gap—.020".

Cam Angle—38° Closed, 22° Open.

Breaker Arm Spring Tension—17-20 ounces.



Rotation—Clockwise viewed from above.

Automatic Advance

Degrees	Distr. R.P.M.	Degrees	Eng. R.P.M.
Start	300	0	600
1	365	2	730
3	400	6	800
9	1090	18	2180
10	1200	20	2400

Fuel Compensator: 10° advance or retard adjustment at distributor. See Ignition Timing.

Vacuum Spark Control: Auto-Lite. Integral type. Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

1950 MODELS

Vacuum Advance

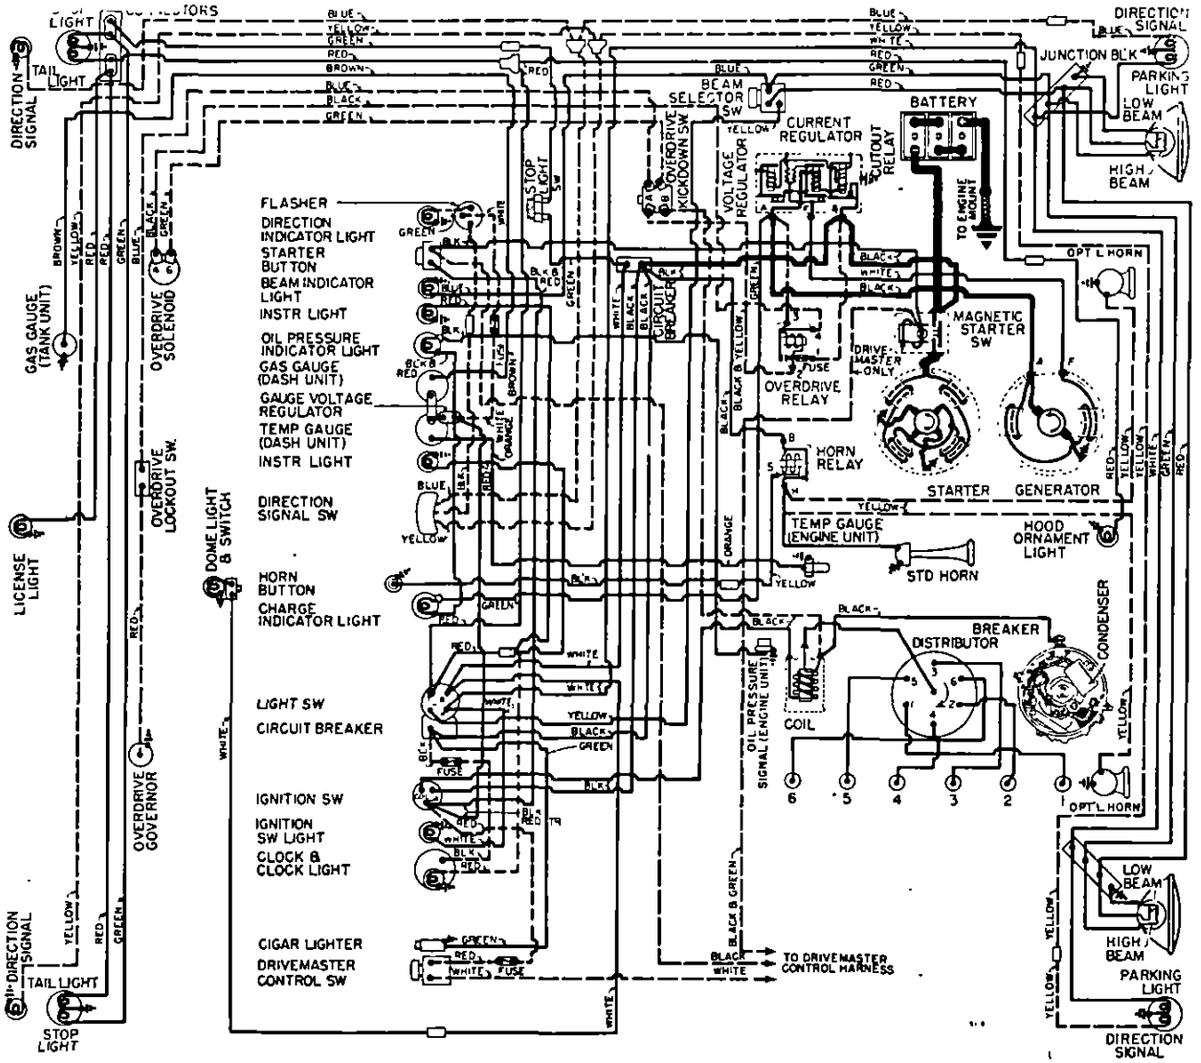
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	9½"
1°	2°	10"
3°	6°	11"
4°	8°	11½"
5°	10°	12"

Distributor Removal: On left side of engine. Disconnect vacuum line, take out hold-down screw in advance arm. Lift off.

►***INSTALLATION CAUTION—If oil pump removed, refer to Oil Pump installation directions in Hudson Special Data.***

IGNITION TIMING

Std. Setting ..... **At Top Dead Center**



NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.

Flywheel Mark—"UDC.1/" (#1 and #6 piston top dead center position) with 4 short marks (¼" apart) ahead of this mark. Visible in opening behind starter.

Timing—With #1 piston on compression stroke, crank engine until long line of flywheel mark "UDC-1/" lines up with pointer in rear engine support plate behind starter. Loosen hold-down screw in quadrant, rotate distributor clockwise to limit of quadrant slot, then rotate distributor counter-clockwise until contacts open, tighten quadrant screw. Check Fuel Compensator setting.

Timing (with Neon Timing Light)—Mark long line on flywheel with white chalk and loosen hold-down screw in distributor quadrant. Operate the engine at idle speed with timing light aimed at flywheel opening and rotate distributor until chalk mark lines up with pointer. Tighten quadrant screw.

Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. with wide open throttle. To adjust, loosen hold-down screw, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping). **Final setting must not be more than 1" (1st short line) ahead of "UDC-1/" flywheel mark.**

1951 MODELS

CARBURET R

Carter WA1-749S. 1¼" single barrel downdraft type with Carter Climatic Control.
Casting No. on Flange—682.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***
Metering Rods & Jets—***See Carter Jet Table in Carburetor Section.***

Fast Idle: Carter Single Barrel Carburetor type.
Setting—⅝" clearance between choke valve and air horn (Gauge T109-85) with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset (Tool T109-41).
See Carburetion Equipment Section for complete data.

Automatic Choke: Carter Climatic Control (Single Barrel Carburetor).
Setting—Center at index.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: AC. Oil-wetted Std., Oil-bath Optl.
Servicing (oil-wetted type)—Clean and re-oil filter element (use same grade engine oil used in crankcase) at 2000 mile intervals or more often if required by operating conditions.
Servicing (oil-bath type)—Service same as oil-wetted type except that filter element not oiled and refill to level with engine oil.

Fuel Pump (Std.): Carter Model M729SZ.
Optl. (Fuel & Vacuum)—AC type "AJ".
Pressure—(Carter) 3½-4½ lbs. at carb. **(AC)** 3-4 lbs.
See Carburetion Equipment Section for complete data.

Gasoline Gauge (1950): King-Seeley Electric type.
Dash Unit—K-S No. 42916.
Tank Unit—K-S No. 42696.

Gasoline Gauge (1951): King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit—K-S No. 45675.
Tank Unit—K-S No. 44513.
See Carburetion Equipment Section for complete data.

BATTERY

National Type OE-2L-100. 6 volt, 17 Plate, 100 Ampere Hour Capacity (20 hour rate).
Grounded Terminal—Positive (+) to frame and engine by a single strap.
Location—On left side under engine hood.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STARTER

Auto-Lite. (1950) MZ-4159, (1951) MZ-4164.
Drive—Bendix No. A-1806. Inboard Barrel type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—Approx. 160 amperes at 150 RPM.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
4.4 "	Lock	2.0	280

Removal: On left front face of rear motor support. To remove, take off Drivemaster mounting bracket bolts (on cars equipped with Drivemaster), disconnect linkage, pull bracket out and forward.
Starting Switch: Auto-Lite No. SS-4001 ('50). SS-4030 ('51). On starter with pushbutton on instrument panel. Operative only with ignition "on" (and clutch disengaged on cars with Vacumotive Drive, Drive-Master or Super-Matic).
See Electrical Equipment Section for complete data.

GENERATOR

Auto-Lite Model GDZ-6001B. Armature GGY-2006F.
Two brush (shunt) type with voltage and current regulation. Ventilated.
Maximum Charging Rate—35 amperes at 8 volts.
Charging Rate Adjustment—None (see Regulator).

Performance Data

Amperes	Volts	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.6-1.8 amperes at 6.0 volts.
Motoring Current—4.2-4.6 amps. at 6.0 volts.
Belt Adjustment: ¾" belt deflection between generator and pump pulleys. Loosen bolts, swing generator out.

REGULATOR

Auto-Lite Model (1950) VRP-6002A, (1951) VRP-6101A. Voltage and Current regulators.
NOTE—VRP-6002A Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control. VRP-6101A Cutout Relay does **not** have extra set of points. "Teleflash" Indicator light is operated from the "A" terminal on the regulator.
NOTE—Regulator cover sealed. Warranty void if seal broken.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min., ground contacts closed (ground contacts open when main contacts close).
Air Gap—.031-.034" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Voltage Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
Contact Gap—.012" min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

LIGHTING

Headlamps: Hall "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when Upper Beam "on."
Direction Signal: *Optl. See Electrical Equipment Section.*
Direction Signal Indicator—At left end of instrument panel. Flashes when Signal in use.

MISC. ELECTRICAL

See 1950-51 Hudson Six Pages for Circuit Breakers, Generator Charge & Oil Presure Signals, and Horns.

ENGINE

ENGINE SPECIFICATIONS: Own Make. Six cylinder, "L" head type.
Bore—3 9/16". *See "Original Bore & Pistons" in Hudson Special Data.*
Stroke—3 7/8".
Displacement—232 cu. ins. **Rated HP**—30.4.
Developed Horsepower—112 at 4200 RPM.
Compression Ratio (Std.)—6.70-1 cast-iron head.
Compression Ratio (Optl.)—7.20-1 aluminum head.
Compression & Vacuum Reading—*See Tune-Up.*
ENGINE REMOVAL: *See Hudson Special Data.*
OIL PAN REMOVAL: *See Hudson Special Data.*
▷*LOCATING HOLE PLUG CAUTION: Plug in locating hole in pan flange at left rear of block (behind starter) must be tight to prevent oil leakage through hole or contamination of oil by dirt and water.*
TIGHTENING TORQUES: *See Hudson Special Data.*
ENGINE FRONT SUPPORT & REAR MOUNTING ADJUSTMENT: *See Hudson Special Data.*
CYLINDER HEAD: *CAUTION—NOT INTERCHANGEABLE with other engines.*
▷**Head Diagram & Tightening Torques**—*See Hudson Special Data.*
PISTONS: Aluminum alloy, Cam ground, T-slot type.
▷*CAUTION—Pistons NOT INTERCHANGEABLE with other engines* (greater height from pin hole to top—2.310-2.314" on Pacemaker, 2.060-2.064" other Sixes).
▷*1950 PISTON PRODUCTION CHANGE: "Solid Skirt" type pistons used intermittently prior to car Serial No. 50A-85955 (these engines identified by letter "P" on upper right corner of front engine face) and on all engines after above number.*
Weight—18⅛ ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0025" to .002" (skirt).
Original Bore & Pistons—*See Hudson Special Data.*
Piston Fitting—Insert piston in cylinder with .002" feeler gauge. Using Piston Feeler Scale (Tool J-888), pull to withdraw feeler, 3 to 4 lbs.
Replacement Pistons: *See Hudson Special Data.*
Installing Pistons: Slot away from camshaft.
PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap.

Ring	Width	End Gap	Side Clearance
Compression	5/64"	.006-.014"	.001"
Oil (upper)	3/16"	.006-.014"	.001"
Oil (lower)	5/32"	.006-.014"	.001"

Installing Rings—Three top rings have offset pin notch (in relation to gap). Install rings so that alternate gaps offset.
Replacement Rings: *See Hudson Special Data.*
PISTON PIN: Diameter—.9684-.9687". **Lgth.**—2.9375". Floating type with diamond-drilled pin holes in piston and rolled steel babbitt faced bearing in connecting rod. Pin retained by lock ring at each end.
Pin Fit in Piston—.0000-.0003" at 70°F. or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—Hand push fit at 70°F.
Piston Pin Servicing—*See Hudson Special Data.*
Replacement Pins: Std., .002", .005", .010" oversize. Select pin to fit piston. **Do not ream pin hole in piston.**
CONNECTING ROD: Length—8⅛".
NOTE—Connecting Rods are interchangeable with other Six Cylinder engines.
Weight—34.24 ozs. (without bearings).
Crankpin Journal Diameter—2.1244-2.1254".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Lower Bearing—steel-backed, babbitt-lined type with upper and lower halves interchangeable. No shims.
Clearance—.0005-.0015". **Sideplay**—.007-.013".
Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.
Palnuts—Tighten finger tight, plus 1/3 turn.
Replacement Bearings: Large std., small std., .010" US.
Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward valve side of engine.
CRANKSHAFT: Four bearing type with integral counterweights. Vibration dampener on front end.
NOTE—Crankshaft not interchangeable with other Six Cylinder engines.
Journal Diameter—2.4988-2.4998".
Bearing Diameter—2.4993-2.5013".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Bearings—Removable steel-backed, babbitt-lined type. Upper and lower halves of each bearing are interchangeable.
Clearance—.0005-.0015".
Front & Rear Oil Seals—*See "Crankshaft & Main Bearings" in Hudson Special Data.*
Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.
NOTE—Bearing shells positioned in cap and crankcase by tang on edge of shell. Can be rotated out without removing crankshaft by using Tool KMO-734.
Palnuts—Tighten finger tight, plus 1/3 turn.
Crankshaft & Main Bearing Removal: *See "Crankshaft & Main Bearings" in Hudson Special Data.*
Replacement Bearings: Std., optl. std., .010" US.
End Thrust: Taken by #3 bearing. Replace bearing if endplay excessive.
Endplay: .003-.009".

ENGINE

CONTINUED FROM PRECEDING PAGE

CAMSHAFT: 4 bearing type. Non-adjustable chain.
Bearing Diameter—#1, 2.375-2.3755"; #2, 1.997-1.9975"; #3, 1.965-1.9655"; #4, 1.497-1.4975".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.002".
Camshaft Removal—*See Hudson Special Data.*

Replacement Bearings: Finished-reamed or unfinished.
Finished Reamed—Will be proper dimension when pressed in place (.0026-.0055" press fit) and no reaming required.
Unfinished—Press in place (.0026-.0055" press fit) and line ream to .001" larger than individual camshaft journals.
►*CAUTION*—Install all bearings with notch at top.

End Thrust: Steel thrust plate fitted between front end of camshaft and sprocket. Plate attached to crankcase by two capscrews and locks.

Timing Chain: Morse. 60 links. ⅜" pitch. Width 1¼".
Chain Tension Shoe—Fibre shoe backed by synthetic rubber plunger mounted inside timing chain cover at top. Holds chain in close mesh with sprockets and prevents whip.

Camshaft Setting: Sprockets marked. Two chain guide links marked with center holes. Mesh chain with center hole in each link opposite "O" mark on each sprocket with #1 piston at top dead center (crankshaft sprocket keyway at top with #1 piston at TDC.) NOTE—With this setting, there should be 6 full links plus two half-links between marks on sprockets (half-links opposite sprocket marks).

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 53/64"	.3412-.3422"	5.730"
Exhaust	1 9/16"	.3402-.3412"	5.730"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

NOTE—Stem clearance worn limit .005" max.

Valve Guides: Removable, one-piece, cast-iron Exhaust guides counterbored at upper end. Install guides as follows:
Intake Guide—Upper end 1 7/16" below top of valve seat. Finish ream to .3432-.3442".
Exhaust Guides—Upper end 1 3/32" below top of valve seat. Finish ream to .3432-.3442". Counterbored 9/16" deep to diameter of 25/64".

Valve Springs: Cadmium plated springs are used. Install springs with closely coiled end up.

	Spring Pressure	Length
Valve Closed	77 lbs.	2 3/16"

NOTE—Reject springs if pressure less than 60 lbs. Free length 2.500".

Valve Lifters: Mushroom type fitted directly in crankcase. Removed from below with camshaft out.
NOTE—Inner sides of guide clamps should be in full contact at all points with matching flat surfaces of front face of each pair of tappet guides within .0015".
Clearance—.00075-.0015".
Replacement Lifters—.002", .004", .010" Oversize.

VALVE TIMING

Tappet Clearance: .008" Intake, .010" Exhaust, Hot. Self-locking tappet screws are used. Remove right front fender apron for access to valve compartment.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 7°18' BTDC. Close 53°42' ALDC.
Exhaust Valves—Open 53°18' BLDC. Close 7°42' ATDC. These figures correct with .010" tappet clearance, Hot or .012" Cold.
Valve Timing Check—Remove front tappet cover and adjust tappet clearance of No. 1 intake valve to .010" Hot, or .012" Cold. Insert .002" feeler gauge in No. 1 intake tappet and rotate engine in direction of rotation until exhaust valve begins to close and light drag is felt on feeler gauge. Engine is correctly timed when first of four long timing marks is approximately ⅝" above index of timing hole in rear engine support plate. Reset tappet clearance to .008" Hot, or .010" Cold.

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, piston pins, valve lifters, and timing chain.
Crankcase Capacity—7 qts. (refill), 7½ qts. (dry).
Normal Oil Pressure—40 lbs. at 30 MPH. No gauge used. See Oil Pressure Indicator below.
Oil Pressure Relief Valve—Non-adjustable release valve and spring under plug on left side of engine ahead of starter.

Oil Pan Removal: *See Hudson Special Data.*

Oil Pump: Rotor type consisting of inner and outer rotor, shaft, body, and cover. Angle mounted on right side of crankcase and driven from camshaft.
Pump Removal & Overhaul—*See "Oil Pump" in Hudson Special Data.*

Oil Pressure Indicator: Hudson Signal Light with Oil Pressure Warning Switch. Consists of light on instrument panel operated by switch as follows:
Oil Pressure Warning Switch—Carter No. A815S or *King-Seeley No. 47100 (Hudson No. 300828).* On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch sealed (no adjustment).
See Electrical Equipment Section for complete data.

Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.
Servicing—Wash filter element in gasoline and re-oil when changing oil.

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass type thermostat, and brass water distribution tube in cylinder block.
Capacity (1950)—18 qts. 19 qts. with heater.
Capacity (1951)—18½ qts. 19½ qts. with heater.
Pressure Cap—Optl. AC #850005 or Stant #AAX-0417.

Radiator Removal: *See "Radiator" in Hudson Special Data.*

Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: By-pass type in water outlet on cylinder head.
Setting—Starts to open 150-155°F. Fully open 185°.

Temperature Gauge (1950): King-Seeley Electric type.
Dash Unit—K-S No. 42918.
Engine Unit—K-S No. 41085.

Temperature Gauge (1951): King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit—K-S No. 45675.
Engine Unit—K-S No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Own Make—Single plate, fluid cushioned type (cork insert type driven member operating in Hudsonite oil. 9" type used on standard models, 10" type used with Drive-Master.
See Clutch Section for complete data.
Facings—Cork insert type. Inside Diameter 6⅜". Outside Diam. 9" (Std.), 10" (With Drive-Master), 90 corks (9"), 108 corks (10"), .203" thick.

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.

Clutch Oil Servicing: *See Hudson Special Data.*
►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over 1/3 revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive: Automatic clutch control. Optl.
See Clutch Section for complete data.

TRANSMISSION

STANDARD

Own Make—All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.
Second Speed Ratio—1.82:1.
See Transmission Section for complete data.

Transmission Control: Handy-shift remote control type with shift lever mounted on steering column.
See Transmission Section for complete data.
►*SLIPPING OUT OF HIGH & SECOND GEAR CORRECTION—See Transmission Section for complete data.*

Transmission Removal: Remove front seat cushion, disconnect front seat from track, disconnect seat adjusting lever and remove seat back from car. Disconnect accelerator pedal at accelerator rod, brake pedal rod at lever. Remove floor mat, remove Weather Control blower unit (2 screws each side), disconnect bowden wire at control valve at cylinder head. Remove floor opening cover over transmission. Disconnect front universal joint at transmission (wire bearings on universal joint spider). Remove bolts attaching center bearing support bracket, move propeller shaft to rear to clear companion flange at transmission. Disconnect clutch pedal lever return spring, remove clutch cross-shaft and bracket, disconnect clutch control link clevis. Disconnect Handy Shift by removing shifter shaft outer lever, nut, and washer. Remove flywheel guard from bottom of clutch housing. Remove two engine rear mounting bolts and nuts, jack up rear end of engine about ½" off frame cross-member (CAUTION—use block of wood on jack to prevent damage to oil pan). Disconnect speedometer cable at transmission case, plug hole with wood plug. Remove two top screws attaching clutch housing to engine, install guide studs (headless screws) in these holes to support transmission, remove remaining screws. Re-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

move breather pipe bracket from clutch housing and bolt attaching breather pipe and rear valve cover. Pull transmission straight back on guide studs, lift transmission out through floor opening (NOTE—Hoist J-1502 can be used to lift transmission out).

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).

Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.82:1.

See Transmission Section for complete data.

Drive-Master Fuse—15 ampere, Part No. 71406. Located in wiring circuit 6" from control switch.

Power Cylinder Lubrication—Must be lubricated at 10,000 mile intervals. *See "Hudson Drive-Master" in Transmission Section.*

OVERDRIVE

Warner Type AS2-R10D (Early '50), AS3-R10D (Late '50), AS4-R10D (Late '50 & '51). (Models AS3,4 have centered ring gear). Optl. with Hudson Transmission. Part of Super-Matic Drive. Has simplified control (2-terminal solenoid, Relay & Throttle Kick-down Switch).

Removal: Same as standard transmission removal (above) except that overdrive control cable and wiring must also be disconnected.

SUPER-MATIC DRIVE TRANSMISSION

Own Make—Four-speed automatic transmission (3-speed automatic shift plus ultra-low). Optl.

See Transmission Section for complete data.

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**

Spicer No. 1268-102X.....**Intermediate**

Needle bearing type. Three used with intermediate universal to rear of propeller shaft center bearing.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint). 2) Rear shaft with slip joint at forward end.

Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross-members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.

Center Bearing Removal & Installation—*See Hudson Special Data.*

REAR AXLE

Own Make—Semi-floating, hypoid gear type with Hotchkiss drive.

See Rear Axle Section for complete data.

Ratios	Std.	Optl.
Std. Transmission	4.1-1	4.55 or 3.82-1
With Drive-Master	4.1-1	4.55 or 3.82-1
With Overdrive	4.55-1	4.1-1
With Super-Matic	4.1-1	4.55-1

Backlash—.004-.006". Screw adjustment.

Removal: Support car on stands under body frame just forward of rear springs, remove fender shields and rear wheels. Disconnect brake line at tee on axle housing, remove tee. Disconnect brake cables at equalizer bar clevis and unscrew end fittings, loosen nuts on cable conduit brackets, on cross-member and free conduits from brackets, disconnect cable conduit clips on rear springs, pull cables and conduits out through guides and clamps. Disconnect rear universal joint and lower propeller shaft. Disconnect lower end of shock absorbers, disconnect and remove rear stabilizer. Disconnect each rear spring at axle housing, and at rear shackle, lower rear end of springs, slide axle out toward rear.

Axle Shaft Removal: Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer. Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used. If knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, remove bearing cap and shims (without disturbing brake backing plate). Pull rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal assembly.

Wheel Bearing Adjustment: Controlled by shims (.003", .005",. or .015" thick) under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft).

Endplay—.001-.004".

SHOCK ABSORBERS

Delco or Monroe. Direct acting, hydraulic types.

Light Scale

Make	Front	Rear
Monroe	303060	300351
Delco	303062	301241

Heavy Scale

Monroe	303061	301768
Delco	303063	301770

Extra Heavy Scale

Monroe	302431	302431
Delco	303063	301770

APPLICATION NOTE—**Light Scale** front and rear shocks used with light scale springs and with front only heavy scale springs. **Heavy Scale** front and rear shocks used with heavy scale springs and with rear only heavy scale springs. **Extra Heavy Scale** front and rear shocks optional on all models. **Part Number** stamped on outside of shock absorber body.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.

See Front Suspension Section for complete data.

Kingpin Inclination—3°36' crosswise.

Caster—½-1½°. *Eccentric adjustment. Both wheels* alike within ½°.

Camber—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Toe In—1/32" ± 1/32". Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tubes equally (to increase toe-in turn rods in direction of wheel travel, to decrease, turn in opposite direction).

Steering Geometry—Inner wheel 30° .Outer 25°.

STEERING GEAR

Gemmer Model 335—"3-tooth" Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinders—Diameters: Front wheel 1 1/16", Rear wheel 15/16".

Drums—11" centrifuse type.

Lining—Molded. Width 1¾" (front & rear) Length per shoe 11" (except rear secondary 11 1/16")

Clearance—.010" at both ends of secondary (rear) shoe with primary shoe forced out against drum

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand brake) linkage which causes rear wheel brakes to be applied mechanically by pedal if hydraulic system not operating.

Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

See Brake Section for complete data.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders. *See Miscellaneous Section for complete data.*

Windshield Wipers: Cable operated—Vacuum type *See Miscellaneous Section for complete data.*

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on plate on right front door pillar post and stamped vertically on upper right front corner of block. Model designation (5A, 6A, etc.) on 1951 models appears only in the separate space above the serial number.
1950 Serial Number—Super 6, 501101 Up. Commodore 6, 502101 Up. First three figures of number indicate model.
1951 Serial Number—All Models, 1001 Up. Cars will be consecutively numbered regardless of model or body type.

TUNE-UP

COMPRESSION PRESSURE: 119 lbs. min. at 125 RPM. but not less than 100 lbs. min. and not over 10 lbs. max. variation between cylinders.

VACUUM READING: 17-18" idling at 540-560 RPM. (Std.), 580-600 RPM. (Vacumotive or Drive-Mstr.).

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .032".
Plugs (Early 1950)—Champion J-7 (Cast-iron Head), H-10 (Aluminum Head), 14 mm.
Plugs (1950-51)—Champion H-8 14 mm. (all Heads).

DISTRIBUTOR: Breaker Gap—.020". Limits .018-.022".
Cam Angle—38° ('50), 39° ('51) Closed.
Breaker Arm Spring Tension—17-20 ounces.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.25-.28 microfarads ('50), .20-.25 microfarads ('51).

IGNITION TIMING: TDC (top dead center).
Timing Procedure—See Ignition Timing.
Flywheel Mark—"UDC-1/" aligned with pointer in rear engine support plate opening behind starter.
Octane Selector Setting—Slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.

CARBURETION:
Idle Setting: (WDO-647SA—Early 1950)—1¼-1¾ turns open, **(WGD-776S—1950-51)**—1-1½ turns open. Turn screws out for richer mixture.
Idle Speed: (Std.)—540-560 RPM. or 7½-8 MPH.
Vacumotive or Drive-Master—580-600 RPM.
Hydra-Matic Drive—490-510 RPM.
Float Level—3/16". Measured from top of float to gasket seat (machined surface) on bowl cover with needle valve seated. **776S NOTE**—Measured from center highest point of float.
Accelerating Pump—Outer hole, max. (Normal). **776S Note**—No seasonal pump adjustment.
Choke Setting: Coil housing 1 point lean (WDO), 2 points lean (WGD).
►*CAUTION*—2 point setting on WGD Carb. supersedes original setting of 1 point lean.

Fuel Pump Pressure: (Carter)—3½-4½ lbs. at carburetor. **(AC)**—3-4 lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve must operate freely.

VALVE TAPPET CLEARANCE: .008" Int., .010" Exh. Hot. NOTE—Self-locking tappet adjusting screws used. Remove apron in right front fender for access.

IGNITION

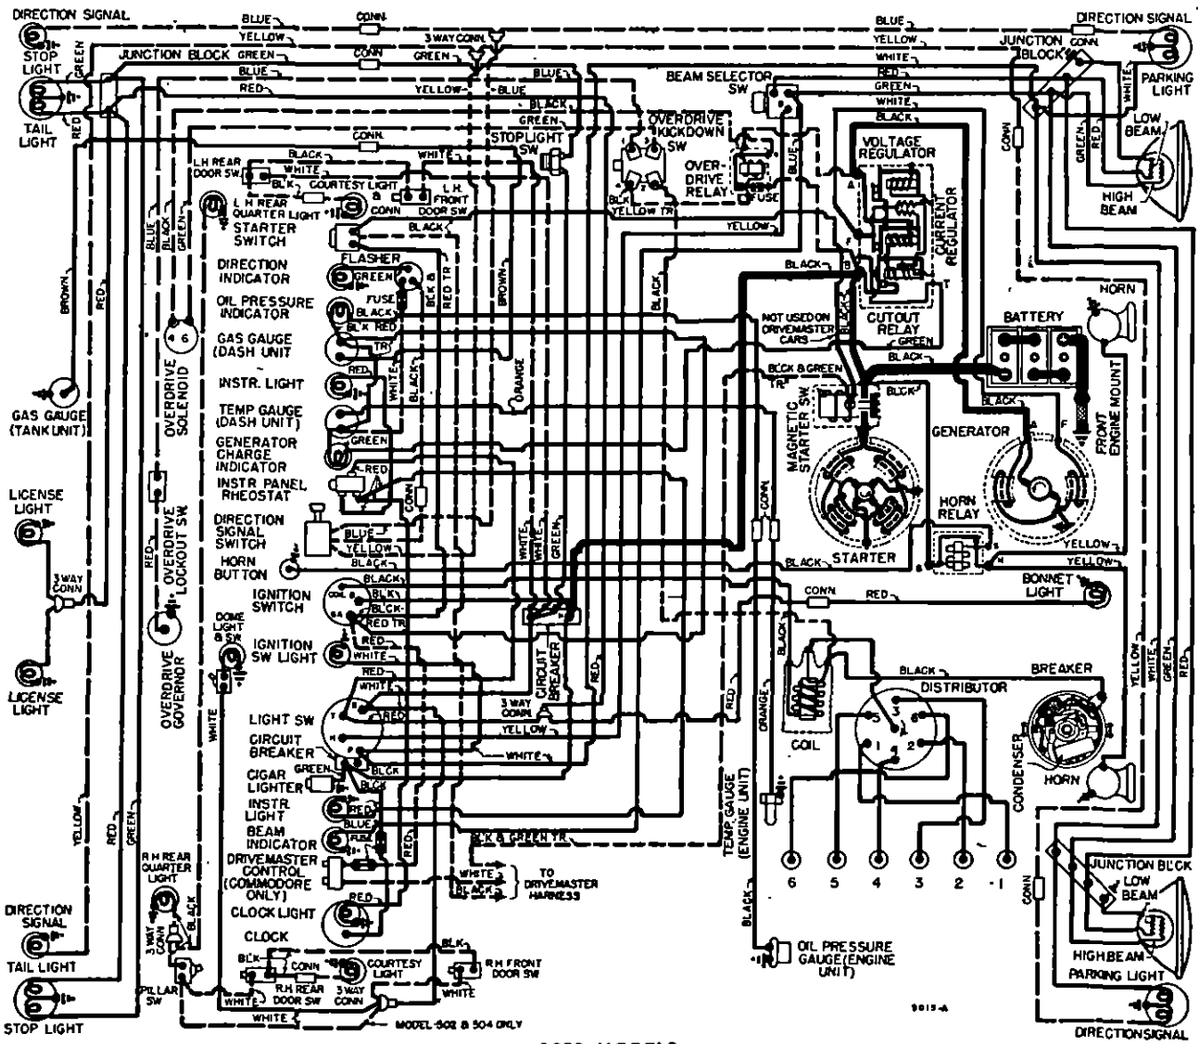
IGNITION SWITCH: Mitchellock.

COIL: Auto-Lite No. CE-6006A (Early), CR-6012A (Late '50 & '51).
Location—Left side of engine above distributor.
Ignition Current—2.5 amperes idling, 4.5 stopped.

CONDENSER: Auto-Lite (1950 "IGS") No. IG-3927G, (1951 "IAT") No. IAT-3076R.
Capacity—.25-.28 microfarads ('50). .20-.25 microfarads ('51).

DISTRIBUTOR: (1950) Auto-Lite Model No. IGS-4213A-1. (1951) Auto-Lite Model No. IAT-4009A. Automatic advance type with Vacuum Spark Control and Fuel Compensator Adjustment.
NOTE—IAT-4009A new "Pivoted Breaker Plate" type.
See Electrical Equipment Section for complete data.
Breaker Plate Identification—Number stamped on plate (at pivot arm pin) indicates maximum vacuum advance.
Breaker Gap—.020". Limits .019-.022".
Cam Angle—38° ('50), 39° ('51) Closed. 22° Open.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Automatic Advance IGS-4213A-1, IAT-4009A



Degrees	Distr. R.P.M.	Degrees	Eng. R.P.M.
Start	500	0	1000
1	670	2	1340
4	1150	8	2300
8	1825	16	3650
9	2000	18	4000

Fuel Compensator: 10° advance or retard adjustment at distributor. *See Ignition Timing.*
Vacuum Spark Control: Auto-Lite. Integral type.

Vacuum Advance—IGS-4213A-1, IAT-4009A

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	13⅜"
1°	2°	14"
2°	4°	14¾"
3°	6°	15⅜"
3.75°	7.50°	16"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

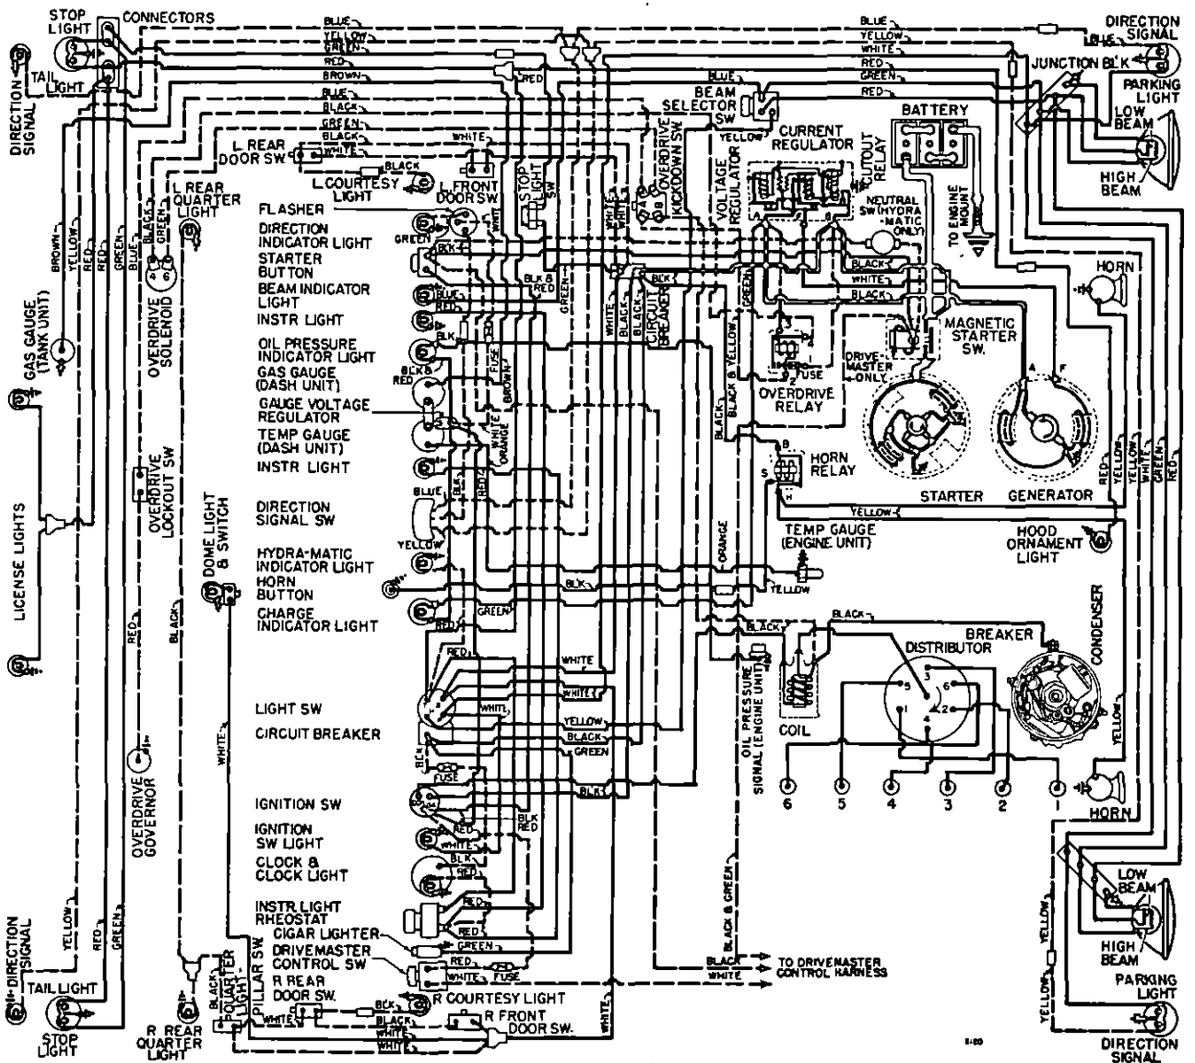
Distributor Removal: On left side of engine. Disconnect vacuum line, take out hold-down screw in advance arm. Lift off.

▷*INSTALLATION CAUTION—If oil pump removed, refer to Oil Pump Installation in Hudson Special Data.*

IGNITION TIMING

Std. Setting*.....*At Top Dead Center

NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.



Flywheel Mark—"UDC-1/" (#1 and #6 piston top dead center position) with 4 short marks (1¼" apart) ahead of this mark (opening behind starter).

NOTE—Early flywheels marked "UDC-1-6/", later flywheels marked "UDC-1/".

Timing—With #1 piston on compression stroke, crank engine until long line of flywheel mark "UDC-1/" lines up with pointer in rear engine support plate behind starter. Loosen hold-down screw in quadrant, rotate distributor clockwise to limit of quadrant slot, then rotate distributor counter-clockwise until contacts open, tighten quadrant screw. Check Fuel Compensator setting.

Timing (with Neon Timing Light)—Mark long line of "UDC-1/" flywheel mark with white paint, connect timing light to #1 spark plug. Idle engine below 800 RPM., adjust distributor (as directed above) until mark lines up with lower edge of opening.

Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. with wide open throttle. To adjust, loosen hold-down screw, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping). **Final setting must not be more than 1" (4th short line) ahead of "UDC-1/" flywheel mark.**

1951 MODELS

CARBURETOR

(1950 Early) Carter WDO-647SA.
(1950 Late and 1951) Carter WGD-776-S. 1¼" dual downdraft with Carter Climatic Control.
Casting No. on Flange (647SA)—542.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

▷*776S METERING ROD & FLOAT VALVE PRODUCTION CHANGE—See Carburetor Section for complete data.*

Fast Idle: Carter Dual (WDO) or (WGD) Carburetor type.
Setting (WDO Carb.)—.054" throttle opening with choke valve closed. Adjust by turning fast idle screw on high step of cam.
Setting (WGD Carb.)—.026" throttle opening with choke valve closed. Check with thermostatic coil housing, gasket, and baffle plate removed. Crack throttle valve, hold choke valve closed, move throttle valve toward closed position as far as possible. If throttle opening not .026" adjust by bending connector rod at lower angle.
See Carburetion Equipment Section for complete data.

Automatic Choke: Carter Climatic Control.
Setting—Set coil housing 1 point lean (WDO), 2 points lean (WGD).

▷*WGD CAUTION*—2 point lean setting supersedes original setting of 1 point lean.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner (std.): AC 1544265 (1544297 for Dr.-Mstr.).
(Optl. oil bath)—1544266 (1544298 Drive-Master).
Filter Element—(std.) #5, (oil bath) #7-S.
Fuel Pump (Std.): Carter Model M729SL or SZ.
Optional (Fuel & Vacuum)—AC Type AJ-1539108.
Replacement Pumps—No. 583 (AJ).
Pressure—(Carter) 3½-4½ lbs., (AC) 3-4 lbs.
See Carburetion Equipment Section for complete data.
Gasoline Gauge (1950): King-Seeley Electric.
Dash Unit—K-S No. 42916, **Tank Unit No. 42696.**
Gasoline Gauge (1951): King-Seeley "CV" (Constant Voltage).
Dash Unit—K-S No. 45675, **Tank Unit No. 44513.**
See Carburetion Equipment Section for complete data.

BATTERY

National OE-2L-100. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to frame and engine by a single strap.
Location—On left side under engine hood.

STARTER

1950—Auto-Lite MZ-4159. Armature MZ-2312.
1951—(Except Hydra-Matic) Auto-Lite No. MCH-6109. Armature No. MCH-2023.
1951—(Hydra-Matic) Auto-Lite No. MCH-6107. Armature No. MCH-2028.
Drive—Bendix No. A-1808 (on MZ-4159, MCH-6109 Starters). Bendix No. A-1792 (on MCH-6107 Starter). A-1808 is Inboard Barrel type. A-1792 Outboard Barrel type.
Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—Approx. 140-160 amperes at 120 RPM. (warm engine).

Performance Data—MZ-4159

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 "	Lock	2.0	280

Performance Data—MCH-6107, 9

0 ft. lbs.	4300	5.0	65
4.0 "	Lock	2.0	335

Starting Switch—Auto-Lite No. SS-4001. On left front fender splash apron, with pushbutton on instrument panel. Operative only with ignition "on" (and clutch disengaged on cars with Vacumotive Drive, Drive-Master or Super-Matic). Hydra-Matic selector lever must be in neutral to operate starter. *See Electrical Equipment Section for complete data.*
Removal: On left front face of rear motor support. To remove, take off Drivemaster mounting bracket bolts (on cars equipped with Drivemaster), disconnect linkage, and pull bracket out and forward, disconnect cables from solenoid switch, remove two starter mounting stud nuts and remove starter.

GENERATOR

Auto-Lite GDZ-6001B. Armature GGY-2006F.
Two brush (shunt) type with voltage and current regulation. Ventilated.
Maximum Charging Rate—35 amperes at 8 volts.
Charging Rate Adjustment—None (see Regulator).

Performance Data

Amperes	Volts	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
35	8.0	1800-2000	2150-2350

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.6-1.8 amperes at 6.0 volts.
Motoring Current—4.2-4.6 amps. at 6.0 volts.
Belt Adjustment: ¾" deflection between generator and pump. Loosen clamp, swing generator out.

REGULATOR

Auto-Lite Model VRP-6002A ('50), VRP-6101A ('51). Vibrating Voltage and current regulators.
►*NOTE*—VRP-6002A Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control. VRP-6101A Cutout Relay does **not** have extra set of points. "Teleflash" indicator light is operated from the "A" terminal on the regulator.
►*NOTE*—Regulator cover sealed. Warranty void if seal broken.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min., ground contacts closed (ground contacts open when main contacts close).
Air Gap—.031-.034" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Voltage Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for other temperatures.
Contact Gap—.012" Min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
Contact Gap—.048-.052" contacts just opening.
Checking (without breaking seals) & Adjustment—*See Electrical Equipment Section for complete data.*

LIGHTING

Headlamps: Hall "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when Upper Beam "on".
Direction Signal: Optl. *See Electrical Equipment Section.*
Direction Signal Flasher—Hudson No. 300877.

Switches

Lighting—Hudson No. 300641 (with Circuit Breaker), No. 300642 (switch only).
Beam Selector—Hudson No. 300799.
Instrument (Commodore)—Hudson No. 160092.
Direction Signal—Hudson No. 305081 (with wires).

MISC. ELECTRICAL

CIRCUIT BREAKERS: Vibrating thermostatic types.
Lighting—Hudson 300643. 30 amp. On light switch.
Misc. Lighting—Hudson No. 301853. 20 ampere. On steering support bracket behind instrument panel.
FUSES: Electric Clock—3 ampere. Behind clock.
Direction Signal—10 ampere. On Direction Signal Harness behind instrument panel.
Drive-Master—15 ampere. In Drive-Master control switch lead on instrument panel.
Overdrive—30 ampere. In insulated fuse holder in overdrive relay feed wire on left front side of dash.
GAUGE VOLTAGE REGULATOR: King-Seeley—Consists of a thermo-bi-metal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on the instrument cluster and is connected between the ignition switch, and the gauge circuits. See Wiring Diagram.
GENERATOR CHARGE SIGNAL: Red indicator on instrument panel (to right of temperature gauge). *See Electrical Equipment Section for complete data.*
OIL PRESSURE SIGNAL: Red indicator on instrument panel (to left of gas gauge). If pressure drops below approximately 13 lbs., red dash signal lights.
Oil Pressure Warning Switch—Carter No. A815S or King-Seeley No. 47100, Hudson No. 300828. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch sealed. Not adjustable.
HORNS: Sparton or Auto-Lite Model HW-4021 (Low Pitch), HW-4022 (High Pitch). Dual horns.

ENGINE

ENGINE SPECIFICATIONS: Own make. 6 cylinder,

Model	Bore	Stroke	Displacement
5A, Super	3 9/16"	4⅜"	262 Cu. In.
6A, Commodore	3 9/16"	4⅜"	262 Cu. In.
7A, Hornet	3 13/16"	4½"	308 Cu. In.

Rated Horsepower—(5A Super & 6A Commodore) 30.4. (7A Hornet) 34.9.
Developed Horsepower—(5A Super & 6A Commodore) 123 at 4000 RPM., (7A) 145 at 3800 RPM.

Compression Ratio	Standard	Optional
5A, 6A	6.7-1	7.2-1
7A	7.2-1	6.7-1

NOTE—6.7-1 ratio is for cast-iron head. 7.2-1 ratio is for aluminum head.
Compression and Vacuum Reading—*See Tune-Up.*
ENGINE REAR MOUNTING ADJUSTMENT: *See Hudson Special Data.*
CYLINDER HEAD & TIGHTENING TORQUE: *See Hudson Special Data.*
►*1951 CYLINDER HEAD & GASKET CHANGE*—New cylinder head and/or gasket not interchangeable with earlier 6 cyl. engines. Impaired cooling will result if incorrect head or gasket used.
ENGINE REMOVAL: *See Hudson Special Data.*
OIL PAN REMOVAL: *See Hudson Special Data*
►*LOCATING HOLE PLUG CAUTION: Plug in locating hole in pan flange at left rear of block (behind starter) must be tight to prevent oil leakage through hole or contamination of oil by dirt and water.*
PISTONS: Aluminum Alloy. Cam Ground. "T" Slot.
►*1950 PISTON PRODUCTION CHANGE: "Solid Skirt" pistons used in production on 501 & 502 cars beginning car Serial No. 501-63216.*
Original Bore & Pistons—*See Hudson Special Data.*
Weight—(5A, 6A) 18½ ozs., (7A) 18⅝ ozs. (stripped.)
Length—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0025 "to .002" (skirt).
Piston Fitting—Insert piston in cylinder with .002" feeler gauge. Pull to withdraw feeler 3 to 4 lbs. using Tool J-888 Piston Feeler Scale to measure pull.
Replacement Pistons: *CAUTION*—Two different types required. *See Hudson Special Data.*
Installing Pistons: Slot away from camshaft.
PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap).

Ring	Width	End Gap	Side Clearance
Compression	5/64"	.007-.012"	.001"
Oil (upper)	3/16"	.007-.012"	.001"
Oil (lower)	5/32"	.007-.012"	.001"

Installing Rings—Three top rings have offset pin notch (in relation to gap). Install rings so that alternate gaps offset.
NOTE—7A top compression ring chrome-plated.
Replacement Rings: *See Hudson Special Data.*
PISTON PIN: Dia.—.9684-.9687". **Length**—2.9375".
Floating type with diamond-drilled pin holes in piston and rolled steel babbitt faced bearing in connecting rod. Pin retained by lock ring at each end.
Pin Fit in Piston—.0000-.0003" at 70°F. or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—.0003" clearance. Hand push fit at 70°F.
Piston Pin Servicing—*See Hudson Special Data.*
Replacement Pins: Std., .002", .005", .010" oversize. Select pin to fit piston. **Do not ream pin hole in piston.**
CONNECTING ROD: Length—8⅛".
Weight—34.24 ozs. (without bearings).
Crankpin Journal Diameter—2.1244-2.1254".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Lower Bearing—Steel-backed, babbitt-lined type with upper and lower halves alike. No shims.
Clearance—.0005-.0015". **Sideplay**—.007-.013".
Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.
Palnuts—Tighten finger tight, plus ¼-⅓ turn.
Replacement Bearings: Furnished Std. ("Large" & "Small"), & .0005", .002", .010", .012" Undersize.
Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward valve side of engine.
CRANKSHAFT: Four bearing type with integral counterweights. Vibration dampener on front end.
Journal Diameter—2.4988-2.4998".
Bearing Diameter—2.4993-2.5013".
Original Journal & Bearing Sizes—*See "Crankshaft Size Code" in Hudson Special Data.*
Bearings—Removable steel-backed, babbitt-lined

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

upper and lower halves of each bearing alike.
Clearance—.0005-.0015".

Crankshaft & Main Bearing Removal: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.
NOTE—Bearing shells positioned in cap and crankcase by tang on edge of shell. Can be rotated out without removing crankshaft with Tool KMO-734.
Palnuts—Tighten finger tight, plus ⅓ turn.

Replacement Bearings: Furnished Std. & .001", .002", .010", .012" Undersize.

End Thrust: Taken by #3 bearing. Replace bearing if endplay excessive. **Endplay**—.003-.009".

Crankshaft Front & Rear Oil Seals: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

CAMSHAFT: 4 bearing type. Non-adjustable chain.
Bearing Diameter—#1, 2.375-2.3755"; #2, 1.997-1.9975"; #3, 1.965-1.9655"; #4, 1.497-1.4975".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.002".
Camshaft Removal—*See Hudson Special Data.*

Replacement Bearings: Furnished as follows:
Finished Reamed—Will be proper dimension when pressed in place (.0026-.0055" press fit).
Unfinished—Press in place (.0026-.0055" press fit) and line ream to .001" larger than journals.

▷*CAUTION*—Install all bearings with notch at top.

End Thrust: Steel thrust plate fitted between front end of camshaft and sprocket. Plate attached to crankcase by two capscrews and locks.

Timing Chain: Morse. 60 links, ⅜" pitch. Width—1¼".
Chain Tension Shoe—Fibre shoe backed by synthetic rubber plunger mounted inside timing chain cover at top. Holds chain in close mesh with sprockets and prevents whip.

Camshaft Setting: Sprockets marked. Two chain guide links marked with center holes. Mesh chain with center hole in each link opposite "O" mark on each sprocket with #1 piston at top dead center (crankshaft sprocket keyway at top with #1 piston at TDC). NOTE—With this setting, there should be 6 full links plus two half-links between marks on sprockets (half-links opposite sprocket marks).

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 53/64"	.3412-.3422"	5.730"
Exhaust	1 9/16"	.3402-.3412"	5.730"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

NOTE—No valve inserts used. Stem clearance worn limit .005" max.

Valve Guides: Removable, one-piece, cast-iron Exhaust guides counterbored at upper end. Install guides as follows:
Intake Guide—Upper end 1 7/16" below top of valve seat. Finish ream to .3432-.3442" (.3437" preferred).
Exhaust Guides—Upper end 1 3/32" below top of valve seat. Finish ream to .3432-.3442" (.3437" preferred). Counterbored 9/16" deep to 25/64".

Valve Springs: Cadmium plated springs are used. Install springs with closely coiled end up.

	Spring Pressure	Length
Valve Closed	77 lbs.	2 3/16".

NOTE—Reject springs if pressure less than 60 lbs. Free length 2.500".

Valve Lifters: Mushroom type fitted directly in crankcase. Removed from below with camshaft out. Service by installing oversize lifter.
NOTE—Inner sides of guide clamps should be in full contact at all points with matching flat surfaces of front face of each pair of guides within .0015".
Clearance—.00075-.0015".
Replacement Lifters—.002", .004", .010" Oversize.

VALVE TIMING

Tappet Clearance: Intake—.008" (Hot), .010" (Cold). **Exhaust**—.010" (Hot), .012" (Cold).
Self-locking tappet screws are used. Remove right front fender apron for access to valve compartment.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 7°18' BTDC. Close 53°42' ALDC.
Exhaust Valves—Open 53°18' BLDC. Close 7°42' ATDC. These figures correct with .010" tappet clearance Hot or .012" Cold.

Valve Timing Check—Remove front tappet cover and adjust tappet clearance of No. 1 intake valve to .010" Hot, or .012" Cold. Insert .002" feeler gauge in No. 1 intake tappet and rotate engine in direction of rotation until exhaust valve begins to close and light drag is felt on feeler gauge. Engine is correctly timed when first of four long timing marks is approximately ⅝" above index of timing hole in rear engine support plate. Reset tappet clearance to .008" Hot, or .010" Cold.

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, valve lifters and timing chain.

▷**Oil Pump & Camshaft Gear Change**—Camshaft driving gear & mating oil pump gear have "Granoseal" finish to reduce wear (may be identified by black velvety appearance).
Crankcase Capacity—7 qts. (refill), 7½ qts. (dry).
Normal Oil Pressure—40 lbs. at 30 MPH. No gauge used. See Oil Pressure Indicator below.
Oil Pressure Relief Valve—Non-adjustable release valve and spring under plug on left side of engine ahead of starter.

Oil Pan Removal: *See Hudson Special Data.*

Oil Pump: Rotor type consisting of inner and outer rotor, shaft, body, and cover. Angle mounted on right side of crankcase and driven from camshaft.

▷*CAUTION*—New granoseal type oil pump gear must be installed when installing new camshaft.
Pump Removal & Overhaul—*See "Oil Pump" in Hudson Special Data.*

Oil Pressure Indicator: Hudson "Teleflash" with Oil Pressure Warning Switch. Consists of light on instrument panel operated by switch as follows:
Oil Pressure Warning Switch—Carter No. A815S or King-Seeley No. 47100. Hudson No. 300828. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch sealed. No adjustment. *See Electrical Equipment Section for data.*

Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.
Servicing—Wash filter element in gasoline and re-oil when changing oil.

COOLING

▷*1951 CYLINDER HEAD AND GASKET CAUTION*—Impaired cooling will result if incorrect head or gasket used. 1951 cylinder head and gasket not interchangeable with earlier 6 cyl. engines.

Cooling System: Positive circulation with pump on front of engine, by-pass type thermostat, and brass water distribution tube in cylinder block.
Pressure Cap (1950)—AC No. 85005 or Stant No. AAX-0417.
Capacity—(1950) 19 qts. without heater, 20 qts. with heater. (1951) 18½ qts. without heater, 19½ qts. with heater.

Radiator Removal: *See "Radiator" in Hudson Special Data.*

Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Hudson No. 166272. By-pass type in water outlet on cylinder head.
Setting—Starts to open 150-155°F. Fully open 185°.

Temperature Gauge (1950): King-Seeley electric type.
Dash Unit—K-S No. 42918. Engine Unit No. 41085.

Temperature Gauge (1951)—King-Seeley "CV" (Constant Voltage).
Dash Unit—K-S No. 45675, Engine Unit No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member) operating in Hudsonite oil. 10" type used on all models.
See Clutch Section for complete data.
Facings—Cork insert type. Inside diameter 6⅜". Outside Diam. 10". 108 corks, .203" thick.

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.

Clutch Oil Servicing: *See Hudson Special Data.*

▷*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Clutch Flushing data.*

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over ⅓ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive: Automatic clutch control. Optl.
See Clutch Section for complete data.

TRANSMISSION

STANDARD

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.
See Transmission Section for complete data.

▷*SLIPPING OUT OF HIGH & SECOND GEAR CORRECTION—See Transmission Section for complete data.*

Transmission Control: Handy-shift remote control type with shift lever mounted on steering column.
See Transmission Section for complete data.

Transmission Removal: Remove front seat cushion, disconnect front seat from track, disconnect seat adjusting lever and remove seat back from car. Disconnect accelerator pedal at accelerator rod, brake

pedal rod at lever. Remove floor mat, remove Weather Control blower unit (2 screws each side), disconnect bowden wire at control valve at cylinder head. Remove floor opening cover over transmission. Disconnect front universal joint at transmission (wire bearings on universal joint spider). Remove bolts attaching center bearing support bracket, move propeller shaft to rear to clear companion flange at transmission. Disconnect clutch pedal lever return spring, remove clutch cross-shaft and bracket, disconnect clutch control link clevis. Disconnect Handy Shift by removing shifter shaft outer lever, nut, and washer. Remove flywheel guard from bottom of clutch housing. Remove two engine rear mounting bolts and nuts, jack up rear end of engine about ½" off frame cross-member (CAUTION—use block of wood on jack to prevent damage to oil pan). Disconnect speedometer cable at transmission case, plug hole with wood plug. Remove two top screws attaching clutch housing to engine, install guide studs (headless screws) in these holes to support transmission, remove remaining screws. Remove breather pipe bracket from clutch housing and bolt attaching breather pipe and rear valve cover. Pull transmission straight back on guide studs, lift transmission out through floor opening.

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic shifting between 2d & High gears. Used with Vacumotive Drive.
See Transmission Section for complete data.

Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.82:1.

►**Drive-Master Fuse**—15 ampere, Part No. 71406. Located in wiring circuit 6" from control switch.

Power Cylinder Lubrication—Lubricate every 10,000 miles. *See "Hudson Drive-Master" in Trans. Section.*

SUPER-MATIC TRANSMISSION

Own Make—Four-speed automatic transmission (3-speed automatic shift plus ultra-low). Optl.
See Transmission Section for complete data.

OVERDRIVE

Warner Type AS2-R10D (Early '50), AS3-R10D (Late '50), AS4-R10D (Late '50 & '51). (Models AS3, 4 have centered ring gear). Optl. Part of Super-Matic Drive. Governor controlled with solenoid operation and throttle operated kick-down switch.
See Transmission Section for complete data.

Overdrive Relay—Hudson No. BT303107.

Throttle Switch—Hudson No. BT303254.

Overdrive Fuse—30 amps. On overdrive relay.

Removal: Same as standard transmission removal, except that overdrive control cable and wiring must be disconnected.

HYDRA-MATIC TRANSMISSION

Four speed planetary type automatic transmission and fluid coupling. *1951 MODELS*—Modulated pressure and hydraulically operated reverse mechanism.
See Transmission Section for complete data.

Lubrication—Check fluid level every 1000 miles. Add fluid as required to maintain level at "F" mark on dip stick. Drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type "A".

Capacity—11 qts. 12 qts. (after overhaul).

Checking Fluid Level—Operate engine at normal operating temperature. Manual control lever in "N" position. Hand brake on. Dipstick located under inspection cover placed on right side under floor mat. Oil level must be just to the full mark on the dip stick. *DO NOT OVERFILL.*

CAUTION—Do not check oil level when transmission temperature is excessively high and do not fill above "F" on dip stick (will cause foaming when hot).

Hydra-Matic Linkage Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See Trans. Section.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**
Spicer No. 1268-102X.....**Intermediate**
Needle bearing types.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint). 2) Rear shaft with slip joint at forward end.

Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.

Center Bearing Removal & Installation—*See "Propeller Shaft" in Hudson Special Data.*

REAR AXLE

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
See Rear Axle Section for complete data.

Axle Ratios:	Std.	Optional
Std. Trans.	4.1-1	①4.55-1
With Overdrive	4.55-1	4.1-1
With Super-Matic Drive	4.55-1	4.1-1
With Hydra-Matic Drive	3.58-1	———

①—3.58-1 also on 7A Hornet model.

Backlash—.004-.006". Screw adjustment.

Removal: Support car on stands under body frame just forward of rear springs, remove fender shields and rear wheels. Disconnect brake line at tee on axle housing, remove tee. Disconnect brake cables at equalizer bar clevis and unscrew end fittings, loosen nuts on cable conduit brackets, on cross-member and free conduits from brackets, disconnect cable conduit clips on rear springs, pull cables and conduits out through guides and clamps. Disconnect rear universal joint and lower propeller shaft. Disconnect lower end of shock absorbers, disconnect and remove rear stabilizer. Disconnect each rear spring at axle housing, and at rear shackle, lower rear end of springs, slide axle out toward rear.

Axle Shaft Removal: Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer. Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used, if knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, remove bearing cap and shims (without disturbing brake backing plate). Pull rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal assembly.

Wheel Bearing Adjustment: Controlled by shims (.003", .005", or .015" thick) under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft).

Endplay—.001-.004".

SHOCK ABSORBERS

Delco or Monroe. Direct acting, hydraulic types.

Make	Front	Rear
Light Scale		
Monroe	303060	300351
Delco	303062	301241
Heavy Scale		
Monroe	303061	301768
Delco	303063	301770
Extra Heavy Scale		
Monroe	302431	302431
Delco	301637	301638

APPLICATION NOTE—Light Scale front and rear shocks used with light scale springs and with front only heavy scale springs. **Heavy Scale** front and rear shocks used with heavy scale springs and with rear only heavy scale springs. **Extra Heavy Scale** front and rear shocks optional on all models. **Part Number** stamped on outside of shock absorber body.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.
See Front Suspension Section for complete data.

Kingpin Inclination—3°36' crosswise.

Caster—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Camber—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Toe In—1/32" ± 1/32" measured at wheel rim. Center steering arm on frame must be at center of car. To adjust loosen clamps at ends of each tie rod and adjust tubes equally.

Steering Geometry—Inner wheel 30°. Outer 25°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

Wheel Cylinders—Diameters: Front wheel 1⅛", Rear wheel 15/16".

Drums—11" centrifuse type.

Lining Molded. Width 2¼" (front whl.), 1¾" (rear). Length per shoe 11" (exc. 11 1/16" rear secondary).

Clearance—.010" at both ends of secondary shoe with primary shoe forced out against drum.

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand-brake)
See Brake Section for complete data.

Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

Hand Brake: See Service Brakes above.

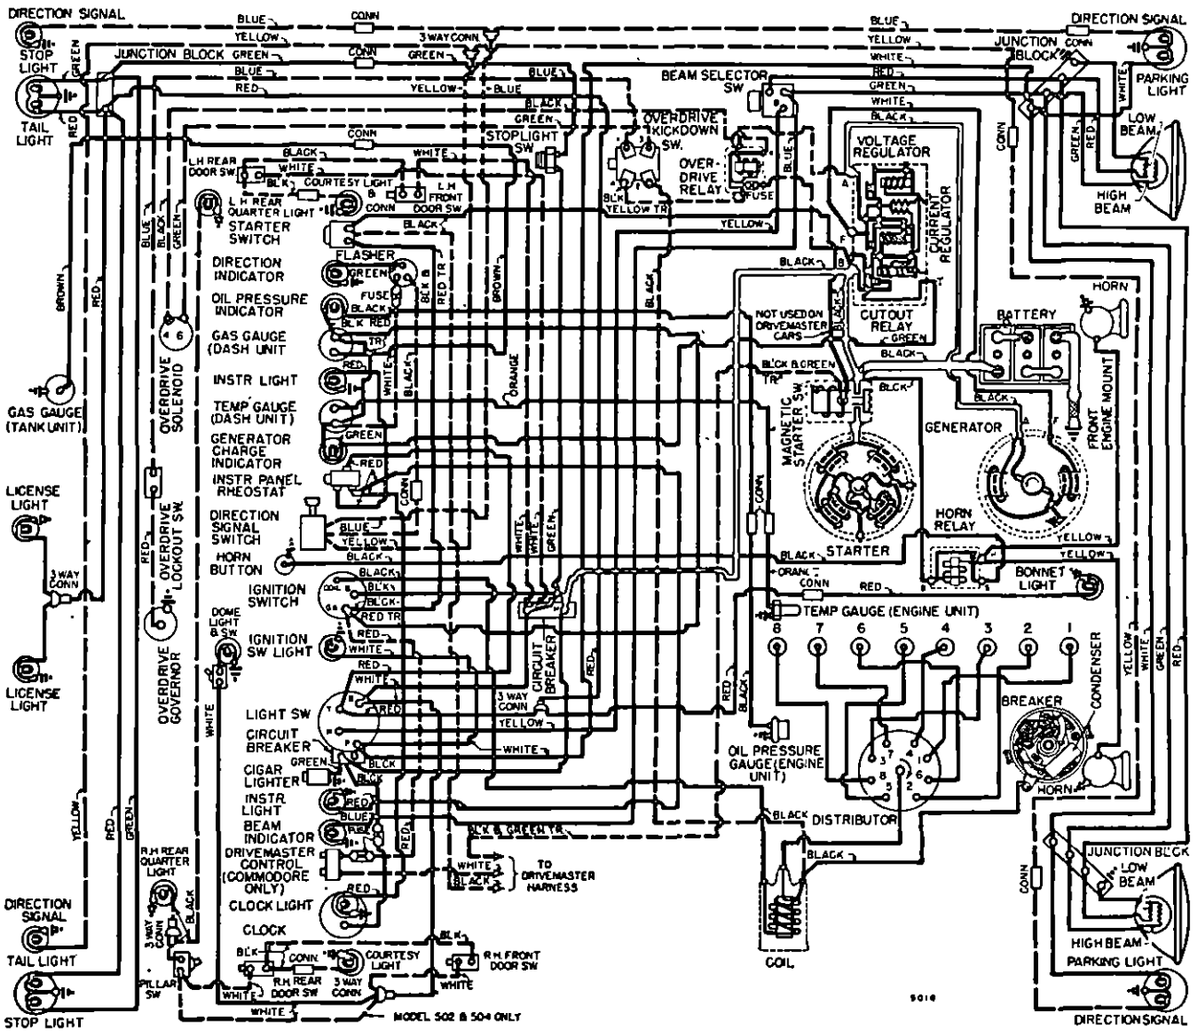
MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric. *See Miscellaneous Section for complete data.*

Windshield Wiper: Cable Operated—Vacuum type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

1950 Super Eight 503
1950 Commodore Eight 504
1951 Commodore Eight 8A
1952 Commodore Eight 8B



SERIAL & ENGINE NUMBERS: Serial Number stamped on plate on right front door hinge pillar post. (1950 & 1952) Engine Number stamped on top of cylinder block between No. 1 and No. 2 exhaust manifold flanges, and (1951) vertically on upper right front of block.
1950 Numbers—Super 8, 503101 Up. Commodore 8, 504101 Up. First three figures of number indicate model.
1951 Numbers—1001 Up.
1952 Numbers—132916 Up (same for all models—cars numbered consecutively regardless of model).

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. minimum with not more than 10 lbs. variation between cylinders at cranking speed of 125 RPM.
VACUUM READING: Steady 17-18" at idling speed.
FIRING ORDER: 1-6-2-5-8-3-7-4.
SPARK PLUG GAPS: .032".
Plugs—(Early 1950) Champion J7 (Cast Iron Head), H-10(Aluminum Head), (1950-52) Champion H-8. 14 mm.
DISTRIBUTOR: Auto-Lite IGT-4204B-1. Full automatic advance with vacuum spark control and Fuel Compensator adjustment.
Breaker Gap—.017". Limits .015-.019".
Cam Angle—27° plus or minus 3°. ***Do not set breaker gap outside limits to secure this cam angle.***
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*
COIL: Auto-Lite CE-6006A (Early), CR-6012A (Late). On right side of engine above distributor.
Ignition Current—2.5 amperes idling, 4.5 stopped.
CONDENSER: Auto-Lite No. IG-2671G.
Capacity—.20-.25 microfarad.
IGNITION TIMING: At TDC.
CAUTION—When setting timing with timing light, disconnect vacuum control line at distributor and plug line to prevent disturbing engine performance.
Timing Mark—Long line at "UDC-1" mark on flywheel aligned with pointer in inspection hole in rear engine support plate on left side of engine.
Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.
Timing Procedure—*See Ignition Timing.*
CARBURETION: (Early 1950) Carter WDO No. 648S, (Late 1950, 1951-52) Carter WGD No. 773S. Dual downdraft types with automatic choke control.
Idle Setting—(648S) 1-1½ turns open. (773S) ½-1 turn open. Turn screw out for richer mixture.
Idle Speed—(Std. Trans.) 550 RPM (With Overdrive) 575 RPM. (Hydra-Matic Drive Cars) 500 RPM. (Vacumotive or Drive-Master) 590 RPM.
Float Level—(648S) 13/64", (773S) 3/16" measured from top of float to gasket seat (machined surface) on bowl cover with needle valve seated (invert to check). 773S Note—measured from center highest point of float.
Accelerating Pump—(648S) Outer hole Normal, Inner hole if less charge required. (773S) No seasonal adjustment.
Fast Idle Setting (648S): .054" throttle opening with choke valve closed. Adjust by turning fast idle screw on high step of cam.
Fast Idle Setting (773S): .026" throttle opening with choke valve closed. Check with thermostatic coil housing, gasket, and baffle removed. Crack throttle valve, hold choke valve closed, move throttle valve toward closed position as far as possible. If throttle opening not .026" at this point, adjust by bending connector rod at lower angle.
Choke Setting: Centered (at index).
Fuel Pump Pressure: 3-4 lbs. (AC), 3½-4½ lbs. (Carter).
MANIFOLD HEAT CONTROL: Automatic thermostatic type. No adjustment. See that valve operates freely.
VALVE TAPPET CLEARANCE: .008" Intake, .010" Exhaust HOT. NOTE—Remove right front wheel and fender side shield for accessibility.

IGNITION

IGNITION SWITCH (1950-51) Ignition switch only, (1952) Combination ignition starting switch (starter operates when key held fully to right—key returns to ignition on position when released).
COIL: Auto-Lite CE-6006A (Early), CR-6012A (Late). On right side of engine above distributor.
Idling Current—2½ amperes idling, 4½ stopped.
CONDENSER: Auto-Lite No. IG-2671G.
Capacity—.21-.25 microfarad.
DISTRIBUTOR: Auto-Lite No. IGT-4204B-1. Full automatic advance with vacuum spark control, and Fuel Compensator.
See Electrical Equipment Section for complete data.

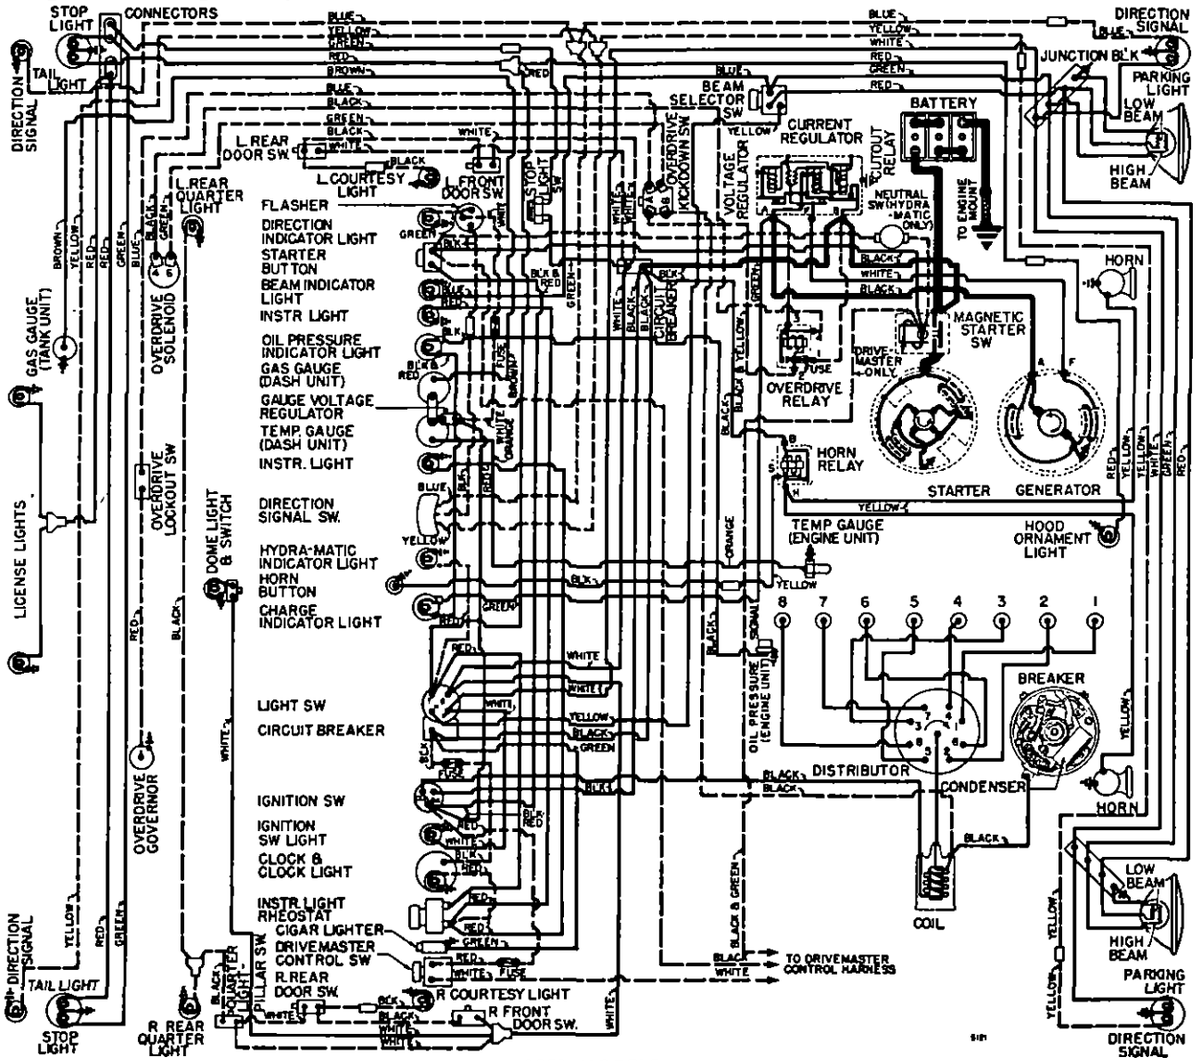
1950 MODELS

Breaker Plate Identification—Number stamped on plate (opposite vacuum control unit), indicates maximum advance.
Breaker Gap—.017". Limits .015-.019".
Cam Angle—27° ± 3°. *Do not set breaker gap outside limits to secure this cam angle.*
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Distr. Degrees	Automatic Advance R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
8	850	16	1700
13	1300	26	2600
17.5	1700	35	3400

Fuel Compensator: 10° adjustment at distributor. See Ignition Timing for adjustment and setting.

Vacuum Spark Control: Auto-Lite, Integral type.



Distr. Degrees	Vacuum Advance Eng. Degrees	Vacuum (" of HG)
Start	0°	13⅜"
1°	2°	14"
2°	4°	14¾"
3°	6°	15⅜"
3.75°	7.5°	16"

IGNITION TIMING

Standard Setting ..... **TDC**

NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.

Flywheel Mark—"UDC-1/" (#1 and #8 piston top dead center position) with four short marks (¼" apart) ahead of this mark (opening behind starter).

1951 MODELS

Timing (with Neon Timing Light)—Mark long line of "UDC-1/" flywheel mark with white paint, connect timing light to #1 spark plug. Idle engine below 600 RPM., adjust distributor as directed above, until timing mark lines up with pointer.

CARBURETOR

(Early 1950) Carter WDO 648S, (1950-51-52) Carter WGD 773S, 1¼" dual barrel downdraft types with Carter Climatic Control.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level and Accelerating Pump): *See Tune-Up Data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Carter Dual (WDO) or (WGD) Carburetor type.
Setting (WDO Carb.)—.054" throttle opening with choke valve closed. Adjust by turning fast idle screw on high step of cam.
Setting (WGD Carb.)—.026" throttle opening with choke valve closed. Check with thermostatic coil housing, gasket, and baffle plate removed. Crack throttle valve, hold choke valve closed, move throttle valve toward closed position as far as possible. If throttle opening not .026" adjust by bending connector rod at lower angle.
See Carburetion Equipment Section for complete data.

Automatic Choke: Carter Climatic Control (dual).
Setting—Coil housing centered at index.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: Oil Wetted type (Standard). Oil Bath type (Optional).

Fuel Pump: AC or Carter No. M729-SL-SZ-SA Diaphragm type fuel pump, or AC Combination fuel-and-vacuum pump.
Replacement Pump (AC)—No. 5484 (Fuel), No. 584 (Fuel & Vacuum).
Pressure—3½-4½ lbs., (Carter). 3 to 4 lbs. (AC).
See Carburetion Equipment Section for complete data.

Gasoline Gauge (1950): King-Seeley Electric type.
Dash Unit—K-S No. 42916.
Tank Unit—K-S No. 42696.

Gasoline Gauge (1951-52): King-Seeley "CV" (Constant Voltage) Electric type.
Dash Unit—K-S No. 45675.
Tank Unit—K-S No. 44513.
See Carburetion Equipment Section for complete data.

BATTERY

National OE-2L-100, 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to engine and frame with a single strap.
Location—On left side under hood.

STARTER

Model	Auto-Lite No.
1950 Synchro-mesh Trans.	MCL-6006
1951-52 Synchro-mesh Trans.	MCH-6109
1951-Early 1952 Hydra-Matic	MCH-6107
1952 Late Hydra-Matic	MCH-6204

Armature—Auto-Lite No. MCH-2023 (for MCL-6006); **MCH-2084** (for MCH-6109); **MCH-2028** (for MCH-6107); **MCH-2088** (for MCH-6204).

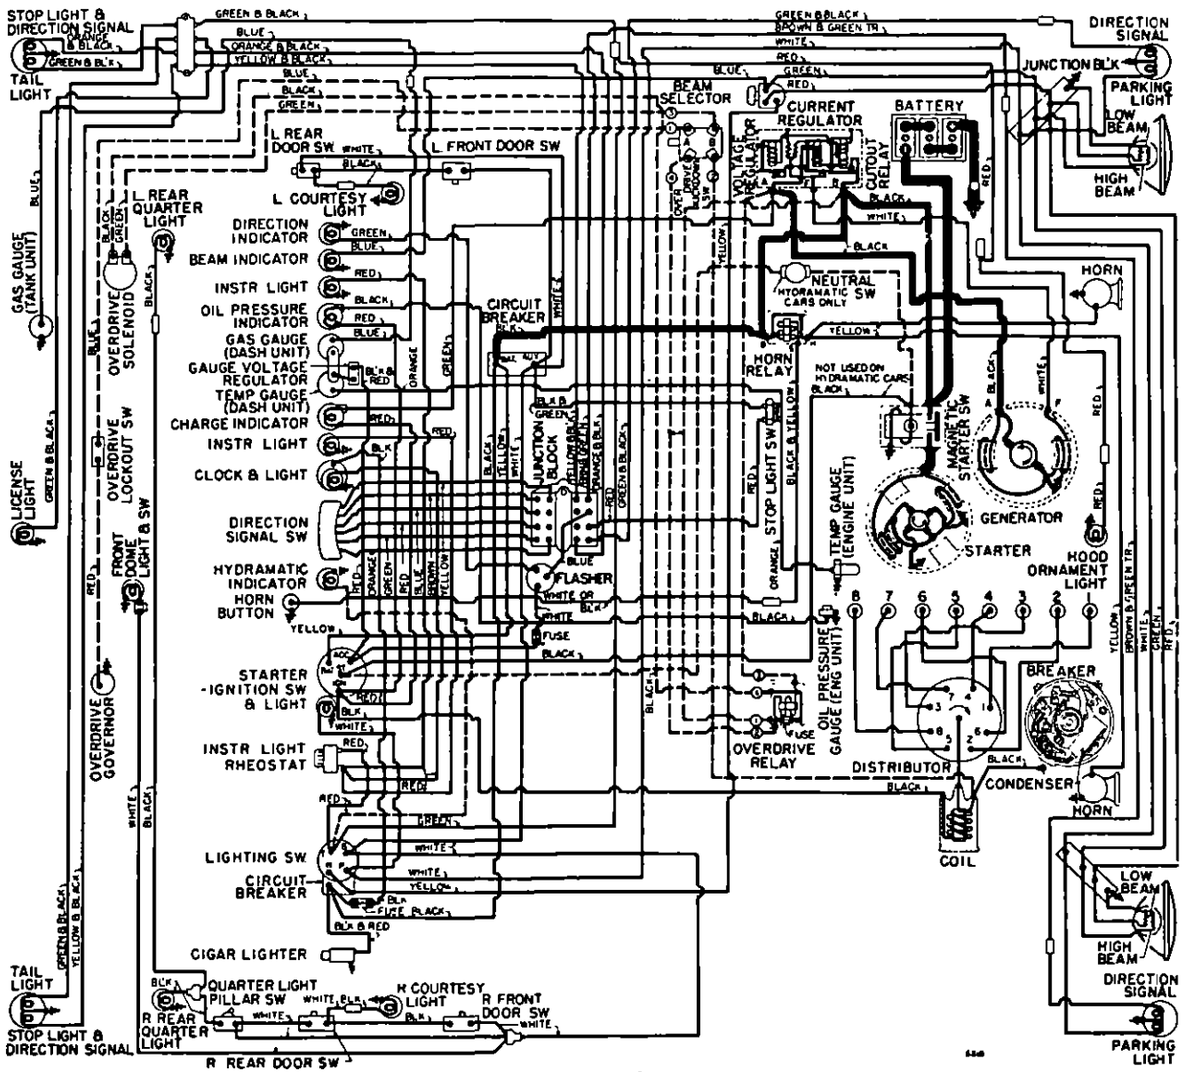
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Drive—(Std. Trans. Cars) Bendix No. 1806. Inboard barrel type.
Drive—(Hydra-Matic Cars) Bendix No. 1792. Outboard barrel type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (with new brushes).
Cranking Engine—Approx. 160 amperes at 120 RPM., (warm engine).

Performance Data—MCL-6006

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.0	65
8.0 "	Lock	2.0	410



Performance Data—MCH-6107, 6109, 6204

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 "	Lock	2.0	335

Starting Switch: Auto-Lite Magnetic type SS-4001 (1950), SS-4030 (1951-52), controlled by combination ignition-starter switch.

GENERATOR

Auto-Lite No. GDZ-6001B. Two brush type with voltage and current regulation.
Armature—Auto-Lite No. GGY-2006F.
Maximum Charging Rate—35 amperes at 8 volts.
Charging Rate Adjustment—None (see Regulator).

1952 MODELS

Performance Data

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 — 950-1050
35①	8.0	1800-2000 — 2150-2350

①—Maximum output 40 amperes with 1952 type VRP-6101B regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.6-1.8 amperes at 6.0 volts.
Motoring Current—4.2-4.6 amps. at 6.0 volts.
Belt Adjustment: ¾" belt deflection midway between generator and water pump pulleys.

REGULATOR

Auto-Lite No. (1950) VRP-6002A, (1951) VRP-6101A, (1952) VRP-6101B. Voltage & Current type.
►*NOTE*—VRP-6002A Cutout Relay has extra set of contacts for Generator "Teleflash" Indicator control. Indicator light is operated from "A" terminal on regulator.
NOTE—Regulator cover sealed. Serviced on replacement basis if seals not broken (to remove cover).
See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" at hinge end of core with contacts open.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F.
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

Setting (VRP-6002A, 6101A)—34-36 amps (marked "35" on cover).
Setting (VRP-6101B)—39-41 amperes (marked "40" on cover).
Contacts Gap—.012" min., (armature against stop).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when upper beam "on."
Direction Signal: Optl. *See Electrical Equipment Section.*
Direction Indicator— At left end of instrument panel. Flashes when signal in use.
Direction Signal Flasher—Hudson No. 300877.

Switches

Lighting—Hudson No. 300641 (with circuit breaker), No. 300642 (switch only).
Beam Selector—Hudson No. (1950-51) 300799, (1952) 303035.
Instrument—Hudson No. (1950-51) 160092, (1952) 304706.
Direction Signal—Hudson No. (1950-51) 305081, (1952) 307052.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Vibrating thermostatic types.
Lighting—Hudson 300643. 30 amp. On light switch.
Misc. Lighting—Hudson No. 301853. 20 ampere. On steering support bracket behind instrument panel.
Convertible Top & Hydraulic Window Regulators—Hudson No. 300626. 30 ampere. On steering support bracket behind instrument panel.
FUSES: Electric Clock—3 ampere. Behind clock.
Direction Signal—10 ampere. On Direction Signal Harness behind instrument panel.

Weather Control—14 ampere. On heater.
Overdrive—30 ampere. In insulated fuse holder in overdrive relay feed wire on left front side of dash.
Drive-Master—15 ampere. In Drive-Master control switch on instrument panel.

GAUGE VOLTAGE REGULATOR: King-Seeley—Consists of a thermo-bi-metal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on the instrument cluster and is connected between the ignition switch, and the gauge circuits. See Wiring Diagram.

GENERATOR CHARGE SIGNAL: Red indicator on instrument panel (to right of temperature gauge). Should light when ignition turned on and should go out when generator begins to charge.
See Electrical Equipment Section for complete data.

OIL PRESSURE SIGNAL: Red indicator in instrument panel (to left of gas gauge). If pressure drops below approximately 13 lbs. red dash signal lights.
See Electrical Equipment Section for complete data.

HORNS: Sparton or Auto-Lite Model HW-4021 (Low), HW-4022 (High). Dual horns operated by relay.
Air Gap—.027-.029" for high pitch (short horn). .032-.034" low pitch (long horn).

Horn Relay: Hudson No. 164401. On engine dash.
Contacts Close—3 volts min., 4 volts max.
Open—2 volts min. (relay upright, terminals down).

ENGINE

ENGINE SPECIFICATIONS: Own make. 8 cylinder. "L" head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches. **Rated HP**—28.8.
Developed Horsepower—128 at 4200 RPM.
Compression Ratio: (Std.)—Cast-iron head 6.7-1.
Compression Ratio: (Optl.)—Aluminum head 7.2-1.
Compression & Vacuum Reading—*See Tune-Up.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Hudson Special Data.*

►***HEAD GASKET IDENTIFICATION & INSTALLATION:*** *See Hudson Special Data.*

OIL PAN REMOVAL: *See Hudson Special Data.*

ENGINE FRONT SUPPORT & REAR MOUNTING ADJUSTMENT: *See Hudson Special Data.*

►***LOCATING HOLE PLUG CAUTION:*** Plug in locating hole in pan flange at left rear of block (behind starter) must be tight to prevent oil leakage through hole or contamination of oil by dirt or water.

PISTONS: Aluminum alloy, Cam ground, T-slot type.
Weight—10¾ ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above or below.
Clearance—.0015-.002" (skirt).
Original Bore & Piston Sizes & Markings—*See Hudson Special Data.*

Replacement Pistons: *See Hudson Special Data.*

Fitting New Pistons: Use .002" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs. Use Tool J-888 Piston Feeler Scale to measure pull.

Installing Pistons: Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.004-.009"	.001"
Oil (upper)	3/16"	.004-.009"	.001"
Oil (lower)	5/32"	.004-.009"	.001"

Installing Rings—Three top rings have offset pin notch (in relation to gap). Install rings so that alternate gaps offset.

Replacement Rings: *See Hudson Special Data.*

PISTON PIN: Dia.—.7497-.750". **Lgth.**—2.4375". Floating type with diamond-drilled pin holes in piston and bronze bushing (with oil grooves at sides) in connecting rod. Lock ring used at each end of pin.
Pin Fit in Piston—.0000-.0003" at 70°F., or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—.0003" clearance. Hand push fit at 70°F.
Piston Pin Servicing—*See Hudson Special Data.*

Replacement Pins: Std.. .002", .005", .010" oversize. Select pin to fit piston. **Do not ream pin hole in piston.**

CONNECTING ROD: Length—8 3/16".
Weight—31.36 ozs. (with bearings).
Crankpin Journal Diameter—1.935-1.936".

Original Journal & Bearing Sizes: *See "Crankshaft Size Code" in Hudson Special Data.*
Lower Bearing—Babbitt-lined, spun type.
Clearance—.0003-.0006". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Install replacement rods furnished on exchange basis. Do not file rods or caps. Palnuts used on bolt nuts.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.
Palnuts—Tighten finger tight, plus 1/3 turn.

Replacement Rods: Std. size and .010" undersize.

Installing Rods: Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT: Five bearing type with integral counterweights and vibration dampener on forward end.
Journal Diameter—#1, 2.279-2.280"; #2, 2.311-2.312"; #3, 2.341-2.342"; #4, 2.373-2.374"; #5, 2.404-2.405".
Bearing Diameter—#1, 2.2805-2.2815"; #2, 2.3125-2.3135"; #3, 2.3425-2.3435"; #4, 2.3745-2.3755"; #5, 2.4055-2.4065".

Original Journal & Bearing Sizes: *See "Crankshaft Size Code" in Hudson Special Data.*
Bearings—Bronze backed, babbitt lined type. Bearings secured in cap and crankcase by brass screws.
Clearance—.001".

Crankshaft & Main Bearing Removal: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Crankcase Front & Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.

►***BEARING INSTALLLATION CAUTION***—Tighten bearing retaining screws just snug to allow bearing to center itself on the screw. SCREW HEADS MUST BE BELOW SURFACE OF BABBITT. Bearing edges should be flush in case but should project .002" above edge of bearing cap.

►***CAUTION—Replacement of main bearings requires removal of crankshaft. Bearing shells retained by brass screws.***

Replacement Bearings: Reamed bearings furnished standard size and .010" Undersize. Unfinished bearings also supplied.

End Thrust: Taken by center (#3) bearing. Replace bearing if endplay excessive.
Endplay—.006-.012".

CAMSHAFT: Five bearing type. Helical gear drive.
Bearing Diameter—#1, 2.028-2.030"; #2, 1.997-1.999"; #3, 1.965-1.967"; #4, 1.9345-1.9365"; #5, 1.497-1.499".
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.002".
Camshaft Removal—*See Hudson Special Data.*

Replacement Bearings: Furnished as follows:
Finished Reamed—Will be proper dimension when pressed in place (.0026-.0055" press fit) and no reaming required.
Unfinished—Press in place (.0026-.0055" press fit) and line ream to .001" larger than individual camshaft journals.

►***CAUTION***—Install all bearings with notch at top.

End Thrust: Bakelite thrust washer between gear and crankcase. Spring loaded button in front end of camshaft bears against hardened plate on gear cover.

Timing Gears: Crankshaft gear Cast-Iron, camshaft gear Aluminum. Teeth have 20° pressure angle and are slightly crowned for quiet operation.
Identification of Gears—Figure "20" on front face of gears (crankshaft gear also marked "FRONT").
Replacement Gear Caution—Camshaft gear not furnished singly (set only). Crankshaft gear furnished singly or in matched set.
Backlash—.002-.004".
Timing Gear Removal & Installation—*See Hudson Special Data.*

Camshaft Setting: Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 1/2"	.3407-.3417"	5.094"
Exhaust	1.380"	.3392-.3402"	5.094"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	.346"	.003-.005"

NOTE—Stem clearance worn limit .005" max.

Valve Guides: Removable type pressed in block.
Guide Removal & Installation—Use Tool J-1188 to drive guides out. Install guides with Tool J-883-A with top of guide 15/16" below top of cylinder block. With guides installed, ream guides with Tool J-129-3 to .3437" (11/32") which will provide proper valve stem-to-guide clearance. NOTE—Car manufacturer recommends that guides be cleaned with Tool KMO-122 to remove carbon and scale out of guides (pay particular attention to carbon in counterbore at top of exhaust guide).

Valve Springs: Cadmium plated springs are used. Install springs with closed coil end up.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1.656"

NOTE—Reject springs if pressure less than 34 pounds. Free length 2.343".

Valve Lifters: Roller shoe type, fitted in removable guides in cylinder block.
Lifter Removal & Installation—*See "Valve System" in Hudson Special Data.*
NOTE—Inner sides of guide clamps should be in full contact at all points with matching flat surfaces of front face of each pair of tappet guides within .0015".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

Tappet Clearance: .008" Int., .010" Exh. at normal operating temperature.
NOTE—Removable apron in right front fender.

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
Above figures correct with .010" tappet clearance, Hot or .012" Cold.
Valve Timing Check—Remove front tappet cover and adjust tappet clearance of No. 1 intake valve to .010" Hot, or .012" Cold. Insert .002" feeler gauge in No. 1 intake tappet and rotate engine in direction of rotation until exhaust valve begins to close and light drag is felt on feeler gauge. Engine is correctly timed when first of four long timing marks is approximately 9/16" above pointer in timing hole in rear engine support plate. Reset tappet clearance at .008" HOT or .010" COLD.

LUBRICATION

Engine Oiling System: Duo-flow (pressure and positive splash) system. Pump delivers oil to front and rear ends of upper tray in oil reservoir. Connecting rod bearings are lubricated by dippers on caps which dip into troughs in this upper tray and also splash oil inside crankcase. Part of this oil is caught in channels inside crankcase and fed into reservoirs directly over each camshaft and crankshaft bearing from which it flows into the bearings.
Crankcase Capacity—(Dry) 8 qts. (Refill) 7 qts.

►*NOTE*—Whenever pan removed, install 1 qt. in upper tray before pan installed, then 7 qts. through oil filler after pan in place on engine.
Normal Oil Pressure—Approximately 13 lbs. at normal operating temperature. No gauge used (see Oil Pressure Indicator below).

Oil Check Valve: Located on right side of crankcase at rear. Opens at 11-15 lbs. Operates dash signal to indicate oil flow.

Oil Pump: Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.

Oil Pressure Indicator: Hudson Teleflash Oil Pressure Indicator. *See Electrical Equipment Section for complete data.*

Crankcase Ventilation: Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

Cooling System: Positive circulation with pump on *front of engine and by-pass type thermostat.*
Capacity—18½ quarts. 19½ quarts with heater.

Radiator Removal: *See Hudson Special Data.*

Water Pump: Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.
See Water Pump Section for complete data.
Belt Adjustment—*See Genertor Belt Adjustment.*

Thermostat: Hudson No. 166272. By-pass type in water outlet on cylinder head.
Setting—Starts to open 150-155°F. Fully open 185°

Temperature Gauge (1950): King-Seeley electric type.
Dash Unit—King-Seeley No. 42918.
Engine Unit—King-Seeley No. 41085.

Temperature Gauge (1951-52): King-Seeley Electric "CV" (constant voltage) with gauge voltage regulator.
Dash Unit—King-Seeley No. 45675.
Engine Unit—King-Seeley No. 44200.
See Miscellaneous Section for complete data.

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert type driven member operating in Hudsonite oil). 10" type used on all models.

►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Flushing instructions.*
See Clutch Section for complete data.
Facings—Cork insert type. Inside Diameter 6⅜". Outside Diam. 10". 108 corks, .203" thick.

Clutch Lubrication: *See "Clutch Notes" in Hudson Special Data.*

Pedal Adjustment: Clearance between underside of toeboard and top face of pedal shank must be 1½". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over 1/3 revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

VACUMOTIVE DRIVE

Vacumotive Drive: Automatic clutch control. 1950-51 Optional.
See Clutch Section for complete data.

SYNCHRO-MESH TRANSMISSION

1950-52 (OWN MAKE)

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.

►*SLIPPING OUT OF HIGH & SECOND GEAR: See Transmission Section for recommended correction.*

Transmission Control: Handy-shift remote control type with shift lever mounted on steering column.
See Transmission Section for complete data.

Transmission Removal: Remove front seat cushion, disconnect front seat from track, disconnect seat adjusting lever and remove seat back from car. Disconnect accelerator pedal at accelerator rod, brake pedal rod at lever. Remove floor mat, remove Weather Control blower unit (2 screws each side), disconnect bowden wire at control valve at cylinder head. Remove floor opening cover over transmission. Disconnect front universal joint at transmission (wire bearings on universal joint spider). Remove bolts attaching center bearing support bracket, move propeller shaft to rear to clear companion flange at transmission. Disconnect clutch pedal lever return spring, remove clutch cross-shaft and bracket, disconnect clutch control link clevis. Disconnect Handy Shift by removing shifter shaft outer lever, nut, and washer. Remove flywheel guard from bottom of clutch housing. Remove two engine rear mounting bolts and nuts, jack up rear end of engine about ½" off frame cross member (CAUTION—use block of wood on jack to prevent damage to oil pan). Disconnect speedomter cable at transmission case, plug hole with wood plug. Remove two top screws attaching clutch housing to engine, install guide studs (headless screws) in these holes to support transmission, remove remaining screws. Remove breather pipe bracket from clutch housing and bolt attaching breather pipe and rear valve cover. Pull transmission straight back on guide studs, lift transmission out through floor opening.

1952 (WARNER)

Warner Model AS63-T86E (Without Overdrive). AS64-T86E (With Overdrive). All helical gear type. Constant mesh (second & high), sliding gear (low & reverse), with remote (steering column) shift.
See Transmission Section for complete data.

Transmission Control: Steering column shift.
See Transmission Section for complete data.

Transmission Removal: *(NOTE—This transmission removed from underneath car. Not necessary to remove floor mat and cover).* Drain lubricant and disconnect front universal joint (retain universal joint bearing cups with tape to hold bearings in place). Disconnect transmission shift rods, speedometer cable (if car equipped with overdrive, disconnect control cable and wiring from overdrive) at transmission, and remove speedometer pinion. Remove nuts from front end of brake pivot brace at No. 3 cross member and remove clevis pin at rear end of brace and move linkage to left side of car. With universal socket on a 10" extension, remove two top bolts attaching transmission-to-clutch housing. Insert in their place, guide studs J-2969 to guide transmission during removal. Remove the two lower transmission-to-clutch housing bolts and lower transmission out of car.

DRIVE-MASTER TRANSMISSION

Drive-Master Transmission: Optl. Conventional 3-speed transmission with automatic gear shifting between Second & High Gears. Used in conjunction with Vacumotive Drive (automatic clutch control).
Identification—Metal tag attached by a cover bolt screw carries second speed ratio 1.82:1.
See Transmission Section for complete data.

►**Drive-Master Fuse**—15 ampere, Part No. 71406. Located in wiring circuit 6" from control switch.
Power Cylinder Lubrication—Must be lubrfcated at 10,000 mile intervals. *See "Hudson Drive-Master" in Transmission Section.*

SUPER-MATIC DRIVE TRANSMISSION

Own Make—Four-speed automatic transmission (3-speed automatic shift plus ultra-low). Optl.
See Transmission Section for complete data.

OVERDRIVE

Year	Warner No.
1950, Early	AS2-R10D
1950, Late	①AS3-R10D
1951-52, 1950 Late	①AS4-R10D

①—Have "centered ring gear."

Warner Type. Optional. Used with Hudson (First Type) Transmission. Governor controlled type with solenoid operation and kick-down switch.
See Transmission Section for complete data.
Overdrive Relay—Hudson No. BT303107.
Overdrive Governor—Auto-Lite No. TGA-4005.
Overdrive Solenoid—Delco-Remy No. 1118164.
Kickdown Switch—Hudson No. BT303254.
Overdrive Fuse—30 amperes. On fuse block on side of overdrive relay.

Removal: Same as for standard transmission, except that overdrive control cable and wiring must be disconnected.

HYDRA-MATIC TRANSMISSION

Four speed planetary type automatic transmission and fluid coupling. *1951-52 MODELS*—Modulated pressure and hydraulically operated reverse mechanism.

See Transmission Section for complete data.

►***PRODUCTION CHANGES & REPLACEMENT PARTS CAUTIONS: See "Hydra-Matic Drive" in Transmission Section.***

►***TESTING & TROUBLE SHOOTING—See "Hydra-Matic Drive" in Transmission Section.***

Lubrication: Check fluid level every 1000 miles. Add fluid as required to maintain level at "F" mark on dipstick. Drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type "A."

Capacity—11 quarts (approx.). 12 quarts (after reassembly).

Checking Fluid Level (1950-51)—Operate engine at normal operating temperature. Manual control lever in "N" position. Hand brake on. Dipstick located under inspection cover placed on right side under floor mat. Oil level must be just to the full mark on the dipstick. *DO NOT OVERFILL.*

Checking Fluid Level (1952)—Set hand brake. Allow engine to idle with Hydra-Matic Selector lever in "Dr4" position for 2 minutes. Place selector lever in "N' position. Roll back floor mat and remove oil level indicator (after cleaning all dirt and lint from around indicator). Wipe indicator dry and check fluid level. Fluid level must be to "F" mark. DO NOT OVERFILL.

►***CAUTION—Do not check oil level when transmission is excessively hot and do not fill above "F" mark on dipstick.***

►***OTHER HYDRA-MATIC SERVICE DATA—See "Hydra-Matic Drive" in Transmission Section.***

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**
Spicer No. 1268-102X.....**Intermediate**
Needle bearing types.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint).

2) Rear shaft with slip joint at forward end.

Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.

Center Bearing Removal & Installation—*See Hudson Special Data.*

REAR AXLE

1950-52 (OWN MAKE)

Own Make. Semi-floating, hypoid gear type with Hotchkiss Drive.

See Rear Axle Section for complete data.

►***IDENTIFICATION NOTE—Housing rear cover is welded in place. Bolts not used.***

Model	Ratios Standard	Optional
Synchro-mesh Tr.	4.1-1 (41-11)	4.55-1 (41-9)
Overdrive Trans.	4.55-1 (41-9)	4.1-1 (41-10)
Super-Matic Tr.	4.1-1 (41-11)	4.55-1 (41-9)
Drive-Master Tr.	4.1-1 (41-11)	4.55-1 (41-9)
Hydra-Matic Tr.	3.58-1 (43-12)	

Backlash—.004-.006". Screw adjustment.

Removal: Support car on stands under body frame just forward of rear springs, remove fender shields and rear wheels. Disconnect brake line at tee on axle housing, remove tee. Disconnect brake cables at equalizer bar clevis and unscrew end fittings, loosen nuts on cable conduit brackets on cross member and free conduits from brackets, disconnect cable conduit clips on rear springs, pull cables and conduits out through guides and clamps. Disconnect rear universal joint and lower propeller shaft. Disconnect lower end of shock absorbers, disconnect and remove rear stabilizer. Disconnect each rear end of springs, slide axle assembly out toward rear of car.

Axle Shaft Removal: Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer. Remove hub and drum assembly using screw type wheel puller (Tool J-736). *CAUTION* Car manufacturer recommends that screw type puller be used, if knock-out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, remove bearing cap and shims (without disturbing brake backing plate). Pull rear wheel bearing and axle shaft, using puller Tool J-352. Do not drag axle shaft on oil seal assembly.

Wheel Bearing Adjustment: Controlled by shims (.003", .005", or .015" thick) under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft). **Endplay**—.001-.004".

1952 (SPICER)

Spicer Type. Semi-floating, hypoid gear type, with Hotchkiss Drive.

See Rear Axle Section for complete data.

►***IDENTIFICATION NOTE—Housing rear cover attached with capscrews.***

►***NOTE—This axle used on "Second Series" cars with "Dual Range" Hydra-Matic Transmission.***

Ratio—3.07-1 (43-14).

Removal: Same as "First Series" (See above).

Axle Shaft Removal: Raise and support rear end of car with jacks placed under frame. Remove wheel, hub (using Puller J-736A), and remove brake cable conduit caps from backing plate and disconnect cable at operating lever. Disconnect brake line at rear wheel cylinder. Remove backing plate, gasket, and grease seal retainer, and shim pack (right side only). Tie shim pack together to insure correct replacement. Withdraw axle shaft using Puller J-352, do not drag on inner seal.

Wheel Bearing Adjustment: Controlled by shims (.003", .005", .010" and .030") between backing plate and end of housing (right side only). To adjust, remove wheel and backing plate (above), add or remove shims for endplay. **Endplay**—.001-.004".

SHOCK ABSORBERS

Delco or Monroe. Direct acting hydraulic types. Furnished—Light, Heavy, and Extra Heavy scales, see application below.

►**APPLICATION NOTE—Light Scale** front and rear shocks used with light scale springs and with front only heavy scale springs. **Heavy Scale** front and rear shocks used with heavy scale springs and with rear only heavy scale springs. **Extra Heavy Scale** front and rear shocks optional on all models. **Part Number** stamped on outside of shock absorber body.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.

►***FRONT SPRING PRODUCTION CHANGE: See Front Suspension Section.***

Kingpin Inclination—3°36' crosswise.

Caster—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Camber—½-1½°. Eccentric adjustment. Both wheels alike within ½°.

Toe-In—0" to 1/16" measured at wheel rim. Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tube equally.

Toe-Out on Turns—Inner wheel 30°. Outer 25°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustments.

See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinders—Front—1 1/8". **Rear**—15/16".

Drums—11" centrifuse type.

Lining—Molded type. Width—Front 2¼". Rear 1¾".

Thickness—.177".

Length Per Wheel—Front—*21.32*". **Rear**—*20.108*".

Clearance—(1950-51) .010", (1952) .015" at both ends of secondary shoe with primary shoe forced out against drum.

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand brake) linkage which applies rear wheel brakes by pedal mechanically if hydraulic system not operating.

See Brake Section for complete data.

Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

Hand Brake: See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders). *See Miscellaneous Section for complete data.*

Windshield Wiper: Cable Operated—Vacuum type.

See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

1952 Models	Model No.	Engine Displacement
Pacemaker	4B	232 cu. in.
Wasp	5B	262 cu. in.
Commodore Six	6B	262 cu. in.
Hornet	7B	308 cu. in.
1953 Models		
Wasp	4C	232 cu. in.
Super Wasp	5C	262 cu. in.
Hornet	7C	308 cu. in.

SERIAL & ENGINE NUMBERS: Both numbers same. Stamped on plate attached to right front door hinge pillar post and stamped vertically on upper right front corner of cylinder block.

1952 Starting Nos.—132916. Same for all models. Cars are numbered consecutively regardless of model.

1953 Starting Nos.—(Wasp) 4C-202928. (Super Wasp) 5C-202919, (Hornet) 7C-202917. *NOTE*—First two digits indicate model, remaining digits are serial number which is consecutive regardless of model designation.

TUNE-UP

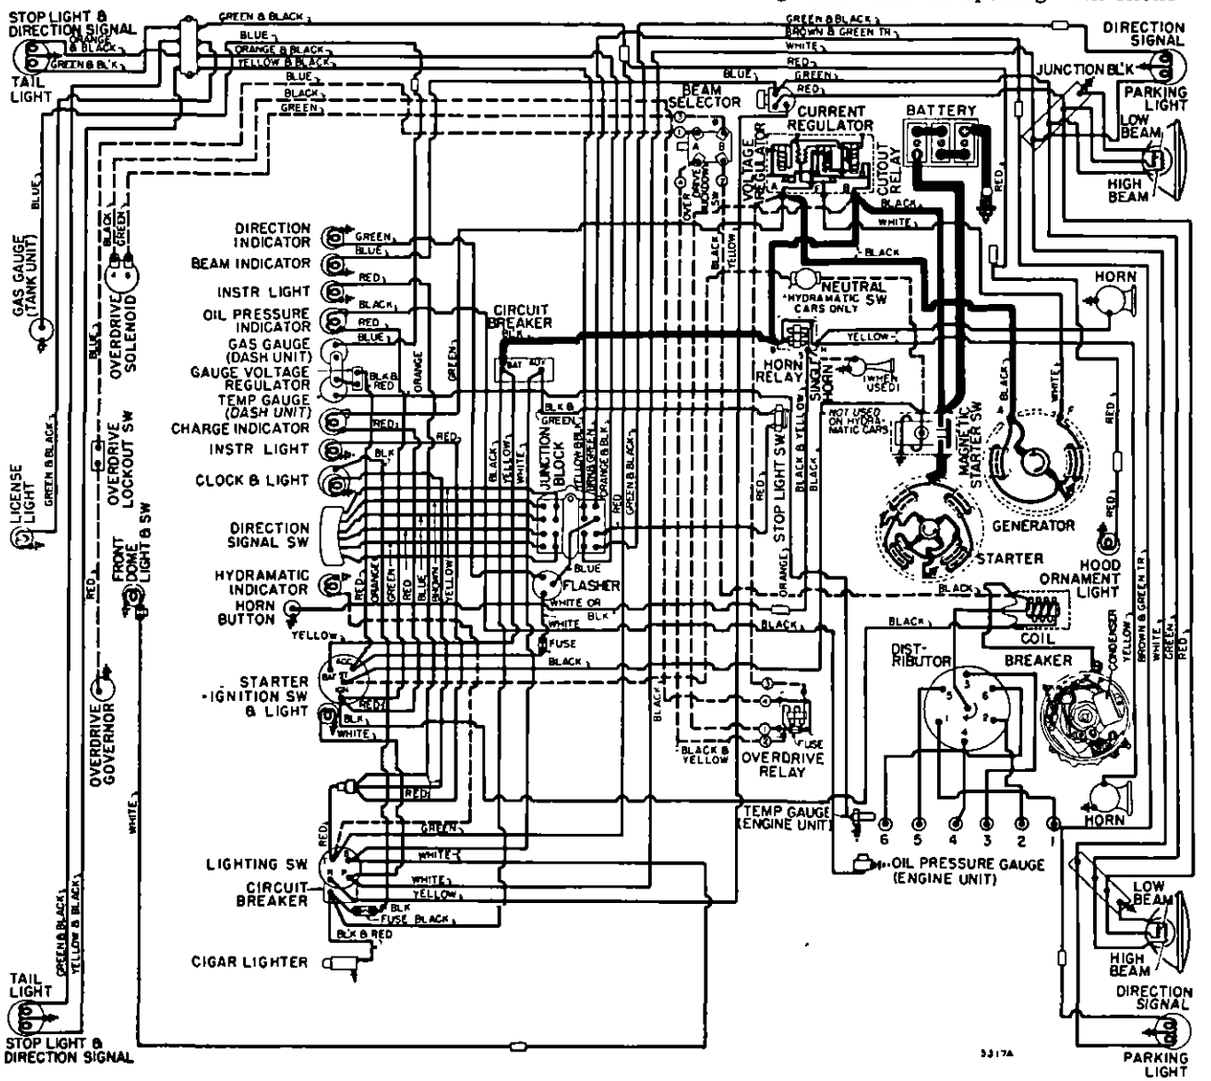
COMPRESSION PRESSURE: 100 lbs. minimum (all models) with not more than 10 lbs. variation between cylinders at cranking speed of 125 RPM.

VACUUM READING: Steady 18-21" at idling speed.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .032"
Plugs—Champion (4C, 5C) H-10, (Others) H-11. 14 mm.
NOTE—Tighten plugs to 25-30 ft. lbs. torque.

DISTRIBUTOR: Auto-Lite (4B, 4C) IAT-4009, (Early 5B, 6B, 7B) IAT-4009A, (Late 5B, 6B, 7B & 5C, 7C) IAT-4009B. Full automatic advance with vacuum spark control and Fuel Compensator adjustment.
Breaker Gap—.020" Limits .018-.022".
Cam Angle—39° plus or minus 3°. *Do not set breaker gap outside limits to secure this cam angle.*
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*



COIL: Auto-Lite CR-6012A. On right of engine.
Ignition Current—2.5 amperes idling, 4.5 amperes stopped, at 6.3 volts.

CONDENSER: Auto-Lite No. IAT-3076R.
Capacity—.21-.25 microfarad.

IGNITION TIMING: At TDC.
CAUTION—When setting timing with timing light, disconnect vacuum control line at distributor and plug line to prevent disturbing engine performance.
Timing Mark—Long line at "UDC-1" mark on flywheel aligned with pointer in inspection hole in rear engine support plate behind starter.
Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. in high gear.
Timing Procedure—*See Ignition Timing.*

CARBURETION (Standard 4B, 4C): Carter WA1, No. 749S. Singe barrel down-draft type with automatic choke.
Idle Setting—½-1½ turns open. Turn screw out for richer mixture.
Idle Speed—(Std. Trans.) 540-560 RPM; (Overdrive) 575 RPM; (Hydra-Matic) 490-510 RPM.
Float Level—½" from top of projection on underside of bowl cover to top of seam on free end of float (invert cover and float assembly to check level).
Accelerating Pump—Center hole Normal, Inner hole if less charge required
Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section for complete data.*
Fast Idle Setting: ⅝" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset.
Choke Setting: Centered (at index).
Fuel Pump Pressure: 3-4 lbs. (AC), 3½-4½ lbs. (Carter).

CARBURETION (Standard 5B, 6B, 7B, 5C, 7C): Carter WGD-776S. Dual down-draft type with automatic choke.
Idle Setting—1-1½ turns open (two screws—set alike). Turn screws out for richer mixture.
Idle Speed—(Std. Trans.) 540-560 RPM; (Overdrive) 575 RPM; (Hydra-Matic) 490-510 RPM.
Float Level—3/16" measured from top of float at center to machined underside of bowl cover with needle valve seated (remove gasket and invert cover and float assembly to check level).
Accelerating Pump—No seasonal adjustment
Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section for complete data.*
Fast Idle Setting: .026" throttle opening with choke

PACEMAKER 4B & WASP 4C MODELS

valve closed. Check with thermostatic coil housing, gasket, and baffle removed. Crack throttle valve, hold choke valve closed, move throttle valve toward closed position as far as possible. If throttle opening not .026" at this point, adjust by bending connector rod at lower angle.

Choke Setting: 2 Points Lean.

Fuel Pump Pressure: 3-4 lbs. (AC), 3½-4½ lbs. (Carter).

CARBURETION (Optional "Twin H-Power"): ***Two Carburetors of same type used per engine.*** **Carter WA1 No. 968S (7B, 7C), No. 990S (5B, 6B, 4C, 5C).** Single barrel downdraft type with automatic choke.

Idle Setting—(968S) 1¼ to 2¼ turns open. **(990S)** ¾ to 1¾ turns open. Turn screw out for richer mixture.

Idle Speed—(Std. Trans.) 540-560 RPM; (Overdrive) 575 RPM; (Hydra-Matic) 490-510 RPM.

►***TWIN CARBURETOR ADJUSTMENT CAUTION***—Adjust as follows for correct equalization of both carburetors: Remove air cleaners, install adjusting pin J-2544-1 through accelerator pedal link bellcrank lever and in hole in cylinder block to lock the lever. On 5B & 5C, adjust throttle shaft rod trunnion to 1 25/32" from top face of bracket to center of clevis pin hole in cross shaft lever. Connect tachometer, but before warming up engine, remove clevis pin from ends of both throttle shaft to carburetor rods, position fast idle cam on each carburetor in "off" position and turn each throttle stopscrew in until it just touches the cam. Set idle mixture screws exactly 2 turns open (7B, 7C), 1¼ turns open (5B, 6B, 4C, 5C). Warm engine, then adjust for correct idle speed (see above). Adjust each idle mixture adjusting screw for maximum increase in idling speed and readjust throttle stopscrews for correct idling speed (CAUTION—turn stopscrew on each carburetor an equal amount). Adjust front and rear throttle shaft-to-carbureor rod clevises so that clevis pins can be installed freely, connect rods. On Hydra-Matic cars adjust throttle linkage (see Hydra-Matic Drive in Transmission Section). Remove linkage adjusting pin, adjust accelerator pedal to bellcrank rod to get 1/64-1/16" clearance between pedal and pedal stop at wide open throttle, re-install air cleaners.

Float Level—½" from top projection on underside of bowl cover to top of seam on free end of float (invert cover and float assembly to check level).

Accelerating Pump—Center hole normal. Inner hole if less charge required.

Hydra-Matic Throttle Linkage Adjustment: ***See "Hydra-Matic Drive" in Transmission Section for complete data.***

Fast Idle Setting: 5/64" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset.

Choke Setting: One point lean.

Fuel Pump Pressure: 3-4 lbs., (AC), 3½-4½ lbs., (Carter).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No adjustment. See that valve operates freely.

VALVE TAPPET CLEARANCE: ***CAUTION—Different setting used for each type camshaft:***

Before Car (1952) No. 147662 (Camshaft No. 304078)—.008" Intake, .010" Exhaust.

Beginning Car (1952) No. 147662 (Camshaft No. 306344 with Tappet Clearance decal on Valve Cover Plate)—.010" Intake, .012" Exhaust HOT.

NOTE—Adjusting screws are self-locking. Remove apron in right front fender for accessibility.

IGNITION

IGNITION SWITCH: Hudson No. BO-306354. Combination ignition-starter switch. Starter operates when key held fully to right (automatically returns to ignition "on" position when released).

Lock Cylinder—Hudson No. BO-47630 (with keys), No. BO-152043 (cylinder only—uncoded).

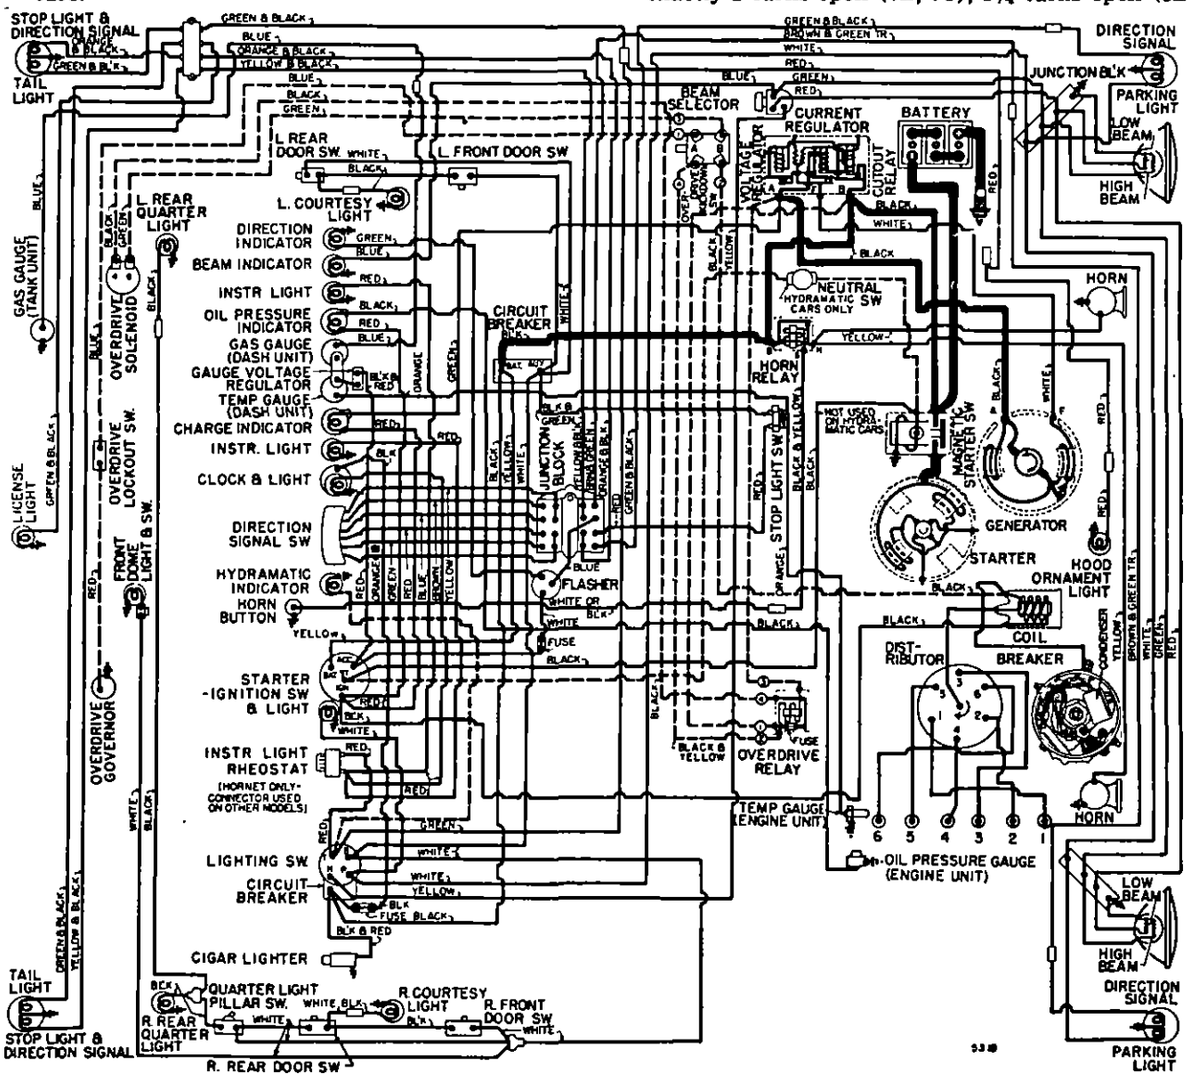
COIL: Auto-Lite CR-6012A. On right of engine.

Ignition Current—2.5 amperes idling, 4.5 amperes stopped, at 6.3 volts.

CONDENSER: Auto-Lite No. IAT-3076R.

Capacity—.21- 25 microfarad.

DISTRIBUTOR: Auto-Lite (4B, 4C) IAT-4009, (Early 5B, 6B, 7B) IAT-4009A, (Late 5B, 6B, 7B & 5C, 7C) IAT-4009B. Full automatic advance with vacuum spark control and Fuel Compensator adjustment. ***These distributors are "pivoted Breaker Plate" type.***



Breaker Plate Identification—Number stamped on plate (at pivot arm pin) indicates maximum vacuum advance.

Breaker Gap—.020". Limits .018- 022".

Cam Angle—39°+3°. ***Do not set breaker gap outside limits to secure this cam angle.***

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

IGNITION TIMING

Std. Setting ..... ***At Top Dead Center***

NOTE—Modify this setting for special fuel and altitude conditions. See Fuel Compensator Setting.

Flywheel Mark—"UDC-1/" (#1 and #6 piston top dead center position) with 4 short marks (¼" apart) ahead of this mark (opening behind starter).

CAUTION—When setting timing with timing light, disconnect vacuum control line at distributor and plug line to prevent disturbing engine performance.

Timing (with Neon Timing Light)—Mark long line of "UDC-1/" flywheel mark with white paint, connect timing light to No. 1 spark plug, idle engine and adjust distributor until mark appears in line with pointer.

Fuel Compensator Setting—Set for slight ping at 15 MPH. when accelerating from 10 MPH. with wide open throttle. To adjust, loosen hold-down screw, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping). **Final setting must not be more than 1" (4th short line) ahead of "UDC-1/" flywheel mark.**

CARBURETOR

CARTER WA1

Carter WA1. Single barrel downdraft type with automatic choke.

Car Model	Carter Model No.
4B, 4C	749S
5B, 6B, 4C, 5C Optl.	Two 990S
7B, 7C Optl.	Two 968S

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section for complete data.*

Fast Idle: Carter Single Barrel Carburetor type.
Setting—⅝" clearance between choke valve and air horn (Gauge T109-85) with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset (Tool T109-41).
See Carburetion Equipment Section for complete data.

Automatic Choke: Carter Climatic Control (Single Barrel Carburetor).
Setting—Centered on index (749S). One point lean 968S, 990S).
See Carburetion Equipment Section for complete data.

CARTER DUAL WGD

Carter WGD, No. 776S (Std. 5B, 6B, 5C, 7C). Dual downdraft type with automatic choke.
See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up Data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section for complete data.*

Fast Idle: Carter Dual (WGD) Carburetor type.
Setting—.026" throttle opening with choke valve closed. Check with thermostatic coil housing gasket, and baffle removed. Crack throttle valve, hold choke valve closed, move throttle valve toward closed position as far as possible. If throttle opening not .026" adjust by bending connector rod at lower angle.
See Carburetion Equipment Section for complete data.

Automatic Choke: Carter Climatic Control.
Setting—Set coil housing 2 points lean.
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: AC. Oil-wetted type (Std.), Oil-bath type (Optl.). **Filter Element**—AC No. 5 (Std.), No. 7S (Optl. oil-bath type).

Fuel Pump: (**Std. 4B, 5B, 6B, 7B, 4C**) Carter M729SZ (fuel only); (**Optl. 4B, 5B, 7B**) AC No. 538 (fuel & vacuum); (**4C Optl., 5C, 7C**) AC No. 583 (first), No. 4057 (later) fuel & vacuum.
Pressure—3½ to 4½ lbs., (Carter). 3 to 4 lbs., (AC).
See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley Electric "CV" type (Constant Voltage) with voltage regulator.
Dash Unit—K-S No. 45674 (1952); No. 46193 (1953).
Tank Unit—No. 44513.
See Carburetion Equipment Section for complete data.

BATTERY

National (1952) OE-2L-100, (1953) 2L-S-100. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to frame and engine by single strap.
Location—On left side under hood.

STARTER

Model	Auto-Lite No.
4B, 4C (Std.)	MZ-4167
5B, 6B, 7B, 5C, 7C (Std.)	MCH-6109
5B, 6B, 7B (Early Hydra-Matic)	MCH-6107
5B, 6B, 7B (Late Hydra-Matic)	MCH-6204
4C, 5C, 7C (Hydra-Matic)	MCH-6204

Armature—Auto-Lite No. MZ-2312 (for MZ-4167); MCH-2084 (for MCH-6109); MCH-2088 (for MCH-6107 & MCH-6204).
Drive—(Std. Trans. Cars) Bendix No. 1806. Inboard barrel type.
Drive—(Hydra-Matic Cars) Bendix No. 1792. Outboard barrel type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (with new brushes).
Cranking Engine—Approx. 160 amperes at 120 RPM. (warm engine).

Performance Data—MZ-4167

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 "	Lock	2.0	280

Performance Data—MCH-6107, 6109, 6204

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 "	Lock	2.0	335

Starting Switch: Auto-Lite Magnetic type, No. SS-4030 or RBM No. 2201-15. Controlled by combination starting and ignition switch. *NOTE*—Hudson No. BT-304524 Neutral Safety Switch used on Hydra-Matic Cars (starter cranks only with selector lever in Neutral "N" position).

GENERATOR

Auto-Lite No. GDZ-6001B (Early), GGW-4801B (Late). Two-brush type with current & voltage regulation.

▷***GENERATOR CAUTION—Two different generators used. Identified by a BLUE name plate or a BLACK name plate. DO NOT USE A BLACK NAME PLATE GENERATOR WITH A BLUE NAME PLATE REGULATOR.***

Armature—Auto-Lite No. GGY-2006F (for GDZ-6001B). **GGW-2006F** (for GGW-4801B).
Maximum Charging Rate—See Current Regulator.

Performance Data—GGW-4801B

Amperes	Volt	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
40	8.0	1800-2000	2150-2350
45	8.0	1925-2125	2350-2550

Performance Data—GDZ-6001B

Amperes	Volt	Cold—R.P.M.—Hot	
0	6.4	870-970	950-1050
17	8.0	1350-1500	1550-1700
35	8.0	1800-2000	2150-2350

Rotation—Counter-Clockwise at commutator end.
Brush Spring Tension—35-53 ozs. new brushes.
Field Current—1.3-1.5 (GDZ-6001B); 1.4-1.5 (GGW-4801B) amperes at 5.0 volts.
Motoring Current—3.9-4.4 (GDZ-6001B); 4.1-4.6 (GGW-4801B) amperes at 5.0 volts.
Belt Adjustment: ¾" belt deflection midway between generator and water pump pulleys.

Form 178—1956-M

REGULATOR

Auto-Lite No. VRP-6101B (GDZ-6001B Gen.), VBE-6104A (GGW-4801B Gen.). Voltage-current type.

►***VOLTAGE REGULATOR CAUTION—Two different regulators used. Identified by a BLUE name plate or BLACK name plate. DO NOT USE A BLUE NAME PLATE REGULATOR WITH A BLACK NAME PLATE GENERATOR.***

NOTE—Regulator cover sealed. Serviced on replacement basis if seals not broken (to remove cover). ***See Electrical Equipment Section for complete data.***

Cutout Relay

Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amperes disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" at hinge end of core with contacts open.

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. ***in normal operation charging at 10 amperes (VRP), at ½ maximum (VBE).***
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—***See Electrical Equip. Section.***

Current Regulator (VRP)

Setting—39-41 amperes (marked "40" on cover).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—***See Electrical Equip. Section.***

Current Regulator (VBE)

►***SETTING CAUTION—"Temperature Compensated" type, Set to following specifications at 70°F.***

Test A	Operating Amperes	Test B
52 max		45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum output.

Test B—After additional 15 minutes operation with current regulator operating (with load applied to hold voltage down to 6.7-6.9 volts).

LIGHTING

Headlamps: "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Red pilot bulb at lower center of speedometer dial. Lights when upper beam "on."

Direction Signal: Optl. ***See Electrical Equipment Section.***

Switches

Lighting—Hudson No. (1952) 300641, (1953) 307191,
Beam Selector—Hudson No. 303035.
Instrument Rheostat (Hornet)—Hudson No. 304706.
Direction Signal—Hudson No. (1952) 307050 for 4B, 5B, No. 307052 for 6B, 7B. (1953) No. 306361.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Vibrating thermostatic types.
Headlight—Hudson No. (1952) 300643—30 amps., (1953) 307192—25 amps. On light switch.
Misc. Lighting—Hudson No. (1952) 301853, (1953) 306362. 20 ampere type. On steering support bracket behind instrument panel.

FUSES: Electric Clock—3 ampere. Behind clock.
Direction Signal—14 ampere. In flasher lead behind instrument panel.
Overdrive—30 ampere. In holder on relay.
Heater—14 ampere. In holder on left side of Weather Control Housing or on cross brace.

GAUGE VOLTAGE REGULATOR: King-Seeley No. 45677 (1952); King-Seeley No. 46283 (1953). Regulator is thermal bi-metal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on on gauge feed circuit. See Wiring Diagram.

GENERATOR CHARGE SIGNAL: Red indicator on instrument panel (to right of temperature gauge). ***See Electrical Equipment Section for complete data.***

OIL PRESSURE SIGNAL: Red indicator on instrument panel. **Warning Switch:** (1952) Carter No. A815S or King-Seeley No. 47100. (1953) Carter No. A658S or King-Seeley No. 47130. On right side of engine above oil pump. Opens at 11-15 lbs.
See Electrical Equipment Section for complete data.

HORNS (1952): Sparton or Auto-Lite Model HW-4021 (Low Pitch), HW-4022 (High Pitch). Twin horns

HORNS (1953): Sparton or Auto-Lite Model HAB-4611 (Low Pitch), HAB-4612 (High Pitch). Twin horns

Horn Relay: Hudson No. 164401. On engine dash.
Contacts Close—3 volts min. 4 volts max.
Open—2 volts min. (relay upright, terminals down).

ENGINE

ENGINE SPECIFICATIONS: All engines 6 Cyl. "L" head type.

Model	Bore	Stroke	Displacement
4B, 4C	3 9/16"	3 7/8"	232 cu. in.
5B, 6B, 5C	3 9/16"	4 3/8"	262 cu. in.
7B, 7C	3 13/16"	4 1/2"	308 cu. in.

Model	Comp. Ratio	Rated H.P.	Developed H.P.
4B, 4C	6.7-1①	30.4	112 at 4200 RPM
5B, 6B	6.7-1①	30.4	123 at 4000 RPM
5C	6.7-1①	30.4	127 at 4000 RPM
7B, 7C	7.2-1②	34.9	145 at 3800 RPM

①—7.2-1 Optl. ②—6.7-1 Optl.

NOTE—6.7-1 ratio is for cast iron head. 7.2-1 ratio is for aluminum head.

Compression & Vacuum Reading—***See Tune-Up.***

CYLINDER HEAD & TIGHTENING TORQUE: ***See Hudson Special Data.***

►***HEAD GASKET IDENTIFICATION & INSTALLATION: See Hudson Special Data.***

ENGINE REMOVAL: ***See Hudson Special Data.***

OIL PAN REMOVAL: Support car on jack stands placed under #2 cross-member. Take out three bolts attaching center steering arm support bracket on this cross-member and drop steering arm and tie rods. Remove flywheel dust cover. Remove pan.

►***LOCATING HOLE PLUG CAUTION***—Plug in locating hole in pan flange at left rear of block (behind starter) must be tight to prevent oil leakage through hole or contamination of oil by dirt and water entering pan through hole.

PISTONS: Aluminum alloy, cam ground type.

►***CAUTION—Pistons NOT INTERCHANGEABLE between engines (except 5B, 5C, 6B) due to different height from pin hole to top as follows:*** **(4B, 4C)**—2.310-2.314"; **(5B, 5C, 6B)**—2.060-2.064"; **(7B, 7C)**—1.967-1.971".
Weight—(4B, 4C) 18⅜ ozs., (5B, 6B, 5C) 18 ozs., (7B, 7C) 18⅝ ozs.
Removal—Pistons and rods removed from above.
Clearance—.0015-.0025" (skirt).
Piston Fitting—Insert piston in cylinder with .002" feeler gauge. Pull to withdraw should be 3 to 4 lbs., using tool J-888 Piston Feeler Scale to measure pull.

Replacement Piston Sizes: ***See "Pistons" in Hudson Special Data.***

Installing Pistons: Slot away from camshaft.

PISTON RINGS: Two compression, two oil rings (one oil ring above and one below), per piston. Rings are square end type and pinned to prevent rotation. Ends are cut and notched to fit pin (clearance on pin must be equal to end gap).

Ring	Width	End Gap	Side Clearance
Compression	5/64"	.006-.014"	.001"
Oil Upper	3/16"	.006-.014"	.001"
Oil Lower	5/32"	.006-.014"	.001"

Installing Rings—Rings have pin notch offset in relation to end gap. Install rings so that short side of notch is installed on alternate sides of pin.

Replacement Rings: Furnished Standard, .002", .005", .010", .015", .020", .030" oversize.

PISTON PIN: Floating type with locking ring at each end. Holes in piston are diamond bored and bearing in rod is steel-backed, bronze bushing. See Rod Bushing Installation below.
Diameter—.9684-.9687". **Length**—2.9375".
Pin Fit in Piston—.0000-.0003" at 70°F. or hand push fit with piston at 200°F.
Pin Fit in Rod Bushing—.0003" clearance. Hand push fit at 70°F.

Rod Bushing Installation: Press old bushing out and press new bushing in with Tool J-2948 (support rod on Burnisher Block J-2950 in press). Then BURNISH bushing in place, using Burnishing Tool J-2791 (rest rod on burnisher block J-29506 in press, press burnishing tool through rod bushing). Ream bushing to diameter of .9685-.9688".

Replacement Pins: Std., .002", .005", .010" oversize. Select pin to fit piston. **Do not ream pin hole in piston.**

CONNECTING ROD: Length 8⅛". **Wgt.** 32⅜ ozs.
Crankpin Journal Diameter—2.1244-2.1254".

►***See "Crankshaft Size Code" in Hudson Special Data.***

Lower Bearing—Steel-backed, babbitt-lined type with upper and lower halves alike. No shims.
Clearance—.0005-.0015". **Sideplay**—.007-.013".

Bearing Adjustment: None (no shims). Replace bearings. Do not file rods or bearing caps.
NOTE—Identifying notches on side of cap and rod must be together when cap installed on rod.

Replacement Bearings: Furnished Std. ("Large" & "Small"), & .0005", .002", .010", .012" Undersize.

Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward valve side of engine.

CRANKSHAFT: Four bearing type with integral counterweights. Vibration dampener on front end.
Journal Diameter—2.4988-2.4998".
Bearing Diameter—2.4993-2.5013".

►***See "Crankshaft Size Code" in Hudson Special Data.***

Bearings—Removable steel-backed, babbitt-lined upper and lower halves of each bearing alike.
Clearance—.0005-.0015".
Crankcase Front & Rear Oil Seal Installation: ***See "Crankshaft & Main Bearings" in Hudson Special Data.***

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.
NOTE—Bearing shells positioned in cap and crankcase by tang on edge of shell. Can be rotated out without removing crankshaft with Tool KMO-734.
Palnuts—Tighten finger tight, plus ⅓ turn.

Replacement Bearings: Furnished Std. & .001", .002", .010", .012" Undersize.

End Thrust: Taken by #3 bearing. Replace bearing if endplay excessive. **Endplay**—.003-.009".

CAMSHAFT: 4 bearing type. Non-adjustable chain.

►***CAMSHAFT PRODUCTION CHANGE—Camshaft No. 306344, replaces No. 304078 at Car Serial No. 147662 (1952 Model). DIFFERENT TAPPET SETTINGS REQUIRED. See Valve Timing following.***
Bearing Diameter—#1, 2.375-2.3755"; #2, 1.997-1.9975"; #3, 1.965-1.9655"; #4, 1.497-14975".

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Bearings—Steel-backed, babbitt-lined bushings. **Clearance**—.0015-.002".

Replacement Bearings: Furnished as follows: **Finished Reamed**—Will be proper dimension when pressed in place (.0026-.0055" press fit). **Unfinished**—Press in place (.0026-.0055" press fit) and line ream to .001" larger than journals.

▷*CAUTION*—Install all bearings with notch at top.

End Thrust: Steel thrust plate fitted between front end of camshaft and sprocket. Plate attached to crankcase by two capscrews and locks. **Endplay**—.003-.005".

Timing Chain: Morse. 60 links, ⅜" pitch. Width—1¼". ***Chain Tension Shoe***—*Fibre shoe backed by synthetic rubber plunger mounted inside timing chain cover at top. Holds chain in close mesh with sprockets and prevents whip.*

Camshaft Setting: Sprockets marked. Two chain guide links marked with center holes. Mesh chain with center hole in each link opposite "O" mark on each sprocket with #1 piston at top dead center (crankshaft sprocket keyway at top with #1 piston at TDC.) NOTE—With this setting, there should be 6 full links plus two half-links between marks on sprockets (half-links opposite sprocket marks).

VALVES:	Head Diam.	Stem Diam.	Length
Intake	1.831"	.3412-.3422"	5.730"
Exhaust	1.556"	.3402-.3412"	5.730"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.346"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

Valve Guides: Removable, one-piece, cast-iron Exhaust guides counterbored at upper end. Install guides using installer handle part of tool J-883-A and installer pilots J-883-8 and J-883-9 (pilots have stop collars which position guides). **Intake Guide**—Upper end 1 7/16" below top of valve seat. Finish ream to .3432-.3442" (.3437" preferred). **Exhaust Guides**—Upper end 1 3/32" below top of valve seat. Finish ream to .3432-.3442" (.3437" preferred). Counterbored 9/16" deep to 25/64".

Valve Springs: Cadmium plated springs are used. Install springs with closely coiled end up.

	Spring Pressure	Length
Valve Closed	73-81 lbs.	2.188"
Valve Open	153-165 lbs.	1.842"

NOTE—Reject springs if pressure less than 60 lbs. at 2 3/16". Spring free length 2.500".

Valve Lifters: Mushroom type fitted directly in crankcase. Removed from below with camshaft out. Service by installing oversize lifter. **Clearance**—.00075-.0015". **Replacement Lifters**—.002", .004", .010" Oversize.

VALVE TIMING

TAPPET CLEARANCE: CAUTION—***Different setting used for each type camshaft.***

▷**First 1952 Cars before No. 147662 (Camshaft No. 304078):** .008" Intake, .010" Exhaust, HOT.

▷**Beginning with 1952 Car No. 147662 and all 1953 Cars (*Camshaft No. 306344 with tappet clearance decal* on valve cover plate):** .010" Intake, .012" Exhaust, HOT. Self-locking tappet screws used. Remove right front fender apron for access to valve compartment.

VALVE TIMING: See Camshaft Setting above.

Camshaft No. 304078

Intake Valves—Open 7°18' BTDC. Close 53°42' ALDC.
Exh. Valves—Open 53°18' BLDC. Close 7°42' ATDC.

Camshaft No. 306344

Intake Valves—Open 26.8° BTDC. Close 99.7° ALDC.
Exhaust Valves—Open 64.9° BLDC. Close 45.7° ATDC.

Valve Tappet Timing Check: Remove front cover and adjust tappet clearance of No. 1 intake valve to .010" Hot, or .012" Cold. Insert .002" feeler gauge in No. 1 intake tappet and rotate engine in direction of rotation until exhaust valve begins to close, and light drag is felt on feeler gauge. Engine is correctly timed when first of four long timing marks is approximately ⅝" above pointer on timing hole in rear engine support plate. Reset tappet clearance to correct clearance (see Tappet Clearance).

LUBRICATION

Engine Oiling System: Pressure to crankshaft, connecting rod, and camshaft bearings, valve lifters and timing chain. **Crankcase Capacity**—7 qts. (refill), 7½ qts. (dry). **Normal Oil Pressure**—40 lbs. at 30 MPH. No gauge **Oil Pressure Relief Valve**—Non-adjustable relief valve and spring under plug on left side of engine

Oil Pump: Rotor type consisting of inner and outer *rotor, shaft, body, and cover. Angle mounted on* right side of crankcase and driven from camshaft. **Oil Pump Overhaul**—***See "Oil Pump" in Hudson Special Data.***

▷***OIL PUMP INSTALLATION CAUTION—See "Oil Pump" in Hudson Special Data.***

Oil Filter: Optl. Fram or Hudson. Replace filter cartridge at 5000 mile intervals.

Oil Pressure Indicator: Hudson "Teleflash" with Oil Pressure Warning Switch. ***See Misc. Electrical.***

Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

Cooling System: Positive circulation with pump on front of engine, by-pass thermostat, and brass water distribution tube in cylinder block. **Pressure Cap**—AC No. 846713. Opens at 7 lbs., pressure. **Capacity**—18½ quarts without heater. 19½ quarts with heater. **Radiator Removal**—***See Hudson Special Data.***

Water Pump: Centrifugal, belt driven, packless type. Shaft mounted on sealed duplex ball bearing. ***See Water Pump Section for complete data.***

Thermostat: Hudson No. F-166272 (Std.), No. SP-161664 (High Type for permanent anti-freeze). *By-pass located in water outlet in cylinder head.* **Setting**—(Std). Starts to open at 150-155°F., fully open at 175°F. (High Type) Starts to open at 165-170°F., fully open at 195°F.

Temperature Gauge—King-Seeley Electric "CV" type. (Constant Voltage) with voltage regulator. **Dash Unit**—K-S No. 45675 (1952); No. 46197 (1953). **Engine Unit**—King-Seeley No. 44200. ***See Miscellaneous Section for complete data.***

CLUTCH

Own Make. Single plate, fluid cushioned type (cork insert driven member) operating in Hudsonite oil. *NOTE*—Two sizes used: 9" (4B, 4C Std.), 10" (4B & 4C with Overdrive, 5B, 6B, 7B, 5C, 7C).

▷***CLUTCH STICKING CORRECTION:*** ***See "Clutch Notes" in Hudson Special Data for Flushing instructions. See Clutch Section for complete data.***

Driven Member:	I.D.	O.D.	Cork Inserts
9" Clutch	5.25"	8.687"	90
10" Clutch	6.375"	9.8125"	108

Clutch Lubrication: ***See "Clutch Notes" in Hudson Special Data.***

Pedal Adjustment: Clearance between underside of toeboard and top face of clutch shank must be 1¼" to 1¾". To adjust, loosen locknut above clevis, remove clevis pin, turn clevis in or out of link, tighten locknut after re-connecting clevis.

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over 1/3 revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to drain. Unhook clutch pedal lever return spring, remove two clutch cross shaft bracket bolts and remove the bracket. Remove clutch control link clevis pin and disconnect the clevis. Install engine holding fixture J-4651 (position "U" shaped *section around oil pan and engage adjusting hooks* in holes provided on each side of frame). Remove flywheel dust pan by taking out two attaching screws. Take out two engine rear mounting bolts and nuts at No. 3 cross member. Raise engine rear support approximately ½" off cross member by adjusting the holding fixture hooks (*NOTE*—If holding fixture not available, use hydraulic jack with block of wood to prevent damage to pan to raise engine). Take out two top screws attaching *clutch housing to engine rear end plate (use universal* socket and extension). Remove breather pipe bracket, remove bolt attaching breather pipe and rear valve chamber cover, remove breather pipe. Remove flywheel pointer, remove starter. Take out two lower attaching screws and remove clutch housing assembly (*CAUTION*—Take care that throw-out collar and bearing does not drop out of clutch cover bore). Loosen all clutch cover-to-flywheel screws evenly to relieve spring pressure, take out screws and remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

1952 (OWN MAKE)

Own Make. All helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse) with remote (steering column) shift.

Transmission Control: Handy-shift remote control type with *shift lever mounted on steering column.* ***See Transmission Section for complete data.***

Transmission Removal: ***See 1951 Hudson Six data.***

1952-53 (WARNER)

Warner Model AS63-T86E (4B, 5B, 6B, 4C, 5C—Without Overdrive). AS65-T86E (7B, 7C—Without Overdrive). AS64-T86E (4B, 5B, 6B, 4C, 5C—With Overdrive). All helical gear type. Constant-mesh (second & high), sliding gear (low & reverse) with remote (steering column) shift. ***See Transmission Section for complete data.***

Transmission Control: Steering column shift. ***See Transmission Section for complete data.***

Transmission Removal: *(NOTE—This transmission removed from underneath car. Not necessary to remove floor mat and cover).* Drain lubricant and disconnect front universal joint (retain universal joint bearing cups with tape to hold bearings in place). Loosen nut on propeller shaft center bearing support nut, disconnect propeller shaft by sliding shaft rearward, disconnect shift rods, speedometer cable (if car is equipped with overdrive, disconnect control cable and wiring from overdrive at transmission), and remove speedometer pinion. Remove nut from front end of brake pivot brace at No. 3 cross-member and remove clevis pin at rear end of brace and move linkage to left side of car. With universal socket on a 10" extension, remove two top bolts attaching transmission-to-clutch housing. Insert in their place, guide studs J-2969 to guide transmission during removal. Remove the two lower transmission-to-housing bolts, lower transmission out.

OVERDRIVE

Warner Type AS4-R10D (part of AS64-T86E Transmission). Optional equipment.
See Transmission Section for complete data.
Overdrive Relay—Hudson No. BT303107.
Overdrive Governor—Auto-Lite No. TGA-4005.
Overdrive Solenoid—Delco-Remy No. 1118164.
Kick-down Switch—Hudson No. BT-306763.
Overdrive Fuse—30 amperes. On fuse block on side of overdrive relay.

Removal: Same as for standard transmission, except that overdrive control cable and wiring must be disconnected.

HYDRA-MATIC TRANSMISSION

"Dual Range," Four-Speed Planetary type automatic transmission with Modulated Throttle Pressure and Hydraulically Operated Reverse.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTIONS: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING—See "Hydra-Matic Drive" in Transmission Section.*

Lubrication: Check fluid level every 1000 miles. Add fluid as required to maintain level at "F" mark on dipstick. Drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type "A."
Capacity—11 quarts (approx.). 12 quarts (after reassembly).
Checking Fluid Level—Set hand brake and allow engine to idle with Hydra-Matic Selector lever in "Dr4" position for 2 minutes. Place selector lever in "N" position. Roll back floor mat and remove oil level indicator (after cleaning all dirt and lint from around cap). Fluid level must be at "F" mark on dipstick. *CAUTION—Do not fill above "F" mark.*

►***OTHER HYDRA-MATIC SERVICE DATA**—See Transmission Section.*

UNIVERSALS

Spicer No. 1268-111X.....**Front & Rear**
Spicer No. 1268-102X.....**Intermediate**
Needle bearing types.

Propeller Shaft & Center Bearing: Two shafts used: 1) Front shaft supported by sealed ball-bearing just ahead of rear coupling flange (no slip joint).
2) Rear shaft with slip joint at forward end.
Center Bearing—Prelubricated sealed annular ball bearing fitted in cast steel housing bolted to support mounting which is secured to underside of frame cross members. Housing cradle mounted on two rubber supports and forward end of support mounting fitted with rubber cushion.

REAR AXLE

1952 (OWN MAKE)

Own Make. Semi-floating, hypoid gear type with Hotchkiss Drive.

►*IDENTIFICATION NOTE: Housing rear cover welded. See Rear Axle Section for complete data.*

Axle Ratios:	Standard	Optional
Synchro-mesh Tr.	4.1-1 (41-11)	①4.55-1 (41-9)
Overdrive Trans.	4.55-1 (41-9)	4.1-1 (41-10)
Hydra-Matic Tr.	3.58-1 (43-12)	

①—3.58-1 (43-12) also Optl. on Model 7B Hornet.

Rear Axle Removal & Wheel Bearing Adjustment: *See 1951 Hudson Six data.*

1952-53 (SPICER)

Spicer Type. Semi-floating, hypoid gear type, with Hotchkiss Drive.
See Rear Axle Section for complete data.

►*IDENTIFICATION NOTE—Housing rear cover attached with capscrews.*

Ratios:	(Standard)	Optional
Std. (Synchro-mesh)	4.09-1	4.55-1
With Overdrive	4.55-1	4.09-1
Hydra-Matic	3.07-1	
Optl.①	3.31-1, 3.53-1, 3.92-1, 4.27-1	

①—"Severe Usage."

Axle Ratio Marking—Ratios can be identified by marking (no. of teeth in gear set) stamped on tag attached to inspection cover by one bolt: 43-14 (3.07-1), 43-11 (3.31-1), 46-13 (3.53-1), 47-12 (3.92-1), 45-11 (4.09-1), 47-11 (4.27-1), 50-11 (4.55-1).

Backlash—.003-.006". Shim adjustment.

Removal: Support rear end of car on jack stands placed under frame. Drain rear axle housing. Remove rear fender shields, remove rear wheels, remove wheel hubs using Puller J-736A. Remove brake cable conduit caps from backing plates, disconnect cables at operating levers. Disconnect brake hose at frame connection and brake lines at rear wheel cylinders. Remove backing plates, gaskets, grease seal retainers and shim pack (right side only, tie shims together to insure correct replacement). Remove axle shaft using puller J-352, remove oil seals using puller J-943. Disconnect rear stabilizer at axle bracket. Disconnect propeller shaft at rear universal (tape bearing cups in place). Remove rear axle "U" bolts, mounting plates, cushions, and retainers. Disconnect rear shock absorbers at lower end. Remove axle assembly from beneath car.

Axle Shaft Removal: Raise and support rear end of car with jacks placed under frame. Remove wheel, rear hub (using Puller J-736-A), and remove brake cable conduit caps from backing plates and disconnect cables at operating levers. Disconnect brake line at rear wheel cylinders. Remove backing plate, gasket, and grease seal retainers, and shim pack (right side only). Tie shims together to insure correct replacement. Withdraw axle shaft using Puller J-352, do not drag on inner seal.

Wheel Bearing Adjustment: Controlled by shims (.003", .005", .010" and .030") between backing plate and end of housing (right side only). To adjust, remove wheel and backing plate (above), add or remove shims for endplay. **Endplay**—.001-.004".

SHOCK ABSORBERS

►*1952 PACEMAKER REAR SPRING PRODUCTION CHANGE—Rear spring shackles offset on later cars. See "Spring Shackles" in Hudson Special Data.*

Delco or Monroe. Direct acting hydraulic types. Furnished Light, Heavy, and Extra Heavy scales.

Hudson Part Nos.	Front	Rear
Light Control (4B,5B,6B,4C,5C)	F-304700	F-304701
Light Control (7B, 7C)	F-303060	①
Heavy Control (All)	F-303601	②
Extra Heavy Control (All)	F-302430	③

①—No. F-300351 or F-301241.
②—No. F-301768 or F-301770.
③—No. F-308999 or F-302431.

APPLICATION NOTE—**Light Scale** front and rear shocks used with light scale springs and with front only heavy scale springs. **Heavy Scale** front and rear shocks used with heavy scale springs and with rear only heavy scale springs. **Extra Heavy Scale** front and rear shocks optional on all models. **Part Number** stamped on outside of shock absorber body.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs and lateral stabilizer.

►*1952 FRONT SPRING PRODUCTION CHANGE: See Front Suspension Section.*

Kingpin Inclination—3°36' crosswise.
Caster—½-1½°. Both wheels alike within ½°.
Camber—½-1½". Both wheels alike within ½°.
Toe-In—0" to 1/16" measured at wheel rim. Center steering arm on frame must be at center of car.
Toe-Out on Turns—Inner wheel 30°. Outer 25°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.
Wheel Cylinders—Front—(4B, 4C) 1 1/16", (5B, 6B, 7B, 5C, 7C) 1 1/8". **Rear**—15/16" (All Models).
Drums—11" centrifuse type.
Lining—Molded type. **Width**—Front (4B, 4C) 1¾", (5B, 6B, 7B, 5C, 7C) 2¼". Rear (All Models) 1¾".
Thickness—.177".
Length Per Wheel—(4B, 4C) 20.108" front and rear. (5B, 6B, 7B, 5C, 7C) 21.32" front, 20.108" rear.
Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Mechanical Follow-Up (Reserve): Over-running linkage between brake pedal and parking (hand-brake) linkage which applies rear wheel brakes by pedal mechanically if hydraulic system not operating.
Setting—1¼" clearance between clevis pin and rear end of slot in pedal rod rear clevis.

Hand Brake—See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top & Windows: Hydro-Lectric type.
See Miscellaneous Section for complete data.

Windshield Wiper: Cable operated—Vacuum type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

Model	Starting Serial & Engine Nos.
1953 1C Jet	203865
1953 2C Super Jet	203543
1954 1D Jet	1269062
1954 2D Super Jet	2269060
1954 3D Jet Liner	3269070

SERIAL & ENGINE NUMBERS: Stamped on plate on right front door body hinge post and also on top flange of right frame side rail near dash panel. Engine number which is the same as serial number is read downward, and located on the front face of the cylinder block at top right corner.

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. minimum at idle speed. All cylinders should be equal to within 10 lbs.

VACUUM READING: 17-20" Hg. at idling speed.

VALVE TAPPET CLEARANCE: Intake .010", Exhaust .012" Hot.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No adj. Valve must operate freely.

IGNITION

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAP: .032".

Spark Plug—Champion H-10. 14 mm.

COIL: Auto-Lite CR-6012A.

Ignition Current—2.5 amps. idling, 4.5 amps. stopped.

DISTRIBUTOR: Auto-Lite IAT-4016.

Condenser—Auto-Lite IAT-3076R. **Capacity** .21-.25 mfd.
Contact Point Set—Auto-Lite IGW-3028BS.
Breaker Gap—.020".
Cam Angle—39°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

►*DISTRIBUTOR INSTALLATION NOTE:* Engine rotation while oil pump removed affects timing. *See "Oil Pump Removal" under Oil Pump in Hudson Special Data.*

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
1	350	2	700
4.5	500	9	1000
12	1325	24	2650
13.5	1500	27	3000

Vacuum Spark Control—Auto-Lite integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5-1/4
1	2	5-3/4
4	8	7-1/2
6	12	8-3/4
7.5	15	9-1/2

IGNITION TIMING

Setting—TDC (Long line before "1UDC" on vibration damper).

►*IGNITION TIMING CAUTION:* When setting timing with timing light, disconnect vacuum line from distributor and plug line to prevent disturbing engine performance.

Timing Mark—Long line before "1UDC" on Vibration Damper. Timing is correct when this mark is in line with pointer on timing chain cover, with engine at idling speed.

CARBURETOR

►*CARBURETOR APPLICATION: Carter carburetors are standard equipment on all models. On "Twin H-Power" (optional), two Carter carburetors are used.*

►*1953 JET ENGINE CUTTING OUT ON TURNS CORRECTION (First Cars):* Set carburetor float level to new setting of 7/16" (was ½"). See Float Setting below.

►*CARTER WA1-2009S CARBURETOR PRODUCTION & RECOMMENDED CHANGES: See "Carter WA1" in Carburetor Section.*

THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC CARS): With engine at normal operating temperature and idle speed adjusted to 490-510 RPM, and selector lever in "N" position, proceed as follows:

Models With Single Carburetor: Install throttle gauge pin J-2544 in lower bellcrank and adjust throttle bellcrank operating rod (rod from lower bellcrank to upper bellcrank) to 2 9/32", measured from centerline of throttle control bellcrank-to-carburetor rod clevis pin, and the top of the machined surface of cylinder head. Tighten jam nut securely. With throttle return spring attached and idle adjusting screw against its stop, and the gauge pin J-2544 still in place in lower bellcrank, adjust throttle control bellcrank-to-carburetor rod until clevis pin slides freely into holes in clevis and hole in bellcrank. Tighten jam nut. With gauge pin in lower bellcrank, and transmission throttle lever (on transmission case) back against its rear stop, adjust length of transmission throttle rod (rod from transmission lever to lower bellcrank) so that it is 3/32" **shorter** than the actual distance between the holes. Tighten jam nut. Remove gauge pin from lower bellcrank and adjust length of accelerator pedal-to-bellcrank rod to give full throttle with 1/64" to 1/16" clearance between accelerator pedal and pedal stop.

Models With "Twin H-Power": Install gauge pin J-2544 in lower bellcrank and in upper bellcrank holes, then adjust length of throttle bellcrank operating rod (rod from lower bellcrank to upper bellcrank) so that operating rod trunnion pin enters bellcrank. Tighten jam nut. With gauge pins still in place, and both carburetors off fast idle (choke open) and with throttle return spring attached, adjust both bellcrank-to-carburetor rods so clevis pin slides freely through clevis and lever. *Complete adjustment as indicated for models with single carburetor.*

STANDARD

Carter WA1-2009S (Early 1953), 2009SA (Late 1953 & 1954). Single barrel downdraft type with automatic choke.

Idle Setting—1/2—1-1/2 turns open. Turn screw out for richer mixture.

Idle Speed—Standard transmission 540-560 RPM, Hydra-Matic transmission 490-510 RPM. Overdrive 575 RPM.

Float Level—7/16" from top edge of bowl cover to soldered edge of seam on float with cover inverted.

Accelerating Pump—Outer hole normal, inner hole if less charge required.

Fast Idle Setting: 5/8" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending link at lower offset.

Automatic Choke Setting: Set at Index.

Hydra-Matic Throttle Linkage Adjustment: *See "Carburetor" above.*

►*OTHER DATA: See "Carter WA1" in Carburetor Section.*

Fuel Pump Pressure: Std. 3-1/2—4-1/2 lbs. Combination 4-5 lbs.

TWIN H-POWER

Carter WA1-2013S (2 carburetors per engine). Single barrel downdraft with automatic choke.

►*TWIN H-POWER CARBURETOR ADJUSTMENT CAUTION:* Proceed as follows:

Idle Setting—For correct equalization of both carburetors: Remove air cleaners, install adjusting pin J-2544-1 through accelerator pedal link bellcrank lever and in hole in cylinder block to lock lever. Connect tachometer, but before warming up engine, remove clevis pin from ends of both throttle shaft to carburetor rods, position fast idle cam on each carburetor in "off" position and turn each throttle stop screw in until it touches cam. Set idle mixture screws exactly 1-1/4 turns open. Warm up engine and adjust for correct idle speed (see below). Adjust each idle mixture adjusting screw for maximum increase in idling speed and readjust throttle stop screws for correct idling speed. *(CAUTION*—Turn stop screws on each carburetor an equal amount). Adjust front and rear throttle shaft to carburetor rod clevises so that clevis pins can be installed freely, connect rods. On Hydra-Matic cars, adjust throttle linkage *(see Hydra-Matic Linkage Adjustment in Transmission Section).* Remove linkage adjusting pin, adjust accelerator pedal to bellcrank rod to get 1/64-1/16" clearance between pedal and pedal stop at wide open throttle, reinstall air cleaners.

Idle Speed—Std. Trans. 540-560 RPM, Hydra-Matic 490-510 RPM, Overdrive 575 RPM.

Float Level—1/4" from top edge of bowl cover to soldered edge of seam on float with cover inverted.

Accelerating Pump—Outer hole normal, inner hole if less charge is desired.

Fast Idle Setting: 1/2" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending link at offset portion.

Automatic Choke Setting: Set at Index.

Hydra-Matic Throttle Linkage Adjustment: *See "Carburetor" above.*

►*OTHER DATA: See "Carter WA1" in Carburetor Section.*

Fuel Pump Pressure: 4-5 lbs. at 1800 RPM.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARB. EQUIPMENT

Fuel Pump: Carter M-729-SZ (Standard. Fuel only). AC No. 4057 (Optional, Fuel & vacuum).
Pressure—4-5 lbs. at 1800 RPM. (Combination) 3-1/2—4-1/2 lbs. (Std).
See "Fuel Pumps" in Carburetion Equipment Section.
Gasoline Gauge: King-Seeley Electric "CV" (constant voltage) type with voltage regulator.
Dash Unit—King-Seeley 46193.
Tank Unit—King-Seeley 44554.
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

National 1-W-90. 6 Volt, 15 plate, 90 Ampere hours *capacity (20 hour rate).*
Battery Ground—Positive (+) terminal to frame.
Engine Ground—Engine to frame.

STARTER

Auto-Lite MZ-4167 (Std. Trans.), **MZ-4172** (Hydra-Matic).
Armature—Auto-Lite MZ-2312 (MZ-4167), MZ-2211 (MZ-4172).
Drive—(Std. Trans.) Bendix No. A 1806 Inboard type. (Hydra-Matic Drive) Bendix No. A 1792 Outboard type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 ft. lbs.	Lock	2.0	280

Starting Switch: Auto-Lite Magnetic type, No. SS-4030 or RBM No. 2201-15. Controlled by combination starting and ignition switch.
Neutral Safety Switch: Hudson No. 304524 located at lower end of steering column. Connected in starter control circuit so that starter operates only when selector lever in "N" Neutral.
Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

GENERATOR

Auto-Lite GGW-4802A. Armature—Auto-Lite GGW-2006F.

Performance Data

Amperes	*Volts*	*Cold* —R.P.M.— *Hot*	
0	6.4	870-970	950-1050
40	8.0	1800-2000	2150-2350
45	8.0	1925-2125	2350-2550

Brush Spring Tension—35-53 ozs.
Field Current—1.4-1.5 amperes at 5.0 volts.
Rotation—Counter-clockwise at commutator end.
Belt Adjustment: 10.5 foot lbs. with torque wrench applied in vertical position on generator adjusting bracket bolt and all generator and attaching bracket bolts loose.

REGULATOR

Auto-Lite VBE-6104A. Voltage and current type with "Temperature Compensated" current regulation.

Cutout Relay

Cuts in—6.3-6.8 volts. (set to 6.4-6.6 volts).
Contact Gap—.015" minimum.
Air Gap—.031-.034" (with contacts just closed).

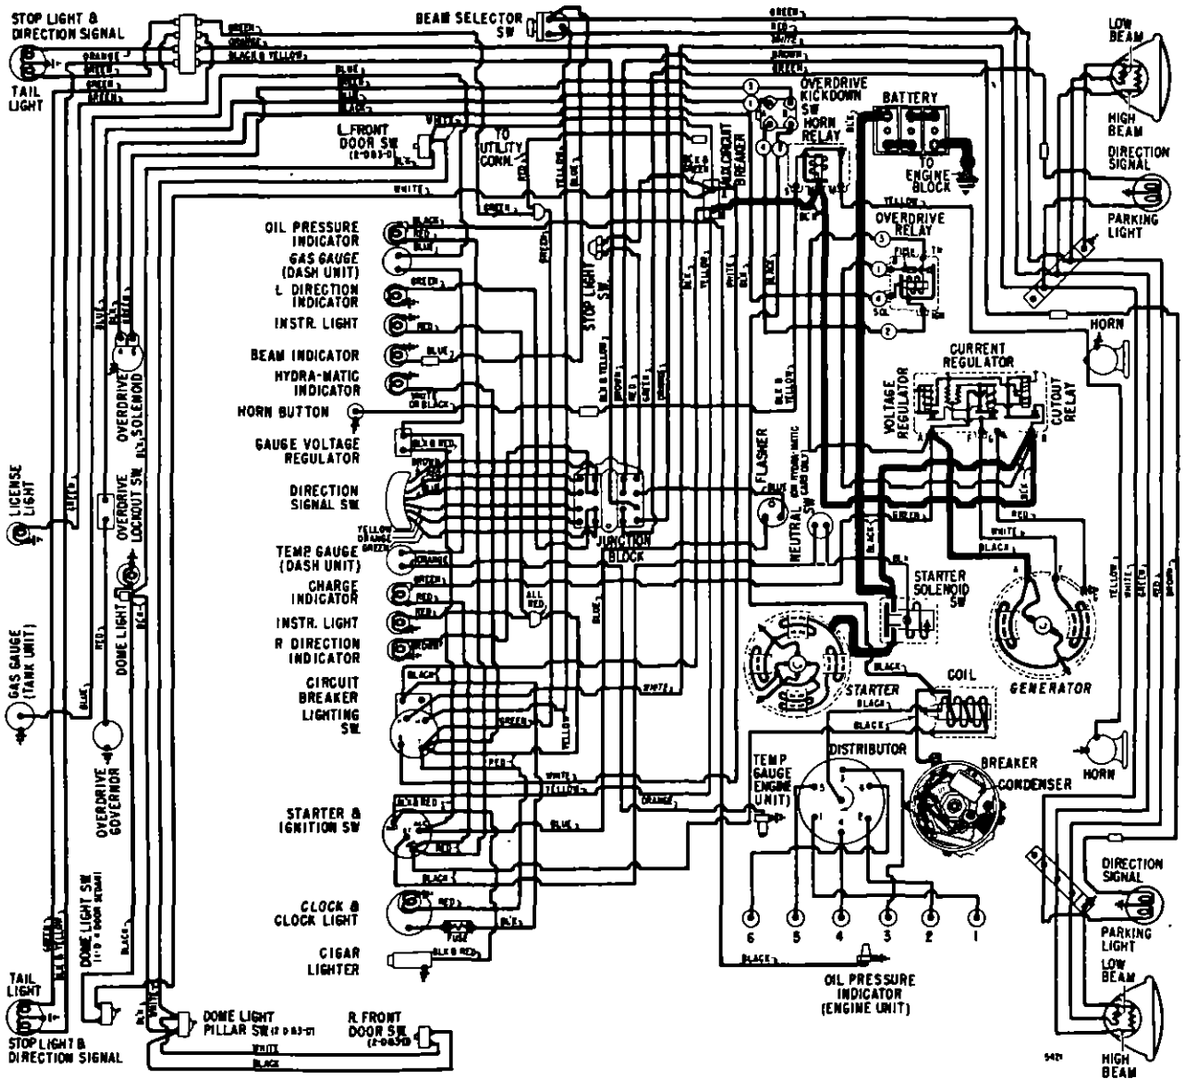
Voltage Regulator

Setting—7.2-7.5 volts at 70° F.
Air Gap—.048-.052" with contacts just opening.
Checking and Adjusting—*See Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

Test A	Operating Amperes	Test B
52 Max.		45 (43-47)



Test A—After 15 minutes operation charging at one-half maximum output.
Test B—After additional 15 minutes operation with current regulator operating (with load applied to hold voltage down to 6.7-6.9 volts).
Air Gap—.048-.052" with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

MISC. ELECTRICAL

►*IMPROVED FLASHER SWITCH OPERATION:* Flasher Switch Hudson No. 309813 replaces 308893 and requires use of Flasher Switch Clamp No. 301775. Place clamp around Flasher and insert base of clamp between base of circuit breaker and cross brace using circuit breaker screw to hold it in place.

►*INSTRUMENT CLUSTER LAMP BULB REPLACEMENT PROCEDURE:* Remove six 1/4" stud nuts and

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

lay back instrument cluster. To remove high beam indicator lamp bulb it is now necessary to remove speedometer cover and two screws holding cover to speedometer. **Note**–Use Mazda 44 when replacing for longer life bulb. Instrument lenses may be replaced in same manner.

Headlamps–Sealed Beam. *See Electrical Equipment Section.*

Directional Signal: *See Electrical Equip. Section.*

Lighting Switch Removal: Remove six 1/4" stud nuts, lay back Instrument Cluster. With battery disconnected remove control knob screw and knob, Escutcheon nut and Escutcheon, remove switch and switch wires.

Stop Light Switch Location: At rear of Master Cylinder attached to brake line fitting.

FUSES: Located as follows:

Clock–SFE-3 ampere in fuse case at back of clock.

Weather Control–SFE-14 ampere in fuse case at left side of heater blower.

Radio–SFE-14 ampere in fuse case at left side of radio.

Overdrive–SFE-30 ampere mounted on overdrive relay.

CIRCUIT BREAKERS: Main Circuit Breaker (25 ampere) mounted on lighting switch. **Auxiliary Circuit Breaker** (30 ampere) mounted on instrument structural brace.

HORNS: Auto-Lite (High Pitch) HAB-4626A, (Low Pitch) HAB-4625A.

ENGINE

ENGINE SPECIFICATIONS: 6 cyl. "L" head type.

Model	Bore	Stroke	Displmnt.	Rated HP
1D, 2D, 3D..	3"	4-3/4"	202 cu. ins.	21.6

Model	Comp. Ratio	Developed HP
1D, 2D, 3D	① 7.5-1	104 at 4000 RPM
1D, 2D, 3D	② 8.0-1	114 at 4000 RPM

①Cast Iron Head. ②Aluminum Head with Twin Carburetors.

Compression & Vacuum Reading–*See Tune Up.*

ENGINE REMOVAL: *See Hudson Special Data.*

OIL PAN REMOVAL: Support car on jack stands placed under #2 crossmember. Take out three bolts attaching center steering arm support bracket on this crossmember and drop steering arm and tie rods. Remove flywheel dust cover. Remove oil pan.

►*LOCATING HOLE PLUG CAUTION:* Plug in locating hole in pan flange at left rear of block (behind starter) must be tight fit to prevent oil leakage or contamination of oil by dirt or water.

CYLINDER HEAD & GASKET: Standard cyl. head (Cast Iron) uses gasket Hudson No. 308017 while Aluminum head used with Twin carburetors uses gasket Hudson No. 308019.

Cylinder Head & Gasket Installation–*See Hudson Special Data.*

TIGHTENING TORQUES: *See Hudson Special Data.*

PISTONS

Aluminum alloy, cam ground, four ring type.

►*CAUTION: Pistons are not interchangeable with other Hudson models due to different height from pin to top of piston.*

Weight–10-1/4 ozs.

Removal–Pistons and rods removed from above.

►*PISTON WEIGHT CAUTION:* Piston weight stamped on head. 10 over 1 indicates 10-1/4 oz. piston. Use same weight piston when making replacement.

Fitting New Pistons: Use ribbon feeler 1/2" wide .002" thick between thrust side of piston (opposite valve mechanism) and cylinder wall. Pull required to remove feeler 3-4 lbs.

Original Bore & Piston Sizes & Markings–*See "Original Bore" in Hudson Special Data.*

Replacement Pistons: *See "Pistons" in Hudson Special Data.*

Installing Pistons: Slot away from camshaft.

PISTON PINS

Floating type with locking ring on each end.

Diameter–.7497-.750". **Length**–2.4375".

Clearance in Piston–.0000-.0003" at 70° F or hand push fit, with piston at 200° F.

Clearance in Rod–.0003". Hand push fit at 70° F.

Replacement Pins: Available in the following oversizes, and are identified by a spot of paint on end of pin. Color denotes oversize. Std. (not painted), .001" (yellow), .002"(orange), .005"(white),.010"(blue).

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Comp. (#1,2)	.0775"	.004-.009"	.001"
Oil (#3)	.186"	.004-.009"	.001"
Oil (#4)	.1514"	.004-.009"	.001"

Replacement Rings: Supplied in Standard & .010" oversize.

CONNECTING RODS

Length–Center to center 8.183" to 8.193". **Weight**–26 ozs.

Crankpin Journal Diameter–1.937-1.938". Out-of-round limit .0015" and taper not more than .001".

►*CRANKSHAFT SIZE CODE: See Hudson Special Data.*

Bearings–Steel-backed, babbitt-lined type (upper and lower halves interchangeable), no shims.

Clearance–.0005-.0015".

Side Play–.007-.013".

Replacement Bearings: Standard & .001", .002", .010", .012" undersize.

Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward camshaft side of engine.

CRANKSHAFT

Journal Diameter–2.4988-2.4998". Four bearings. Out-of-round limit .0015".

►*CRANKSHAFT SIZE CODE: See Hudson Special Data.*

Bearings–Steel-backed babbitt-lined. Upper and lower halves of bearings alike.

Clearance–.0005-.0015".

Replacement Bearings: Standard & .001", .002", .010", .012" Undersize.

End Thrust: On No. 3 bearing.

End Play–.003-.009".

Rear Bearing Oil Seal Installation: *See Hudson Special Data.*

CAMSHAFT

Journal Diameters–(1) 2.375", (2) 1.997", (3) 1.965", (4) 1.497".

Bearings–Steel-backed babbitt-lined bushings.

Clearance–.0005-.0015".

End Thrust: Controlled by thrust plate behind camshaft sprocket.

End Play–.003-.005".

Timing Chain: Link Belt. **Width** 1.000". **Pitch** .375". **Links** 60.

Camshaft Setting: Timing chain has two marked links six full links apart. Both crankshaft and camshaft sprockets have a marked tooth. With crankshaft sprocket installed and turned to TDC position, install one marked link over crankshaft sprocket marked tooth, insert sprocket into chain with marked link over marked tooth, rotate camshaft until screw holes line up and install screws.

VALVES

Tappet Clearance: Intake .010", Exhaust .012". Hot.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.500"	.3417"	5.045"
Exhaust	1.395"	.3407"	5.043"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.346"	.001-.003"
Exhaust	45°	.346"	.003-.004"

Valve Seat Width–Intake .054", Exhaust .075".

Valve Springs: Install valve springs with closely coiled end of spring up.

Free Length–2.1875".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	40-48	1.953"
Open	116-124	1.607"

Valve Guides: Remove Tappet adjusting screws and drive out with tool J-267. Use tool J-883-A installer and tool J-883-10 pilot to replace guide. Insert guide to a depth of 1-9/32" from top of guide to top of valve seat.

Valve Lifters: Mushroom type self-locking adjusting screws. Remove from below with camshaft out. Serviced by installing oversize lifters.

Diameter–.62325-.62375". **Length**–2.310".

Clearance–.00075-.0015".

Replacement Lifters–Std., .002", .004", .010" Oversize.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves—Open 26.8° BTDC. Close 99.7° ALDC.
Exhaust Valves—Open 64.9° BLDC. Close 45.7° ATDC.
Valve Timing Check—Set No. 1 Intake Valve Tappet at .010" clearance hot and insert .002" feeler between tappet and valve stem. Rotate engine clockwise until a slight drag is felt on feeler gauge. The engine is properly timed if the long mark (1UDC) is 1" from pointer. The first small mark should be 1/4" before the pointer.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill), 5-1/2 qts. (dry engine).
Note—1 qt. additional for dry filter.
Normal Oil Pressure: 40 lbs. at 30 MPH.
Pressure Regulator Valve—Non-adjustable relief valve and spring under plug on left side of engine.
Oil Pressure Indicator—Hudson "Teleflash" with Oil Pressure Warning Switch. Consists of light on instrument panel operated by switch as follows:
Oil Pressure Warning Switch—King-Seeley No. 47170. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch is sealed (Not adjustable).
Oil Pump: Rotor type. Angle mounted on right side of engine and driven by camshaft.

Pump Overhaul—*See Hudson Special Data.*
►*OIL PUMP REMOVAL CAUTION: See "Oil Pump Removal" under Oil Pump in Hudson Special Data.*
Oil Filter: Fram or Hudson. Replace filter cartridge at 5000 mile intervals.
Replacement Filter Element—Hudson No. SP-302496.
Crankcase Ventilator: Oil-wetted type filter element in oil filler cap, (air intake). Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

Water Capacity: 16 qts. with heater. 15 qts. without heater.

Pressure Valve: AC No. 850549 Radiator filler cap. 7 lbs. pressure.
Thermostat: Hudson No. F-308042 (Std.) No. SP-307952 (High type for permanent anti-freeze). Std. opens at 150-155° F. High type opens at 165-170° F.
Water Pump: Centrifugal, belt driven, packless type. Shaft mounted on sealed duplex ball bearing. *See "Hudson" in Water Pump Section.*

Pump Removal—Remove Generator adjusting bracket, remove fan blade assembly and pump mounting bolts. Remove pump from engine.

Temperature Gauge: King-Seeley Electric "CV" (constant voltage) with voltage regulation.
Dash Unit—King-Seeley 46197.
Engine Unit—King-Seeley 44200.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck Model 9A7. Assembly No. 361361. Single plate dry disc.
See "Borg & Beck" in Clutch Section.
Clutch Disc. No. B & B No. 382118 (Std. Trans.), **B & B No. 382191** (Overdrive).
Pedal Adjustment: Tighten or release adjusting nut on clutch adjusting link to obtain 3/4—1-1/4" distance from under surface of floor board to top face of clutch shank.
Removal: Place car on jack stands. Remove propeller shaft, speedometer cable and disconnect selector levers. (Disconnect wiring on Overdrive equipped cars) Remove screws holding cross shaft support assembly. With transmission supported on jack, disconnect throw-out lever rod. Remove screws holding throw-out lever boot and retainer. Remove transmission support screws and slide transmission back and lower to floor. Remove retaining pin and spring from clutch bell housing and throw-out lever pivot. Remove throw-out release assembly from housing. Punch mark cover pressure plate lug and flywheel for reassembly. Remove assembly to flywheel cap screws uniformly to reduce spring tension and lower clutch assembly.

SYNCHRO-MESH TRANSMISSION

Warner—With and without Overdrive. *See "Warner Transmissions" in Transmission Section.*
Transmission Control: *See "Transmission Controls" in Transmission Section.*
Removal: Disconnect universal joint at rear axle companion flange, and remove propeller shaft as an assembly. Tape around bearing cups to retain cups and rollers. Disconnect transmission shift control rods at transmission shift levers. Disconnect speedometer cable and remove speedometer gear. Remove clutch cross shaft support screws and support. Disconnect adjusting rod at outer end of throw-out lever and remove retainer and boot from lever. Remove the two top transmission to bell housing bolts (use universal socket on 10" extension). Install two guide pins Tool J-2969 in these bolt holes. Remove remaining two bolts, slide transmission back and lower to floor.

OVERDRIVE

Warner R10—*See "Warner R10 Overdrive" in Transmission Section.*
Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Range. Four speed automatic transmission with fluid coupling.
See "Hydra-Matic Drive" in Transmission Section.
►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*
►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*
Lubrication—Check fluid level every 1000 miles of operation. Drain and refill every 25000 miles, Use only "Hydra-Matic Drive Fluid" type A.
Capacity—8-1/2 qts. (refill).
Checking Fluid Level—Set hand brake and allow engine to idle with Hydra-Matic Selector lever in "Dr4" position for two minutes. Place selector lever in "N" position. Roll back floor mat and remove oil level indicator (after cleaning all lint and dirt from around indicator). Wipe indicator dry and check fluid level. Fluid level must be to "F" mark.

►*CAUTION: Do not check oil level when transmission is excessively hot and do not fill above "F" mark on dip stick.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer. One at each end of propeller shaft.

REAR AXLE

Spicer 44-2. Semi-floating, hypoid gear type with Hotchkiss drive.
See "Spicer Hypoid" in Rear Axle Section.

	Axle Ratio	
Synchro-mesh	Overdrive	Hydra-Matic
4.1-1 (Std.)	4.27-1 (Std.)	3.54-1 (Std.)
4.27-1 (Opt.)	4.1-1 (Opt.)	3.31-1 (Opt.)
3.31-1 (Opt.)	3.31-1 (Opt.)	
	3.54-1 (Opt.)	

Gear & Pinion Teeth. 4.10 (41-10); **4.27** (47-11); **3.31** (43-13); **3.54** (46-13).
Severe Usage Ratios—4.89-1, 4.27-1, 4.09-1, 3.92-1, 3.54-1, 3.31-1.
Rear Axle Ratio Note—*Ratio is marked on metal tag attached to rear axle by rear axle cover bolt. A tag marked 43 over 13 would mean the axle ratio was 3.31 to 1.*
Back Lash—.002-.006" desired.

Axle Shaft Removal: Raise rear end of car off floor and place jack stands under axle assembly. Disconnect brake cables at toggle and unhook brake cables from parking brake levers. Disconnect brake hose at frame connection and brake lines from wheel cylinders. Remove wheel & hub. Remove backing plate bolts and backing plate, wheel bearing oil seal caps and axle shims (shims only on right side). Tie shims together for reinstallation. Use Puller J-352-B to remove axle shaft and Puller J-943 to remove seal.

Rear Axle Assembly Removal: Place jack stands under frame just ahead of rear springs. Disconnect brake cables at toggles and unhook from parking brake levers, brake hose from frame connection, brake line from wheel cylinders. Remove wheels, brake cylinders, backing plates and pull axle shafts. Disconnect propeller shaft at rear companion flange (tape rollers and caps to prevent falling off). Remove nuts from spring "U" bolts and the lower shock absorber studs. Disconnect stabilizer. Lower assembly and roll from beneath car.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Wheel Bearing Adjustment: Controlled by shims (.003", .005", .010", & .030") between backing plate (on the right side only) and end of axle housing. To adjust remove wheel and backing plate (above), add or remove shims for end play.
End Play–.001" to .004".

SHOCK ABSORBERS

Monroe–Direct acting hydraulic type. Units are sealed (serviced by replacement).

Hudson Shock Absorber Nos.

1953 Models

Control	Front	Rear
Light	308394	308395
Heavy	308996	308997
Extra Heavy	308998	308999

1954 Models

Control	Front	Rear
Light	308996	308997
Heavy	311326	311327
Ex. Heavy	311328	311329
Severe Usage	309862	309863

FRONT SUSPENSION

Independent linked parallelogram type with coil springs and lateral stabilizer.
See "Hudson" in Front Suspension Section.
King Pin Inclination–3°58' crosswise.
Caster–0° ± 1/2° (Neg. 1/2° desired with empty car).
Camber–1/4°–1 1/4° Pos.
Maximum variation between right and left wheel Caster or Camber 1/2°.
Toe-in–0"-1/16" measured at wheel rim.
Toe-out on Turns–Inner wheel 30°, Outer wheel 25°. Maximum allowable variation between wheels 1/2°.

STEERING

Gemmer–Worm and 2 tooth roller, with push-pull adjustment.
See "Gemmer Steering Gears" in Steering Gear Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix (Lockheed) Hydraulic–Self centering (floating shoe) type. Parking lever applies rear service brakes.
NOTE–No anchor pin adjustment.
See "Bendix (Lockheed) Self-Centering" in Brake Section.
Drums–Diameter 9" Centrifuse cast iron. 11" Severe Usage 1D, 2D.
Wheel Cylinder Diameter–Front 1-1/8", Rear 15/16".
Replacement Lining and Shoes–Linings or shoes with linings come in Std. or .030" oversize.

Lining Width & Thickness

Service	Front	Rear
Standard	2" x .175"	2" x .175"
Severe Usage 1D, 2D	1-3/4" x .175"	

Clearance–Eccentric adjustment for each shoe (2 per wheel). Tighten adjustment until wheel drag is heavy and back off eccentric until wheel is free. *NOTE*–Locknuts used on eccentrics.
Standard Master Cylinder: On frame to left of transmission.
Checking Fluid–Access hole in floor pan. Roll back floor covering, remove access hole cover, clean lint and dirt from filler plug, remove plug. Fluid should be 1/2 to 1" below top of filler opening.
Removal–Remove from beneath car. Not necessary to disturb other parts.

MISC. MECHANICAL

Windshield Wipers: Vacuum operated type. *See "Windshield Wipers" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model

4D ..... Wasp
5D ..... Super Wasp
7D ..... Hornet

SERIAL & ENGINE NUMBERS: Stamped on plate on right front door body hinge post and also on top of right frame side rail near dash panel: Engine number which is the same as serial number is read downward and located on the front face of the cylinder block at top right corner.

Starting Serial Number—269069 for all models and runs consecutively. A digit preceeding this number designates the model: **4**—Wasp, **5**—Super Wasp, **7**—Hornet.

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. min. at cranking speed. Allowable variation between cylinders 10 lbs.

VACUUM READING: Steady 17-20" at idling speed.

VALVE TAPPET CLEARANCE: Intake .008", Exhaust .010" hot.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No Adj. Valve must operate freely.

IGNITION

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAP: .032".

Spark Plug—(4D, 5D) Champion H10, (7D) Champion H11. 14 mm.

COIL: Auto-Lite 6012-A.

Ignition Current—2.5 amps. idling, 4.5 amps. stopped.

DISTRIBUTOR: Auto-Lite IAT-4009 (4D with 232" engine), **Auto-Lite IAT-4009-B** 4D, 5D, 7D (with 262" & 308" engine).

Condenser—Auto-Lite IAT-3076R. **Capacity** .21-.25 mfd.

Contact Point Set—Auto-Lite IAT-3028BS.

Breaker Gap—.020".

Cam Angle—39°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Clockwise viewed from above.

►*DISTRIBUTOR INSTALLATION NOTE:* Engine rotation while oil pump removed affects timing. *See "Oil Pump Removal" under Oil Pump in Hudson Special Data.*

Automatic Advance (IAT-4009)

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	300	0	600
1	333	2	666
3	400	6	800
9	1100	18	2200
10	1200	20	2400

(IAT-4009-B)

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	500	0	1000
1	675	2	1350
4	1150	8	2300
8	1825	16	3650
9	2000	18	4000

Vacuum Spark Control: Auto-Lite integral type.

Vacuum Advance (IAT-4009)

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	9½
1	2	10
3	6	11
5	10	12

(IAT-4009-B)

Start	0	9-1/4
1	2	10
2	4	10-1/2
3	6	11
3.75	7.5	11-1/2

IGNITION TIMING

Setting—TDC (Long line before "1UDC" on flywheel).

►*IGNITION TIMING CAUTION:* When setting timing with timing light, disconnect vacuum line from distributor and plug line to prevent disturbing engine performance.

Timing Mark—Long line before "UDC1" on flywheel. Timing is correct when the long line ahead of "UDC1" appears in line with pointer at opening of rear engine support plate.

CARBURETOR

►*CARBURETOR APPLICATION:* Single carburetors used on all models or two carburetors used with Twin-H Power, all models.

WASP

Carter WA1 7495—Single barrel downdraft with automatic choke.

Idle Setting—1/2—1-1/2 turns open. Turn screw out for richer mixture.

Idle Speed—550 RPM (Std. & O.D. Trans.), 500 RPM (Hydra-Matic or Automatic Trans. in "DR" range).

Float Level—1/2" distance from top of seam on float to tip on lower edge of float chamber, when needle is seated.

Accelerating Pump—Outer hole normal, inner hole if less charge required.

Fast Idle: 5/8" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending link at lower offset.

Automatic Choke Setting: Set at index.

Hydra-Matic & Automatic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" and "Studebaker Automatic Transmission" in Transmission Section.*

►*OTHER DATA: See "Carter WA1 Carburetor" in Carburetor Section.*

Fuel Pump Pressure: 3-1/2—5-1/2 lbs. (Std.), 4-5 lbs. (Combination).

SUPER WASP & HORNET

Carter WGD 2115S—Dual downdraft type with automatic choke.

Idle Setting—3/4—1-3/4 turns open. Turn screws out for richer mixture.

Idle Speed—550 RPM (Std. & O.D. Trans.), 500 RPM (Hydra-Matic & Automatic Trans. in "DR" range).

Float Level—3/16" between top of float and bowl cover with cover inverted and gasket removed.

Accelerating Pump—No seasonal adjustment required.

Fast Idle: .026" throttle opening with choke valve closed. Check with thermostatic coil housing, gasket and baffle removed. Crack throttle valve, hold choke valve closed, move throttle toward closed position as far as possible. If throttle opening not exactly .026" bend connector link at lower angle.

Automatic Choke Setting: Set 2 points lean.

Hydra-Matic & Automatic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" & "Studebaker Automatic Transmission" in Transmission Section.*

►*OTHER DATA: See "Carter WGD Carburetors" in Carburetor Section.*

Fuel Pump Pressure: 3-1/2—5-1/2 lbs. (Std.), 4-5 lbs. (Combination).

TWIN H-POWER (ALL)

Carter WA1 2114S (4D, 5D), Carter WA1 2113S (7D). Two used. Single barrel downdraft with automatic choke.

►*TWIN-H POWER CARBURETOR ADJUSTMENT CAUTION:* Proceed as follows:

Idle Setting—For correct equalization of both carburetors: Remove air cleaners, install adjusting pin J-2544-1 through accelerator pedal link bellcrank lever and in hole in cylinder block to lock lever. On 5D, adjust throttle shaft rod trunnion to 1-25/32" from top face of bracket to center of clevis pin hole in cross shaft lever. Connect tachometer, but before warming up engine, remove clevis pin from ends of both throttle shaft to carburetor rods, position fast idle cam on each carburetor "off" position and turn each throttle stopscrew in until it just touches the cam. Set idle mixture screws exactly 2 turns open (7D), 1-1/4 turns open (4D, 5D). Warm engine, then adjust for correct idle speed (see below). Adjust each idle mixture adjusting screw for maximum increase in *idling speed and readjust throttle stop screws for* correct idling speed (*CAUTION*—turn stopscrew on each carburetor an equal amount). Adjust front and rear throttle shaft-to-carburetor rod clevises so that clevis pins can be installed freely, connect rods. On Hydra-Matic cars adjust throttle linkage (see Hydra-Matic Drive & Studebaker Automatic Trans. Linkage adjustment in Transmission Section). Remove linkage adjusting pin, adjust accelerator pedal to bellcrank rod to get 1/64-1/16" clearance between pedal and pedal stop at wide open throttle, reinstall air cleaners.

Idle Speed—540-560 RPM (Std.), 490-510 RPM (Hydra-Matic & Automatic), 575 RPM (Overdrive).

Float Level—1/2" from top of float seam to tip on lower edge of float chamber cover.

Accelerating Pump—Outer hole normal, inner hole if less charge required.

Fast Idle—1/2" (2114S), 5/8" (2113S) clearance between choke valve and air horn with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending at lower offset.

Automatic Choke—Set 1 point lean.

Hydra-Matic & Automatic Trans. Throttle Linkage Adjustment: *See "Hydra-Matic Drive" & "Studebaker Automatic Trans." in Transmission Section.*

►*OTHER DATA: See "Carter WA1 Carburetors" in Carburetor Section.*

Fuel Pump Pressure: 3-1/2—5-1/2 lbs. (Std.), 4-5 lbs. (Combination).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARB. EQUIPMENT

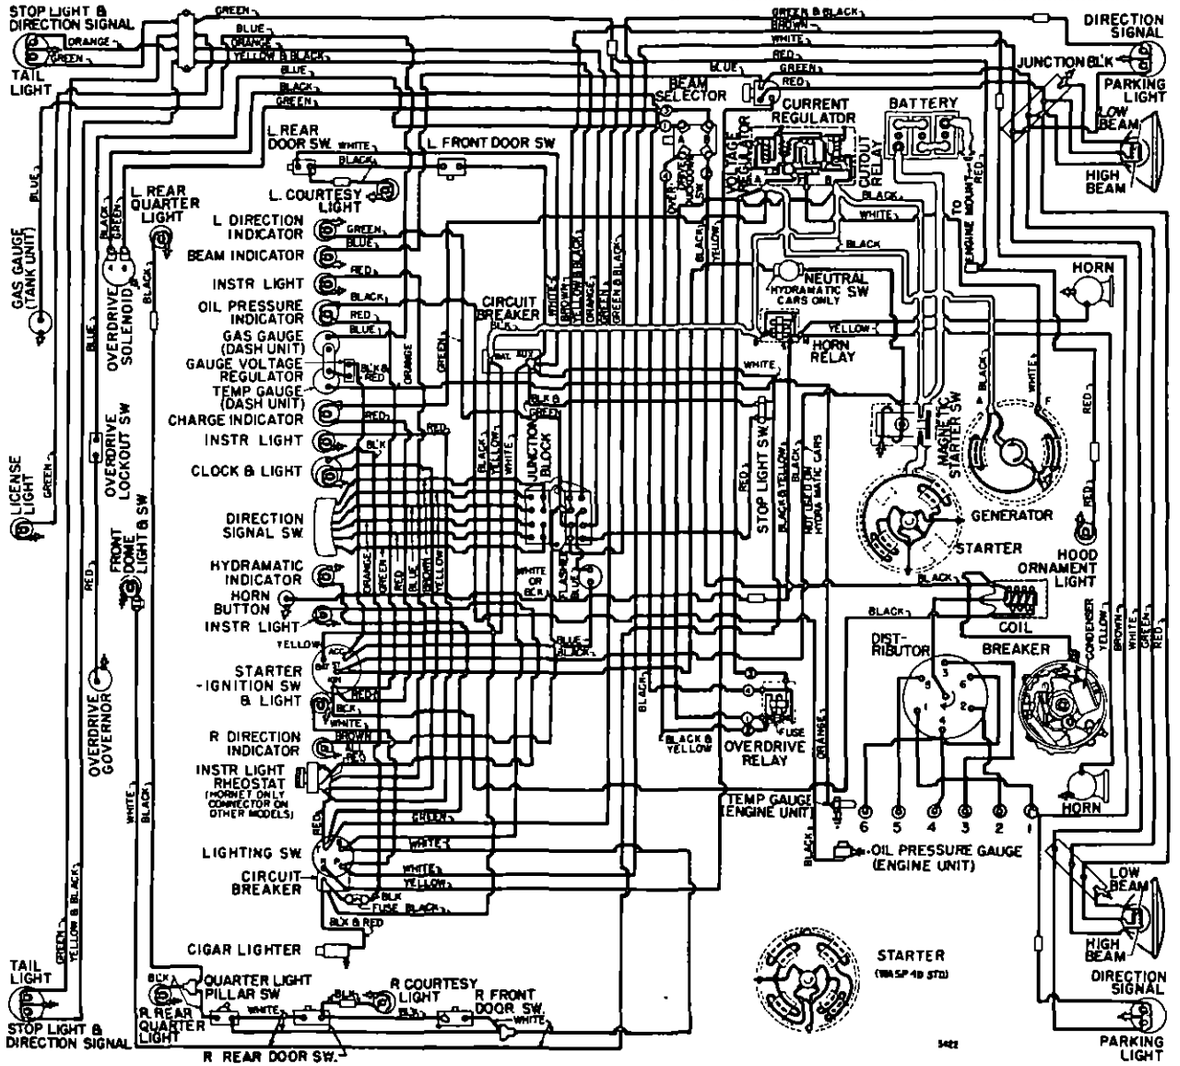
Fuel Pump: Carter M-729SZ Std., AC No. 4057 (Optl. Fuel & Vacuum).
Pressure–3-1/2–5-1/2 lbs. (Carter), 4-5 lbs. (AC).
See "Fuel Pumps" in Carburetion Equipment Section.
Gasoline Gauge: King-Seeley Electric CV (constant voltage) type with voltage regulator.
Dash Unit–King-Seeley 46379.
Tank Unit–King-Seeley 44513.
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

National 2LS-100–6 volt, 17 plate, 100 ampere hour (20 hr. rate).
Battery Ground–Positive (+) terminal.
Engine Ground–Left front engine mount and frame.

STARTER

Auto-Lite Starter	Armature
4D, Synchro-mesh MZ-4167	MZ-2312
5D, 7D Synchro-mesh MCH-6109	MCH-2084
4D, 5D, 7D Auto. Trns.. MCH-6204	MCH-2088



Drive–Bendix A1806 (Std. Trans.), A1792 (Auto. Trans.).
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–42-53 ozs.

Performance Data
MZ-4167

Torque	RPM	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 ft. lbs.	Lock	2.0	280

MCH-6109 & 6204

0 ft. lbs.	4300	5.0	65
6.0 ft. lbs.	Lock	2.0	335

Starting Switch: Auto-Lite Magnetic type **SS-4030** or **RBM-2201-15.** Controlled by combination starting and ignition switch.
Neutral Safety Switch: Hudson No. 304524 located at lower end of steering column. Connected in starter control circuit so that starter operates only when selector lever is in "N" Neutral.
Adjustment–*See "Hydra-Matic Drive" or "Automatic Transmission" in Transmission Section.*

GENERATOR

Auto-Lite GGW-4801B (Std.), GGJ-6101E (Optl.).
Armature Number–GGW-2006F (GGW-4801-B).

Performance Data
(GGW-4801-B)

Amperes	Volts	Cold – RPM –	Hot
0	6.4	870-900	950-1050
40	8.0	1800-2000	2150-2350
45	8.0	1925-2125	2350-2550

(GGJ-6101-E)

0	6.0	600-700	650-750
50	8.0	1400-1600	1550-1750
55	8.0	1500-1700	1650-1850

Brush Spring Tension–35-53 ozs.
Field Current–1.4-1.5 Amperes at 5.0 volts. (GGW-4801-B), 1.4-1.6 Amperes at 5.0 volts (GGJ-6101-E).
Rotation–Counter-clockwise at commutator end.
Belt Adjustment: 3/4" belt deflection midway between generator and water pump pulleys.

REGULATOR

Auto-Lite VBE-6104A (GGW-4801-B Gen.) VBF-6003A (GGJ-6101-E Gen.). Voltage and Current type with "Temperature Compensated" current regulation.

Cutout Relay
Cuts In–6.3-6.8 volts (set to 6 4-6.6 volts).
Cuts Out–4.1-4.8 volts.
Contact Gap–.015" Minimum.
Air Gap–.031-.034" at hinge end of core with contacts just closed.

Voltage Regulator
Setting–7.2-7.5 volts (VBE-6104A), 7.1-7.4 volts (VBF-6003A) in normal operation charging at 1/2 maximum rate.
Air Gap–.048-.052" with contacts just opening.
Checking & Adjusting–*See Electrical Equip. Section.*

Current Regulator
▷*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°.*

	Test A Operating Amperes	Test B
VBE-6104A	52 Max.	45 (43-47)
VBF-6003A	66 Max.	55 (53-57)

Test A–After 15 minutes operation charging at one-half maximum output.
Test B–After additional 15 minutes operation with current regulator operating (with load applied to hold voltage down to 6.7-6.9 volts on "VBE" or 6.7-7.0 volts on "VBF").
Air Gap–.048-.052" with contacts just opening.
Checking & Adjusting–*See Electrical Equip. Section.*

MISC. ELECTRICAL

Head Lamps: Sealed Beam. *See Electrical Equipment Section.*
Directional Signals: *See Electrical Equip. Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Lighting Switch Removal: Disconnect Negative battery cable, loosen screw and remove control knob, remove escutcheon nut and escutcheon, remove switch and wires from switch.

Stop Light Switch Location: At rear of Master Cylinder (Std. Brakes) ahead of Master Cylinder (Power Brakes).

FUSES: Located as follows:

Clock–SFE-3 ampere in fuse case at back of clock.

Weather Control–SFE-14 ampere in fuse case at left side.

Radio–SFE-14 ampere in fuse case at left side of radio.

Overdrive–SFE-30 ampere mounted on overdrive relay.

CIRCUIT BREAKERS: Main Circuit Breaker (25 ampere) mounted on lighting switch. **Auxiliary Circuit Breaker** (30 ampere) mounted on instrument structural brace.

HORNS: Auto-Lite (High Pitch) HAB-4626A, (Low Pitch) HAB-4625A.

ENGINE

ENGINE SPECIFICATIONS: 6 cyl. "L" head type.

Model	Bore	Stroke	Displmnt.	Rated HP
4D	3-9/16"	3-7/8"	232 cu. ins.	30.4
5D	3-9/16"	4-3/8"	262 cu. ins.	30.4
7D	3-13/16"	4-1/2"	308 cu. ins.	34.9

Model	Comp. Ratio	Developed HP
4D	① 7.0-1	126 at 4400 RPM
4D	② 7.5-1	129 at 4400 RPM
5D	① 7.0-1	140 at 4000 RPM
5D	② 7.5-1	143 at 4000 RPM
5D	② 7.5-1 ③	149 at 4000 RPM
7D	① 7.0-1	156 at 3800 RPM
7D	② 7.5-1	160 at 3800 RPM
7D	② 7.5-1 ③	170 at 4000 RPM

① Cast Iron Head.
② Aluminum Head.
③ Twin-H Power.

Compression & Vacuum Reading–*See Tune Up.*

ENGINE REMOVAL: *See Hudson Special Data.*

OIL PAN REMOVAL: Support car on jack stands placed under #2 cross-member. Take out three bolts attaching center steering arm support bracket on this cross-member and drop steering arm and tie rods. Remove flywheel dust cover. Remove pan.

►*LOCATING HOLE PLUG CAUTION: Plug in locating hole in pan flange at left rear of block (behind starter) must be tight fit to prevent oil leakage or contamination of oil by dirt or water.*

CYLINDER HEAD GASKET: Used as follows:

Model	Cast Iron Hd.	Aluminum Hd.
4D	309112	309114
5D	309116	309118
7D	309120	309122
7D (Exc. 6.8-1)		307408
7D (7X Eng.) Severe Usage		309390

Cylinder Head & Gasket Installation–*See Hudson Special Data.*

TIGHTENING TORQUES: *See Hudson Special Data.*

PISTONS

►*CAUTION:* Pistons NOT INTERCHANGEABLE between engines due to different height from pin hole to top as follows: 4D–2.310-2.314", 5D–2.060-2.064", 7D–1.967-1.971".

Aluminum alloy, cam ground, four ring type.

Original Bore & Piston Sizes & Markings–*See "Original Bore" in Hudson Special Data.*

Weight–18-1/8 ozs. (4D, 5D), 18-5/8 ozs. (7D).

Removal–Pistons & Rods removed from above.

►*PISTON WEIGHT CAUTION:* Piston weight stamped on head of piston. Use same weight piston when replacing pistons.

Fitting New Pistons: Use ribbon feeler 1/2" wide .002" thick and scale with cylinder and piston both at 70° F. Piston is properly fitted when 3-4 lbs. pull required to remove feeler.

Replacement Pistons: *See "Pistons" in Hudson Special Data.*

Installing Pistons: Slot away from camshaft.

PISTON PINS

Floating type with locking ring at each end.

Diameter–.968". **Length**–2.937".

Clearance in Piston–From .000 to .0003" at 70° F.

Clearance in Rod–Hand push fit at 70° F.

Replacement Pins: Available in the following oversizes and identified by a spot of paint on end of pin. Color denotes oversize. Std. not painted, .001" yellow, .002" orange, .005" white, .010" blue.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Comp.	.0775"	.006-.014"	.001"
Oil (#3)	.186"	.006-.014"	.001"
Oil (#4)	.1545"	.006-.014"	.001"

Replacement Rings: Supplied in Standard & .010" Oversize.

CONNECTING RODS

Length–Center to center 8-1/8". **Weight**–34.24 ozs.

Crankpin Journal Diameters–2.125". Out of round limit .0015".

►*CRANKSHAFT SIZE CODE: See Hudson Special Data.*

Bearings–Steel-backed Babbitt. (Upper & lower halves interchangeable). No shims.

Clearance–.0005-.0015".

Side Play–.007-.013".

Replacement Bearings: Standard, .001", .002", .010", .012" Undersize.

Installing Rods: Not offset. Oil spit hole in lower end of rod must be toward camshaft side of engine.

CRANKSHAFT

Journal Diameter–2.4988-2.4998".

►*CRANKSHAFT SIZE CODE: See Hudson Special Data.*

Bearings–Steel-backed, Babbitt-lined. Upper and Lower halves of bearings alike. No shims.

Clearance–.0005-.0015".

Replacement Bearings: Standard, .001", .002", .010", .012" Undersize.

End Thrust: On No. 3 bearing.

End Play–.003-.009".

Rear Bearing Oil Seal Installation: *See Hudson Special Data.*

CAMSHAFT

Journal Diameters–(1) 2.375", (2) 1.997", (3) 1.965", (4) 1.497".

Bearings–Steel-backed, Babbitt-lined bushings.

Clearance–.0015-.002".

End Thrust: Controlled by thrust plate behind camshaft sprocket.

End Play–.003-.005".

Timing Chain: Link Belt. Width 1.250". Pitch .375". Length 60 Links.

Camshaft Setting: Timing chain has two marked links, six full links apart. Both crankshaft and camshaft sprockets have a marked tooth. With crankshaft sprocket installed and turned to TDC position, install one marked link over crankshaft sprocket marked tooth, insert camshaft into chain with marked link over marked tooth, rotate camshaft until screw holes line up and install screws.

VALVES

Tappet Clearance: Intake .008", Exhaust .010" hot.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.831"	.3417"	5.815"
Exhaust	1.561"	.3407"	5.815"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.346"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

Valve Seat Width–Intake .054", Exhaust .075".

►*VALVE GRINDING CAUTION:* Replace valve when grinding reduces distance from upper edge of valve seat to top of valve to less than 1/16".

Valve Springs: Install valve springs with closely coiled end of spring up.

Free Length–2.500".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	77	2 3/16"
Open	160	1 27/32"

Valve Guides: Remove Tappet adjusting screws and drive out guides with tool J-267. Use tool J-883-A Installer and tool J-883-10 Pilot to replace guide. Insert guide to a depth of 1 9/32" from top of guide to top of valve seat.

Valve Lifters: Mushroom type fitted directly in crankcase. Removed from below with camshaft out. Serviced by installing oversize lifter.

Clearance–.00075-.0015".

Replacement Lifters–.002", .004", .010" Oversize.

►*VALVE LIFTER NOTE*–Replace tappet (excessive oil consumption) when oil is expelled in squirts from around tappet. Check for out of round bore in block. Oversize available .002", .004" & .010".

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 33.7° BTDC. Close 80.1° ALDC.

Exhaust Valves–Open 73.9° BLDC. Close 28.4° ATDC.

Valve Timing Check–Set No. 1 Intake Valve Tappet at .010" clearance (hot) and insert .002" feeler between tappet and valve stem. Rotate engine clockwise until a slight drag is felt on feeler gauge. The engine is *properly timed when the first of the five timing marks* on the flywheel is 5/8" above the pointer in timing hole. Reset valve tappet to specifications.

OILING SYSTEM

Crankcase Capacity: 7 qts. refill, 7-1/2 qts. dry.

Normal Oil Pressure: 40 lbs. at 30 MPH.

Pressure Regulator Valve–Non-adjustable relief valve and spring under plug in left side of engine.

Oil Pressure Indicator–Hudson "Teleflash" with Oil Pressure Warning Switch. Consists of light on instrument panel operated by switch as follows:

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pressure Warning Switch–King-Seeley No. 47170. On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch is sealed (not adjustable).

Oil Pump: Rotor type. Angle mounted on right side of engine and driven from camshaft.

Pump Overhaul–*See "Oil Pump" in Hudson Special Data.*

Oil Filter: Fram or Hudson. Replace filter cartridge at 5000 mile intervals.

Replacement Filter Element–Hudson No. SP-302496.

Crankcase Ventilator: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

Water Capacity: 19-1/2 qts. *NOTE*–Capacity without heater 18-1/2 qts.

Pressure Valve: Hudson No. 302265. Radiator filler cap pressure type.

Thermostat: Hudson No. 166272 (Std.), 161664 (High type for permanent Anti-Freeze). Standard type opens 150-155° F, High type opens 165-170° F.

Water Pump: Centrifugal, belt driven, packless type. Shaft mounted on sealed duplex ball bearing. *See "Hudson" in Water Pump Section.*

Pump Removal–Remove generator adjusting bracket, remove fan blade as assembly and pump mounting bolts. Remove pump from engine.

Temperature Gauge: King-Seeley Electric "CV" type (constant voltage) with gauge voltage regulator.
See "Temperature Gauges" in Miscellaneous Section.

Dash Unit–King-Seeley 46372.

Engine Unit–King-Seeley 44200.

Gauge Voltage Regulator–King-Seeley 46377.

CLUTCH

Own. Single plate fluid cushioned type (cork insert driven member) operating in Hudsonite oil. 9" on 4D (less Overdrive), 10" 4D (with Overdrive), 5D, 7D.

►*CLUTCH STICKING CORRECTION: See "Clutch Notes" in Hudson Special Data for Flushing instructions.*

See "Hudson Clutches" in Clutch Section.

Clutch Lubrication: *See "CLUTCH SERVICING" in Hudson Special Data.*

Clutch Disc No.–Hudson 303342 (9"), 304885 (10").

Pedal Adjustment: 1-1/2" between floor board and rear face of pedal. Adjust by loosening locknut above clevis and turn clevis in or out as required.

Removal: Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate behind starter, remove plug, turn engine over 1/3 revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to drain. Unhook clutch pedal lever return spring, remove two clutch cross shaft bracket bolts and remove the bracket. Remove clutch control link clevis pin and disconnect the clevis. Install engine holding fixture J-4651 (position "U" shaped section around oil pan and engage adjusting hooks in holes provided on each side of frame). Remove flywheel dust pan by taking out two attaching screws. Take out two engine rear mounting bolts and nuts at No. 3 cross member. Raise engine rear support approximately 1/2" off cross member by adjusting the holding fixture hooks *(NOTE*–If holding fixture not available, use hydraulic jack with block of wood to prevent damage to pan to raise engine). Take out two top screws attaching clutch housing to engine rear end plate (use universal socket and extension). Remove breather pipe bracket, remove bolt attaching breather pipe and rear valve chamber cover, remove breather pipe. Remove flywheel pointer, remove starter. Take out two lower attaching screws and remove clutch housing assembly *(CAUTION*–Take care that throw-out collar and bearing does not drop out of clutch cover bore). Loosen all clutch cover-to-flywheel screws evenly to relieve spring pressure, take out screws and remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model AS63-T86E (4D, 5D) Without Overdrive. AS65-T86E (7D) Without Overdrive. AS64-T86E (4D, 5D, 7D) With Overdrive. Three speed, all helical gear type.

See "Warner Transmission" in Transmission Section.

Transmission Control: *See "Transmission Controls" in Transmission Section.*

Removal: *(NOTE–This transmission removed from underneath car. Not necessary to remove floor mat and cover).* Drain lubricant and disconnect front universal joint (retain universal joint bearing cups with tape to hold bearings in place). Loosen nut on propeller shaft center bearing support nut, disconnect propeller shaft by sliding shaft rearward, disconnect shift rods, speedometer cable (if car is equipped with overdrive, disconnect control cable and wiring from overdrive at transmission), and remove speedometer pinion. Remove nut from front end of brake pivot brace at No. 3 cross-member and remove clevis pin at rear end of brace and move linkage to left side of car. With universal socket on a 10" extension, remove two top bolts attaching transmission-to-clutch housing. Insert in their place, guide studs J-2969 to guide transmission during removal. Remove the two lower transmission-to-clutch housing bolts and lower transmission out of car.

OVERDRIVE

Warner R10. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Warner R10 & R11 Overdrive Controls" in Transmission Section*

HYDRA-MATIC DRIVE

Dual Range. Four-Speed Planetary type automatic transmission with Modulated Throttle Pressure and Hydraulically operated reverse.

See "Hydra-Matic Drive" in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication–Check fluid level every 1000 miles of operation, drain and refill every 25,000 miles. Use only Hydra-Matic Drive fluid.

Capacity–8-1/2 qts.

Checking Fluid Level–Set hand brake and allow engine to idle with selector lever in "DR4" position for two minutes. Place selector lever in "N" position. Roll back floor mat and remove oil level indicator (after cleaning all lint and dirt from around indicator). Wipe indicator dry and check fluid level. Fluid level must be to "F" mark.

►*CAUTION: Do not check fluid level when transmission is excessively hot and do not fill above "F" mark on dip stick.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

AUTOMATIC TRANSMISSION

Detroit–Torque Converter and 3 speed automatic planetary transmission with hydraulic control.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Studebaker Automatic Transmissions" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Studebaker Automatic Transmissions" in Transmission Section.*

Lubrication: Check fluid level every 1,000 miles, drain and refill every 25,000 miles. Use "Hydra-Matic Drive" or "Automatic Trans." fluid type A.

Checking Fluid Level–Apply Parking Brake, place Selector Lever in "L" position, operate engine at idling speed to obtain normal operating temperature. Roll back left floor mat, remove access hole cover, clean area around gauge cap and withdraw gauge. Oil level should be tested with engine idling and Selector Lever in "L" position. Add oil to bring level to full mark.

Capacity–11 qts. (Place 6 qts. in transmission, operate at idle with Selector lever in "L" position and add fluid to bring level to full mark).

►*OTHER AUTOMATIC TRANS. SERVICE DATA: See "Studebaker Automatic Transmission" in Transmission Section.*

UNIVERSALS

Spicer. One at each end of propeller shaft.
See Universals Section for complete data.

►*ASSEMBLY CAUTION:* The tack welded tie-bar or the welded spots where the bar was attached must be located in the relief of the companion flanges when assembling the universal.

REAR AXLE

Spicer 44-2. Semi-floating, hypoid gear type with Hotchkiss drive.
See "Spicer Hypoid" in Rear Axle Section.

	Axle Ratio	
Synchro-mesh	**Overdrive**	**Automatic**
4.09-1 (Std.)	4.55-1 (Std.)	3.07-1 (Std.)
4.55-1 (Opt.)	4.09-1 (Std.)	

Severe Usage Ratios–4.55-1, 4.27-1, 3.92-1, 3.54-1, 3.31-1, 3.07-1.

Gear & Pinion Teeth–4.09 (45-11), 4.55 (50-11), 3.07 (43-14).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rear Axle Ratio Note–Ratio is marked on metal tag attached to rear axle by rear axle cover bolt. A tag marked 43 over 14 would mean an axle ratio of 3.07 to 1.

Back Lash–.003-.006".

Axle Shaft Removal: Raise rear end of car off floor and place jack stands under axle assembly. Disconnect brake cables at toggle and unhook brake cables from parking brake levers. Disconnect brake hose at frame connection and brake lines from wheel cylinder. Remove wheel & hub. Remove backing plate bolts and backing plate, wheel bearing oil seal caps and axle shims (shims only on right side). Tie shims together for reinstallation. Use Puller J-352-B to remove axle shaft and Puller J-943 to remove seal.

Rear Axle Assembly Removal: Place jack stands under frame just ahead of rear springs. Disconnect brake cables at toggles and unhook from parking brake levers, brake hose from frame connection, brake line from wheel cylinders. Remove wheels, brake cylinders, backing plate and pull axle shafts. Disconnect propeller shaft at rear companion flange (tape rollers and caps to prevent falling off). Remove nuts from spring clip "U" bolts and lower shock absorber studs. Disconnect stabilizer. Lower assembly and roll from beneath car.

Wheel Bearing Adjustment: Controlled by shims (.003", .005" & .015") between backing plate (right side only) and end of axle housing. To adjust, remove wheel and backing plate (see Axle Shaft Removal), add or remove shims for endplay adjustment.

End Play–.001-.004".

SHOCK ABSORBERS

Monroe & Delco–Direct acting hydraulic type. Units are sealed (serviced by replacement).

Hudson Shock Absorber Nos.

Control	Front	Rear
Light 4D, 5D	① 304700	① 304701
Light 7D	① 303060	① 300351
Light 7D		② 301241
Heavy All	① 303061	① 301768
Heavy All		② 301770
Ex. Hvy. All	① 302430	① 302341
Severe Usage All	① 306707	① 309683

① Monroe. ② Delco.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs and lateral stabilizer.

See "Hudson" in Front Suspension Section.

King Pin Inclination–3° 36" crosswise.

Caster–1/2° to 1-1/2°. Pos.

Camber–1/2° to 1-1/2°. Pos.

Maximum variation between right and left wheel caster or camber 1/2°.

Toe-In–0" to 1/16".

Toe-out on Turns–Inner wheel 30°, outer wheel 25°. Variation between wheels 1/2°.

STEERING

Manual: Gemmer Model 335. Three-tooth Worm & Roller with "push-pull" adjustments.

See "Gemmer Steering Gears" in Steering Section.

Power Steering: Two types used as follows:

(4D, 5D)–Monroe Linkage Type. *See "Monroe Power Steering" in Steering Section.*

(7D)–Saginaw Linkage Type. *See "Saginaw Linkage Type Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix Hydraulic, Duo-Servo, Single Anchor. Without eccentric adjustment. Parking lever applies rear service brakes.

See "Bendix Hydraulic" in Brake Section.

Drums–Diameter 11".

Wheel Cyl. Diameter–Front 4D, 1 1/16", 5D, 7D 1 1/8". Rear All 15/16".

Replacement Lining & Shoes–Linings & shoes with linings come in Std. & .030" Oversize.

Lining Width & Thickness

Model	Front	Rear
4D	1-3/4" x .177"	1-3/4" x .177"
5D, 7D	2-1/4" x .177"	1-3/4" x .177"

Clearance–.015" at each end of secondary shoe with primary shoe out against drum, or adjusting screw backed off 14 notches or clicks from point where wheel can just be turned by hand.

Mechanical Follow-up (Pedal Pushrod) Adjustment–Adjust pedal pushrod (linking pedal to lever on frame cross-member) for clearance of 1 1/4" between rear side of retaining pin in lever and rear end of slot in slide link.

Standard Master Cylinder: On frame to left of transmission.

Checking Fluid–Access hole in floor pan. Roll back floor covering, remove access hole cover, clean lint and dirt from filler plug, remove plug. Fluid should be 1/2 to 1" below the top of filler opening.

Removal–Remove from beneath car. Not necessary to disturb other parts.

Power Brakes: Bendix Power Unit–Combination vacuum power unit and hydraulic master cylinder. Replaces conventional master cylinder.

See "Bendix Power Unit" in Brake Section.

Checking Fluid–Raise hood, clean surface around filler plug and remove plug. Maintain fluid level not lower than 1/4" below the bottom of reservoir filler opening.

Removal–Remove key lock washer and pin from pedal bell crank under instrument panel and remove rod from pedal. Raise hood and disconnect hose assembly by removing outlet fitting bolt to the master cylinder.

NOTE–Do not remove stop light switch, wires, or hose assembly from outlet fitting. Loosen clamp and remove manifold vacuum hose at the check valve on the power unit. Loosen the reserve tank hose from the fitting on the check valve. Remove the four cap screws securing the assembly to the dash bracket.

MISC. MECHANICAL

Windshield Wipers: Vacuum operated type. *See "Windshield Wipers" in Miscellaneous Section.*

Window Regulators: Hydro-Lectric, with single action hydraulic window cylinders. *See "Hydro-Lectric Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Hydro-Lectric, with double acting hydraulic top operating cylinders. *See "Hydro-Lectric Power Tops" in Miscellaneous Section.*

►*AIR CONDITIONING CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

Wasp 35540
Hornet 35560

SERIAL NUMBER: Stamped on plate attached to cowl.
Starting Serial Number—(Wasp)—Kenosha W-1001, El Segundo WC-1001, Unassembled Export WKD-1001.
Starting Serial Number—(Hornet)—Kenosha X-1001, El Segundo XC-1001, Unassembled Export XKD-1001.

ENGINE NUMBER: Stamped on machined surface (left side) of cylinder block at side of No. 2 cylinder.
Starting Engine No.—(Wasp) M-1001, (Hornet) F-1001.

TUNE-UP

COMPRESSION PRESSURE: At cranking speed 100 lbs. min , allowable variation limit 10 lbs.

VACUUM READING: 17-20" at idling speed.

VALVE TAPPET CLEARANCE: Intake .010" (GO), .011" (NO GO), Exhaust .015" (GO), .016" (NO GO).

►*VALVE TAPPET ADJUSTMENT NOTE:* Manifold and carburetor assembly must be removed for access to valve compartment. On Wasp Twin H-Power & Hornet (All Cars), engine must be jacked over to permit manifold removal as follows:

1) Disconnect fuel and vacuum lines at carburetors and manifold, disconnect exhaust pipe at manifold, disconnect throttle linkage.

2) Remove top nut on front engine supports and loosen rear engine supports.

3) Place jack between front right hand corner of cylinder block and point just below upper wheelhouse-to-wheelhouse crossmember and wheelhouse panel, move engine up and to left for clearance to remove manifold (not necessary to drain cooling system—hoses will permit this movement).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. No. adj. Valve must operate freely.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .032".

Spark Plug—Champion H10 (Wasp), H11 (Hornet). Tighten to 30 ft. lbs. (Cast Iron Head), 25 ft. lbs. (Aluminum Head).

COIL: Auto-Lite CR-6012A.

Ignition Current—2.5 Amps. idling, 4.5 Amps. stopped.

DISTRIBUTOR: Auto-Lite IAT-4202 (Wasp), IAT-4203A (Hornet).

Condenser—Auto-Lite IAT-2015R. **Capacity**—.21-.25 mfd.

Contact Point Set—Auto-Lite IGW-3028 BS (All).

Breaker Gap—.018-.022". **Cam Angle**—39°±3°.

Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Automatic Advance—IAT-4202

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		300	0		600
1		350	2		700
4.5		500	9		1000
12		1325	24		2650
13.5		1500	27		3000

Automatic Advance—IAT-4203A

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		500	0		1000
1		670	2		1340
4		1150	8		2300
8		1825	16		3650
9		2000	18		4000

Vacuum Spark Control—Auto-Lite integral type.

Vacuum Advance—IAT-4202

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5 1/4
1	2	5 3/4
4	8	7 1/2
6	12	8 3/4
7.5	15	9 1/2

Vacuum Advance—IAT-4203A

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	9 1/2
1	2	10
2	4	10 3/8
3	6	10 7/8
3.75	7.5	11 1/4

IGNITION TIMING

Setting—TDC.

Timing Mark—(Wasp)—Long line before "1UDC" on damper. (Hornet)—Long line before "UDC1" on flywheel.

CARBURETOR

►*CARBURETOR APPLICATION NOTE: One or two (Twin-H-Power) Carburetors used as follows:*

Model	Carter No.
Wasp (HI-TORQUE)	WA1 2009SA
Wasp (TWIN-H-POWER)	WA 1 2013S
Hornet (CHAMPIONSHIP 6)	WGD 2252S
Hornet (TWIN-H-POWER)	WA1 2113S

Throttle Linkage Adjustment (Hydra-Matic): Adjust idle speed to 490-510 RPM (compressor running on Air Conditioned cars), engine at normal idling speed, transmission warm and selector lever in neutral position.

Wasp—Adjust carburetor rods and install aligning pins J-2544 so that both pins index at the rear upper throttle lever and lower bell crank and hole in boss on cylinder block.

Hornet—Aligning pin J-2544 should fit freely in bell crank lever and hole in boss of cylinder block. If aligning ping does not index, remove carburetor to throttle rod lever clevis pins and readjust rods.

All Models—Then recheck and adjust carburetor idle adjusting screws. Disconnect throttle rod at left side of transmission case, clean machined surface of case and check lever using Tool J-2915 flush against surface with edge of gauge against transmission side cover. Gauge should fit freely in hole of throttle valve lever. Adjust trunnion so throttle rod fits freely in hole in trunnion. Shorten throttle valve rod 1/16" or approximately two turns by backing off front nut and tightening rear nut.

CARTER WA1 (Wasp HI-TORQUE) (2009SA Single Carb.)

Idle Setting—½-1½ turns open. Turn screw out for richer mixture.

Idle Speed (Without Air Conditioning)—540-560 RPM (Standard Trans.), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral).

Idle Speed (With Air Conditioning)—Same as above with compressor running.

Float Level—7/16" from tip of cover projection to soldered edge of seam on float with cover inverted.

Accelerating Pump—Outer hole normal, inner hole if less charge is required.

Fast Idle: 5/8" clearance between choke valve and air horn with throttle valve closed and stop screw against (not on) fast idle cam. Adjust by bending link at lower offset.

Unloader Adjustment: Use Gauge T109-84 (9/16") to check choke valve opening or clearance between lower edge of valve and air horn wall. Adjust by bending cam on throttle using Tool T109-41.

Automatic Choke Setting: Set at Index.

►*OTHER DATA: See "Carter WA1" carburetors in Carburetor Section.*

Fuel Pump Pressure: 3½-4½ lbs. (Single Action), 3½-5 lbs. (Fuel & Vacuum), at 500 RPM.

CARTER WGD (Hornet Championship 6) 2252S (Single Carb.)

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 1-2-3, LEFT barrel 4-5-6.*

Idle Setting—1¾-2¾ turns open. Turn screw out for richer mixture.

Idle Speed (Without Air Conditioning)—540-560 RPM (Standard Trans.), 575 RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral).

Idle Speed (With Air Conditioning)—Same as above with compressor running.

Float Level—¼" between top of float and bowl cover (gasket removed) and cover inverted.

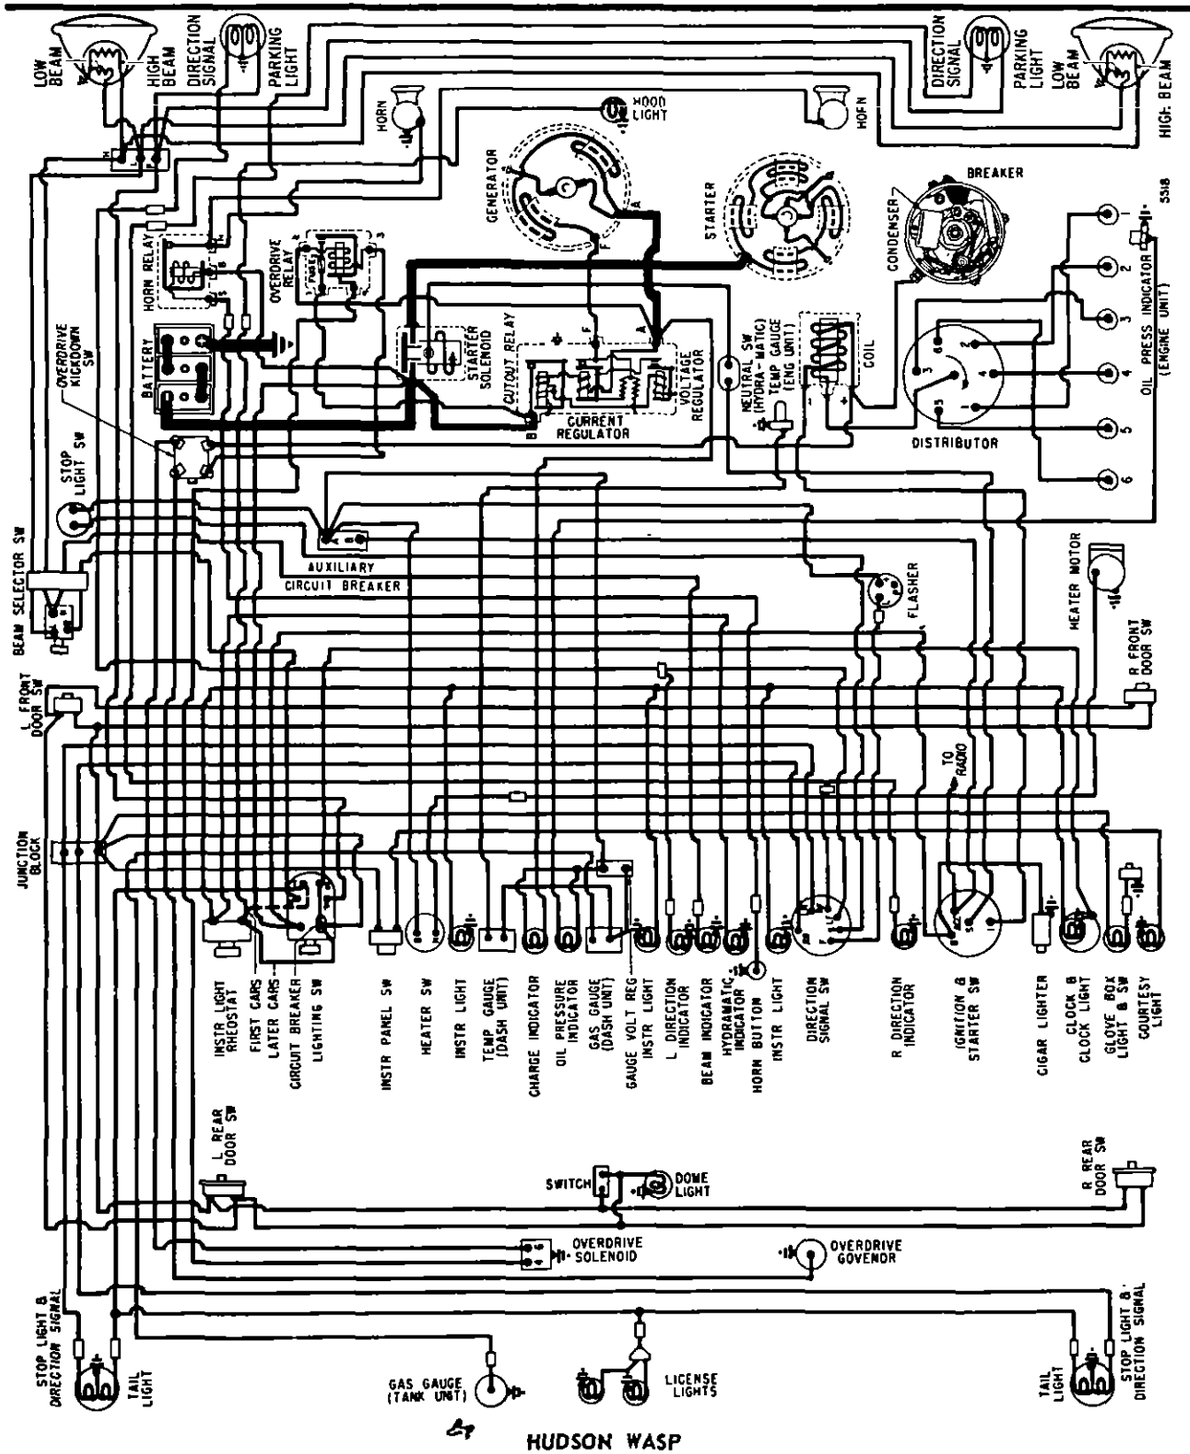
Accelerating Pump—No seasonal adjustment.

Fast Idle: .030" clearance between throttle valve and bore of carburetor (side opposite idle port) with choke valve closed.

Unloader Adjustment: Use Gauge T109-106 (7/32") to check choke valve opening or clearance between lower edge of valve and air horn wall. Adjust by bending choke shaft unloader arm with Tool 109-105.

Automatic Choke Setting: Set at Index.

►*OTHER DATA: See "Carter WGD" carburetors in Carburetor Section.*



Fuel Pump Pressure: 3½-4½ lbs. (Single Action), 3½-5 lbs. (Fuel & Vacuum), at 500 RPM.

CARTER WA1 (Twin-H-POWER) (2013S & 2113S)

►*MANIFOLD FUEL DISTRIBUTION: An internal manifold compensator port is incorporated in twin carburetor manifolds.*

Idle Setting—For correct synchronization of both carburetors: Remove clevis pins from throttle shaft to carburetor rod clevis. Connect vacuum gauge and tachometer. Hold fast idle cam in normal idle position and adjust idle speed screws until throttle valves just seated in closed position. Adjust idle mixture screws (½-1½ turns out (Wasp), 1¼-2¼ turns out (Hornet). Run engine until temperature normalized. Hold front carburetor throttle valve closed and adjust rear carburetor

CONTINUED ON NEXT PAGE

HUDSON WASP

CONTINUED FROM PRECEDING PAGE

idle speed 25-40 RPM less than specified. Adjust rear carburetor mixture for best operation. Adjust front carburetor idle speed to where an increase of 10-15 RPM is noted (Idle mixtures). Readjust the rear carburetor until the specified RPM is obtained and then adjust the front carburetor until a slight increase in RPM is noted. Readjust idle mixture to obtain best *mixture and manifold vacuum. Adjust throttle shaft to* carburetor rod clevis, retaining the throttle valves in idle position and accelerator linkage in released position. Reinstall clevis pins.

Idle Speed (Without Air Conditioning)—540-560 RPM Standard Trans.), 575-RPM (Overdrive), 490-510 RPM (Hydra-Matic in Neutral).

Idle Speed (With Air Conditioning)—Same as above with compressor running.

Float Level—¼" (2013S), ½" (2113S) from tip on lower edge of cover to seam on float with cover inverted.

Accelerating Pump—Outer hole normal, inner hole if less charge is desired.

Fast Idle: *½" (2013S), 5/8" (2113S) clearance between* choke valve and air horn with throttle valve closed and stop screw against (not on) first step of fast idle cam. Adjust by bending link at offset portion.

Unloader Adjustment: Use Gauge T109-84 (9/16") to check valve opening or clearance between lower edge of valve and air horn wall. Adjust by bending cam on throttle lever using Tool 109-41.

Automatic Choke Setting: Set one point lean.

►*OTHER DATA: See "Carter WA1" carburetors in Carburetor Section.*

Fuel Pump Pressure: 3½-4½ lbs. (Single action), 3½-5 lbs. (Fuel & Vacuum) at 500 RPM.

CARB. EQUIPMENT

Air Cleaner: *DRY TYPE—DO NOT WASH.* Clean at 1000 mile intervals by removing cartridge and shaking thoroughly to remove dirt. Replace cartridge every 10,000 miles or six months.

Fuel Pump: Carter M729SZ (Std. Trans.) Single action. **AC No. 4057** (O.D. & Automatic Trans.) Combination fuel and vacuum.
Pressure—3½-4½ lbs. (Single action), 3½-5 lbs. (Fuel & Vacuum), at 500 engine RPM.
See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: King-Seeley Electric "CV" (constant voltage) type with voltage regulator.
Dash Unit—King-Seeley 46375.
Tank Unit—King-Seeley 44558.
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Auto-Lite 1-M-100 (Wasp), 1H-105-D (Hornet). 6 volt, 15 plate, 100 ampere hour (Wasp), 105 ampere hour (Hornet) capacity (20 hr. rate).
Battery Ground—Positive, to cylinder head.
Engine Ground—Rear engine mount crossmember to transmission.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STARTER

Auto-Lite No.	Starter	Armature
Wasp (Std. Trans.)	MZ-4167	MZ-2312
Wasp (Hydra-Matic)	MZ-4172	MZ-2211
Hornet (Std. Trans.)	MCH-6109	MCH-2084
Hornet (Hydra-Matic)	MCH-6306	MCH-2088

Drive—Bendix No. A1806 (Std. Trans.), A1792 (Hydra-Matic).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs.

Performance Data

(MZ-4167 & 4172)

Torque	RPM	Volts	Amperes
0 ft. lbs.	4000	5.0	68
4.4 ft. lbs.	Lock	2.0	280

(MCH-6109 & 6306)

0 ft. lbs.	4300	5.0	65
6.0 ft. lbs.	Lock	2.0	335

Starter Switch: Magnetic type, controlled by combination Ignition and Starting Switch. Turn key full right against spring tension to start.

Neutral Safety Switch (Hydra-Matic Cars): Hudson No. 3143998. Permits starter operation only with selector lever in Neutral "N" position.

GENERATOR

Auto-Lite GGW-4802B. Armature—GGW-2006F.

Performance Data

Amperes	Volts	Cold — RPM — Hot
0	6.4	870-970 — 950-1050
40	8.0	1800-2000 — 2150-2350
45	8.0	1925-2125 — 2350-2550

Brush Spring Tension—35-53 ozs.

Field Current—1.6-1.7 amperes at 5.0 volts at 70°F.

Rotation—Counter-clockwise at commutator end.

Belt Adjustment: ¾" deflection midway between water pump & generator pulleys.

REGULATOR

Auto-Lite VBE-6101-A, Voltage & Current type with "Temperature Compensated" current regulation.

Cutout Relay

Cuts In—6.3-6.8 volts. (Set to 6.4-6 6 volts).

Contact Gap—.015" minimum.

Air Gap—.031-.034" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F.

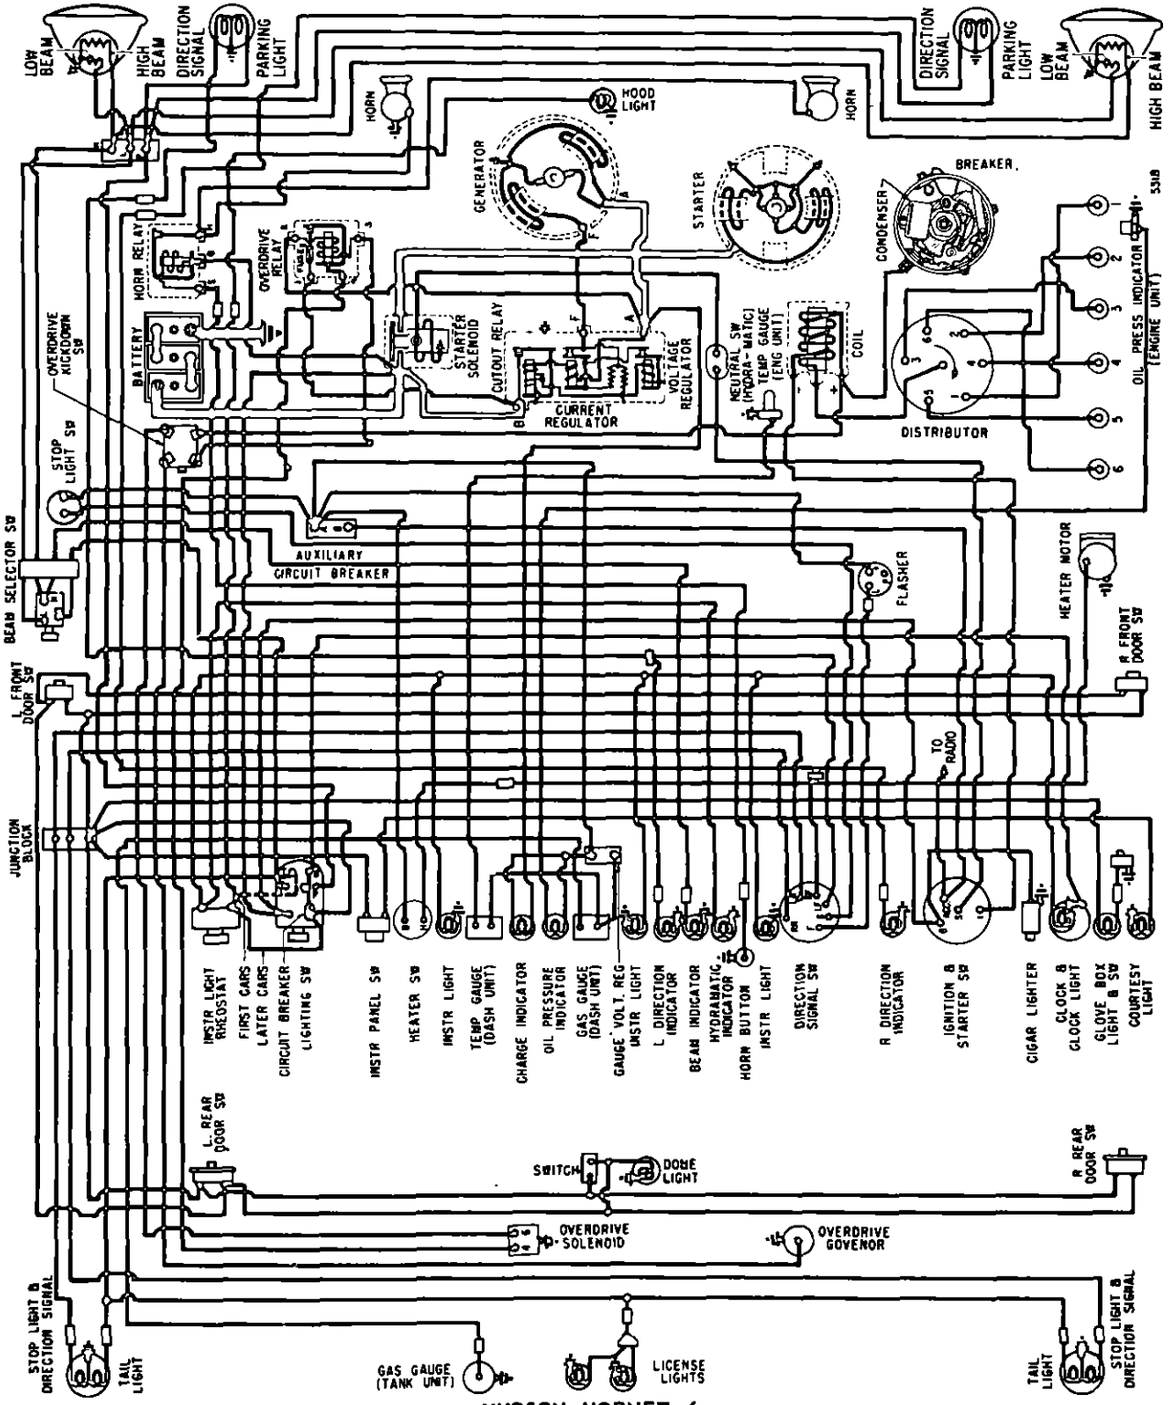
Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

▷*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
52 Max.		45(43-47)



Test A—After 15 minutes operation charging at one-half maximum output.

Test B—After additional 15 minutes operation with current regulator operating (with load applied to hold voltage down to 6.7-6.9 volts).

Air Gap—.048-.052" with contacts just opening.

Checking & Adjusting—*See Electrical Equip. Section.*

CONTINUED ON NEXT PAGE

HUDSON HORNET 6

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equipment Section.*

Direction Signal: *See Electrical Equipment Section.*

Lighting Switch Removal: Remove knob (Allen wrench) and retaining nut. Lower assembly and remove wires.

Stop Light Switch Location: At tee fitting in line to front brakes.

FUSES: Overdrive—30 ampere. On overdrive relay.

CIRCUIT BREAKER: Two used as follows:

30 ampere (Main light circuit) attached to headlight switch.

20 ampere (Ignition switch, heater motors and stop light switch), located behind dash panel on left side of cowl.

HORNS: Sparton. Twin horns. Hudson No. 3141323 (Low Note), No. 3141324 (High Note).

Current Draw—13-17 amperes (Low Note), 12-16 amperes (High Note), at 5-7 volts.

Horn Relay: Hudson No. 3141308.

ENGINE

►*AIR CONDITIONING CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 6 cyl. "L" head.

Model	Bore	Stroke	Displacement
Wasp	3"	4¾"	202 Cu. Ins.
Hornet	3-13/16"	4½"	308 Cu. Ins.

	Compr. Ratio	Rated HP	Developed HP
Wasp	7.5-1①	21.6	115 at 4000
Wasp (Twin HP)	8.0-1②	21.6	126 at 4000
Hornet	7.5-1②	34.88	160 at 4000
Hornet (Twin HP)	7.5-1②	34.88	170 at 4000

①—Cast Iron Head ②—Aluminum Head.

CYLINDER HEAD & MANIFOLDS: *See "Cylinder Head & Manifolds" in Hudson Special Data.*

►*MANIFOLD REMOVAL (WITH ENGINE IN CAR): Required for valve tappet adjustment. See VALVE TAPPET ADJUSTMENT NOTE under Tune-Up.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Hudson Special Data.*

PISTONS

Aluminum alloy, cam ground, with taper ground skirt.

Original Bore & Pistons—*See "Original Bore & Pistons" in Hudson Special Data.*

Weight—10.4 ozs. (Wasp), 18.5 ozs. (Hornet).

Removal—Pistons & rods removed from above.

Fitting New Pistons: Use ribbon feeler .002" thick and scale with both piston and cylinder bore at 70°F. Pull required to remove feeler 3-4 lbs.

Replacement Pistons: *See "Original Bore & Pistons" in Hudson Special Data.*

Installing Pistons: Notch in top of piston must be toward front of engine.

PISTON PINS

Floating type with locking ring at each end.

	Length	Diameter
Wasp	2.4375" ±.005"	.7499" +.000" - .00025"
Hornet	2.942-2.932"	.9687-.96845"

Clearance in Piston—Hand push fit with piston heated to 200°F.

Clearance in Rod—.0003". Rod should turn in piston under its own weight.

Replacement Pins: (Wasp) Std. & .002", .005", .010", .015", .020" Oversize. (Hornet) Std. & .002", .005", .010" Oversize.

PISTON RINGS

	Width	End Gap	Side Clearance
Compr.	.0775"	.004-.009"①	.002-.004"
Oil #3	.186"	.004-.009"①	.001-.003"
Oil #4	.1514"	.004-.009"①	.001-.003"

①—Wasp, (Hornet .006-.014").

Replacement Rings: Sets of Std. and .020" Oversize.

Installing Rings: Rings are pinned in piston to prevent rotation. Ring clearance on pin must be same as end gap.

CONNECTING RODS

Crankpin Journal Diameter—1.937-1.938" (Wasp), 2.1244-2.1254" (Hornet).

Original Bearing Sizes—*See "Original Bearing Sizes" in Hudson Special Data.*

Bearings—Steel backed babbitt. No shims.

Clearance—.0005-.0015". **Side Play**—.007-.013".

Replacement Bearings: Std. .001", .002", .010", .012" Undersize.

Installing Rods: Notch in top of piston toward front of engine. Spit hole in rod to thrust or camshaft side of engine.

CRANKSHAFT

Journal Diameter—2.4988-2.4998". Four bearings.

Original Bearing Sizes—*See "Original Bearing Sizes" in Hudson Special Data.*

Bearings—Steel-backed babbitt. No Shims.

Clearance—.0005-.0015".

Replacement Bearings: Std., .001", .002", .010", .012" Undersize.

End Thrust: Taken by No. 3 main bearing.

End Play—.003-.009".

Crankshaft Front & Rear Bearing Oil Seals: *See "Crankshaft & Main Bearings" in Hudson Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Hudson Special Data.*

VIBRATION DAMPENER: *See "Vibration Dampener" in Hudson Special Data.*

CAMSHAFT

Bearings—Steel-backed babbitt-lined bushings.

Clearance—.0005-.0015" (Wasp), .0015-.002" (Hornet).

Camshaft Removal—*See "Camshaft & Bearings" in Hudson Special Data.*

End Thrust: Controlled by thrust plate behind camshaft sprocket. **End Play**—.003-.005".

Timing Chain: Link Belt. **Width** 1.000" (Wasp), 1.250" (Hornet). **Pitch** .375". **Length** 60 links.

Camshaft Setting: Timing chain has two marked links, six full links apart. Both crankshaft and camshaft have a marked tooth. With crankshaft sprocket installed and turned to TDC position, install one marked link of chain over crankshaft marked tooth, insert camshaft sprocket into chain with marked link over marked tooth, rotate camshaft until screw holes line up and install screws.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Hudson Special Data.*

VALVES

Tappet Clearance: Intake .010" (Go), .011" (No Go). **Exhaust** .015" (Go), .016" (No Go). COLD.

►*TAPPET CLEARANCE ADJUSTMENT NOTE: Manifold assembly must be removed for access to valve compartment. See VALVE TAPPET ADJUSTMENT NOTE under Tune-Up.*

Wasp Valves

Valve	Head Diam.	Stem Diam.	Length
Intake	1.495-1.505"	.3412-.3422"	5.045"
Exhaust	1.390-1.400"	.3412-.3422"	5.043"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.346"	.001-.003"
Exhaust	46°	.346"	.002-.004"

Hornet Valves

Valve	Head Diam.	Stem Diam.	Length
Intake	1.831"	.3412-.3422"	5.815"
Exhaust	1.556"	.3402-.3412"	5.815"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.346"	.0015-.003"
Exhaust	45°	.346"	.002-.004"

NOTE—Valve face and valve seat angle are the same.

►*VALVE GRINDING CAUTION:* Replace valve when grinding reduces distance from upper edge of valve seat to top of valve to less than 1/16".

Valve Springs: Install springs with closed coils toward valve.

Valve Spring Specifications

Wasp	Pressure	Length
Open	116-124 lbs.	1 19/32"
Closed	40-48 lbs.	1 61/64"

Free Length—2 3/16" approximately.

Hornet	Pressure	Length
Open	153-165 lbs.	1 27/32"
Closed	73-81 lbs.	2 3/16"

Free Length—2½" approximately.

Valve Guides: Remove old guides through valve seat opening using Tool J-2814. Install new guides as follows: **Wasp**—Use Tool J-883-A with Pilot J-883-10 to install guides to depth of 1 9/32" from top of guide to top face of block. **Hornet**—Use Tool J-883-A with Pilot J-883-8 or 9 and install guides to depth of 1 7/16" (Intake), 1 3/32" (Exhaust) from top of guide to top face of block.

Valve Lifters: Mushroom type fitted directly in crankcase. Remove from below with camshaft out.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Wasp①	Open	Close
Intake	26.8° BTDC	99.7° ALDC
Exhaust	64.9° BLDC	45.7° ATDC

Hornet①	Open	Close
Intake	33.7° BTDC	80.1° ALDC
Exhaust	73.9° BLDC	28.4° ATDC

①—Valve lash .008" Intake, .010" Exhaust

Valve Timing Check—(Wasp & Hornet)—Set No. 1 Intake Valve Tappet at .010" clearance (Hot) and insert .002" feeler between tappet and valve stem. Rotate engine until a slight drag is felt on feeler gauge. **(Wasp)**—The engine is properly timed if the long mark on damper (1UDC) is 1" from pointer. The first small mark should be ¼" before the pointer. **(Hornet)**—The

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

engine is properly timed when the first of the five timing marks on the flywheel is 5/8" above the pointer in timing hole.

OILING SYSTEM

Crankcase Capacity: 5 qts. (Wasp), 7 qts. (Hornet). Add ½ qt. for dry engine.

Normal Oil Pressure: 40 lbs. at 30 MPH.

Pressure Regulator Valve—Non-adjustable spring loaded, located on left side of cylinder block.

Oil Pressure Indicator Switch: King-Seeley 47185 (Wasp), 47170 (Hornet). On right side of engine above oil pump. Contacts open at 11-15 lbs. Switch is sealed (not adjustable).

Oil Pump: Rotor type. Angle mounted on right side of engine and driven by camshaft.

Pump Overhaul, Removal & Installation—*See "Oiling System" in Hudson Special Data.*

Oil Filter: Fram or Hudson. Replace filter cartridge at 5000 mile intervals.

Replacement Filter Element—Hudson No. 8990183.

Crankcase Ventilation: Oil-wetted type filter element in oil filler cap (air intake). Outlet pipe in rear valve compartment cover on right side of engine.

COOLING

►*RADIATOR TO FAN BLADE CLEARANCE CAUTION (Wasp):* There should be ½" clearance between radiator core and fan blades on cars equipped with standard or overdrive transmissions. Starting with Serial No. W-5886, all cars with standard and overdrive transmissions are equipped with Rear Engine Support Plate Hudson No. 3146059 to provide this ½" clearance.

Water Capacity: 14 qts. (Wasp), 19½ qts. (Hornet).

Pressure Valve: 7 lb. radiator filler cap (standard), 13 lb. cap with air conditioning.

Thermostat: Hudson No. 5325067 (157°-162°). Located in cylinder head water outlet housing.

Water Pump: Centrifugal type with non-adjustable packless type seal. *NOTE*—Water pump discharges into brass water distributing tube to provide uniform circulation around valves.

See "Hudson" in Water Pump Section.

Pump Removal—Remove generator adjusting bracket, remove fan blade as assembly and pump mounting bolts. Remove pump from engine.

Temperature Gauge: King-Seeley Electric "CV" type (constant voltage) with gauge voltage regulator.

See "Temperature Gauges" in Miscellaneous Section.

Dash Unit—King-Seeley 46372.

Engine Unit—King-Seeley 44200.

CLUTCH

Borg & Beck. (Wasp) 9A7, (Hornet) 10A6.

Assembly No.—(Wasp) 1361, (Hornet) 1385.

Clutch Disc. No.—(Wasp) 382118 Std., 382191 Overdrive.

Clutch Disc. No.—(Hornet) 382372 Std., 382215 Overdrive.

Pedal Adjustment: Pedal free travel ½-¾". Adjust length of beam to throw-out lever rod. Lengthening rod reduces free play. NOTE—Do not disturb clutch pedal to beam rod adjustment.

►*CAUTION:* Pedal-to-beam rod should not be disturbed in service. This rod can be checked (with pedal against floor board) as follows: **Wasp**—Clearance between flat surface of beam lever and rear edge of bracket should be 7/8". **Hornet**—Outer end of beam lever should project 5/16" from beam toward the rear.

►*WASP CLUTCH BEAM INSULATOR DISTORTION CORRECTION:* To correct this condition, reinforce the new insulator with .015" shim made up to same dimensions as insulator.

Removal: Remove transmission (see below), disconnect clutch pedal linkage, remove housing and pan, punch-mark flywheel, clutch cover, and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange. Remove clutch and driven disc.

SYNCHRO-MESH TRANSMISSION

Warner. 3 Speed Std. Transmission & Overdrive Optl. *See "Warner Transmissions" in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect brake tube bracket on underside of body. Disconnect torque tube (see Rear Axle Removal below). Disconnect hand brake cable at bellcrank and brake cable housing at bellcrank bracket. Move rear axle to rear to disconnect front universal joint from transmission mainshaft. Disconnect speedometer cable and shift rods (On Overdrive Cars, disconnect overdrive control and wiring). Remove two upper transmission mounting screws, install guide pins (Tool J-1434) in these holes, remove two lower mounting screws, slide transmission straight back to clear clutch pilot bearing, remove transmission from beneath car.

OVERDRIVE

Warner R10. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Warner R10 Overdrive Controls" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Range four speed automatic transmission with fluid coupling.

See "Hydra-Matic Drive" in Transmission Section.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid every 1000 miles, drain and refill at 25,000 mile intervals.

Capacity—8½ qts. (9½ qts. after overhaul).

Checking Fluid Level—Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of two minutes after transmission has reached normal operating temperature. With selector lever in "N" position, remove dipstick and check fluid level (dipstick located under right front floor plate). Add "AQ-ATF" Hydra-Matic fluid to bring level to "F" mark.

►*CAUTION:* Do not check fluid level when transmission is excessively hot and do not fill above "F" mark on dipstick.

►*OTHER HYDRA-MATIC DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit, Mechanics and Saginaw. One used at front end of propeller shaft.

See Universals Section for complete data.

REAR AXLE

Own. Semi-floating, hypoid gear type with torque tube drive.

See "Hudson Rear Axles" in Rear Axle Section.

Axle Ratio—Used as follows:

	Standard	Overdrive	Hydra-Matic
Wasp	4.1-1 (9-37)	4.4-1(8-35)	3.6-1(12-43).
Hornet	4.1-1(10-41)	4.4-1(9-40)	3.2-1(13-41).

Backlash—.002-.006". Shim adjustment.

Axle Shaft Removal: Remove wheel. Pull drum (use hub puller J-736-B). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims. Withdraw axle shaft with puller J-2498. Do not drag shaft splines on inner oil seal.

Rear Axle Assembly Removal: Raise and support rear of body. Disconnect hand brake cable at bell crank and cable housing at bracket. Disconnect torque tube at transmission, rear brake hose at bracket on body floor pan, rear springs and shock absorbers from axle tube, and stabilizer bar at tube. Roll assembly from beneath car.

Wheel Bearing Adjustment: Shims behind brake backing plate.

SHOCK ABSORBERS

Direct acting hydraulic type. Serviced by replacement.

Front—Hudson No. 3118500. **Rear**—3117364. Set of two.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper end of steering knuckle pin and seat in outer wheel house panel.

See "Hudson" in Front Suspension Section.

►*CASTER & CAMBER LOSS OF ADJUSTMENT CORRECTION:* Beginning engine No. X-1152 (Hornet), W-1200 (Wasp), improved eccentric bolt nut (deeper counter-bore) provides more positive locking of eccentric adjusting bolt. If necessary, 5/8" I.D. washer may be installed to insure locking of the bolt and eccentric washers.

►*FRONT CROSSMEMBER INSTALLATION CAUTION:* When installing front crossmember the distance between centers of either front or rear mounting bracket bolt holes must be 19½" to insure maintaining front wheel alignment.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

King Pin Inclination–3°36'.
Caster–(Without Power Steering) Pos. ½° desired, limits 0° to Pos. ½°. (With Power Steering) 1° desired, limits Pos. ½° to Pos. 1°.
Camber–0° desired, limits Neg. ¼° to Pos. ¼°.
Toe-In–1/16-3/16".
Toe-Out on Turns–Outer wheel 20°, Inner wheel 24° (Wasp), 26° (Hornet).

STEERING

Gemmer. Worm & Roller with push-pull adjustments. *See "Gemmer Worm & Roller" in Steering Section.*
Power Steering: Monroe Linkage type. *See "Monroe Linkage Power Steering" in Steering Section.*
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" Steering Gear in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller" Steering Gear in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor (without Eccentric). Service brake system has "Mechanical Follow-up" linkage (between pedal and parking brake linkage). Hand lever applies rear wheel service brakes.

See "Bendix Hydraulic, Single Anchor" in Brake Section.

►*WASP BRAKE CHATTER CORRECTION (Caused by Uneven Wheel to Hub Contact Ledges): See "Bendix Hydraulic, Single Anchor" in Brake Section.*

►*SOFT OR SPONGY BRAKE PEDAL CORRECTION:* When correct bleeding of brake system does not eliminate soft or spongy brake pedal, check master cylinder to pedal shaft brace. When pedal shaft flexes at this point (due to poor engagement of slot in pedal shaft with elongated hole in brace), it is advisable to elongate the two mounting bolt holes at rear of brace, move brace back so slot in shaft engages small hole in keyhole slot in brace. Use Bite Washer Hudson No. 3138264 in place of lockwashers to retain brace in proper location. Late production cars have above correction completed.
Drum Diameter–10" (Wasp), 11" (Hornet).
Wheel Cylinder Diameter–1 1/8" (Front), 15/16" (Rear).
Replacement Lining & Shoes–Shoes with lining, or linings only furnished in Std. size only.

Lining Width & Length

Wasp	Front	Rear
Primary	2¼ x 8½"	1¾" x 8½'
Secondary	2¼" x 11"	1¾" x 11"
Hornet	**Front**	**Rear**
Primary	2½" x 9 3/8"	2" x 9 3/8"
Secondary	2½" x 12"	2" x 12"

Clearance–.015" heel and toe of secondary shoe with primary shoe out against drum, or adjusting screw backed off 14 notches or clicks from point where wheel can just be turned by hand.

Mechanical Follow-up Cable Adjustment–Depress brake pedal against 3½" spacer block on floor (with pedal cable and pushrod disconnected), adjust mechanical follow-up cable length at clevis end so that clevis pin can be installed freely with no slack in cable.

Standard Master Cylinder: Under front floor at left of transmission.
Checking Fluid–Roll back floor mat, remove access hole cover in floor pan, maintain fluid ½-1" below filler opening.
Removal–Remove from beneath car. Not necessary to disturb other parts.

Power Brakes: Bendix Power Unit. *See "Bendix Power Unit" in Brake Section.*
Checking Fluid–Check every 1,000 miles. Maintain fluid to within ½" of filler opening.

MISC. MECHANICAL

Windshield Wipers: Vacuum operated type. *See "Windshield Wipers" in Miscellaneous Section.*
Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Miscellaneous Section.
Power Window Regulators: Electric. Reversible motor in each door.
See "Power Window Regulators" in Miscellaneous Section.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to center of cowl panel under hood.

Starting Serial Number– Kenosha Y-1001, El Segundo YC-1001, Unassembled Export YKD-1001.

ENGINE NUMBER: Below right exhaust manifold.

Starting Engine Number–P-1001.

TUNE-UP

►*HARD STARTING CORRECTION (CARS BEFORE ENGINE NO. P-14763) & CARBURETOR PRODUCTION CHANGE: See "Carter WGD" in Carburetion Section for installation of Atmospheric Vent.*

►*POOR WARM-UP CORRECTION & CARBURETOR PRODUCTION CHANGE: See "Carter WGD" in Carburetion Section for recommended changes on carburetors date-coded before tag date "M-5" or Engine No. P-24900.*

►*SLOW COLD STARTING CORRECTION:* Check spark plugs, breaker points, all electrical connections, and ignition timing. See that carburetor choke valve has .005" clearance in all positions and that choke valve and shaft operate freely. Choke vacuum piston must operate freely in cylinder and there must be no bind between unloader arm on choke lever and fast idle link. *NOTE–*Automatic choke may be set one point rich or lean from standard setting to improve starting and warming up performance.

COMPRESSION PRESSURE: 140 lbs., at cranking speed (150 RPM), with wide open throttle.

VACUUM READING: 19" at 1500 RPM. 17.25" at 425 RPM.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic type. Located at left manifold outlet.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders–RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plug–(Before Engine No. P-6001) Champion H-10 or Auto-Lite AL-7. (After Engine No. P-6001) Champion N-8 or Auto-Lite AG-5. Tighten plugs to 30 ft. lbs.

COIL: Auto-Lite CR-6001.

Ignition Current–2.30 amps. (idling).

DISTRIBUTOR: (Before Engine No. P-6001) Auto-Lite IBK-4001. (After Engine No. P-6001) Auto-Lite IBK-4001-B.

Condenser–Auto-Lite IBB-2015L. **Capacity** .25-.28 mfd.

Contact Point Set–Auto-Lite IGW-3028JS.

Breaker Gap–.017"±.002".

Cam Angle–33°-39°.

Breaker Arm Spring Tension–17-20 ozs.

Rotation–Counter-clockwise viewed from above.

Automatic Advance–IBK-4001

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		300	0		600
1		325	2		650
11		600	22		1200
19		1135	38		2270
20		1200	40		2400

Automatic Advance–IBK-4001-B

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		300	0		600
1		375	2		750
8		850	16		1700

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	6 1/4"
1	2	6 5/8"
6	12	9"
11	22	12 1/8"
12	24	13"

IGNITION TIMING

Setting–5° BTDC.

Timing Mark–Timing indicator on chain cover marked 0 - 5 - 10 - 15. Align groove in vibration dampener with correct mark on indicator.

CARBURETOR

Carter WGD, No. 2231S (Early), 2231SA (Later). Dual downdraft type with automatic choke.

►*HARD STARTING CORRECTION (CARS BEFORE ENGINE NO. P-14763) & CARBURETOR PRODUCTION CHANGE:* An atmospheric vent has been incorporated in later carburetors and can be installed on early cars to correct a hard starting condition. *See "Carter WGD Carburetor" in Carburetor Section.*

►*POOR WARM-UP CORRECTION & CARBURETOR PRODUCTION CHANGE: See "Carter WGD" in Carburetion Section for recommended changes on carburetors date-coded before tag date "M-5" or Engine No. P-24900.*

►*SLOW COLD STARTING CORRECTION: See TUNE-UP (above).*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting–½-1½ turns open. Turn screws out for richer mixture.

Idle Speed–425 RPM with transmission in "N". (Air Conditioning turned on).

Float Level–¼" from underside of bowl cover to top of float at center with needle valve seated. Measure with bowl cover and float assembly inverted. *NOTE–This ¼" setting supersedes original specification of 3/16". See also "Hard Starting Correction" above.*

Fast Idle: .030" throttle opening or clearance between valve and wall on side opposite idle ports with choke valve tightly closed. Adjust by bending choke rod at lower angle.

Unloader Adjustment–With fast idle adjustment completed, hold throttle valve wide open and close choke valve as far as possible. **Do not force choke valve closed.** Clearance between upper edge of choke valve and inner wall of air horn should be 3/16" (Gauge T109-28). Adjust by bending choke shaft unloader arm.

Automatic Choke: 1 point rich.

►*OTHER DATA: See "Carter WGD Carburetor" in Carburetor Section.*

THROTTLE LINKAGE ADJUSTMENT: *CAUTION–Control rod dimensions should be checked and length adjusted before linkage adjustment is made.*

Control Rod Dimensions: Check and adjust each rod as follows:

Carburetor Throttle Rod (from carburetor throttle lever to accelerator pedal lever)–Over-all length of rod from center of ball pivot at carburetor end to "L" bend at rear end of rod must be 15½". Adjust by loosening locknut near forward end and turning end fitting in or out of rod.

Adjuster Rod (Upper throttle rod from carburetor throttle rod to cross-shaft lever)–Over-all length between centers of rod ends must be 6 9/16". Adjust by bending rod at existing bend near center.

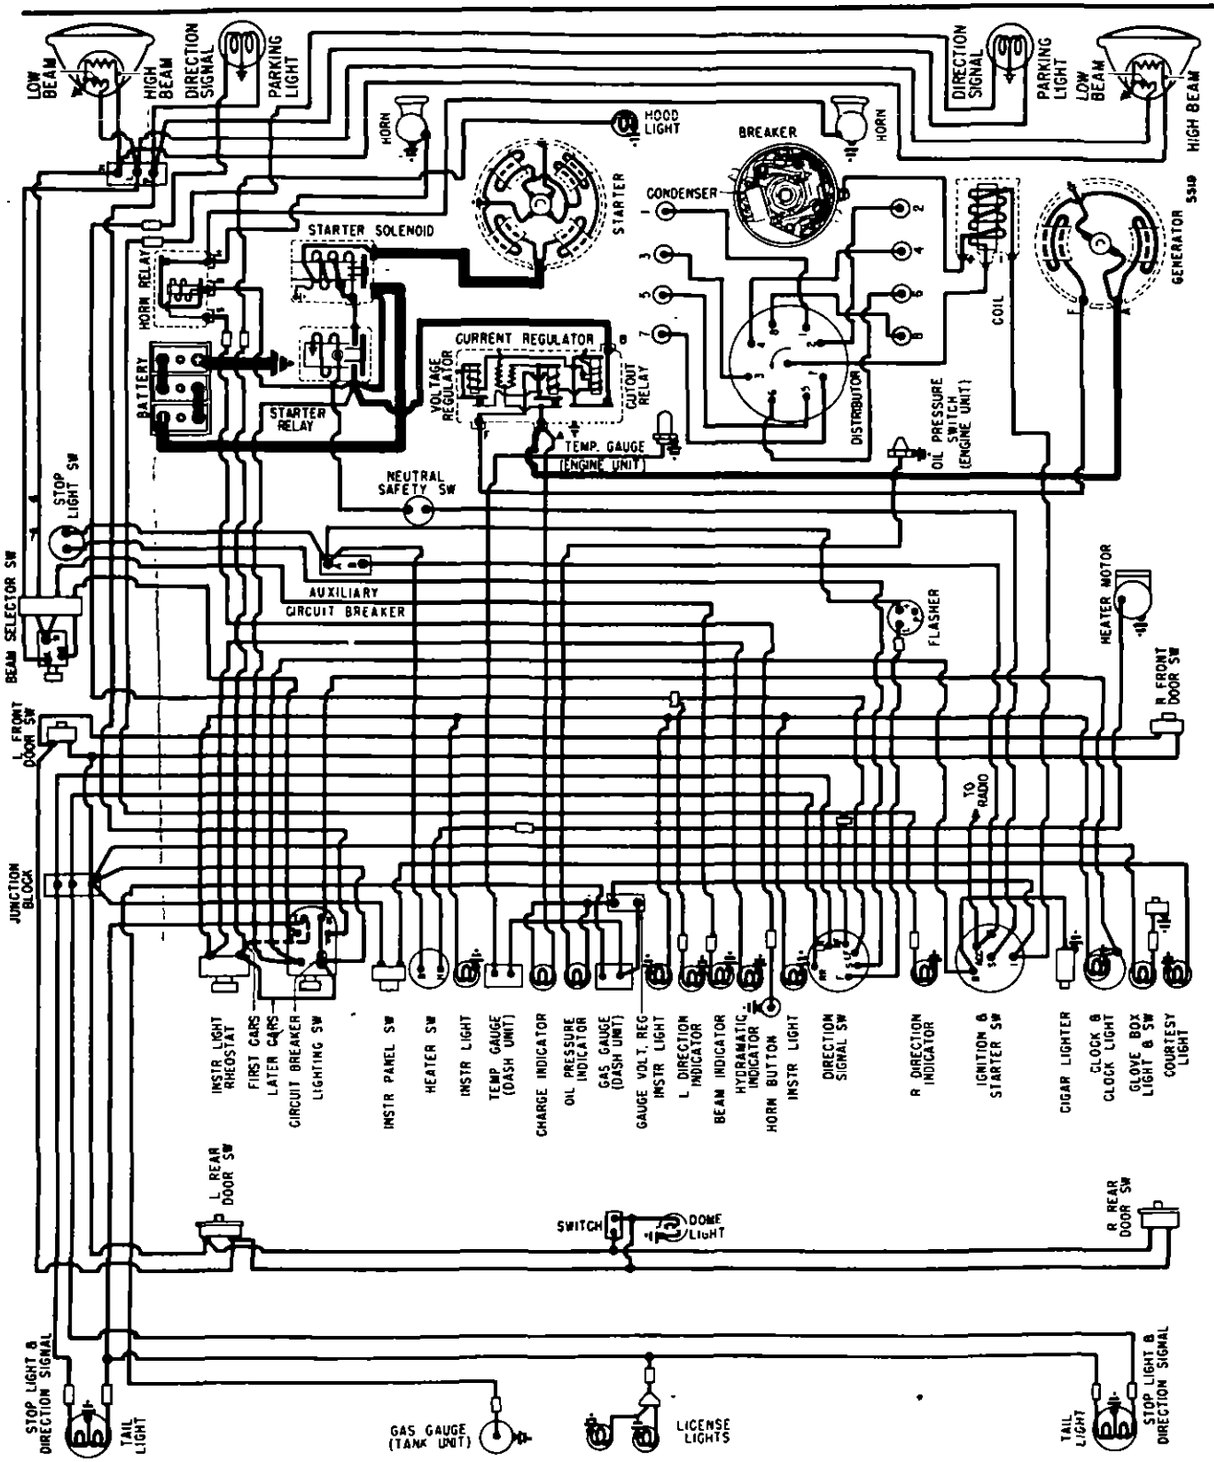
Throttle Valve Rod (Lower throttle rod from cross-shaft to control lever on transmission case)–Length between center of pins at ends of rod must be 26 1/8" (measured in straight line). Adjust by bending rod.

Throttle Linkage Adjustment: Adjust engine idle speed to 400 RPM with engine at normal operating temperature. Block carburetor choke valve in the wide open position and disconnect throttle rod at throttle valve shaft outer lever at transmission. Move transmission throttle lever to the rear against its stop and hold a straight edge across milled surface at rear of transmission case. The taper on end of lever should just contact straight edge. If necessary to adjust, loosen lever clamp screw nut and turn shaft counter-clockwise until valve has reached its stop. Hold shaft in this position and rotate lever on shaft so that taper on lever lines up with milled surface on rear of case. Reconnect rod to lever. Remove carburetor air cleaner and disconnect the upper throttle rod from center hole of throttle cross shaft. Lightly hold cross shaft lever forward so that throttle valve in transmission is against its stop (*CAUTION–*Do not spring linkage). Loosen locknut at each end of adjuster (rod connector) on carburetor throttle rod so that upper throttle rod can be connected in center hole of cross-shaft lever without disturbing linkage, tighten locknuts against adjuster and make certain that rod fits freely in lever. Reset engine idle speed (see Idle Speed Setting above).

Fuel Pump Pressure: 3½-5 lbs. max. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter M2256S (Fuel & Vacuum).



Pressure–3½-5 lbs. at 500 RPM.

See "Fuel Pumps" in Carburetion Equipment Section.

Gasoline Gauge: Auto-Lite Electric type.

Dash Unit–Auto-Lite 13380A.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Tank Unit—Auto-Lite 12642A.

See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Auto-Lite 1H-105D. 6 volt, 105 ampere hour capacity (20 amp. rate).

Battery Ground—Positive.

Engine Ground—Battery to engine with body ground from transmission to rear crossmember.

STARTER

Auto-Lite MCL-6132. Armature—MCH-2122.

Drive—Overrunning clutch (solenoid pinion shift).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4900	5.0	65
8.0 ft. lbs.	Lock	2.0	410

Starting Switch: Auto-Lite Solenoid SSX-4003 mounted on starter with SEPARATE relay (Magnetic Switch), Hudson No. 3118899 on left fender apron. Controlled by combination Ignition & Starter Switch Hudson No. 308595. Turn key full right to start engine.

See "Auto-Lite Solenoid Starter Switch (No Relay)" in Electrical Section.

Neutral Safety Switch: Hudson No. 3143999. On steering column. Permits starter operation with selector lever in "P" or "N" only.

GENERATOR

Auto-Lite GGW-4801F. Armature—GGW-2006F.

Maximum Charging Rate—*See Voltage Regulator.*

Performance Data

Amperes	Volts	Cold — RPM — Hot
0	6.4	870-970 — 950-1050
45	8.0	1925-2125 — 2350-2550

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35-53 ozs.

Field Current—1.6-1.7 amps at 5.0 volts.

Belt Adjustment: ½" belt deflection midway between water pump and generator pulleys.

REGULATOR

Auto-Lite VBE-6101-A

Cutout Relay

Cuts In—6.3-6.8 volts.

Cuts Out—4.1-4.8 volts.

Contact Gap—.015" minimum.

Air Gap—.031-.034" with contact open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. After 15 minutes operation charging at one-half maximum rate.

Air Gap—.048-.052" with contacts opening.

Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
52		45 (43-47)

Test A—After 15 minutes operation charging at ½ maximum rate.

Test B—After additional 15 minutes operation with current regulator operating (load applied to hold voltage

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

down to 6.7-6.9 volts).
Air Gap–.048-.052" with contacts just opening.
Checking & Adjusting–See *Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. See *Electrical Equip. Section.*
Direction Signals: See *Electrical Equipment Section.*
Light Switch Removal: Loosen Allen screw and remove retaining nut. Push switch back and remove from dash.
Stop Light Switch: Located at tee fitting in line to front brakes.

FUSES: Radio–SFE-14 (14 amp.) in lead wire to radio.

CIRCUIT BREAKERS: Two used. 30 amp. in main light switch protects headlights, tail, instrument and interior lights. 20 amp. located on rear side of dash just forward of steering column protects stoplights, direction signal, Weather Eye blowers and accessory lights.

HORNS: Sparton. Hudson No. 3141323 (Low Note). 3141324 (High Note).
Horn Relay: Hudson No. 3141308.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*IMPROVED OIL CONTROL PRODUCTION CHANGES & CORRECTION ON EARLY CARS:* For improved oil control at the intake valve stems, THREE types of rocker arm shafts have been used in production and latest type should be installed whenever trouble experienced on cars with previous type shafts (before Engine No. P-17288). See *Rocker Arms under "Valve System" in Hudson Special Data for complete details.*

►*INTAKE VALVE STEM OIL DEFLECTOR PRODUCTION CHANGE: See VALVES below.*

ENGINE SPECIFICATIONS: V8 valve-in-head.

Bore	Stroke	Displacement
3 13/16"	3½"	320 cu. ins.

Compression Ratio	Developed HP	Rated HP
8.25-1①	208 at 4200 RPM	46.5

①–After Engine No. P-6001. 7.8-1, before Engine No. P-6001

Compression & Vacuum Reading: See *TUNE-UP.*

OIL PAN REMOVAL: Remove steering idler arm attaching bolts and drop steering linkage. Remove exhaust crossover pipe.

CYLINDER HEAD INSTALLATION: See *"Cylinder Head & Manifolds" in Hudson Special Data.*

TIGHTENING TORQUES: See *"Tightening Specifications" in Hudson Special Data.*

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset toward thrust side of piston.
Removal–Pistons and rods removed from above.
Clearance–.001-.0015" (top of skirt), .000-.0015" (bottom of skirt).
Replacement Pistons: Furnished Std. size, .010", .020", .030" oversize.
Installing Pistons: Install with "F" cast in piston strut and notch in piston head toward front of engine.

PISTON PINS

Full floating type. Retained in piston by lock rings at each end. **Diameter**–.9803".
Pin Fit in Piston–Palm press fit with piston heated in water to 200°F.
Pin Fit in Connecting Rod–Palm press fit at room temperature.
Replacement Pins: Std. size, .003", .006" oversize.
Piston Pin Bushing (In Connecting Rod) Installation: See *"Piston Pins" in Hudson Special Data.*

PISTON RINGS

Three rings (two compression & one oil) used. Upper compression ring is chrome plated.

Ring	Width	End Gap	Side Clearance
Compr.	.078"	.010-.018"	.0015-.005"
Oil	.186"	.010-.018"	.0015-.005"

Installing Rings: Install upper compression ring and oil ring with gap toward camshaft side of engine. Install lower compression ring with gap toward opposite side from camshaft. All gaps should be midway between piston pin bosses.

CONNECTING RODS

Length–6 25/32" (center-to-center).
Crankpin Journal Diameter–2.250".
Lower Bearing–Replaceable precision type.
Clearance–.0005-.0025". **Sideplay** .003-.011".
Replacement Bearings: Std. size, .001", .002", .020" undersize.
Installing Rods: Install odd numbered rods in left bank and even numbered rods in right bank, with numbers on rods facing down and away from block and milled oil groove in connecting rod cap upward and toward crankshaft.

CRANKSHAFT

Journal Diameter–2.500". Five bearings.
Bearings–Precision type. The four front crankshaft bearings are interchangeable.
Clearance–.0005-.0025".
Replacement Bearings: Std. size, .001", .002", .020" undersize.
End Thrust: Taken by No. 5 (rear) main bearing.
Endplay–.0035-.0085".
Crankshaft Rear Main Bearing Oil Seal: See *"Crankshaft & Main Bearings" in Hudson Special Data.*
►*CRANKSHAFT REAR MAIN BEARING OIL LEAK CORRECTION: See "Crankshaft & Main Bearings" in Hudson Special Data.*
Crankshaft Front Oil Seal: See *"Engine Front Cover" in Hudson Special Data.*
Vibration Dampener: See *"Vibration Dampener" in Hudson Special Data.*

CAMSHAFT

Bearings–Five, steel-backed babbitt lined precision bearings.
Clearance–.0005-.0045".
End Thrust: Taken by thrust plate behind camshaft sprocket. **Endplay**–.004-.006".
Camshaft Removal & Installation: See *"Camshaft & Bearings" in Hudson Special Data.*
Timing Chain & Sprocket Removal–See *"Timing Chain" in Hudson Special Data.*
Engine Front Cover Removal: See *"Engine Front Cover" in Hudson Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Hudson Special Data.*
Camshaft Setting: Both sprockets marked "0". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers.

VALVES

►*INTAKE VALVE STEM OIL DEFLECTOR PRODUCTION CHANGE:* Starting with Engine No. P-13644, Intake Valve Stem Oil Deflector, Part No. 6476056, entered production. The deflector, a rubber cap, is located over valve stem and installed on top section of cast valve guide. This deflector can be installed on all earlier engines for improved oil control.
Tappet Clearance: Hydraulic lifters. Adjustment not required unless cylinder head removed or valve lifters replaced. See *"Valve Tappet Adjustment" in Hudson Special Data.*

Valve	Head Diam.	Stem Diam.	Length
Intake	1.937"	.3725"	5.712"
Exhaust	1.687"	.3715"	5.690"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.374"	.001-.002"
Exhaust	45°	.374"	.002-.003"

Valve Seat Width–3/64" (Intake), 5/64" (Exhaust).
Valve Springs: Single springs used. Install springs with two closely wound coils against cylinder head.

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	78-86 lbs.	1¾"
Open	158-172 lbs.	1 3/8"

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance excessive. Valves are furnished with .003", .010", .020", .030" oversize stems.
Checking Valve Stem Clearance and Reaming Guides for Oversize Valve Stems: See *"Valve System" in Hudson Special Data.*
Valve Lifters: Hydraulic type.
Hydraulic Valve Lifter Removal, Overhaul & Testing–See *"Valve System" in Hudson Special Data.*
Rocker Arm Assembly: See *"Valve System" in Hudson Special Data.*
►*ROCKER ARM SHAFT PRODUCTION CHANGES (For Improved Oil Control): See "Valve System" in Hudson Special Data.*
►*ROCKER ARM SQUEAK CORRECTION (Caused by insufficient oil reaching rocker arm shafts): See "Valve System" in Hudson Special Data.*

VALVE TIMING

See *"Camshaft Setting" under* CAMSHAFT above.
Intake Valves–Open 14° BTDC. Close 56° ALDC.
Exhaust Valves–Open 52° BLDC. Close 18° ATDC.
Valve Timing Check: Remove cylinder head cover and spark plugs. Crank engine until No. 6 piston in right bank is on TDC (on compression stroke). This places No. 1 piston on TDC on the exhaust stroke overlap position. Rotate crankshaft 90°. Install a dial indicator on No. 1 intake rocker arm pushrod end. Crank engine slowly in direction of rotation (clockwise) until dial indicator indicates pushrod movement, (the hydraulic lifter should be fully charged for this check). At the time dial indicator moves, the ignition timing

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

mark on vibration dampener should align with the 14° (approximately) position on the degree quadrant section of the timing assembly cover. *NOTE–If more than ½" variance in either direction is evident, remove engine front cover and inspect timing chain installation.*

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill).

Normal Oil Pressure: 45 lbs. at 40 MPH. 10 lbs. at idle speed.

Pressure Regulator–In oil pump. Not adjustable.

Oil Pressure Indicator: Red light on instrument panel. Lighted when engine oil pressure low.

Oil Pressure Switch–King-Seeley 47195.

Oil Pump: Gear type. On rear main bearing cap, driven through distributor drive and camshaft gear.

Oil Pump Removal, Overhaul & Installation–*See "Oiling System" in Hudson Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe in valve tappet cover.

COOLING

Water Capacity: 21 qts. (with heater), 20 qts. (without heater).

Pressure Valve: Radiator filler cap. 7 lbs. (Std.) 14 lbs. (With Air Conditioning).

Thermostat: 170°. Starts to open at 167°-173° F.

Water Pump: Packless type with sealed ball bearing.

See "Hudson V8" in Water Pump Section.

Temperature Gauge: King-Seeley Electric type.

Dash Unit–K-S No. 46372.

Engine Unit–K-S No. 44215.

See "Temperature Gauges" in Miscellaneous Section.

ULTRAMATIC DRIVE

Packard "Twin-Ultramatic". Torque converter (with hydraulic operated direct speed clutch) and hydraulic operated planetary unit.

►*ULTRAMATIC HIGH RANGE CLUTCH AND LOW RANGE BAND FAILURE CORRECTION: See "Twin-Ultramatic Transmission" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Twin-Ultramatic Transmission" in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level–*(CAUTION–Fluid level must be checked at normal operating temperature and after engine has been idling at 800 RPM for at least one minute to completely fill system).* Run engine at low idle speed while fluid level is being checked, using dipstick located in engine compartment. Add fluid as required to bring level to "Full" mark on dipstick.

Capacity–22 pints. Use only Automatic Transmission Fluid Type A having an AQ-ATF number on can.

Linkage Adjustment: See *CARBURETOR* above.

►*OTHER TWIN-ULTRAMATIC DATA: See "Twin-Ultramatic" in Transmission Section.*

UNIVERSALS

Mechanics or Saginaw. One universal joint used at front end of propeller shaft.

REAR AXLE

Own. Semi-floating, hypoid gear type with torque tube drive.

See "Hudson Hypoid" in Rear Axle Section.

►*PROPELLER DRIVE SHAFT NOISE CORRECTION & PRODUCTION CHANGE:* A noise developing at 58-62 MPH under light throttle pressure, either pull or coast (similar to rear axle gear noise) may be caused by drive shaft and can be corrected by installing a two-piece shaft Part No. 3145400. The later two-piece shaft replaced the former one-piece shaft in production at Car Serial Y-5887.

►*REAR AXLE RATIO PRODUCTION CHANGE:* Beginning with Car Serial No. Y-5887, the rear axle ratio has been changed from 3.54-1 (11-39), to 3.2-1 (13-41). When installing a new service axle having the 3.2-1 ratio, speedometer gear, Part No. 6450318 (18 teeth), and adaptor, Part No. 6450518 is required.

Axle Ratio–3.54-1 (11-39) before Car Serial V-8235. 3.2-1 (13-41) after Car Serial V8235. **Backlash**–.002-.006"

Rear Axle Assembly Removal: Raise rear of body. Disconnect hand brake cable at bellcrank and the housing at bracket. Disconnect torque tube from transmission, rear brake hose at bracket on body floor pan, rear springs, shock absorbers and rear axle stabilizer bar at axle tube. Roll axle from under car and remove truss rods, torque tube and propeller shaft from rear axle.

Axle Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644-B). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims and replace same amount when reassembling). Withdraw shaft using Puller J-2498, do not drag on inner seal.

Wheel Bearing Adjustment: Shims behind brake backing plate.

Rear Suspension: *See "Hudson Rear Suspension" in Rear Axle Section.*

SHOCK ABSORBERS

Delco or Monroe. Direct acting type. Serviced by replacement.

Front Shocks–Hudson Part No. 3118500 (Set of 2).

Rear Shocks–Hudson Part No. 3117364 (Set of 2).

FRONT SUSPENSION

Independent. With coil springs located between upper ends of steering knuckle pin and seat in outer wheelhouse panel.

See "Hudson" in Front Suspension Section.

►*CAMBER & CASTER ECCENTRIC BOLT NUT BOTTOMING ON SHOULDER OF ECCENTRIC BOLT CORRECTION & PARTS PRODUCTION CHANGE:* (Eccentric bolt nut will not tighten sufficiently to prevent bolt from turning). On early cars install a 5/8" I.D. washer between nut and eccentric washer. At Car Serial No. Y-1292 the counter-bore of the eccentric nut has been increased to 3/16".

Kingpin Inclination–6½°.

Caster (Manual Steering)–½° Pos. desired, with 0-½° Pos. limit **(Power Steering)** 1° Pos. desired with ½-1° Pos. limits.

Camber–0° desired with ¼° Neg to ¼° Pos. limit.

Toe-In–1/16-3/16".

Toe-Out on Turns (Manual Steering)– Inner wheel 25°, Outer wheel 20¼° **(Power Steering)** Inner wheel 25°, Outer wheel 21¼°.

STEERING

►*POWER STEERING PUMP VIBRATION CORRECTION & PUMP BRACE PRODUCTION CHANGE (AIR CONDITIONED CARS):* Install Power Steering Pump Brace Part No. 3146406, between cover capscrew and engine cylinder head. Cars after Serial No. Y-6374 have the brace installed in production.

Manual: Gemmer Model 305. Worm & Roller with "push-pull" adjustments.

See "Gemmer Steering Gears" in Steering Section.

Power Steering: Monroe "Linkage Type". *See "Monroe Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix. Hydraulic duo-servo single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See "Bendix Hydraulic" in Brake Section.

►*SPONGY BRAKE PEDAL CORRECTION (EXCEPT POWER BRAKES): See "Brake Notes" in Hudson Special Data.*

Drum Diameter–11".

Wheel Cyl. Diameter–1 1/8" (Front), 15/16" (Rear).

Lining Width–2½" (Front Wheels), 2" (Rear Wheels).

Lining Length–9 3/8" (Primary Shoes), 12" (Secondary Shoes).

Clearance–Back off adjusting screw 14 notches from point where wheel can just be turned by hand.

Standard Master Cylinder: Mounted on support under floor pan to left of transmission.

Checking Fluid–Remove access cover under floor mat on left side. Maintain level ½-1" below filler top.

Removal–Remove from below without disturbing other parts.

Power Brakes: Bendix Power Unit. Replaces standard cylinder.

See "Bendix Power Unit" in Brake Section.

Removal of Power Unit–Remove vacuum and air cleaner hoses at inlet tubes. Remove hydraulic line. Disconnect pushrod from brake pedal linkage. Remove unit from mounting brackets.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Own. Compressor clutch controlled magnetically. Inoperative unless control knob turned "ON". *See "Hudson Air Conditioning" in Miscellaneous Section.*

►*AIR CONDITIONER COMPRESSOR VIBRATION CORRECTION & COMPRESSOR BRACE PRODUCTION CHANGE (Cars before Serial No. Y-6448): See "Hudson Air Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electric. Individual motors in each window. *See "Power Window Regulators" in Miscellaneous Section.*

HOOD ASSEMBLY
ALL MODELS (EXC. DARRIN)

HOOD ADJUSTMENT: Loosen bolts attaching hinge to cowl bracket, and hood to hinge arm enough to permit movement at these points, but still tight enough to retain adjustment until final tightening. Close hood and check for fit, using cowl contour and fender lines as guides. A telescoping joint is provided at the center of hood crossbar for hood adjustment at cowl and at hood edge and fenders (spread hood using a suitable spreader to lower hood line at cowl, and extend edges of hood at fenders. To raise hood at cowl, and provide clearance at edge of hood and fender, reverse spreading operation). Adjust hood for snug fit at anti-squeak molding by adjusting hinges at vertical slots in cowl bracket. Hood can be moved to one side or the other by pressure at nose of hood, for movement of hood mounting bolts in hinge arm. Fenders may also be moved vertically a slight distance to align fender line and hood line.

TIGHTENING SPECIFICATIONS
1946-48 "L" HEAD ENGINE

	Ft.Lbs.	In.Lbs.
Cylinder Head Bolts①	40-50	480-600
Spark Plugs	5-10	60-120
Con. Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mtg. Bolts	36-40	432-480
Camshaft Sprocket Bolts	35-40	420-480
Camshaft Retaining Nut	30-35	360-420
Filler Block Screws	14-16	168-192
Int. & Exh. Manifolds	31-35	372-420
Oil Pan Screws	10-14	120-168

①—Tighten cold and recheck with engine at 150°.

1949-55 "L" HEAD ENGINE

	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts	30-35	360-420
Spark Plugs	30	360
Con. Rod Bearing Bolts	40-45	480-540
Main Bearing Cap Bolts	85-95	1020-1140
Flywheel Mounting Bolts	35-40	420-480
Camshaft Sprocket Nut	35-40	420-480
Int. & Exh. Manifolds	30-35	360-420
Vibration Dampener Bolt	100-130	1200-1560

CAUTION—Torque figures given are for clean and dry threads. If threads oiled, reduce torque approx. 10%.

"F" HEAD ENGINE

	Ft. Lbs.	In. Lbs.
Cylinder Head Bolts	60-70	720-840
Spark Plugs	25-35	300-420
Con. Rod Bearing Bolts	50-55	600-660
Main Bearing Cap Bolts	65-75	780-900
Flywheel Mtg. Molts	35-41	420-492
Camshaft Thrust Plate	20-26	240-312
Int. & Exh. Manifolds	29-35	348-420

ENGINE
"L" HEAD ENGINE

ENGINE REMOVAL: Drain cooling system and proceed as follows:

1)—Remove hood and radiator assemblies. Disconnect and remove battery. Remove distributor, air cleaner and carburetor. Disconnect throttle lever from linkage and shaft on cylinder head.

2)—Disconnect fuel pump inlet line at frame, and disconnect wiper hose from tubing at pump.

3)—Remove the two nuts attaching engine front endplate to engine front mounts. Disconnect exhaust pipe at manifold flange and at hanger clamp on clutch housing.

4)—Disconnect solenoid to starting motor cable, water temperature gauge engine unit, wiring at engine oil gauge unit, cable coil negative terminal and the wiring at generator.

5)—Disconnect engine rear mount from #2 crossmember, gearshift rods at transmission, overdrive control cable, and wiring to overdrive electrical controls. If car is equipped with Hydra-Matic, remove throttle rear rod and throttle lever from transmission. Disconnect speedometer cable, and remove or disconnect propeller shaft as necessary.

6)—Disconnect clutch linkage (if Synchro-mesh Trans.).

7)—Attach suitable engine lifting bracket to cylinder head (#7 and #28 cylinder head bolts—see Head Diagram). Raise hoist and turn engine at a slight angle to frame with front of engine higher than rear, then remove engine from car. Be extremely careful while removing to prevent damage to car and accessories.

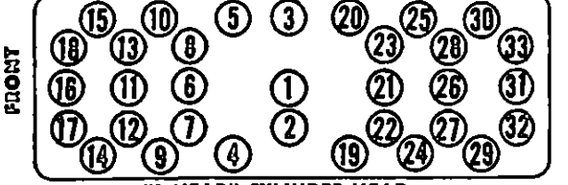
OIL PAN
"L" HEAD ENGINE

OIL PAN REMOVAL: Raise front end of car and support it securely on stands. Disconnect steering drag link at idler arm on frame, turn wheels to right and work drag link clear of oil pan. Drain oil, remove oil pan capscrews and lockwashers, slide pan to rear.

▷INSTALLATION NOTE—Lower Filler Blocks (front and rear) must be removed to install new oil pan side gaskets. See "Front & Rear Filler Blocks" under Crankshaft & Main Bearings (above) for data.

CYLINDER HEAD & MANIFOLD
"L" HEAD ENGINE

CYLINDER HEAD INSTALLATION: Following procedure is recommended:

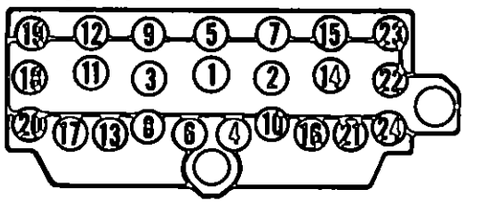


1) Blow out all blind tapped holes in head to insure full tightening of bolts without bottoming.

2) Install guide pins in head bolt holes #14 and #30 (see diagram). These holes are smaller diameter in gasket and head for piloting. *NOTE*—Guide pins can be made from #207354 Head Bolts by cutting heads off and slotting end so that they can be installed and removed with a screwdriver.

3) Install head gasket and cylinder head.

4) Coat head bolts with Perfect Seal Gasket Paste, K-F No. 200047, tighten bolts snugly in sequence shown in head diagram, then torque bolts to 30-35 ft. lbs. in same sequence.



5) Warm engine up to normal operating temperature and retorque bolts to 30-35 ft. lbs. Check head bolts and gasket for leaks. *NOTE*—Recheck head bolts after 500-600 miles of operation.

"L-HEAD" CYLINDER HEAD

"F" HEAD ENGINE

CYLINDER HEAD INSTALLATION: Use a torque indicating wrench to tighten cylinder head stud nuts and cap screws, tighten in correct sequence as shown in diagram and to correct torque as shown in tightening specifications. Recheck with engine warmed up to operating temperature of 150°F.

"F-HEAD" CYLINDER HEAD

ORIGINAL BORE & PISTONS
"L" HEAD ENGINE

BORE & PISTON SIZES: Engines originally equipped at factory with special oversize pistons may be identified by code letter following engine number: "N"—Pistons are .020" Oversize.

"AN"—Pistons .020" Oversize. Main and connecting rod bearings Undersize (See Original Bearing Sizes).

"NX"—Pistons .020" Oversize. Main bearings are Undersize (see Original Bearing Sizes following).

"F" HEAD ENGINE

BORE & PISTON SIZES: Engines originally equipped at factory with special oversize pistons may be identified by code letter following engine number: "B" or "AB"—Pistons and cylinder bores .010" Oversize.

PISTONS
"L" HEAD ENGINE

PISTON IDENTIFICATION: Two types of aluminum alloy pistons used which can be identified as follows:

▷*CAUTION—Piston weight different on each type.*

Strut Type Piston—Has wide strut embedded within skirt at each piston pin boss and drilled oil drain holes in both #3 and #4 ring grooves.

T-Slot Type Piston—Has horizontal slot in lower (#4) ring groove and short vertical slot on one side of piston skirt. #3 oil ring groove has drilled oil drain holes.

REPLACEMENT PISTONS: See "Piston Identification" for types used. Each type piston furnished in following sizes: Standard, .005", .010", .020", .025", .030", .040", .050", .060" Oversize.

▷*CAUTION—Piston weight different on each type.*

PISTON RINGS
"L" HEAD ENGINE

REPLACEMENT RINGS: Standard type cast iron rings, or Chrome type Oil Control Rings furnished in Standard size and the following oversizes (below). Chrome type rings are recommended for engines being overhauled after high mileage and especially where cylinder bore out-of-round and taper are near the "high limit."

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Replacement Ring Oversizes—Cast iron type or Chrome type, furnished either singly or in complete sets. Standard size, .010, .030", .040", .050" Oversize.

ORIGINAL BEARING SIZES

"L" HEAD ENGINE

MAIN & CONNECTING ROD BEARING SIZES: Engines originally equipped with special undersize main and connecting rod bearings may be identified by code letter following engine number:

"A"—Main & Connecting Rod Bearings .010" Undersize.
"X"—Main Bearings .002" Undersize.
"AN"—Main & Connecting Rod Bearings .010" Undersize and Pistons Oversize (see Original Bore and Pistons).
"NX"—Main Bearings .002" Undersize and Pistons Oversize (see Original Bore and Pistons).

"F" HEAD ENGINE

MAIN & CONNECTING ROD BEARING SIZES: Engines originally equipped with special undersize main and connecting rod bearings may be identified by code letter following engine number:
"A" or "AB"—Main and Connecting Rod Bearings .010" Undersize.

CRANKSHAFT & MAIN BEARINGS

"L" HEAD ENGINE

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front and rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket). Rear filler blocks (additional **upper filler block guard** in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger. Filler blocks can be removed and replaced without disturbing crankshaft as follows:

Front Filler Block (Lower) Servicing: Remove by taking out mounting capscrews and timing gear cover capscrews which enter the filler block. When installing filler block, first install oil pan side gaskets (No. 200266), install filler block (use Perma-tex), install new end gasket (No. 200267) on block.

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal). Remove and discard old gasket or seal. Install new seal (no. 204654) in same manner as described below for Rear Filler Block (Upper) Guard. Install lower filler block **after** upper filler block guard has been installed.

Rear Filler Block (Upper) Guard Servicing: Guard is seated in groove in crankcase and can be "rotated" out without disturbing crankshaft after lower filler block removed. Remove and discard old gasket or seal, clean out seal groove. Install new graphite impregnated seal (no. 204654), flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward the center (ends must extend slightly above flat surface of guard). **Do not use shellac or sealing compound in groove.**

►***CAUTION***—Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft. If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal.

"F-HEAD" ENGINE

REAR BEARING OIL SEAL: Consists of a wick type packing installed in grooves in bearing cap and crankcase. To install new packing, insert packing in groove, working both ends toward center with round piece of wood or steel. With packing firmly seated in groove, cut off ends flush with surface. *NOTE*—Crankshaft must be removed to install packing in upper (crankcase) half of bearing.

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case. When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. *CAUTION*—Do not cut off this protruding portion of the packing.

FLYWHEEL

1951-53 "L" HEAD ENGINE

►***CRANKSHAFT OR FLYWHEEL REPLACEMENT (HYDRA-MATIC DRIVE CARS)—If it is necessary to replace crankshaft or flywheel, determine if ⅜" spacer is located between crankshaft flange and flywheel. If so, proceed as follows for correct replacement:***

Crankshaft Replacement—Replace original parts with the following: Crankshaft—No. 209227; Hydra-Matic Flywheel—No. 209001; Flywheel Bolts—No. 209005; Flywheel to Crankshaft Dowel (Oversize)—No. 209002. DISCARD THE ⅜" SPACER WHEN THESE PARTS ARE INSTALLED.

Flywheel Replacement—To install a new flywheel on the original crankshaft, use a service replacement flywheel and the ORIGINAL ⅜" SPACER AND FLYWHEEL BOLTS. ***NOTE—One Dowel only used in new flywheel, (Part No. 209002). See "Flywheel" (below) for installation data.***

FLYWHEEL REPLACEMENT (HYDRA-MATIC DRIVE CARS): Remove flywheel to crankshaft dowel using Tool KF-115-1 (Dowel must be tapped 5/16"-24 to use Tool KF-115-1). Remove flywheel bolts, plates and flywheel (CAUTION—Do not hammer on flywheel or damage torus cover gasket surface). ***IF ⅜"SPACER FOUND BETWEEN FLYWHEEL AND CRANKSHAFT, see "Crankshaft Replacement Note" above.***

Installation—Clean crankcase flange and mating surface on flywheel being careful not to scratch or nick surfaces. Use Acetone to remove Pliobond 30 sealing compound. Apply a thin coating of Pliobond sealing compound, about ½" wide on crankshaft flange surface at bolt circle diameter, smoothing compound toward outer edge. Allow to dry about one minute. Install flywheel on crankshaft flange and enter all flywheel bolts through plates. Replace bolts and hardened plates and tighten bolts. (CAUTION—Diametrically opposite bolts should be tightened to 105 ft. lbs., uniformly or leakage may result). Mount dial indicator so stem or button rests on torus cover gasket sealing area and check flywheel runout which should not exceed .005" total indicator reading. Ream dowel hole using Tool KF-115-3, 115-4, 115-5, 115-6. (CAUTION—Bolts used for holding guide are not heat treated alloy steel and should be tightened only enough to hold block firmly to flywheel). Install dowel using Tool KF-115-7, making sure that dowel does not extend beyond face of crankshaft flange.

►**Flywheel Replacement Note**—Service crankshaft and crankshaft in partial engine service assembly have a dowel hole 15/32" in diameter. When installing either of these parts, enlarge the dowel hole using a sharp ½" drill and Tools KF-115-2, 115-3, 115-4, before reaming for oversize dowel (Part No. 209002).

CAMSHAFT & BEARINGS

1947 "L" HEAD EN INE

CAMSHAFT CHANGE (1947): Two different camshafts are used (camshaft changed when fuel pump mounting location changed) and can be identified as follows:

Early Cars—Fuel pump mounted at rear of engine.
Later Cars—Fuel pump mounted at front of engine.

Replacement Camshafts for All Engines

K-F Part No. 200113.....Fuel Pump at Rear
K-F Part No. 203017.....Fuel Pump at Front

"L" HEAD ENGINE

CAMSHAFT REMOVAL: Camshaft can be removed with radiator off and engine in car as follows:

1. Remove timing gears (remove both gears and chain as an assembly). This requires removal of vibration dampener and pulley, timing gear cover.
2. Remove cylinder head.
3. Remove fuel pump.
4. Remove oil pan, oil pan return tube & oil pump.
5. Lift valves, using valve spring lifter tool C-482 (see Note below), block valves up by inserting a clothespin or block of wood under each valve head. NOTE—Remove right front tire and wheel and take off splash shield under fender for access to valves.
6. Block up valve Lifters (lift each lifter up by hand and fasten in upper position with a wire).
7. Remove Camshaft Thrustplate by taking out two screws retaining thrustplate on crankcase.
8. Pull camshaft out through front of engine.

Camshaft Bearing Replacement Note—Requires removal of engine from car for access to plug at rear of block which must be removed.

1951-55 "L" HEAD ENGINE

CAMSHAFT & REPLACEMENT PARTS CAUTION: ***TWO DIFFERENT CAMSHAFTS used in production and special VALVE LIFTERS and OIL PUMP DRIVE GEAR must be used with each camshaft as listed below.***

Camshaft

Type & Identification①	Part No.
Cast Iron (Circle O & #733340)	207218
Steel Forging (#700599)	203017

①—Identification number and marks are cast or stamped on shaft.

VALVE LIFTERS: Steel lifters must be used ONLY with Cast Iron camshaft. Cast Iron lifters can be used with Cast Iron or steel camshaft.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Lifters

Type & Identification	Part No.
Steel (Stamped with "diamond")	②207171
Cast Iron (no mark)	②207219

②—Std. Size. Also furnished .001", .002", .005" Oversize.

OIL PUMP DRIVE GEAR: Oil pump drive gear must be SAME material as camshaft (use Cast Iron gear with cast iron camshaft, steel gear with steel camshaft).

Oil Pump Drive Gear

Type & Identification	Gear	Gear & Shaft
Cast Iron (Stamped "O")	207222	207221
Steel (no mark)	200248	203185

VALVE SYSTEM

1947-50 "L" HEAD ENGINE

VALVE LIFTER REMOVAL: Lifters can be removed **on some cars,** without disturbing head, as follows: Remove splash shield under right front fender for access to valve compartment. Remove valve spring seat lock (retaining pin on early cars, split type locks on later cars). Turn tappet clearance adjusting screw down as far as possible, remove valve spring. Working through spark plug hole, lift valve up with a wire to provide clearance. Turn tappet clearance adjusting screw up free of the lifter barrel, tilt adjusting screw and locknut to clear valve stem and lift these parts out of the lifter barrel. Raise lifter barrel up until lower end clears hole in block, then tilt barrel and remove.

►***NOTE—If lifter barrel cannot be emoved in this manner, remove cylinder head and remove valve.***

VALVE TAPPET ADJUSTMENT

"L-HEAD" ENGINE

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below). Remove right front wheel and access cover in fender splash shield for access to valve compartment. Remove spark plugs so that engine can be turned over by moving fan or fan belt. By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment.**

Valve Tappet Adjustment Order (numbered from FRONT of engine)

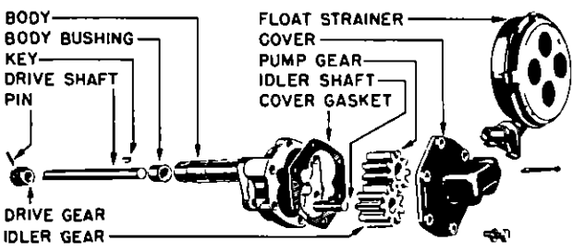
Fully Raise Valve	Then ADJUST Valve:
Nos. 1 and 3	Nos. 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos. 2 and 6	Nos. 7 and 11
Nos. 10 and 12	Nos. 1 and 3
Nos. 4 and 5	Nos. 8 and 9
Nos. 7 and 11	Nos. 2 and 6

ROCKER ARMS

"F-HEAD" ENGINE

ROCKER ARM ASSEMBLY REMOVAL: Lock the rocker arms, shaft, brackets, and springs together as a unit by removing the cover studs in front and rear rocker arm shaft brackets and installing four 5/16"-24 thread set screws in the two front and two rear brackets in the same way the set screws are installed in center brackets. Remove the nuts on the six bracket studs and lift entire assembly off studs as a unit.

INSTALLATION: Check push rods, straighten or replace any that are bent. Place push rods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of push rods before installing nuts on bracket studs. Torque nuts to 30-36 ft. lbs. Remove four extra set screws from two front and two rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.



OILING SYSTEM

OIL PUMP

"L" HEAD ENGINE

OIL PUMP SERVICING: Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling. Service pump as follows:

Disassembly—Take out cotter pin and remove screen float assembly. Remove cover and gasket. Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear. remove idler gear (remove idler shaft if required). Take off lower drive gear (press fit and keyed to shaft).

"L-HEAD" ENGINE OIL PUMP

Oil Pump Clearances—Check as follows:

1)—Pump Body Bushing: if over .005" clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to .500-.501".

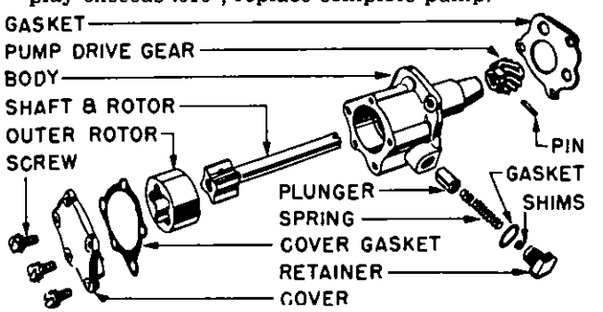
2)—Pump Shaft: shaft diameter .4990-.4985".

3)—Lower Drive Gear: end of gear should be .001-.006" beyond gasket seat on pump body.

4)—Upper Drive Gear: .002-.004" clearance between underside of gear and upper end of pump body. Controlled by pressing lower drive gear on shaft until this clearance obtained.

NOTE—Cover plate should be replaced if worn from contact with gears, or if cracked.

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose). Replace by using drift inserted in distributor drive shaft bore from top of block. Install new bushing from below (must be flush with bottom of block).



Reassembly—Press upper drive gear on shaft with pin hole at right angles to tongue on shaft. Insert new pin and peen ends flush with gear. Install shaft and gear in pump body. Press lower drive gear on shaft (with key in place) until .002-.004" clearance obtained between upper drive gear and upper end of pump body. Press idler gear shaft in body, install idler gear. Install cover using new gasket and pin oil screen float assembly on cover. Check shaft and gears—must rotate freely when turned by hand.

Oil Pump Installation—Set #1 piston at top dead center. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx. parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut. Remove distributor shaft for cyl. head installation.

►***CAUTION—Check Ign. Timing after pump installed.***

"F" HEAD ENGINE

OIL PUMP REMOVAL & OVERHAUL: (Removal)—Rotate engine until distributor rotor points to No. 1 firing position and timing mark on flywheel or vibration dampener is directly under pointer. On 4 Cyl. Models do not remove distributor (pump must be installed so gears mesh without moving rotor for correct engine timing). On 6 Cyl. Models, remove distributor. (CAUTION—Engine must not be rotated with oil pump removed). Remove pump mounting bolts and pull pump out as far as possible. Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (Note—It may be necessary to loosen engine support bolts for more movement). Check pump shaft for wear before disassembling pump by mounting it in a vise with a dial indicator bearing against shoulder on gear, at right angles to relief valve housing. Move gear toward, then away from indicator and note total reading. If this play exceeds .010", replace complete pump.

"F-HEAD" ENGINE OIL PUMP

Disassembly: Remove cover screws, cover and gasket and shake outer rotor from housing. Remove relief valve retainer, gasket, shims, spring, and plunger. If rotor is to be replaced, file off one end of gear retaining pin, pull gear off shaft and remove shaft and inner rotor from housing. Clean all parts in solvent and check for wear, pits and scoring.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Checking Rotor Clearance: Position inner rotor with one lobe engaged between two lobes of outer rotor, then measure clearance of opposite inner rotor lobe and lobe of outer rotor. This clearance should not exceed .010". To check end clearance, place a small piece of .010" shim stock on inner rotor so that it does not overhang edge of rotor at any point. Install cover and gasket and tighten screws. If shaft can be turned by hand, end clearance is excessive. Install new cover and repeat test. If rotors still not tight, replace rotors.

Reassembly: Install relief valve, spring, gasket and retainer. If shims were removed, install them between spring and retainer. If new rotors installed, slide gear on shaft after installing shaft and rotor in housing. Position gear so there is not over .010" clearance between gear and pump housing and drill a 5/32" hole through pump shaft for retaining pin. Install pin and peen ends. Install cover and gasket and tighten screws.

Installation (6 Cyl. Models): Make certain that No. 1 piston is on top dead center and that timing mark on flywheel or vibration dampener is directly under pointer. Install new gasket between pump and block and be sure that gasket matches pump intake and discharge ports. Start pump into mounting hole but do not engage gears. Insert a long screw driver through distributor hole and engage slot in pump drive gear. Rotate pump gear so that when meshed with camshaft gear, slot will be practically vertical with off-set to rear, as it enters camshaft gear. As pump is pushed in and gears are fully meshed, slot will be about 45° from vertical position. (NOTE—If gear is meshed one tooth away from the correct position, slot will be 36° off, which is readily noticeable). Install distributor and check ignition timing.

COOLING SYSTEM

1947-50 "L" HEAD ENGINE

RADIATOR REMOVAL: Drain water, disconnect hose connections. Disconnect two tie rods at top of radiator. Remove nuts on mounting studs underneath radiator, lift radiator up and out.

1951-55 "L" HEAD ENGINE

RADIATOR REMOVAL: Drain water, disconnect hose connections. Take out radiator-to-shroud screws, 6 total (3 each side). Lift core out, tilting upper end to rear as core being raised.

PROPELLER SHAFT NOTES

1947-50 MODELS

CENTER SUPPORT BEARING: Consists of a ball bearing on rear end of front propeller shaft mounted in rubber in steel plate mounted on frame.

Removal & Disassembly—Disconnect front and intermediate universal joints, take off nuts on center support frame mounting bolts, remove front shaft and support bearing assembly. Clamp front shaft in a vise, remove bolt, lockwasher, and plain washer on rear end of shaft (in universal joint companion flange), pull companion flange using Puller C-452. Remove rear dust shield. Pull support plate off bearing insulator, remove bearing insulator. Use jaw type puller (KF-56) and pull bearing off shaft, remove front dust shield.

►***CAUTION—Do not wash bearing in gasoline or solvent.***

Reassembly—Install front dust shield and bearing (use driver KF-11) on splined end of front propeller shaft (bearing must support shield firmly). Place rubber insulator over bearing (small diameter to rear). Coat outer surface of insulator with liquid soap and slip support plate in place over insulator (flanged end of sleeve to front, insulator bottomed against bead on inside of sleeve). Install rear dust shield, companion flange, flat washer, lock washer, and bolt. Tighten bolt until flange and dust shield bottom against shaft shoulder (25-30 ft.lbs. torque).

Bearing Support Installation: When installing front propeller shaft and support bearing assembly in car, install washers and insulators on each support stud on frame cross-member in the following order: Spacer, Bushing, Front Support Insulator (fluted end to rear), Front Support Washer (has large hole), Support Bearing Plate, Rear Support Insulator (fluted end forward), Rear Support Washer (has small hole), and nut (tighten to 15-20 ft. lbs.).

►***CAUTION—Install center bearing support on frame studs so that sleeve in which bearing seated slopes downward toward the rear to provide correct propeller shaft angularity.***

HOOD ADJUSTMENT: *See Kaiser Special Data.*

MODEL IDENTIFICATION

STARTING SERIAL NUMBERS

	Model	Serial Numbers
1947 Kaiser	K-100	K-100-001001 Up
1947 Kaiser Custom	K-101	K-101-2000001 Up
1948 Kaiser	K-481	K-481-001001 Up
1948 Kaiser Custom	K-482	K-482-001001 Up

SERIAL NUMBER: On left front door hinge post.
Body Number Note—Stamped on plate on left side of cowl or on right front face of dash.

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Nameplate on left side of crankcase. NOTE—Numeral following Engine Model Designation (first part of Engine Number) indicates Engine Plant as follows: 4—Detroit, 8—Muskegon.

►**Engine Number Symbol (Special Bore & Bearing Sizes).** *See "Original Bore & Pistons" & "Original Bearing Sizes" in Kaiser Special Data.* Note—Symbol consists of 1 or 2 letters following engine number.

TUNE-UP

COMPRESSION PRESSURE: 115-125 lbs. (for 6.86-1 Heads), 120-130 lbs. (7.3-1 Heads) at cranking speed of 140 RPM. (engine hot, all plugs out, throttle wide open). All cylinders must be equal within 10 lbs.

►*NOTE—7.3-1 Heads marked by "73" stamped on head directly above engine number pad on block.*

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAPS: .032"
Plug Type—Auto-Lite A-5 (normal driving), A-7 (for short runs or to correct hard-starting in cold climates). 14 mm. metric type.

IGNITION: *See Coil, Condenser, and Distributor.*
Breaker Gap—.020" (.018-.022").
Cam Angle or Dwell—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Distributor.*

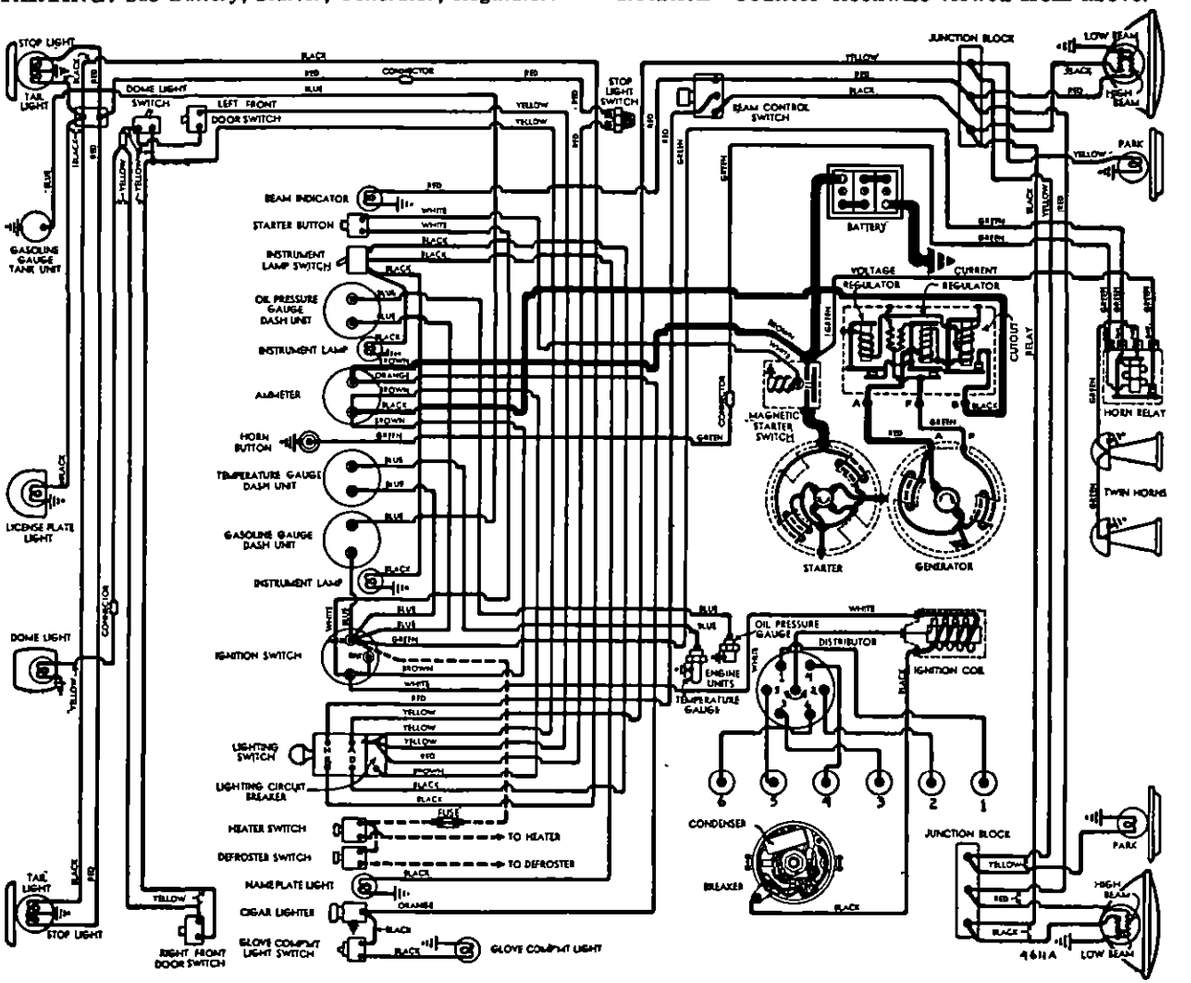
IGNITION TIMING: TDC. (at Top Dead Center).
Timing Procedure—*See Ignition Timing.*
Timing Mark—Mark "DC" on flywheel (first cars), on vibration dampener (beginning Eng. No. 17160).
Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION: *See Carburetor & Carb. Equipment.*
Idle Setting—¾-1¼ turn open—one screw (WA1 Carb.), 1¼-2¼ turns open—one screw (W1 Carb.), 1-1¾ turns open—2 screws (WCD Carb.). Turn screws out for richer mixture.
Idle Speed—550 RPM.
Float Level (WA1 Carb.)—5/16" (610S), ⅜" (622S with first Float and Inlet Valve), ½" (622SA, SB & 622S with late type Float and Inlet Valve). Measure from top of projection on bowl cover to top of soldered seam on free end of float with bowl cover assembly inverted.
Float Level (W1)—½" from top of float at free end to gasket seat on cover.
Float Level (WCD Carb.)—9/64" (685S with first type Inlet Valve); 1/16" (685S & 685SA with later type Inlet Valve) from top of each float to gasket seat on cover with valve closed (bowl cover assembly inverted).
Accelerating Pump—Lower Hole (med.) Normal.
NOTE—Pump on 574S has no seasonal adjustment.
Fuel Pump Pressure: 3½-4½ lbs. (for pump mounted at rear of engine), 3-4¼ lbs. (pump mounted at front of engine).
►*CAUTION—Pump pressure must not exceed 4½ lbs.*

►**VALVE TAPPET CLEARANCE:** *CAUTION—Two settings used.*
Before Eng. No. 10769—.010" Int., .014" Exh. Cold.
After Eng. No. 10769—.014" All Valves, Cold.

►**Adjustment Procedure**—*See Kaiser Special Data.*
NOTE—Remove splash shield under right front fender for convenience in adjusting valves.
Valve Timing Check—*See Valve Timing.*

STARTING: *See Battery, Starter, Generator, Regulator.*



IGNITION

IGNITION SWITCH: Douglas or Mitchellock. Kaiser Frazer No. 201354 (Before Kaiser No. K-100-65372 & Kaiser Custom No. K-101-2005405), No. 203186 (After above numbers).
Lock Cylinder—K-F No. 201898 (with key).

COIL: Auto-Lite Model IG-4093. Mounted on left side of cylinder head opposite distributor.
Ignition Current—3 amperes idling, 5 amperes at 6.4 volts (stopped).

CONDENSER: Auto-Lite No. IG-2671K.
Capacity—.20-.25 microfarad.

DISTRIBUTOR: Auto-Lite Model IGS-4211. Full automatic advance type with auxiliary vacuum spark control and octane selector adjustment.
IGS-4214 (Used on later '48 Cars)—*See "1949-50 Kaiser" for data on this Distributor.*
Breaker Gap—.020" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance—IGS-4211

Distributor Degrees	RPM.	Engine Degrees	R.P.M.
Start	350	0	700
1	365	2	730
3	400	6	800
7	1150	14	2300
10	1700	20	3400

Octane Selector—Manual adjustment at distributor providing 10° advance and retard. See Ignition Timing.

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance—IGS-4211

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	8"
2°	4°	9½"
4°	8°	11¼"
6°	12°	12¾"
7.5°	15°	14"

Distributor Removal: On cylinder head between #4 and #5 cylinders. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING

Std. Setting ..... At TDC.

TIMING MARK NOTE—Timing mark located on flywheel (before Eng. No. 17160), on vibration dampener (Eng. No. 17160 up). Consists of "DC" mark or "0" mark at top dead center with 1° graduations before and after this point.

Timing (with Timing Light C-693)—Mark "DC" or "0" top dead center mark on flywheel (before Eng. No. 17160), on vibration dampener (Eng. No. 17160 Up) with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine at 400 RPM. (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen clampscrew in end of arm under distributor, rotate distributor until timing mark appears in line with pointer, tighten clampscrew. Check octane selector setting.

►CAUTION—Reset engine idling speed at 550 RPM.

Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

CARTER WA-1

Carter WA1 Type 622SB superseding 622S & 622SA (All Models). 1¼" Single Barrel, Downdraft type with Fast Idle and Climatic Control.

►NOTE—622S carburetor can be converted to 622SA by installing new Float and Inlet Valve assembly and changing float level.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle (WA1 Carburetors): Carter Single Barrel

See Carburetion Equipment Section for data.

Setting—5/8" clearance between choke valve and air horn (Gauge T109-85) with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset (Tool T109-41).

Automatic Choke (WA1 Carburetors): Carter Climatic Control (Single Carburetor Type).

See Carburetion Equipment Section for complete data.

Setting—Centered (coil housing at index mark).

CARBURETOR

CARTER WCD

Carter WCD Type 685S superseded by 685SA (Optl. on Custom K-482). 1¼" Dual (double barrel), Downdraft type with Fast Idle and Climatic Control.

►NOTE—685S carburetor can be converted to 685SA by installing new intake Needle & Valve Assembly and resetting float level to 685SA specifications.

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle (WCD Carburetors): Carter Dual (WCD)

See Carburetion Equipment Section for complete data.

Setting—.016" throttle opening with choke valve held closed and throttle lever stopscrew backed off (adjust by turning fast idle screw in or out).

Automatic Choke (WCD Carburetors): Carter Climatic Control (Dual Carburetor Type).

See Carburetion Equipment Section for data.

Setting—Centered (coil housing at index mark).

CARBURETOR

CARTER W1

Carter W1 Type 574S. 1¼" Single Barrel, downdraft type with manual choke.

NOTE—This carburetor used for part production starting with following numbers: **K-100 51361, K-101 2000001.**

See Carburetor Section for complete data.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

CARB. EQUIPMENT

Air Cleaner: AC Oil-bath type. Kaiser-Frazer No. 200618 (All Models with WA1 or W1 Carburetors), No. 203372 (K-482 Custom with WCD Carburetor).

Servicing—Empty and clean reservoir, wash cleaner in kerosene, refill to indicator line with approx. 1 pint SAE No. 50 engine oil (No. 20 for below freezing tem.) at 1000 mile intervals or when engine tuned up (more often if required by operating conditions).

Fuel Pump (Early type—mounted at rear of engine): AC No. 1539057, K-F No. 200281. Diaphragm type.

►*CAUTION—Install this pump with rocker arm OVER camshaft eccentric.*

See Carburetion Equipment Section for data.

Pressure—3½-4½ lbs. maximum.

Fuel Pump (Later type—mounted at front of engine): AC No. 1539073 (K-F No. 201509) Diaphragm type fuel pump or AC No. 1539074 (K-F No. 202319) combination Fuel-and-Vacuum Pump.

Replacement Pump—AC No. 574 (for 1539073), No. 582 (for 1539074 fuel-and-vacuum pump).

►*CAUTION—Install these pumps with rocker arms UNDER camshaft eccentric.*

See Carburetion Equipment Section for data.

Pressure—3-4¼ lbs.

Gasoline Gauge: King-Seeley electric type.

Dash Unit—K-S No. 41405, Kaiser-Frazer No. 201545 (First Type—Ivory on Green), K-S No. 42015, Kaiser-Frazer No. 202786 (Later Type—White on Beige).

Tank Unit—K-S No. 7916, Kaiser-Frazer No. 201546

See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite Type 1M-100D. 6 Volt, 15 Plate, 105 Ampere Hour capacity (20 hour rate).

Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.

Location—In engine compt. on left side.

STARTER

Auto-Lite Model MAW-4043, Armature MAW-2128.

Drive—Barrel type Bendix Drive No. A1792.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
2.75 "	1480	5.0	200
5.75 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
18.0 "	Lock	4.0	670

Starting Switch: Auto-Lite Model SS-4001 magnetic switch. Mounted on starter and controlled by push-button on instrument panel.

See Electrical Equipment Section for complete data.

Removal: Flange mounted on left front face of flywheel housing. To remove, disconnect cables, take out flange mounting screws.

GENERATOR

Auto-Lite Model GDZ-4818A. Armature GDZ-2006F. Two brush type with voltage and current regulation.

Maximum Charging Rate—35 amperes, 8.0 volts, 1900 RPM. or approximately 20 MPH.

Charging Rate Adjustment—None (see Regulator).

Cold Performance Data Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
5	6.65	1060	5	6.65	1150
10	6.85	1200	10	6.85	1290
15	7.05	1340	15	7.05	1430
20	7.3	1480	20	7.3	1590
25	7.55	1620	25	7.55	1750
30	7.8	1760	30	7.8	1980
35①	8.0	1900	35	8.0	2250

①—Current Regulator setting. See Regulator data.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—35-53 ozs. (new brushes).

Field Current—1.60-1.78 amperes at 6.0 volts.

Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal: Pivot mounting at left front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts. NOTE—Remove battery for access.

Belt Adjustment: ½" belt deflection midway between generator and fan pulleys (adjust by pulling generator out with 15 lb. force with all bolts loose).

REGULAT R

Auto-Lite Model VRP-4004F-2. Vibrating type Voltage and current regulators (with Cutout Relay) in case on left fender shield.

See Electrical Equipment Section for complete data.

NOTE—Regulator cover sealed. Warranty void if seals broken.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Red jewel on left side of instrument panel (above starter button). Lighted when upper (country beams) in use.
Direction Signal (Custom Models): Mitchell (United Specialties) type.
See Electrical Equipment Section for complete data.
Direction Indicators—Right and Left indicator lights above instrument dials. Lighted when direction signal on same side of car is operating.

Switches

Lighting—Kaiser-Frazer No. 200819.
Beam Selector—Kaiser-Frazer No. 201605.
Direction Signal—Kaiser-Frazer No. 202692.
Instrument—Kaiser-Frazer No. 200821 (Before Kaiser No. K100-46044), No. 202715 (Kaiser after No. K100-46044 & all Custom cars).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	4030
Parking	3	63
Beam Ind., Clock	1	51
Instrument, Nameplate	1½	55
Stop & Tail	21-3	1154
Rear License	3	63
Dome, Glove Compt.	21	1129

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type. On back of lighting switch.
FUSES: Clock—2 ampere. In clock lead.
Direction Signal—9 ampere. In flasher lead under instrument panel to left of steering column.
HORNS: Auto-Lite. Model HT-4021 or HT-4023 (Low Note), HT-4022 or HT-4024 (High Note). Twin horns.
Horn Relay: Auto-Lite Model HRL-4101. Relay connected through ignition switch (horns operative only with ignition switch "on").
Contacts Close—1.5-3.0 volts (seal to core with 4.0 volts maximum).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (between armature leg and yoke with armature sealed to core).

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16". **Stroke**—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3.
Developed Horsepower—100 at 3600 RPM.
Compression Ratio—6.86-1 (First Cars), 7.3-1 (All Cars after Eng. No. 304305—Detroit, 66125—Muskegon).
▷*NOTE—7.3 Heads marked by "73" stamped on left front directly above engine number on block.*
Compression & Vacuum Reading—*See Tune Up data.*
TIGHTENING TORQUES: *See Kaiser Special Data.*
CYLINDER HEAD INSTALLATION: *See Kaiser Special Data.*
ENGINE REMOVAL: *See Kaiser Special Data.*
OIL PAN REMOVAL: *See Kaiser Special Data.*
PISTONS: Two types used. Aluminum alloy, Cam-ground, Tin-plated, strut type with split skirt, or T-slot type. Length 3 9/16" (both types).
Original Bore & Piston Sizes—*See Kaiser Special Data.*
NOTE—Pistons can be identified by drilled oil drain holes in fourth ring groove and strut within skirt at each pin boss (Strut Type), or by horizontal slot in fourth ring groove and short vertical slot on one side of skirt (T-slot Type).
Weight—15.58 ozs. (strut type), 14.28 ozs. (T-slot).
Clearance—.0255-.0315" (Top Land). See Fitting new pistons.
Removal—Pistons and rods removed from above.
Fitting New Pistons: Use .0015" feeler stock ½" wide inserted on side opposite slot. Pull to withdraw feeler must be 5-10 lbs.
Replacement Pistons—*See Kaiser Special Data.*
Installing Pistons: Slot in skirt toward left or away from camshaft (all types). NOTE—On pistons marked by arrow on head, arrow toward front of car.
PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled for oil drainage (all types), fourth groove drilled (strut type pistons), slotted (T-slot pistons).

Ring	Width	End Gap	Side Clearanec
Compr. (#1)	.0925-.0935"	.008-.016"	.0025-.004"
Compr. (#2)	.0925-.0935"	.008-.016"	.0015-.0035"
Oil (#3, 4)	.1550-.1545"	.008-.016"	.001-.0025"

Installing Rings: Side marked "TOP" (compression rings) upward.
Replacement Rings—*See Kaiser Special Data.*
PISTON PIN: Diameter—55/64". **Length**—2 13/16". Floating type, with lock ring at each end.
Pin Fit in Piston—Tight fit (—.0003" clearance), or push fit with piston heated to 212°F. (heat piston in water at 212°F. to install new pins).
Pin Fit in Rod Bushing: +.0003" clearance. When installing oversize pins or new bushings, ream bushings for this clearance with DD-82-2 Reamer (used also to ream piston pin bore in piston).
Replacement Pins: Std. size and .003", .005" Oversize.
CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".
▷*CAUTION—Special bearing sizes used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.*
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0023". **Sideplay**—.006-.010".
Bearing Adjustment: None. Replace bearings. Do not file rods or bearing caps.
Replacement Bearings: Furnished Std. Size and .001", 002". .010". .012" Undersize.
Installing Rods: Rods and bearing caps marked. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).
CRANKSHAFT: Four bearing, counterweighted type with vibration dampener on forward end.
Journal Diameters—2.3744-2.3752".
▷*CAUTION—Special bearing sizes used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.*
Bearings—Removable, steel-backed babbitt-lined.
Clearance—.0015-.002".
Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. Upper main bearing shells can be "rotated" out by installing tool KF-8 in crankshaft journal hole (lug on tool engages edge of bearing when crankshaft rotated).
Filler Block (Front & Rear) Removal & Installation *See "Crankshaft & Main Bearings" in Kaiser Special Data.*
Replacement Bearings: Furnished Std. size and .002", .004", 010" Undersize. NOTE—Two types of #1 bearings (flanged & unflanged). See Endplay data.
End Thrust: Taken by front (#1) bearing (special thrustwasher used with unflanged bearings). Controlled by shims installed between bearing journal and thrustwasher. **Endplay**—.004-.006".
Endplay Adjustment—*See "Crankshaft & Main Bearings" in Kaiser Special Data.*
CAMSHAFT: Four bearing. Two-sprocket chain drive. NOTE—Two different camshafts used due to relocation of fuel pump. Camshaft No. 200113 (first cars—pump at rear), No. 203017 (later cars—pump at front).
Journal Diameters—#1, 1 7/8"; #2, 1 13/16"; #3, 1 3/4"; #4, 1 1/4".
Bearings—Steel-backed, babbitted bushings.
Clearance—.002-.004".
Bearing Adjustment: None. Replace bushings with camshaft removed.
End Thrust: Taken by thrust plate on front of engine Between front bearing journal and sprocket.
Camshaft Removal: *See "Camshaft & Bearings" in Kaiser Special Data.*
Timing Chain: Non-adjustable type. Width 1". Pitch .500", Length 23" or 46 links.
Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3395-.3387"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3481"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width—5/64-3/32" (intake), 3/32-7/64" (Exhaust). Use KF-58 Relief Counterboring Set to remove any high shoulder in block above valve head.
Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides for correct clearance using Reamer C-249.
Valve Guide Installation—Use Driver DD-849. Drive old guide down and out, drive new guide down into place (same height as old guide with mark on driver stem in line with top face of block). NOTE—Tapered end of guide must be upward.
Valve Springs: Check spring with tester C-647. Pressure should be 101±3 lbs. at 1⅜". Spring free length 1 15/16".

ENGINE

CONTINUED FROM PRECEDING PAGE

	Spring Pressure	Length
Valve Closed	51 lbs.	1 43/64"
Valve Open	113 lbs.	1 5/16"

Valve Lifters: Barrel type. NOTE—Lifters can be removed (some engines only) without disturbing cylinder head. *See "Valve System" in Kaiser Special Data.*
Clearance—.0005-.0018". With correct clearance, lifter should rotate in bore with a slight drag.
Replacement Lifters—Furnished Std. size and .0005", .001", .0015", .002" Oversize.

VALVE TIMING

►**Tappet Clearance:** *CAUTION—Two settings used:*
Before Eng. No. 10769—.010" Int., .014" Exh. Cold.
After Eng. No. 10769—.014" All Valves, Cold.
►**Adjustment Procedure**—*See Kaiser Special Data.*
Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With tappet clearance set at .014" (running clearance), #1 exhaust valve should close with piston 10° or .045" after top dead center with the ten-degree mark after the dead center mark "DC" at indicator in flywheel housing inspection hole (before Eng. No. 17160). Beginning with Eng. No. 17160, marks located on dampener.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, exhaust valve lifters, timing chain. Oil pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Under plug on right side of crankcase between #4 & #5 cylinders. Opens at 35 lbs. Adjustable by adding or removing washer, No. 200272, between end of spring and plug.
Oil Pan Removal: *See Kaiser Special Data.*
Crankcase Ventilation: Filter element in oil filler cap Outlet pipe located on front valve cover plate.
Oil Pump: Gear Type. In crankcase.
Oil Pump Servicing—*See Kaiser Special Data.*
Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.
Oil Pressure Gauge: King-Seeley electric type.
Dash Unit—K-S No. 41410, Kaiser-Frazer No. 201539 (First Type—Ivory on Green), K-S No. 42020, Kaiser-Frazer 202787 (Later—White on Beige).
Engine Unit—K-S No. 40767, K-F No. 201540.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Sealed system (relief valve in filler cap) with positive circulation and thermostat.
Capacity (First 22" Radiator)—15 qts. (14 qts. at driving level). **(Later 17" Radiator)** 13½ qts. (13 qts. at driving level).
Pressure Valve—AC. No. 846740 (Radiator Filler Cap). Opens at 3¾ lbs. (3¼-4¼ lbs.).
Radiator: Two types used as follows:
First Cars—No. 200445 (22" wide). Service by installing later type (No. 202906) and installing Radiator Shroud Side Panel Extension No. 203100 (two required), using No. 576 screws (10 required).
Later Cars—Radiator No. 202906 (17" wide).
Radiator Removal—*See Kaiser Special Data.*
Water Pump: Centrifugal type with ball bearing shaft.
See Water Pump Section for complete data.
Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only). In water outlet elbow on cylinder head.
Setting (Std. type)—Begins to open at 148-155°F.
Temperature Gauge: King-Seeley electric type.
Dash Unit—K-S No. 41415, Kaiser-Frazer No. 201543 (First Type—Ivory on Green), K-S No. 42025, Kaiser-Frazer 42025 (Later—White on Beige).
Engine Unit—K-S 40380, Kaiser-Frazer 201550.
See Miscellaneous Section for complete data.

CLUTCH

Borg & Beck.....**Model 9A7**
Auburn (Some Cars).....**Model 9251-15**
Clutch Identification—Types can be identified by number of pressure plate springs—3 (Auburn), 9 (Borg & Beck—cover also stamped "951").
See Clutch Section for complete data.
Facings (Borg & Beck)—Woven asbestos, 2 required. I.D. 6". O.D. 9¼". Thickness ⅛".
Facings (Auburn)—Moulded metallic or Raybestos, 2 required. I.D. 6". O.D. 9¼. Thickness .135".
Pedal Adjustment: Pedal free travel ¾-1". To adjust, position nut on pedal assist spring link (at rear end of spring) so that it is lined up with spring adjusting gauge, KF-10, installed on spring.
Removal: Remove transmission (see Transmission Removal below), remove clutch housing underpan, disconnect clutch pedal cross-shaft from pedal linkage. Install Clutch Plate Aligning Arbor, C-360, to hold clutch parts in alignment, take out mounting screws in clutch cover flange (rotate flywheel so that all screws accessible through pan opening). Remove aligning arbor, remove clutch cover assembly and driven member through underpan opening.

TRANSMISSION

Warner Model AS11-T86E. All helical gear type. Constant-mesh, synchro-mesh (Second and High), sliding gear (Low and Reverse).
See Transmission Section for complete data.
Transmission Control: Remote control type with gearshift lever mounted on steering column.
See Transmission Section for complete data.
Removal: Disconnect front propeller shaft at front universal joint (take out bolts in transmission companion flange), move shaft out of the way. Disconnect speedometer drive cable and transmission control levers at transmission case, free parking brake cable support bracket from frame cross-member. Remove four bolts mounting engine support on frame cross-member (support comes out with transmission). Loosen all four bolts mounting transmission on clutch housing, remove two lower bolts only (CAUTION—two upper bolts must support transmission until ready for removal). Remove flywheel housing underpan, raise rear end of engine (place jack under flywheel, use wood block between jack and flywheel) for sufficient clearance for transmission removal. Remove the two upper transmission mounting bolts, move transmission back until clear of clutch, slide tranmission clear of cross-member and remove from beneath car.

UNIVERSALS

Detroit Series 4200. Ball-and-trunnion type or Mechanics. Roller bearing type. Three used with intermediate universal at propeller shaft support

Propeller Shaft & Support Bearing: Two shafts used:
Propeller Shaft & Support Bearing Servicing—*See "Propeller Shaft" in Kaiser Special Data.*

REAR AXLE

Spicer (Salisbury) Model 41-2. Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratio—4.09-1 Std., 3.73-1 Special.
Backlash—.003-.006". Shim adjustment.
Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange. disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers and sway eliminator links (when used) at spring seat, disconnect parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.
Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out using Puller KF-15.
Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential pinion), then adjust endplay at left wheel. **Endplay**—.001-.006".

SHOCK ABSORBERS

Monroe. Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

	Front	Rear
Kaiser-Frazer No. (Std.)	201490	201493
Kaiser-Frazer No. (Exp.)	202864	202866

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—4¾—5¾° crosswise.
Caster—0° preferred (—1° to +1°).
Camber—¼° preferred (0° to ¾°).
Toe-In—1/16". Adjust by turning both tie rods
Steering Geometry (Toe-out): Inner wheel 23°. Outer wheel 20°. No adjustment. Check for bent steering arms.

STEERING GEAR

Gemmer Model 305. Worm-and-Roller type with "push-pull" adjustments.
NOTE—Both "2-tooth Roller" and "3-tooth Roller" types used. Both gears are similar design.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear wheel service brakes.
See Brake Section for complete data.
Drums—Composite (cast-iron & steel). Diameter 11"
Clearance—.008" at heel and toe of each shoe.
Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).
Hand Brake: See Service brake data (above).

HOOD ADJUSTMENT: *See Kaiser Special Data.*

M_DEL IDENTIFICATION

SERIAL NUMBER: On left front door hinge post.
1949 Numbers—Model K-1491—K-491-001000 and up, Deluxe K-492—K-492-001000 and up.
1950 Numbers—Prefixed by K-501 (Special and Traveler), K-502 (Deluxe).
Body Number Note—Stamped on plate on right front face of dash in engine compartment.

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Name Plate on left side of crankcase.
NOTE—Numeral following Engine Model Designation (first part of Engine Number on Engine Name Plate) indicates Engine Plant: 4—Detroit, 8—Muskegon.

►**Engine Number Symbol (Special Bore & Bearing Sizes).** *See "Original Bore & Pistons" & "Original Bearing Sizes" in Kaiser Special Data.* Note—Symbol consists of 1 or 2 letters following engine number.

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. (7.3-1 Heads) at cranking speed of 70 RPM. (engine hot, all plugs out, throttle wide open). All cylinders must be equal within 10 lbs.
NOTE—7.3-1 Heads marked by "73" stamped on head directly above engine number pad on block.

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4 .See diagram.

SPARK PLUG GAPS: .032".
Plug Type—Auto-Lite A-5 or AR5.

DISTRIBUTOR: Breaker Gap—.022" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

IGNITION TIMING: 4° BTDC.
Timing Procedure—*See Ignition Timing.*
Timing Mark—4th. graduation before top dead center "0" mark on vibration dampener.

►***CAUTION—Engine must be idling below 450 RPM. when setting timing.***
Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION:
Idle Setting—(WA1) ¾-1¾ turns open—one screw. (WCD) 1-1½ turns open—two screws. Turning screws out gives richer mixture.
Idle Speed—550 RPM.
Float Level (WA1 Carb.)—½" from top of projection on bowl cover to top of soldered seam on free end of float (bowl cover inverted).
Float Level (WCD Carb.)—Flush to 1/32" from top of each float to gasket seat on cover with valve closed (floats must hang free on inverted cover).
Accelerating Pump—(WA1) Lower Hole, med., Normal. (WCD) Lower Hole, short stroke, Normal.

Choke Setting: Centered (coil housing at index mark).

Fuel Pump Pressure: 3-4½ lbs. (pump mounted at front of engine).

►***CAUTION—Pump pressure must not exceed 4½ lbs.***

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .014" All Valves, Cold.

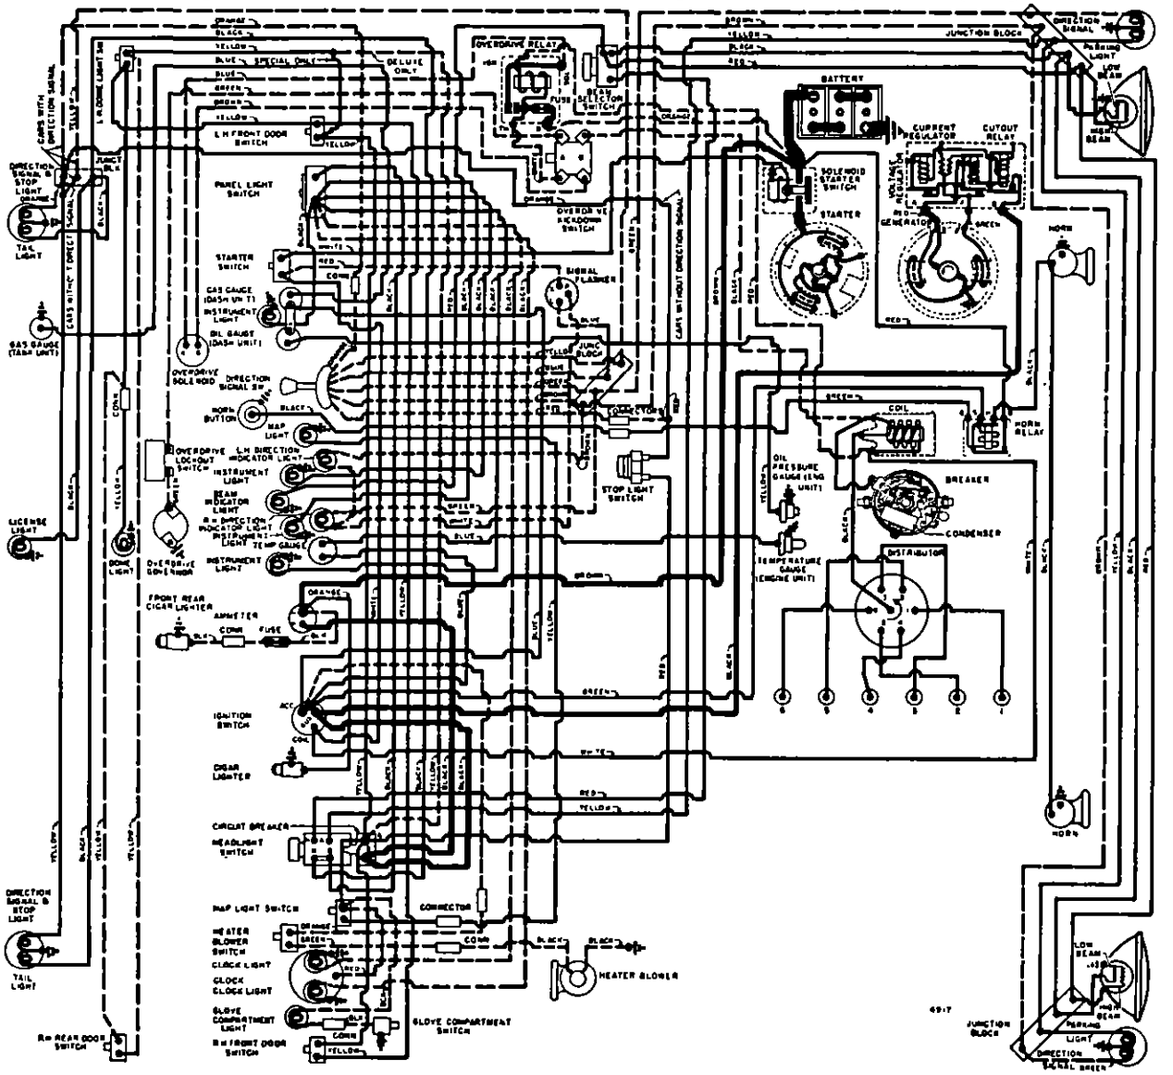
►**Adjustment Procedure**—*See Kaiser Special Data.*
NOTE—Remove splash shield under right front fender for convenience in adjusting valves.

IGNITION

IGNITION SWITCH: Kaiser&Frazer No. 204485.
Lock Cylinder—Kaiser-Frazer No. 203885 (with key).

COIL: Auto-Lite IG-4093, IG-6001 or 9A. On left side of engine opposite distributor.
Ignition Current—4.8 amperes at 6.3 volts (stopped).

CONDENSER: Auto-Lite Part No. IG-2671K.
Capacity—.20-.25 microfarad.



DISTRIBUTOR: Auto-Lite Model IGS-4214. Full automatic advance type with auxiliary vacuum spark control and octane selector adjustment.
Breaker Plate Identification—Maximum vacuum advance limited by slot in plate. Plate marked #5.
Breaker Gap—.022" (.018-.022").
Cam Angle—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	325	0	650
1	450	2	900
6.5	1200	13	2400
8	1475	16	2950
9	1675	18	3350

Octane Selector—Manual adjustment at distributor providing advance and retard. See Ignition Timing.

Vacuum Spark Control: Auto-Lite (integral type). Linked directly to breaker plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring in unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	10"
3	6°	13"
5	10°	15"

Distributor Removal: On cylinder head between #4 and #5 cylinders. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING

Std. Setting.....4° BTDC.
Timing Mark—Timing mark located on vibration dampener. Consists of "0" mark at top dead center with 1° graduations before and after this point.
Timing (with Timing Light C-693)—Mark fourth degree mark before "0" top dead center mark on vibration dampener with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine **below 450 RPM.** (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw in end of arm under distributor, rotate distributor *until timing* mark appears in line with pointer, tighten cap screw. Check octane selector setting.
►*CAUTION—Reset engine idling speed at 550 RPM.*
Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

CARTER WA-1

Carter WA1 Type 622SB. (Special). 1¼" Single Barrel, Downdraft with Carter Climatic Control.
Casting No. on Flange—309.
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*
Fast Idle (WA1 Carburetors): Carter Single Barrel.
See Carburetion Equipment Section for data.
Setting—⅝" clearance between choke valve and air horn (Gauge T109-85) with throttle valve closed and stopscrew against (not on) first step of fast idle cam. Adjust by bending connector link at lower offset (Tool T109-41).
Automatic Choke (WA1 Carburetors): Carter Climatic Control (Single Carburetor Type).
See Carburetion Equipment Section for data.
Setting—Centered (coil housing at index mark).

CARBURETOR

CARTER WCD

Carter WCD Type 723S (Deluxe)—1¼ Dual (Double barrel), Downdraft type with Fast Idle and Climatic Control.
Casting No. on Flange—550.
See Carburetor Section for complete data.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*
Fast Idle: Carter Dual (WCD) type.
See Carburetion Equipment Section for complete data.
Setting—.018" throttle opening with choke valve held closed and throttle lever stopscrew backed off.
Automatic Choke: Carter Climatic Control (Dual Carburetor Type).
See Carburetion Equipment Section for data.
Setting—Centered (coil housing at index mark).

CARB. EQUIPMENT

Air Cleaner: (Special). AC #1544029 Oil-bath type.
Element—AC No. 7-S.
Servicing—*Empty and clean reservoir, wash cleaner* in kerosene, refill to indicator line with SAE No. 50 engine oil (No. 20 for below freezing temp.) at 2000 mile intervals or when engine tuned.
Fuel Pump: AC No. 1539074 combination Fuel-and-Vacuum Pump.
Replacement Pump—AC No. 582.
►*CAUTION—Install pump with rocker arms UNDER camshaft eccentric.*
See Carburetion Equipment Section for data.
Pressure—3-4¼ lbs.
Gasoline Gauge: King-Seeley electric type.
Dash Unit—K-S No. 42455.
Tank Unit—K-S No. 7916.
See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite Type 1M-100D—6 Volt, 15 Plate, 105 Ampere Hour Capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.
Location—In engine compt. on left side.

STARTER

Auto-Lite Model MAW-4054. Armature MAW-2128.
Drive—Barrel type Bendix Drive No. A1792.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	4900	5.5	65
2.75 "	1480	5.0	200
8.50 "	400	4.0	400
6.0 "	Lock	2.0	335

Starting Switch: Magnetic switch K-F Part No. 204752 on splash shield near starter and controlled by push-button on instrument panel.
See Electrical Equipment Section for complete data.
Removal: Flange mounted on left front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws.

GENERATOR

35 Amp.....Auto-Lite GDZ-4818A. Arm. GDZ-2006F.
45 Amp.....Auto-Lite GGU-6001B. Arm. GGU-2006F.
Two brush type with voltage and current regulation.
Charging Rate Adjustment—None (see Regulator).
Maximum Charging Rate—As given below.

Performance Data (GDZ-4818A)

Amperes	Volts	Cold—R.P.M.—Hot
0	6.4	870-970 950-1050
35	8.0	1800-2000 2150-2350

Performance Data (GGU-6001B)

45	8.0	1550 Max. .....

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—(GDZ) 1.60-1.78 amperes at 6.0 volts, (GGU) 1.6-1.8 —amperes at 6.0 volts.
Motoring Current—(GDZ) 4.16-4.60 amps. at 6.0 volts, (GGU) 5.5-6.5 amperes at 6.0 volts.
Removal: Pivot mounting at left front of engine. To remove, disconnect leads, take out clamp bolt and pivot bolts. NOTE—Remove battery for access.
Belt Adjustment: Adjust by pulling generator out with 15 lb. force in line with adjuster link with all mounting bolts loose. A 6 lb. adjustment for new belt is recommended.

REGULATOR

35 Amp.—Auto-Lite VRP-4004F-2.....for GDZ Gen.
45 Amp.—Auto-Lite VAV-4002C.....for GGU Gen.
Vibrating type voltage and current regulators.
See Electrical Equipment Section for complete data.
NOTE—Regulator cover sealed. Warranty void if seals broken.

Cutout Relay

Cuts In—6.4-7.0 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—As follows:
VAV-4002C 44-46 amperes (marked '45' on cover).
VRP-4004F-2 34-36 amperes (marked '35' on cover).
Checking (without breaking seal) & Adjustment—*See Electrical Equipment Section.*
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING

Headlamps: Hall "Sealed Beam" type. Upper and lower beams controlled by beam selector switch.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height at 25 ft.).
Beam Indicator—Red jewel at top of speedometer dial. Lighted when upper (country beams) in use.
Direction Signal: (Deluxe) Mitchell (United Specialties) type.
See Electrical Equipment Section for complete data.
Direction Indicators—Right and Left indicator lights on lower face of speedometer. Lighted when direction signal on same side of car in operation.

Switches

Lighting—Kaiser-Frazer No. 203830.
Beam Selector—Kaiser-Frazer No. 204545.
Instrument Panel—Kaiser-Frazer No. 203833.
Courtesy (on Instrument Panel)—K-F No. 203662.
Door—Kaiser-Frazer No. 204229.
Dome Lamp—Kaiser-Frazer No. 204779.
Stop Lamp—Kaiser-Frazer No. 201466.
Direction Signal—Kaiser-Frazer No. 204551.

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type, 30 amperes. On back of lighting switch.
FUSES: Clock—2 ampere. In clock lead.
Overdrive—20 amperes. On control relay.
Cigar Lighter—30 amperes. In lead back of instrument panel.
HORNS: Auto-Lite or Sparton—A-L HW-4017 (Low Note), HW-4018 (High Note). Twin horns.
Horn Current—Approximately 15 amperes each at 6.2 volts.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Horn Relay: Auto-Lite Model HRL-4101—Relay connected through ignition switch (horns operative only with ignition switch "on").
Contacts Close—1.5-3.0 volts (seal to core with 4.0 volts maximum).
Contacts Open—.5 volt min. (open from seal).
Contact Gap—.026". **Air Gap**—.016-.020" (armature air gap with contacts closed but not sealed), .015-.018" (between armature leg and yoke with armature sealed to core.

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16" (3.3125-3.3145"). *See "Original Bore & Pistons" in Kaiser Special Data.*
Stroke—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3.
Developed Horsepower (with Single Carb.)—100 at 3600 RPM. **(With Dual Carb.)** 112 at 3600 RPM.
Compression Ratio—7.3-1.
NOTE—7.3-1 Heads marked by "73" stamped on left front directly above engine number on block.
Compression & Vacuum Reading—*See Tune-Up data.*

TIGHTENING TORQUES: *See Kaiser Special Data.*

CYLINDER HEAD INSTALLATION: *See Kaiser Special Data.*

ENGINE REMOVAL: *See Kaiser Special Data.*

OIL PAN REMOVAL: *See Kaiser Special Data.*

PISTONS: Aluminum alloy. Cam-ground. Tin-plated, T-slot type. Length 3 9/16".
Clearance—See Fitting new pistons.

▷***CAUTION—Mark piston and rod assemblies before removal to insure re-installation in same cylinder.***
Original Bore & Piston Sizes—*See Kaiser Special Data.*

Fitting New Pistons: Use .0015" feeler stock ½" wide inserted on side opposite slot. Pull to withdraw feeler must be 5-10 lbs.
Replacement Pistons—*See Kaiser Special Data.*

Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled, fourth groove slotted for oil drainage.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0925-.0935"	.008-.016"	.0025-.004"
Comp. (#2)	.0925-.0935"	.008-.016"	.0015-.0035"
Oil (#3,4)	.1550-.1545"	.008-.016"	.001-.0025"

Installing Rings: Side marked "TOP" (compression rings) upward.
Replacement Rings—*See Kaiser Special Data.*

PISTON PIN: Diameter—.8591-.8593". **Lgth.**—2 13/16". Floating type with lock ring at each end.
Pin Fit in Piston—Push fit with piston heated to 212°F. (heat piston in water at 212°F. to install new pins).
Pin Fit in Rod Bushing—Light press fit. When installing new bushings, ream bushings with DD-82-2 Reamer to inside diameter of .8593-.8595" for new std. pins.

▷**CAUTION**—Pin bushing must protrude 1/64" in each side of rod.

Replacement Pins: Std. size and .003", .005" Oversize.

CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".

▷***CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.***
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0015". **Sideplay**—.006-.010".

Bearing Adjustment: None. Replace bearings. Do not file rods or bearing caps.

Replacement Bearings: Furnished Std .Size and .001", .002", .010", .012" Undersize.
CAUTION—Install bearings with tang engaging notch in rod and cap and oil hole aligned with oil spurt hole in rod.

Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).

CRANKSHAFT: Four bearing, counterweighted type with vibration dampener on forward end.
Journal Diameters—2.3744-2.3752". NOTE—Allowable taper or out-of-round .001".

▷***CAUTION—Special bearing size used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.***
Bearings—Removable, steel-backed, babbitt-lined.
Clearance—.0005-.0015".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps. Upper main bearing shells can be "rotated" out by installing tool KF-8 in crankshaft journal hole (lug on tool engages edge of bearing when crankshaft rotated).
Filler Block (Front & Rear) Removal & Installation—*See "Crankshaft & Main Bearings" in Kaiser Special Data.*

Replacement Bearings: Furnished Std. size and .001", .002", .010", .012" Undersize.

End Thrust: Taken by front (#1) bearing (special thrustwasher used with unflanged bearings). Controlled by shims installed between front crankshaft thrust washer (ahead of #1 bearing) and crankshaft thrust plate (behind crankshaft sprocket).
Endplay—.004-.006".
Endplay Adjustment—*See "Crankshaft & Main Bearings" in Kaiser Special Data.*

CAMSHAFT: Four bearing. Two-sprocket chain drive.
Journal Diameters—#1, 1.8725-1.8735"; #2, 1.8095-1.8105"; #3, 1.7472-1.7485"; #4, 1.2475-1.2485".
Bearing Diameters (I. D.)—#1, 1.8745-1.8755"; #2, 1.8115-1.8125"; #3, 1.7495-1.7502"; #4, 1.2495-1.2505".
Bearings—Steel-backed, babbitted bushings.
Clearance—.002-.004".

Camshaft Removal: *See "Camshaft & Bearings" in Kaiser Special Data.*

Bearing Adjustment: None. Replace bushings with camshaft removed.

Replacement Bushings: Replace as set (furnished finished line-bored and do not require reaming after installation). Use KF-4 Camshaft Bearing Remover & Replacer.

▷***CAUTION—Align oil hole in bushings and block.***

End Thrust: Taken by thrust plate on front of engine (between front bearing journal and camshaft sprocket **Endplay**—.003-.007".

Timing Chain: Non-adjustable type. Width 1". Pitch .500", Length 23" or 46 links.

▷***Timing Chain Caution—Morse and Link Belt chains used. Interchangeable only as complete sets with both sprockets.***

Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3382-.3390"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3481"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width—5/64-3/32" (intake), 3/32-7/64" (Exhaust). Use KF-58 Relief Counterboring Set to remove any high shoulder in block above valve head.

Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides for correct clearance using Reamer C-249.
Valve Guide Installation—Place guide (tapered end of guide toward top) in position in bore. Use Tool KF-27 when installing guides to correct position of 1 7/32" below top face of cylinder block.

Valve Springs: Check spring with tester C-647. Pressure should be 45 ± 2½ lbs. at 1 21/32".

	Spring Pressure	Length
Valve Closed	51 lbs.	1 43/64"
Valve Open	113 lbs.	1 5/16"

Valve Lifters: Barrel type. Two types used and are interchangeable. One type using tappet adjusting screw with locknut, other type is self-locking.
Clearance—Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters—Furnished Std. size and oversize. Oversize identified as follows: "A" .0005", "B", .001", "C", .0015", "D", .002", "K" .005", "S", .008".
Lifter Removal—*See Kaiser Special Data.*

VALVE TIMING

Tappet Clearance: .014" All Valves, Cold.

▷**Adjustment Procedure**—*See Kaiser Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With .014" tappet clearance (running clearance), #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark after dead center "0" mark on dampener aligned with pointer at front of engine.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, exhaust valve lifters, timing chain. Oil pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35-40 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Located in right side of cylinder block below the valve chamber and toward the rear of engine. Adjustable by replacing spring or installing washers between spring and plug.

Oil Pan Removal: *See Kaiser Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe located on front valve cover plate on right side of engine. NOTE—Two types of valve cover and outlet pipe assemblies used—can be identified by angle of cut-off at lower end of tube: (Early 1949 Cars) angular cut-off faces forward. (Later 1949 Cars) angular cut-off faces toward rear.

▷***CAUTION—Do not install later valve cover & outlet pipe assembly on early cars (may cause loss of oil through tube).***

Oil Pump: Gear type. In crankcase.
Oil Pump Servicing—*See Kaiser Special Data.*

Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.

Oil Pressure Gauge: King-Seeley electric type.
Dash Unit—K-S No. 42460.
Engine Unit—K-S 40767 (1949), 40790 (1950).
See Miscellaneous Section for complete data.

COOLING

Cooling System: Sealed system (relief valve in filler cap) with positive circulation and thermostatic control.
Capacity—13½ qts. (13 qts. at driving level).
Pressure Valve—AC No. 850501 (Radiator Filler Cap). 3¼-4¼ lbs.

Radiator: No. 202906 (17" wide). Side mounted to shroud with six bolts.
Radiator Removal—*See Kaiser Special Data.*

Water Pump: Centrifugal type with ball bearing shaft.
See Water Pump Section for complete data.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only). In water outlet elbow on cylinder head.
Setting (Std. type)—Begins to open at 149-156°F. Fully open at 176°F.

Temperature Gauge: King-Seeley electric type.
Dash Unit—K-S No. 42465.
Engine Unit—K-S 40380 (212°), 42553 (224°).
See Miscellaneous Section for complete data.

CLUTCH

Pass. Cars.....**Auburn 9251-15 or Borg & Beck 9A7**
Taxi.....**Borg & Beck 10A7**

►**Clutch Identification**—Types can be identified by number of pressure plate springs—3 (for Auburn), 9 (Borg & Beck—cover marked 951 (9A7), 948 (10A7).
See Clutch Section for complete data.
Facings (Auburn)—Moulded metallic or Raybestos. 2 required. I. D. 6". O. D. 9¼". Thickness .135".
Facings (Borg & Beck)—Woven asbestos, 2 required. I. D. 6" (7" 10A7), O. D. 9¼" (10" 10A7). ⅛" thick.

Pedal Adjustment: Pedal free travel ⅝-¾". To adjust remove return spring, clevis pin and release clevis end of adjusting link from clutch pedal shaft bellcrank. Turn clevis end in or out to obtain correct pedal free movement. Install adjusting link clevis on bellcrank, insert clevis pin, cotter pin, and return spring.

Removal: Remove transmission (see Transmission Removal below), remove housing pan. Position of clutch on the flywheel must be marked before removal. Rotate flywheel, using Flywheel Turning Tool C-771 and loosen six bolts equally before removing. Remove clutch pressure plate and cover assembly and clutch disc.

TRANSMISSION

Warner Model AS23-T86E (Std.), Model AS24-T86E with new Type R10B Overdrive (Optl.)—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gear-shift lever mounted on steering column.
See Transmission Section for complete data.

Removal: Remove clutch pedal return spring, clevis pins at cross shaft coupling and slide coupling onto cross shaft. Disconnect gear shift rods at transmission levers. (If overdrive is installed disconnect overdrive shift rod at overdrive unit). Disconnect speedometer cable at transmission (plug hole in transmission to prevent loss of lubricant). Disconnect wiring to overdrive. Support rear of engine using Tool KF-47 or suitable jack under clutch housing, disconnect propeller shaft at front companion flange. Free engine rear support from crossmember by taking out two insulator bolts at transmission. Disconnect and remove master cylinder operating rod. Disconnect hand brake cable at equalizer and engine rear crossmember. Remove eight bolts at frame side rails and remove crossmember. Remove four bolts holding transmission to clutch housing and pull out the transmission. (If overdrive is installed it will be removed with transmission).

OVERDRIVE

Warner Type R10B (with special AS24-T86E Transmission)—Optl. Equipment. New Governor controlled type (no centrifugal pawls) with electrical solenoid operation and throttle controlled "kick-down."
See Transmission Section for complete data.
Overdrive Solenoid—D-R 1118132, K-F No. 200911.
Governor—Kaiser-Frazer No. 200908.
Control Relay—Auto-Lite HRT-4001 or 1A. Has 20-ampere fuse on BAT terminal.
Kick-down Switch—Kaiser-Frazer No. 203451.
Lock-out Switch—Kaiser-Frazer No. 200915.

Removal: Remove drain plug in overdrive housing and drain lubricant. Disconnect wiring at shift fork rail switch terminals. Disconnect speedometer cable at overdrive housing, control wire at control shaft lever on overdrive housing and the tie-down clips. Disconnect front propeller shaft at front companion flange and move shaft away from housing. Remove Overdrive and Transmission as a unit (see Transmission Removal above).

UNIVERSALS

Detroit Series 4200. Ball-and-Trunnion. 3 used with intermediate universal at propeller shaft support.

Propeller Shaft & Support Bearing: Two shafts used with support bearing on frame cross member at intermediate universal. *See "Propeller Shaft" in Kaiser Special Data.*

REAR AXLE

Spicer (Salisbury) Model 41-2—Semi-floating, Hypoid Gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratio (491)—4.09-1 Std., 3.73-1 or 3.91-1 Optl.
Ratio (492)—3.91-1 Std., 4.27-1 or 4.55-1 with O. D., 3.73-1 or 4.09-1 Optl.
Backlash—.003-.006". Shim adjustment.

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft at rear universal flange, disconnect hydraulic brake line at connector on axle housing, disconnect rear shock absorbers and sway eliminator links (when used) at spring seat, disconnect parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.
Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out.

Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential shaft), adjust endplay at left wheel.
Endplay—.001-.006".

SHOCK ABS RBERS

Monroe—Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSI N

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—5½° preferred (4¾-5¾° crosswise).
Caster—0° preferred (—1° to +1°).
Camber—¼° preferred (0° to ¾°).
Toe-In—1/16". Adjust by turning both tie rods.
Steering Geometry (Toe-out)—Inner wheel 23°. Outer wheel 20°. No adjustment.

STEERING EAR

Gemmer Model 305—Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.
►*SELF ADJUSTING BRAKE NOTE*—Used on a limited number of cars during 1949-50 production. *See "Wagner Lockheed" Brakes in Brake Section for complete data.*
Drums—Composite (cast-iron & steel). Diameter 11"
Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).
Clearance—.008" at heel and toe of each shoe.
Braking Power—56% Front wheels, 44% Rear.

Hand Brake: See Service brake data (above).

MISC. MECHANICAL

Windshield Wiper: Vacuum type, cable operated.
See Miscellaneous Section for complete data.

HOOD ADJUSTMENT: *See Kaiser Special Data.*
OIL PAN REMOVAL: *See Kaiser Special Data.*

MODEL IDENTIFICATION

1951 Models	First Serial No.
K-511 Special	K511-001000
K-512 Deluxe	K512-001000
1952 Models	
K-521 Virginian Special	K521-1000001
K-521 Deluxe	K521-1200001
K-522 Virginian Deluxe	K522-1000001
K-522 Manhattan	K522-1200001

SERIAL NUMBER: Stamped on plate on left front door pillar post.

First Numbers (1951 & 1952)—*See Model Identification table above.*

ENGINE NUMBER: Stamped on pad on left front upper corner of engine block and on Engine Name Plate on left side of crankcase. *NOTE*—Numeral following Engine Model Desigation (first part of Engine Number on Engine Name Plate) indicates Engine Plant: 4—Detroit, 8—Muskegon.

▷*ENGINE NUMBER SYMBOL (Special Bore & Bearing Sizes):* Consists of one or two letters following engine number. *See "Original Bore & Pistons" in Kaiser Special Data.*

TUNE-UP

COMPRESSION PRESSURE: 120-130 lbs. at cranking speed.

VACUUM READING: 17½" steady idling at 550 RPM.

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAPS: .030".
Plugs: Auto-Lite A5 (Early 1951), A7 (Later). Type A7 used for new car break-in. Type A5 can be used for replacement if A7 too hot for sustained high speed driving.

DISTRIBUTOR (DELCO-REMY): No. 1110224. Automatic advance with auxiliary vacuum spark control and octane selector adjustment.
Breaker Gap—.022".
Cam Angle—31-37° with .022" gap.
Breaker Arm Spring Tension—17-21 ozs.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

DISTRIBUTOR (AUTO-LITE): No. IGS-4214. Automatic advance with auxiliary vacuum spark control and octane selector adjustment.
Breaker Gap—.020" (.018-.022").
Cam Angle—38°.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.
Automatic & Vacuum Advance—*See Ignition.*

COIL: Delco-Remy No. 1115328 (1951), No. 1115380 (1952), Auto-Lite No. CR-6009A (1951-52).
Ignition Current—4.8 amperes at 6.3 volts (stopped).

CONDENSER: Delco-Remy 1869704 or Auto-Lite IG-2671K.
Capacity—(Delco-Remy) .18-.23 mfd. (Auto-Lite) .20-.25 mfd.

IGNITION TIMING: 4° BTDC.
Timing Procedure—*See Ignition Timing.*
Timing Mark—4th. graduation before top dead center "0" mark on vibration dampener.

▷***CAUTION—Engine must be idling below 450 RPM. when setting timing.***

Octane Selector Setting—Set for slight ping when accelerating with wide open throttle.

CARBURETION: Carter WGD, No. 781S. Dual downdraft type with automatic choke.

▷*EARLY 1951 CARBURETOR CHANGE (To correct Hard Starting & Stalling due to flooding): See "Carter WGD" in Carburetor Section.*

Idle Setting—Both screws ½-1 turn open. Turn screws out for richer mixture.

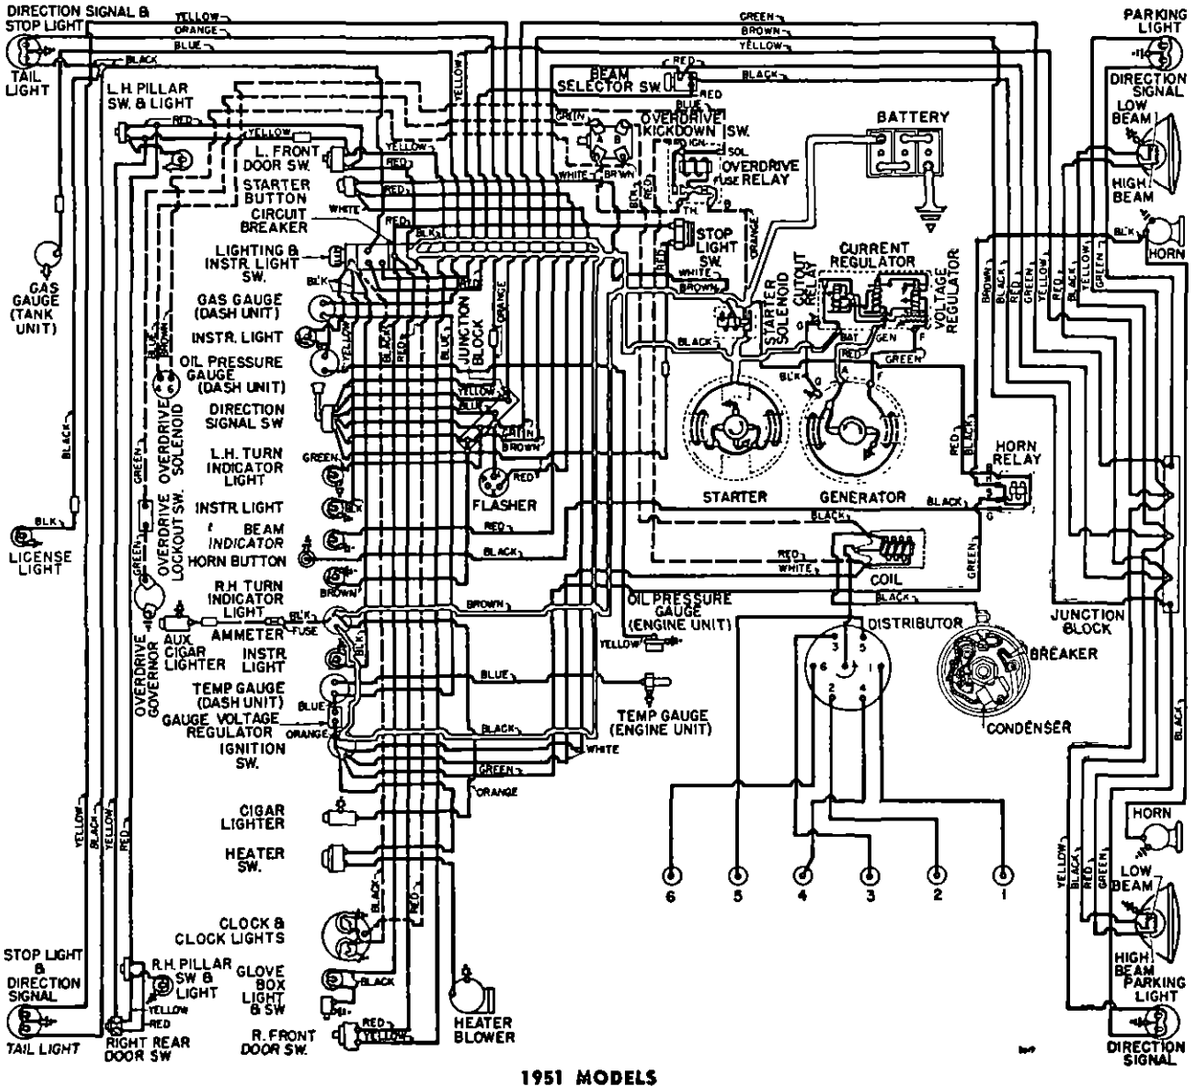
Idle Speed—(Synchro-mesh Cars) 550-600 RPM., (Hydra-Matic Cars) 425-450 RPM.

Float Level—***CAUTION—First cars with spring-loaded intake needle require different setting.*** 7/64" (first cars with spring-loaded intake needle), ¼" (later cars with solid intake needle) measured from machined surface of bowl cover to top of float with assembly inverted.

▷***CAUTION—When checking first carburetors with spring-loaded needle, float should rest of own weight on needle (pressure will compress spring and cause false setting).***

Accelerating Pump—No seasonal adjustment.

Choke Setting: Centered (coil housing at index mark).



Fuel Pump Pressure: 3-4½ lbs. (pump mounted at front of engine).

▷***CAUTION—Pump pressure must not exceed 4½ lbs.***

MANIFOLD HEAT CONTROL: Automatic thermostatic type. See that valve operates freely.

VALVE TAPPET CLEARANCE: .014" All Valves, Cold.

▷**Adjustment Procedure**—*See Kaiser Special Data.*

1951 MODELS

IGNITI N
DELC -REMY

IGNITION SWITCH: K-F No. 207760.

COIL: Delco-Remy No. (1951) 1115328, (1952) 1115380. Ignition Current—4.8 amperes at 6.3 volts (stopped).

DISTRIBUTOR: Delco-Remy No. 1110224. Automatic advance type with auxiliary vacuum spark control and octane selector adjustment. "Center Bearing" breaker plate.

Breaker Gap—.022".

Cam Angle—31-37° with .022" gap.

Breaker Arm Spring Tension—17-21 ozs.

Rotation—Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM.	Degrees Eng.	RPM.
Start	450	0-4	900
5-7	1175	10-14	2350
8-10	1600	16-20	3200

Vacuum Spark Control: Delco-Remy No. 1116054. Integral type linked directly to breaker plate.

Plunger Travel—3/32".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	9-11
5	10	14-18

AUTO-LITE

IGNITION SWITCH: K-F No. 207760.

COIL: Auto-Lite No. CR-6009A.

Ignition Current—4.8 amperes at 6.3 volts (stopped).

DISTRIBUTOR: Auto-Lite No. IGS-4214. Automatic advance type with auxiliary vacuum spark control and octane selector adjustment.

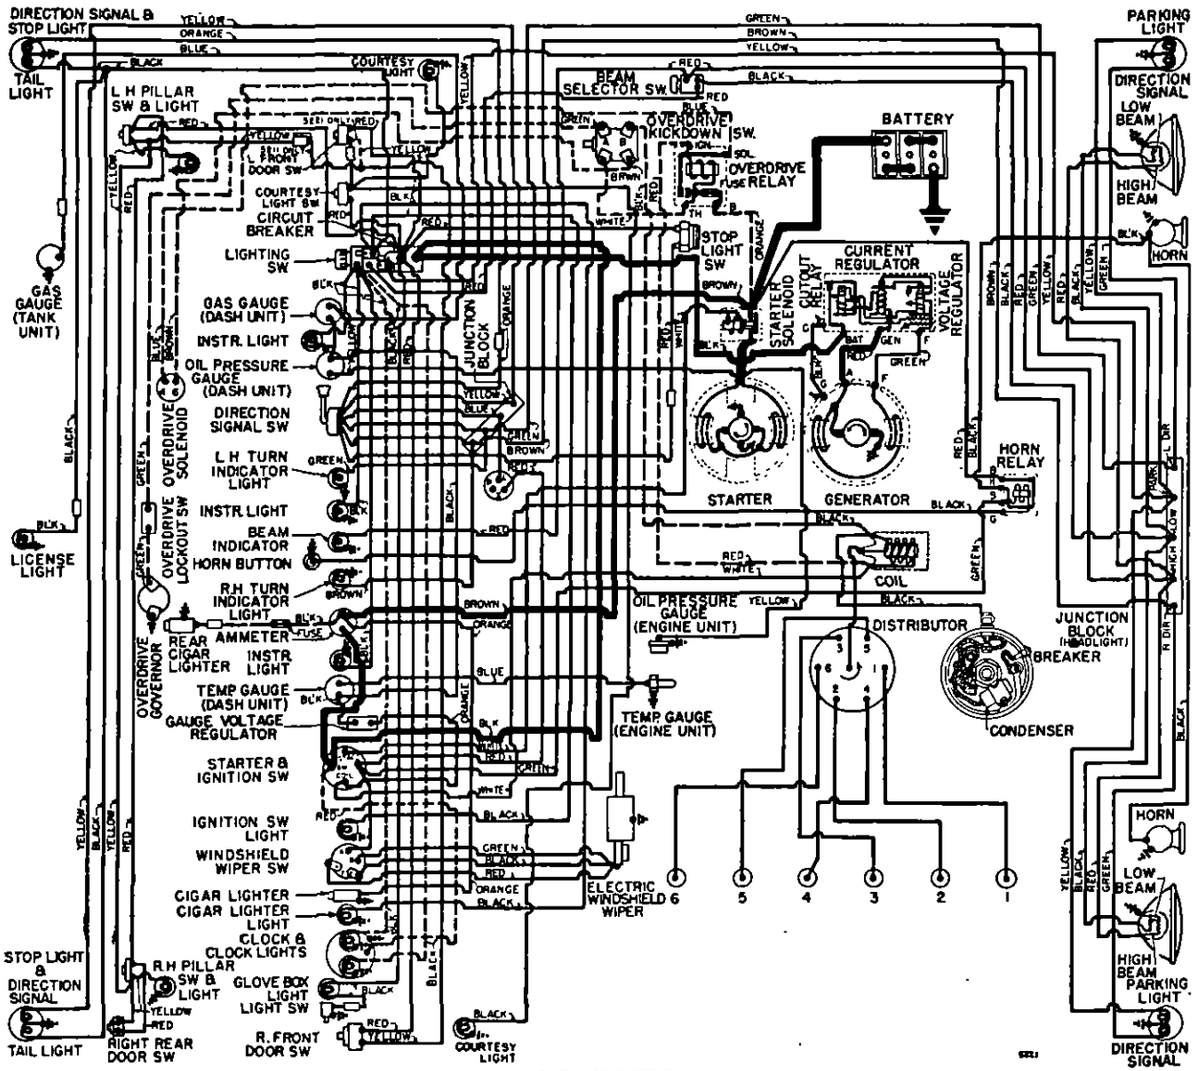
Breaker Plate Identification—Maximum vacuum advance limited by slot in plate. Plate marked #5.

Breaker Gap—.020" (limits .018-.022").

Cam Angle—38°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.



Automatic Advance

Degrees Distr.	RPM.	Degrees Eng.	RPM.
Start	325	0	650
1	450	2	900
6.5	1200	13	2400
8	1400	16	2800
9	1675	18	3350

Vacuum Spark Control: Auto-Lite integral type, linked directly to breaker plate.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	10
3	6	13
5	10	15

1952 MODELS

IGNITION TIMING

Std. Setting.....**4° BTDC.**

Timing Mark—Timing mark located on vibration dampener. Consists of "0" mark at top dead center with 1° graduations before and after this point.

Timing (with Timing Light C-693)—Mark fourth degree mark before "O" top dead center mark on vibration dampener with chalk or white paint. Connect timing light to #1 spark plug terminal and direct light at timing mark. Idle engine **below 450 RPM.** (back off throttle stopscrew to decrease normal idle speed of 550 RPM.). Loosen hold-down screw in advance arm, center screw in slot, tighten hold-down screw. Loosen cap screw in end of arm under distributor, rotate distributor until timing mark appears in line with pointer, tighten cap screw. Check octane selector setting.

►***CAUTION***—Reset engine idling speed to 550 RPM on cars with Synchro-mesh transmission.

Octane Selector Setting—Set for slight ping when accelerating with wide-open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor clockwise (if no ping noted), counter-clockwise (if ping too severe).

CARBURETOR

Carter WGD Type 781S. 1¼" Dual (double barrel), Downdraft type with Fast Idle and Climatic Control.

►***EARLY 1951 CARBURETOR CHANGE (To correct Hard Starting & Stalling due to Flooding): See "Carter WGD" in Carburetor Section.***

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Rods & Jets—*See Carter Jet Table in Carburetor Section.*

Fast Idle: Carter Dual (WGD) type.

Setting—With thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed. There should now be .018" to .023" clearance (gauge T109-29) between throttle valve and bore of carburetor (side opposite idle port). Adjust by bending the choke connector rod at lower angle bend.

See Carburetion Equipment Section for complete data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Automatic Choke: Carter Climatic Control (Dual Carburetor Type).
Setting—Centered (coil housing at index mark).
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: AC. Oil-bath type.
Filter Element—AC No. 23.

Fuel Pump: AC. Combination fuel-and-vacuum pump.
Replacement Pump: AC No. 9549 or 9616.

►***CAUTION—Install pump with rocker arm UNDER camshaft eccentric.***
Pressure—3-4½ lbs. ***CAUTION—Pressure must not exceed 4½ lbs.***
See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley electric "CV" (Constant Voltage) type with Voltage Regulator.
Dash Unit—King-Seeley No. 45507.
Tank Unit—King-Seeley No. 44504.
Voltage Regulator—***See Misc. Electrical.***
See Carburetion Equipment Section for complete data.

BATTERY

Auto-Lite Type 1M-100D—6 Volt, 15 Plate, 105 Ampere Hour Capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal grounded at left front engine support. Engine ground cable connected at same point.
Location—In engine compt. on left side.

STARTER

DELCO-REMY

Delco-Remy (Std) No. 1107087 or 1107125, (Hydra-Matic Drive) No. 1107088 or 1107126.
Armature—Delco-Remy No. 1878077 (all models).
Drive—Barrel type Bendix Drive No. A3281.
Roation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. (new brushes).

Performance Data—1107087, 88

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	5000	5.67	65
12	"	Lock	3.37	525

Performance Data—1107125, 26

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	5500	5.65	70
11	"	Lock	3.25	550

Starting Switch: Magnetic switch on splash shield near starter controlled by pushbutton (1951) ignition key (1952). ***HYDRA-MATIC CARS***—Neutral Safety switch used so that starter operative only with selector lever in Neutral.

AUTO-LITE

Auto-Lite Model MAW-4054. Armature MAW-2138.
Drive—Barrel type Bendix Drive A3281.
Roation—Counter-clockwise at commuator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4300	5.5	65
6	"	Lock	2.0	335

Starting Switch: Same as Delco-Remy (above).

GENERATOR

DELCO-REMY

Delco-Remy. (1951) No. 1102733, (1952) No. 1102782. Two brush shunt type with voltage and current regulation.
Armature—Delco-Remy No. 1879002 (1951 1102733 Gen.), No. 1912599 (1952 1102782 Gen.).
Charging Rate Adjustment—None. See Regulator.

Performance Data—Cold

	①Amperes	Volts	R.P.M.
1102733	30	8.0	2050
1102782	40	8.0	2150

①—Not maximum. See Current Regulator.
Roation—Counter-clockwise at commutator end.
Brush Spring Tension—28 ozs. each.
Field Current—1.75-1.95 amperes (1102733), 1.87-2.0 amperes (1102782) at 6.0 volts.

Belt Adjustment: Loosen all mounting bolts, pull generator out in line with adjuster link with force of 15 lbs. (use spring scale hooked to generator bolt lug), tighten mounting bolts before slacking off on scale pull.

AUTO-LITE

Auto-Lite Model GDZ-6001F. Armature No. GGY-2006F. Two brush type with voltage and current regulation.
Charging Rate Adjustment—None (see Regulator).

Performance (GDZ-6001F)

Amperes	Volts	Cold — R.P.M. — Hot
0	6.4	870-970 — 950-1050
17	8.0	1350-1500 — 1550-1700
35	8.0	1800-2000 — 2150-2350

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—35-53 ozs. (new brushes).
Field Current—1.3-1.5 amperes at 5.0 volts.
Motoring Current—3.9-4.4 amperes at 5.0 volts.

Belt Adjustment: Same as Delco-Remy generator (above).

REGULATOR

DELCO-REMY

Delco-Remy No. (1951—1102733 Gen.) No. 1118302, (1952—1102782 Gen.) No. 1118392. Voltage and current type. ***CAUTION—Each regulator must be used with correct type generator.***

►***"1118300" SERIES REGULATORS—Have screw adjustment for settings and single regulator springs.***
See Electrical Equipment Section for complete data.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay
Cuts In—5.9-6.7 volts hot (set to 6.4 volts hot).
Contact Gap—.020" (same for both contacts).
Air Gap—.020" (with contacts just closed).

Voltage Regulator
Setting—(1118302) 7.0-7.7 volts, (1118392) 7.2-7.6 volts. Set both models to 7.4 volts hot. Check with regulator hot and with cover in place.
Air Gap—(1118302) .075", (1118392) .068" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—***See Elec. Equip. Section.***

Current Regulator
Setting—(1118302) 32-40 amperes (set to 36 hot).
Setting—(1118392) 40-46 amperes (set to 42 hot).
Air Gap—.075" with armature pressed down to point where contacts are just touching.
Checking & Adjustment—***See Elec. Equip. Section.***

AUTO-LITE

Auto-Lite No. VRP-6001A (for GDZ-6001F Gen.). Vibrating type voltage and current regulators.
See Electrical Equipment Section for complete data.

Cutout Relay
Cuts In—6.3-6.8 volts (set to 6.4-6.6 volts).
Cuts Out—4.1-4.8 volts, approx. 4-6 amps. disch.).
Contcat Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70°F. See Electrical Equipment Section for settings at other temperatures.
Checking (Without Breaking Seal) & Adjustment—***See Electrical Equipment Section.***
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on cover).
Checking (Without Breaking Seal) & Adjustment—***See Electrical Equipment Section.***
Air Gap—.048-.052" with contacts just opening.

LIGHTING

Headlamps: Hall "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Beam Indicator—Red jewel at top of speedometer dial. Lighted when upper (country beams) in use.

Direction Signal: Mitchell (United Specialties).
See Electrical Equipment Section for complete data.
Direction Indicators—Right and Left indicator lights on lower face of speedometer. Lighted when direction signal on same side of car in operation.

Switches
Headlight & Instrument—Kaiser-Frazer No. 207782.
Beam Selector—Kaiser-Frazer No. 204545.
Dome Lamp—Kaiser-Frazer No. 204779.
Direction Signal—Kaiser-Frazer No. 207789 (Std.), No. 209294 (Hydra-Matic Cars).

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Thermostatic type, 30 amperes. On back of lighting switch.

FUSES: Clock—2 ampere. In clock lead.
Overdrive—20 amperes. On control relay.
Rear Seat Cigar Lighter—30 ampere. In lead back of instrument panel.

HORNS: Delco-Remy No. 1999649 (Low Note), **D-R No. 1999650** (High Note).

Horn Relay: Relay connected through ignition switch (horns operative only with ignition switch "on").

GAUGE VOLTAGE REGULATOR: King-Seeley—No. 45550. Thermo-bi-metal interrupter unit designed to maintain a constant voltage of 5 volts (regardless of generator charging voltage fluctuation) on gauge feed circuit. Unit is mounted on the instrument cluster and is connected between the ignition switch, and the gauge circuits. See Wiring Diagram.

ENGINE

ENGINE SPECIFICATIONS: Own (Continental). Six Cylinder, "L" head type.
Bore—3 5/16" (3.3125-3.3145").
Stroke—4⅜".
Displacement—226.2 cu. ins. **Rated HP.**—26.3.
Developed Horsepower—115 at 3650 RPM.
Compression Ratio—7.3-1.
NOTE—7.3-1 Heads marked by "73" stamped on left front directly above engine number on block.
Compression & Vacuum Reading—***See Tune-Up data.***

ENGINE & OIL PAN REMOVAL: ***See Kaiser Special Data.***

CYLINDER HEAD & TIGHTENING TORQUES: ***See Kaiser Special Data.***

ENGINE

CONTINUED FROM PRECEDING PAGE

PISTONS: Aluminum alloy, Cam-ground, Tin-plated, T-slot type. Length 3 17/32".

►*CAUTION—Some engines have oversize cylinder bores and pistons. See "Original Bore & Pistons" in Kaiser Special Data.*

Clearance—See Fitting new pistons.

►*CAUTION—Mark piston and rod assemblies before removal to insure re-installation in same cylinder.*

Fitting New Pistons: Use .0015" feeler stock ½" wide inserted on side opposite slot. Pull to withdraw feeler must be 5-10 lbs. *NOTE*—Used pistons should be 5-10 lbs. pull on .004" feeler.

Replacement Pistons: Furnished Std. and .010", .020", .025", .030", .040", .050", .060" Oversize.

Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON RINGS: Two compression, two slotted oil rings, all above pin. Third ring groove drilled, fourth groove slotted for oil drainage.

Ring	End Gap	Side Clearance
Compr. (upper)	.008-.016"	.002-.004"
Compr. (lower)	.008-.016"	.0015-.0035"
Oil (all)	.008-.016"	.0025-.004"

Installing Rings: Side marked "TOP" (compression rings) upward.

Replacement Rings: Ring sets and single rings furnished in following sizes for oversize ranges indicated: Std. (Std.-to-.009"), .020" (.010"-to-.029"), .030" (.030-to-.039"), .040" (.040"-to-.049"), .060" (.050"-to-.069").

PISTON PIN: Diameter—.8591-.8593". **Lgth.**—2 13/16". Floating type with lock ring at each end.
Pin Fit in Piston—Push fit with piston heated to 160°F. (heat piston in water at 160°F.).
Pin Fit in Rod Bushing—Light press fit. When installing new bushings, ream bushings with DD-82-2 Reamer to .8593-.8595" for new standard pins.

►*CAUTION*—Pin bushing must protrude 1/64" on each side of rod.

Replacement Pins: Std. size and .003", .005" Oversize.

CONNECTING ROD: Length—7". **Weight**—29.6 ozs.
Crankpin Journal Diameter—2.0619-2.0627".

►*CAUTION—Special bearing sizes used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.*
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0015". **Side Play**—.006-.010".

Bearing Adjustment: None. Replace bearings.

Replacement Bearings: Furnished Std. Size and .001", .002", .010", .012" Undersize.
CAUTION—Install bearings with tang engaging notch in rod and cap and oil hole aligned with oil spurt hole in rod.

Installing Rods: Mark rods and bearing caps. Install wth marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. NOTE—Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 toward front; #2, 4, 6 toward rear of engine).

CRANKSHAFT: Four bearing counterweighted type with vibration dampener on forward end.

►*CRANKSHAFT OR FLYWHEEL REPLACEMENT (HYDRA-MATIC DRIVE CARS) CAUTION—See "Crankshaft & Main Bearings" in Kaiser Special Data.*
Journal Diameters—2.3744-2.3752". NOTE—Allowable taper or out-of-round .001".

►*CAUTION—Special bearing sizes used in some engines. See "Original Bearing Sizes" in Kaiser Special Data.*
Bearings—Removable, steel-backed babbitt-lined.
Clearance—.0005-.0015".

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.

Replacement Bearings: Furnished Std. size and .001", .002". .010", .012" Undersize.

End Thrust: Taken by flanges on #4 (rear) bearing. If endplay not within limits, install new bearing.
End Play—.003-.006".
Endplay Adjustment—*See "Crankshaft & Main Bearings" in Kaiser Special Data.*

Flywheel Replacement: *See "Flywheel" in Kaiser Special Data.*

CAMSHAFT: Four bearing. Two-sprocket chain drive.

►*CAMSHAFT CHANGE CAUTION—Two types used in production (steel and cast iron). See Kaiser Special Data for identification and Oil Pump Drive Gear and Valve Lifter type used with each camshaft.*
Journal Diameters—#1, 1.8725-1.8735"; #2, 1.8095-1.8105"; #3, 1.7472-1.7485"; #4, 1.2475-1.2485".
Bearing Diameters (I.D.)—#1, 1.8745-1.8755"; #2, 1.8115-1.8125"; #3, 1.7495-1.7502"; #4, 1.2495-1.2505".
Bearings—Steel-backed, babbitted bushings.
Clearance—.001-.003", running clearance.

Camshaft Removal: *See Kaiser Special Data.*

Bearing Adjustment: None. Replace bushings with camshaft removed.

Replacement Bushings: Replace as set. Use KF-4 camshaft bearing remover and replacer.

►*CAUTION—Align oil hole in bushings and block.*

End Thrust: Taken by thrust plate on front of engine (between front bearing journal and camshaft sprocket). **Endplay**—.003-.007".

Timing Chain: Non-adjustable type. Width 1". Pitch .500", Length 23" or 46 links.

►**Timing Chain Caution**—Both Morse and Link Belt Chains used. Chains and sprockets interchangeable only in COMPLETE SETS.

Camshaft Setting: Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.3414-.3406"	5 3/16"
Exhaust	1 21/64"	.3382-.3390"	5 3/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3520"	.0008-.0026"
Exhaust	45°	.3315"	.0032-.0050"

Valve Seat Width: 5/64-3/32" (Int.), 3/32-7/64" (Ex.). Use KF-58 Relief Counterboring Set to remove any high shoulder in block above valve head.

Valve Guides: Replace when stem clearance exceeds maximum (above). Use tool KF-27 to remove old guides and to install new guides (tool will position guides properly with upper end 1 7/32" below top face of cylinder block). Install guides with tapered end toward top of block and use Valve Guide Reamer C-249 to ream guides to inside diameter of .3432-.3422" for correct stem clearance.

►*GUIDE REPLACEMENT CAUTION*—Guides must be .0005-.003" press fit in block. If guides loose, ream block, using tool KF-57, and install oversize guides furnished .0005" O.S. (marked "A"), and .0055" O.S. (marked "L").

Valve Springs: Free length 1 31/32".

	Spring Pressure	Length
Valve Open	118 lbs.	1 5/16"
Valve Open	118 lbs.	1 5/16"

Valve Lifters: Mushroom type with self-locking tappet adjusting screws. **Diameter** .6855-.6860".

►*CAUTION*—Two types used (different type for each camshaft). STEEL lifters used only with Cast Iron Camshaft, CAST IRON lifters can be used for both Steel and Cast Iron camshafts. *See "Camshaft & Bearings" in Kaiser Special Data.*
Clearance—Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters—Furnished Std. size and oversize as follows: "B" .001", "D" .002", "K" .005".

VALVE TIMING

Tappet Clearance: .014" All Valves, Cold.

►**Adjustment Procedure**—*See Kaiser Special Data.*

Valve Timing: See Camshaft Setting above.
Intake Valves—Open 10° BTDC. Close 60° ALDC.
Exhaust Valves—Open 55° BLDC. Close 10° ATDC.
Valve Timing Check—With .020" tappet clearance, #1 exhaust valve should close with piston 10° or .045" after top dead center with ten-degree mark **after** dead center "0" mark on dampener aligned with pointer at front of engine. Reset tappet to .014" clearance, COLD.

LUBRICATION

Lubrication System: Pressure to crankshaft, connecting rod, camshaft bearings, valve lifters and timing chain. Oil Pump located in oil pan.
Crankcase Capacity—5 qts. (refill), 5½ (dry).
Normal Oil Pressure—35-40 lbs., 2000 RPM., 30 MPH.
Oil Pressure Regulator—Adjust by replacing spring or install washers between end of spring and plug.

Oil Pan Removal: *See Kaiser Special Data.*

Crankcase Ventilation: Filter element in oil filler cap (air intake). Outlet pipe located on front valve cover plate on right side of engine.

Oil Pump: Gear Type. In crankcase.
Oil Pump Servicing—*See Kaiser Special Data.*

►*OIL PUMP DRIVE GEAR CAUTION—See CAMSHAFT data for correct type gear to be used with each type camshaft.*

Oil Filter: Replace cartridge at 10,000 mile intervals or more often if required by operating conditions.

Oil Pressure Gauge—King-Seeley "CV" (Constant Voltage) type, with voltage regulator.
Dash Unit—King-Seeley No. 45511.
Engine Unit—King-Seeley No. 44030.
Gauge Voltage Regulator—See Misc. Electrical.
See Miscellaneous Section for complete data.

COOLING

Cooling System: Pressure system (relief valve in filler cap) with thermostat control.

Capacity—(1951) 13½ qts. without heater, 14½ qts. with heater; (1952) 13½ qts. with heater.
Pressure Valve—AC No. 850501 (Radiator Filler Cap). 3¼-4¼ lbs.

Radiator Removal: *See Kaiser Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Water Pump: Centrifugal type with ball bearing shaft.
See Water Pump Section for complete data.

Thermostat: Kaiser-Frazer No. 200160 (Std.), No. 202349 (for Permanent Anti-freeze only). In water outlet elbow on cylinder head.
Setting (Std. type)—Begins to open at 149-156°F. Fully open at 176°F.
Setting (High Temp.)—Starts to open 166-174°F., fully open at 194°F.

Temperature Gauge: King-Seeley "CV" (Constant Voltage) type, with voltage regulator.
Dash Unit—K-S No. 45514.
Engine Unit—K-S No. 44200.
Gauge Voltage Regulator—See Misc. Electrical.
See Miscellaneous Section for complete data.

CLUTCH

Auburn Model 9251-18 or Borg & Beck 9A7 No. 951. Single plate dry disc type.
Clutch Identification—Types can be identified by number of pressure plate springs—3 (for Auburn), 9 (Borg & Beck). Borg & Beck cover marked 951.
See Clutch Section for complete data.
Facings (Borg & Beck)—Woven Asbestos, 2 required. Inside Diam. 6". Outside Diam. 9¼". Thickness ⅛".
Facings (Auburn)—Molded metallic or Raybestos. 2 required. I.D. 6". O.D. 9¼". Thickness .135"

Pedal Adjustment—Pedal free travel ⅝-¾". To adjust remove return spring, clevis pin and release clevis end of adjusting link from clutch pedal shaft bell-crank. Turn clevis end in or out to obtain correct pedal free movement.

Removal: Remove transmission (see Transmission Removal below), remove housing pan. Position of clutch on the flywheel must be marked before removal. Rotate flywheel, and loosen six bolts equally before removing.

SYNCRO-MESH TRANSMISSION

Warner Model AS49-T86E (Std.), Model AS50-T86E with new Type R10B Overdrive (Optl.)—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Remote control type with gear-shift lever mounted on steering column.
See Transmisiun Section for complete data.

Removal: Remove clutch pedal return spring, clevis pins at cross shaft coupling and slide coupling onto cross shaft. Disconnect gear shift rods at transmission levers. (If overdrive is installed disconnect overdrive shift rod at overdrive unit). Disconnect speedometer cable at transmission (plug hole in transmission to prevent loss of lubricant). Disconnect wiring to overdrive. Support rear of engine using Tool KF-47 or suitable jack under clutch housing, and disconnect propeller shaft. Free engine rear support from crossmember by removing insulator bolts at transmission. Disconnect master cylinder. Disconnect hand brake cable to clear crossmember. Remove bolts from side rails holding crossmember and remove crossmember. Remove transmission to clutch housing mounting bolts and pull out transmission.

OVERDRIVE

Warner Type R10B (with special AS50-T86E Transmission)—Optl. Equipment. New Governor controlled type (no centrifugal pawls) with electrical solenoid operation and throttle "kickdown."
See Transmission Section for complete data.
Overdrive Solenoid—D-R 1118132, K-F No. 200911.
Governor—Kaiser-Frazer No. 200908.
Control Relay—Auto-Lite HRT-4001A, K-F Part No. 201636. Has 20-ampere fuse on BAT terminal.
Kick-down Switch—Kaiser-Frazer No. 203451.
Lock-out Switch—Kaiser-Frazer No. 200915.

Removal: Remove drain plug in overdrive housing and drain lubricant. Disconnect wiring at shift fork rail switch terminals. Disconnect speedometer cable at overdrive housing, control wire at control shaft lever on overdrive housing and the tie-down clips. Remove Overdrive and Transmission as a unit (see Transmission Removal above).

HYDRA-MATIC TRANSMISSION

Four-speed planetary type automatic transmission and fluid coupling.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level every 1000 miles. Add fluid as required to maintain level at "F" mark on dip stick. Drain and refill every 25,000 miles. Use Hydra-Matic Fluid (Automatic Transmission Fluid Type "A").

Capacity—Approx. 11 qts. (refilling and draining). 12 qts. (when transmission disassembled).

Checking Fluid Level—Check only with transmission warm (set hand brake, run engine with selector in "N"). With transmission oil hot, idle engine for at least two minutes, then check with engine running and selector in "N". Dip stick located under inspection hole cover in floor pan under front floor mat. Add fluid as required to bring level up to "F" mark on stick.

▷*CAUTION—Do not fill above "F" mark on dip stick.*

Linkage Adjustment: *See "Hydra-Matic Drive Linkage Adjustment" in Transmission Section.*
Hydra-Matic Neutral Switch—Delco-Remy No. 1997846. At lower end of steering column.
Neutral Switch Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

▷*OTHER HYDRA-MATIC DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer—Two used. Needle bearing cross type. Front yoke slides on transmission mainshaft.

REAR AXLE

Spicer (Salisbury) Model 41-2 (Early), Model 44-2 (Later). Semi-floating, hypoid gear type with Hotchkiss Drive.
See Rear Axle Section for complete data.
Ratios—As listed below. *RATIO NOTE*—Ratios indicated by tag on differential cover. Tag numbers indicate number of teeth on ring gear and pinion as listed with ratios following:

Model	Ratio & Gear Combination
Std.	3.91-1 (43-11 or 51-13) & 4.09-1 (45-11)
Overdrive	4.55-1 (50-11)
Hydra-Matic	3.54-1 (46-13) or 3.31-1 (43-13)

Backlash—.003-006". Shim adjustment.

Removal: Hoist rear end of car and place supports under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propeller shaft, hydraulic brake line at axle housing, rear shock absorbers, and parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.
Axle Shaft Removal—Remove rear wheel and drum using puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out.

Wheel Bearing Adjustment: Adjust endplay by adding or removing shims located between backing plate and axle housing flange (shims .003", .005", .010", .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block on differential shaft), adjust endplay at left wheel.
Endplay—.001-.006".

SHOCK ABSORBERS

Monroe—Direct acting, hydraulic type. Serviced by replacement (mountings serviced separately).

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs.
See Front Suspension Section for complete data.
Kingpin Inclination—5° crosswise preferred (limits 4¾ to 5½°).
Caster—0° preferred (limits Neg. 1° to Pos. 1°).
Camber—Pos. ½° preferred (limits 0° to Pos. ¾°).
Toe-In—⅛" preferred (limits 1/16" to ⅛"). Adjust by turning both tie rods equally.
Toe-out on Turns—Inner wheel 20°, outer wheel 17½°. No adjustment.

STEERING GEAR

Gemmer Model 305—Worm-and-Roller type with "push-pull" adjustments.
See Steering Gear Section for complete data.

BRAKES

Service Brakes: Bendix (Lockheed) Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See Brake Section for complete data.
Drums—Composite (cast-iron & steel). Diameter 11".
Lining—Molded type. Width 2". Thickness 13/64". Length 12¼" (forward shoe—all wheels), 10 1/32" (rear shoe—all wheels).
Clearance—.010" between lining and drum at adjusting cam. *CAUTION*—Center brake shoes by several brake applications before adjusting brakes and before checking for drag after adjustment.
Braking Power—55.5% Front wheels, 44.5% Rear.
Hand Brake: See Service Brake data (above).

MISC. MECHANICAL

WINDSHIELD WIPER: (Deluxe Models)—Auto-Lite No EWJ-4004. Electric type. **(Standard Models)**—Vacuum type, cable operated.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

Model	Model Designation
1953 Dragon	K-530
1953 DeLuxe	K-531
1953 Manhattan	K-532
1953 Carolina	K-538
1954 Manhattan (supercharged)	K-542
1954 Special	K-545
1955 Manhattan (2-Door)	51367
1955 Manhattan (4-Door)	51347

SERIAL NUMBER: On plate located on left front door hinge pillar post.

Starting Serial Number: 001001 (1953-54). 10001 (1955).

ENGINE NUMBER: Stamped on left side at upper front of cylinder block and plate on left side of cylinder block.

►*ENGINE NUMBER NOTE (Special Bore & Bearing sizes): See "Original Bore & Piston Sizes" in Kaiser Special Data.*

TUNE-UP

►*1954-55 SUPERCHARGED ENGINE HARD STARTING CORRECTION: See "Carter WCD Carburetor" in Carburetion Section.*

COMPRESSION PRESSURE: 120 lbs. at cranking speed (70 RPM).

VACUUM READING: 17½" steady at idling speed (500 RPM).

VALVE TAPPET CLEARANCE: Intake & Exhaust .014" cold.

Adjustment Procedure–*See Kaiser Special Data.*

MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4. See diagram.

SPARK PLUG GAP: .030".

Spark Plug–Auto-Lite A-7 or equivalent. 14mm.

COIL: Delco-Remy 1115380.

Ignition Current–1.3 amps. idling, 5 amps. at 6.3 volts, stopped.

DISTRIBUTOR: Delco-Remy 1110224 (Without Supercharger), 1110237 (With Supercharger).

Condenser–Delco-Remy 1869704. **Capacity** .18-.23 mfd.
Contact Point Set–Delco-Remy 1871862.
Breaker Gap–.022".
Cam Angle–31-37°.
Breaker Arm Spring Tension–17-21 ozs.
Rotation–Counter-clockwise viewed from above.

Automatic Advance–1110224

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	450	0-4	900
5-7	1175	10-14	2350
8-10	1600	16-20	3200

Automatic Advance–1110237

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	.9-11
5	10	.14-18

IGNITION TIMING

Setting–4° BTDC. at 450 RPM.
Timing Mark–4th. graduation before "0" TDC mark on vibration dampener in line with pointer on left side of engine. *NOTE*–Dampener marked "0" at TDC with 1° graduations on each side.

►*TIMING CAUTION:* Idle engine **below 450 RPM.** when *setting timing. Reset engine to normal idling speed* after timing completed.

CARBURETOR

CARTER WGD

Carter WGD 999S (Early 1953), 2052S (Late 1953 & Early 1954), 2052SA (Late 1954 & 1955). Models without Supercharger.

►*1953 HYDRA-MATIC CARS FULL THROTTLE SETTING:* If wide open throttle at carburetor cannot be secured AFTER Hydra-Matic throttle linkage adjusted, bend lower end of bellcrank on left side of cylinder head (to which transmission rod attached) away from engine just far enough to permit full throttle opening (*CAUTION*–Do not bend offset portion of bellcrank and prevent throttle control extension shaft from bending by wedging screwdriver under shaft).

Idle Setting–½-1½ turns open. Turn screws out for richer mixture.
Idle Speed (Synchro-mesh & Overdrive)–500 RPM.
Idle Speed (Hydra-Matic)–450 RPM. with selector lever in Neutral "N" position.
Float Level–9/32" from top of float at center of machined underside of bowl cover with needle valve seated (remove gasket and invert float and cover assembly).
Accelerating Pump–No seasonal adjustment.

Fast Idle: With thermostatic cover and coil assembly removed, crack throttle, hold choke valve closed, release throttle. Throttle valve opening measured between edge of valve and bore on side opposite idle ports should be .018-.023". Adjust by bending choke *connector rod at lower angle.*

Unloader Adjustment: With throttle valve wide open and choke valve closed as far as possible without forcing, there should be 9/64" (Gauge T109-34) clearance between upper edge of choke valve and inner wall of *air horn. Adjust by bending arm on choke trip lever.*

Automatic Choke Setting: One point Lean (9995), Two points Lean (2052S), Centered at index (2052SA).

Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section.*

►*OTHER DATA: See "Carter WGD" in Carburetion Section.*

Fuel Pump Pressure: 5 lbs. maximum at 1800 RPM.

CARTER WCD

Carter WCD 2146S. Dual downdraft type with automatic choke. *NOTE*–This carburetor used with Supercharger Kaiser Model VS-57A.

►*CARBURETOR ADJUSTMENT NOTE:* Carburetor is completely shrouded by supercharger air pipe but three Access Plugs are provided for carburetor adjustment (idle mixture screws and idle speed screw). Shroud must be removed for other adjustments.

***Idle Setting**–½-1½ turns open. Turn screws out for* richer mixture.
Idle Speed (Synchro-mesh & Overdrive)–500 RPM.
Idle Speed (Hydra-Matic)–450 RPM. with selector lever in Neutral "N" position.
Float Level–3/16" from top of each float to machined surface of bowl cover (Gauge T109-162). Invert cover assembly with gasket removed, place gauge on cover under floats, adjust floats vertically and laterally to barely touch gauge legs.
Accelerating Pump–Two holes in pump arm under dust cover: Lower hole–short stroke, Upper hole–long stroke.

Fast Idle: .026" throttle valve opening (Gauge T109-189) with choke valve tightly closed. Adjust by turning fast idle screw.

Unloader Adjustment: With throttle valve wide open there should be 7/32" (Gauge T109-106) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever.

Automatic Choke Setting: Centered (on index).

Hydra-Matic Throttle Linkage Adjustment: *See "Hydra-Matic Drive" in Transmission Section.*

►*OTHER DATA: See "Carter WCD" in Carburetion Section.*

Fuel Pump Pressure: 9 lbs. maximum at 1800 RPM. (models with supercharger).

CARB. EQUIPMENT

Fuel Pump (1953): AC No. 9616 or Carter M-808SA (Fuel & Vacuum). AC No. 9617 or Carter M-998S (Fuel only).

Fuel Pump (1954-55): Carter M957S (models without supercharger). Carter M2145S (models with supercharger). *NOTE–Special high pressure pump used on models with supercharger.*
Pressure–5 lbs. max. (without supercharger); 9 lbs. max. (with supercharger), both at 1800 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley "CV" (Constant Voltage) electric type with Gauge Voltage Regulator.
Dash Unit–*King-Seeley 45980 (1953); 46424 (1954-55).*
Tank Unit–King-Seeley 44504.
See "Fuel Gauges" in Carburetion Equipment Section.

CONTINUED FROM PRECEDING PAGE

BATTERY

Auto-Lite 1M-100D. 6 Volt, 15 Plate, 100 Ampere Hour (20 hour rate).
Grounded Terminal—Positive (+) terminal.
Engine Ground—At left front of engine.

STARTER

Delco-Remy 1107125 (Synchro-mesh & Overdrive), 1107126 (Hydra-Matic). Armature No. 1878077.
Drive—Bendix "Folo-thru" No. A3281.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	5500	5.65	70
11 ft. lbs.	Lock	3.25	550

Starting Switch: R.B.M. No. 5686-2 Magnetic Switch controlled by ignition switch for "key starting" (turn key to extreme right hand position for starting).

Hydra-Matic Neutral Safety & Back-up Light Switch: Delco-Remy 1997846 (1953), 1998065 (1954-55) located at lower end of steering column. Starter operative only with selector lever in "N" (neutral) position.

GENERATOR

Delco-Remy 1102782. Armature—1912599.

Performance Data—Cold

Amperes	Volts	RPM
40①	8.0	2150

①—Not maximum. See Regulator data.

Brush Spring Tension—28 ozs. each.
Field Current—1.87-2.0 amperes at 6.0 volts.
Rotation—Counter-clockwise at commutator end.

Belt Adjustment: Adjust to 15 lbs. pull on generator in line with adjusting link with all mounting bolts loose.

REGULATOR

Delco-Remy 1118392 (1953); 1118842 (1954-55). *See notes below.*

►*1953 1118392 REGULATOR NOTE: See "1118300 Series Regulators" in Electrical Equipment Section. Specifications below are "Normal" settings.*

►*1954-55 1118842 REGULATOR NOTE: Checking procedure is different than for previous models. See "Delco-Remy 1118825 Series Regulator" in Electrical Equipment Section. Specifications below are "Normal" settings.*

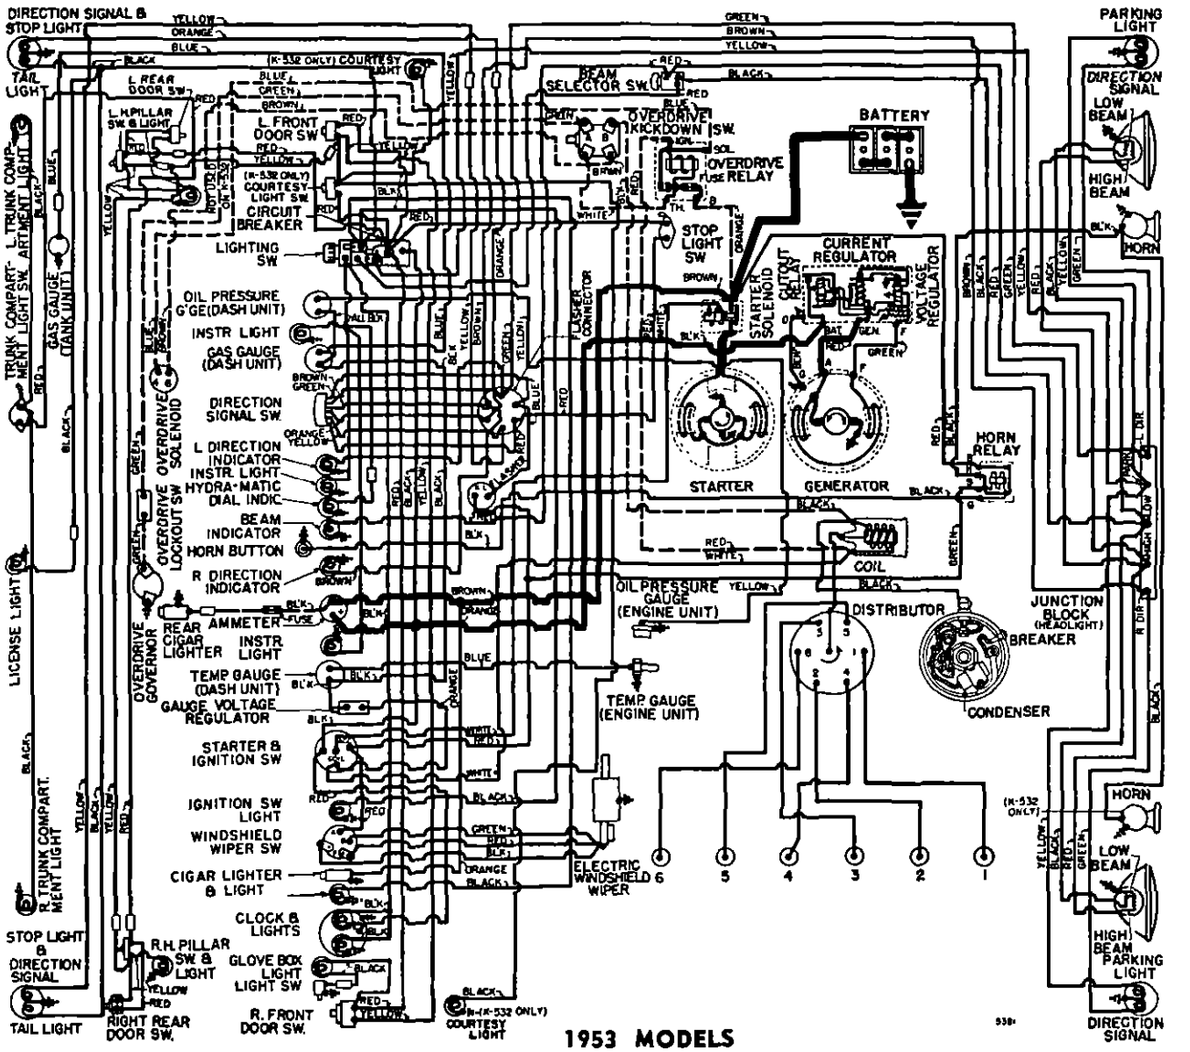
Cutout Relay

Cuts In—6.4 volts hot.
Contact Gap—.020".
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.3 volts hot.
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator



Setting—42 Amperes.
Air Gap—.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting—*See Electrical Equip. Section.*

MISC. ELECTRICAL

Head Lamps: *Sealed Beam. See Electrical Equip. Section.*
Directional Signal: *See Electrical Equip. Section.*
Lighting Switch Removal: Disconnect battery cable. Remove knob. Remove set screw or move clamp spring toward the head of knob. Remove nut that holds assembly to instrument panel. Detach cables noting color code for reinstallation.

Stop Light Switch Location: In "Tee" at junction of brake lines to front brake cylinders.
CIRCUIT BREAKER: 30 ampere. On lighting switch.
FUSES: Located in line at point noted.
Overdrive—20 Ampere. On Control Relay on left front of dash.
Heater—14 Ampere. Under instrument panel near ignition switch.
Rear Seat Cigar Lighter—30 Ampere. Near ammeter.
HORNS: Delco-Remy 1999649 (Low Note), **1999650** (High Note).
Horn Relay—Connected through Ignition Switch (operative only with ignition "on".

CONTINUED ON NEXT PAGE

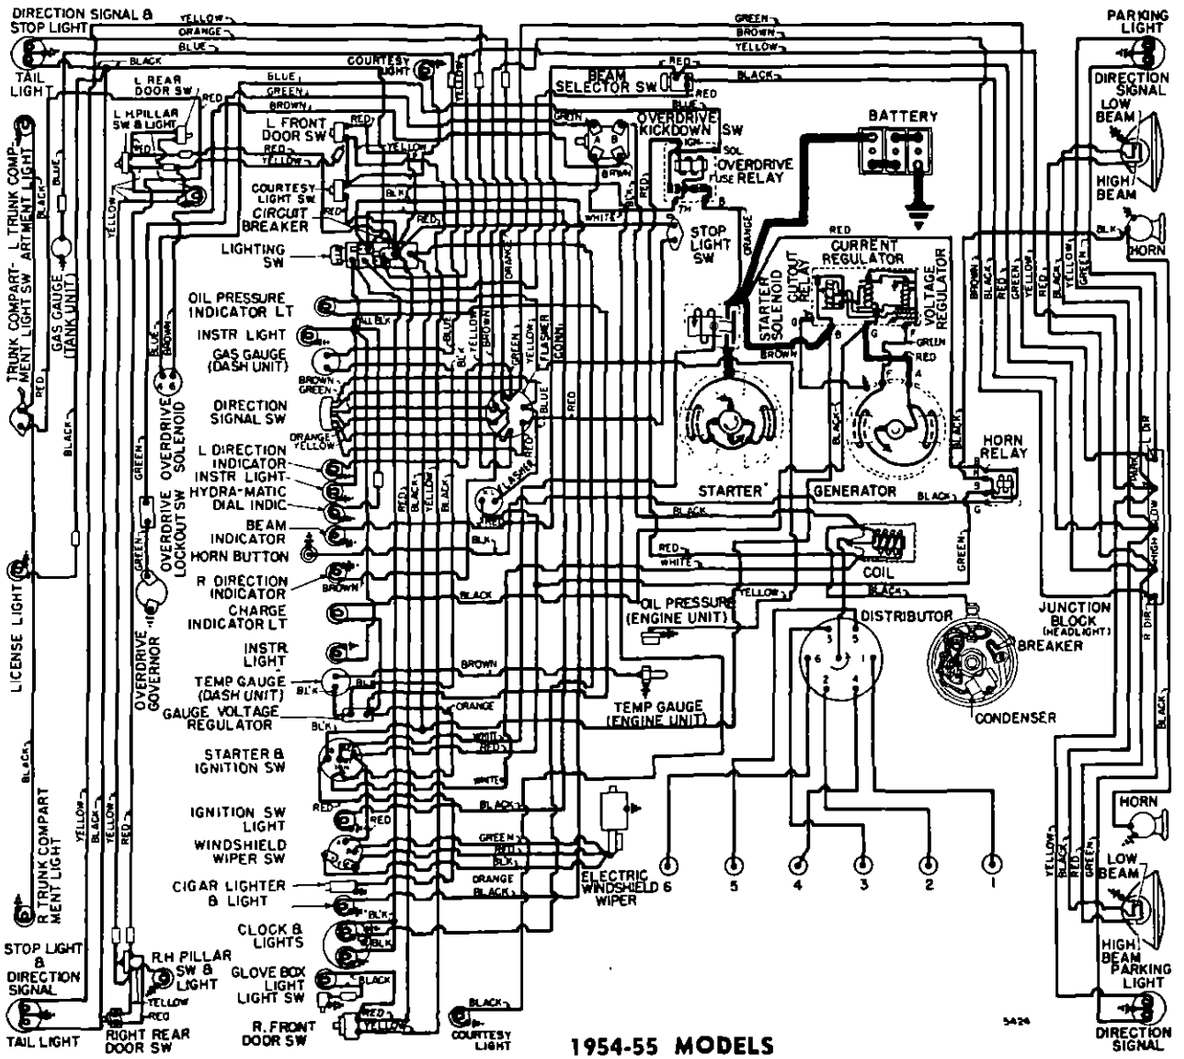
1953 MODELS

CONTINUED FROM PRECEDING PAGE

GAUGE VOLTAGE REGULATOR: King-Seeley 45550 (1953), 46439 (1954-55). Thermo-bi-metal interrupter unit which maintains constant voltage of 5 volts in gauge feed circuits (regardless of charging voltage fluctuations). Mounted on back of instrument panel and connected between ignition switch and gauge circuits. See diagram.

ENGINE

►*ENGINE NOTE: Engine with Supercharger used on some 1954 & 1955 Models. See Supercharger Data below.*



ENGINE SPECIFICATIONS: 6 Cyl. "L" Head.

Series	Bore	Stroke	Displacement
All	3 5/16"	4 3/8"	226.2 cu. ins.

Series	Compr. Ratio	Rated HP	Developed HP
All	7.3-1	26.3 ①	118 at 3650 RPM

①—140 at 3800 RPM (Engines with Supercharger).

SUPERCHARGER (1954-55): Centrifugal type with automatic variable speed drive (variable drive pulley operated by air piston in housing with manifold vacuum control). Operation is completely automatic and supercharger idles except when throttle opened for acceleration or high speed performance. At this point, the variable drive shifts to high ratio and supercharger provides 4 lbs. maximum boost.

1954-55 MODELS

Lubrication—Maintain oil level in case at mark on dipstick. Use only recommended oil.

Supercharger Overhaul—*See "Kaiser Supercharger" in Carburetion Equipment Section.*

ENGINE REMOVAL: *See Kaiser Special Data.*

OIL PAN REMOVAL: *See Kaiser Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Kaiser Special Data.*

PISTONS

Aluminum alloy "T" slot, cam ground, tinplated type.

►*ORIGINAL BORE & PISTONS: See Kaiser Special Data.*

Weight—15.187-15.437 ozs. *NOTE*—All pistons to be within .25 ozs. of equal weight.

Removal—Pistons & rods removed from above.

Fitting New Pistons: Fit new pistons to 5-10 lbs. pull on .0015"x½" ribbon feeler. *NOTE*—Used pistons should have same 5-10 lbs. pull on .004" feeler.

Replacement Pistons: Standard, .010", .020", .025", .030", .040", .050" and .060" Oversize.

Installing Pistons: Pistons marked with cylinder number. Install pistons with "T" slot toward left or away from camshaft (opposite from rod oil hole).

PISTON PINS

Floating type with snap ring at each end.

Diameter—.8591-.8593". **Length**—2.780".

Clearance in Piston—Light push fit at 150-160°F, piston temperature.

Clearance in Rod—Light push fit at room temperature.

Replacement Pins: Standard, .003" & .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Upper)	.0925-.0935"	.007-.020" ①	.002-.004"
Compr. (Lower)	.0925-.0935"	.007-.020" ①	.003-.007"
Oil (Upper)	.1545-.1550"	.007-.020" ①	.006-.010"
Oil (Lower)	.1545-.1550"	.007-.020" ①	.0025-.004"

①—In new or rebored cylinders, .045" in evenly worn cylinders.

Replacement Rings: Ring sets and single rings furnished in following sizes for Oversize ranges indicated: Std. (Std.-.009"), .020" (.010-.029"), .030" (.030-.039"), .040" (.040-.049"), .060" (.050-.069").

Installing Rings: Side marked "Top" (compression rings) upward. Chrome-plated ring must be installed in top (#1) ring groove.

CONNECTING RODS

Length—6.998-7.002" (Center to center). **Weight**—29.6 ozs.

Crankpin Journal Diameter—2.0619-2.0627".

►*ORIGINAL BEARING SIZES: See Kaiser Special Data.*

Bearings—Steel backed babbitt. No shims.

Clearance—.0005-.0015".

Side Play—.006-.011".

Replacement Bearings: Furnished Std. .001", .002", .010" and .012" Undersize.

Installing Rods: Numbers on rods and bearing caps together and installed in same numbered cylinder with marks toward camshaft (oil spray hole also toward camshaft). Rod lower bearings are offset with narrow side toward nearest main bearing.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CRANKSHAFT

Journal Diameter–2.3744-2.3752".
ORIGINAL BEARING SIZES: See Kaiser Special Data.
Bearings–Steel backed babbitt.
Clearance–.0005-.0015".
Replacement Bearings: Furnished in Std., .001", .002", .010" and .012" Undersize.
End Thrust: Taken by #4 main bearing which is flanged type.
End Play–.002-.006".
Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Kaiser Special Data.*

CRANKSHAFT OR FLYWHEEL REPLACEMENT (HYDRA-MATIC DRIVE CARS): *See "Flywheel" in Kaiser Special Data.*

CAMSHAFT

Journal Diameters– (1) 1.8725-1.8735", (2) 1.8095-1.8105", (3) 1.7472-1.7485", (4) 1.2475-1.2485".
Bearings–Steel-backed babbitt.
Clearance–.001-.003".
End Thrust–Taken by thrust plate behind camshaft sprocket.
Endplay–.003-.006".

Camshaft Removal–*See "Camshaft & Bearings" in Kaiser Special Data.*

►*1953-55 CAMSHAFT REPLACEMENT PARTS CAUTION: TWO* different camshafts used in production (steel and cast iron). Correct type oil pump drive gear and valve lifter must be used with each type camshaft. For identification, *see "Camshaft & Bearings" in Kaiser Special Data.*

Timing Chain: Morse & Link Belt. *CAUTION–Chains and sprockets interchangeable only as units.* **Width** 1", **Pitch** ½", **Length** 46 links.
Camshaft Setting: Mesh chain with 9 links (or 10 link pins) between marks on sprockets with #6 piston on TDC of compression stroke.

VALVES

Tappet Clearance: .014" All Valves, Cold.
Adjustment Procedure–*See "Tappet Clearance Adjustment" in Kaiser Special Data.*

Valve	Head Diameter	Stem Diameter	Length
Intake	1.520"	.3402-.3412"	5.190"
Exhaust	1.328"	.3382-.3390"	5.200"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.3520"	.0010-.0030"
Exhaust	45°	.3315"	.0032-.0052"

Valve Seat Width–Intake .078-.093". Exhaust .093-.109".
Valve Springs: Free length 1.969".

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	51	1.672"
Open	118	1.312"

Valve Guides: Guides are .001-.003" press fit in cylinder block. Press new guides in (taper end upward) until top of guide is 1 7/32" below top face of block. Ream guides to I.D. of .3422-.3432".

Valve Lifters: Mushroom type with self-locking adjusting screws.
►*CAUTION: Two different camshafts used requiring different type lifters. For identification and correct lifter application, see "Camshaft & Bearings" in Kaiser Special Data.*
Diameter–.6855-.6860".
Clearance–Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.
Replacement Lifters–Standard and following Oversizes: "B" .001", "D" .002", "K" .005".

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves–Open 10° BTDC. Close 60° ALDC.
Exhaust Valves–Open 55° BLDC. Close 10° ATDC.

►*VALVE TIMING NOTE: Tappet clearance for timing is different than standard clearance, .018" (Intake), .020" (Exhaust).*

Valve Timing Check–With .020" tappet clearance, #1 exhaust valve should close with piston 10° ATDC. when 10th. graduation after top dead center mark "O" in line with pointer on timing chain cover. Reset tappet clearance to .014" Cold running clearance.

OILING SYSTEM

Crankcase Capacity: 5 quarts (refill).
Normal Oil Pressure: 35 Lbs. at 30 MPH (2000 RPM).
Pressure Regulator Valve: Spring & plunger behind plug on left side of crankcase. Replace spring or add washers between spring and plug.
Oil Pressure Gauge (1953): King-Seeley "CV" (Constant Voltage) type with voltage regulator.
Dash Unit–King-Seeley 45984.
Engine Unit–King-Seeley 44030.
See "King-Seeley "CV" Gauges" in Miscellaneous Section.
Oil Pressure Indicator (1954-55): King-Seeley Electric Switch No. 47180 and Instrument panel light. Light goes on when ignition switch turned in, goes out as oil pressure reaches minimum.
Oil Pump: Gear Type with floating screen intake.
Pump Overhaul–*See Kaiser Special Data.*
►*CAUTION: Two different camshafts used requiring different type oil pump drive gears. For identification and correct oil pump drive gear application, see "Camshaft & Bearings" in Kaiser Special Data.*
Oil Filter: Partial flow. Located on left side engine to rear of filler.
Replacement Filter Element–Kaiser No. 200136 (for use with 209985 filter).

Crankcase Ventilation: Breather cap on oil filler and tube in valve tappet cover.

COOLING

Water Capacity: 12½ quarts. Add 1 quart for heater.
Pressure Valve: Radiator filler cap (3½-4½ lbs.).
Thermostat: In water outlet on cylinder head. Std. type opens 157-162°F. Permanent Anti-freeze Type opens at 177-182°F.
Water Pump: Packless, seal ball bearing type.
See "Kaiser" in Water Pump Section.

Pump Removal–Disconnect hose at pump inlet. Detach generator adjusting link (fan belt tensioner). Remove belt and pump mounting bolts.

Temperature Gauge: King Seeley Electric "CV" (constant voltage) with Voltage Regulator.

Dash Unit–King-Seeley 45987 (Early 1953); No. 46346 (Late 1953); No. 46428 (1954-55).
Engine Unit–King-Seeley No. 44200 (Early 1953); No. 44214 (Late 1953-55).
See "King-Seeley Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 9A7 or Auburn 9251-18. Single plate.
NOTE–Borg & Beck clutch Assembly No. 951.
See "Borg & Beck" and "Auburn" in Clutch Section.
Clutch Disc No. Kaiser No. 208629 (Std. Trans.), 213068 (Overdrive).
Pedal Adjustment: Pedal free travel should be 1" (¾-1"). Adjust trunnion at rear end of connector link (between pedal intermediate lever and clutch shaft lever).
Removal: Remove Transmission (see Transmission below), remove clutch housing pan. Position of clutch on the flywheel must be marked before removal. Rotate flywheel, and loosen six bolts equally before removing.

SYNCHRO-MESH TRANSMISSION

Warner Model AS49-T86E (Std.) **Model AS50-T86E** (With R10 Overdrive).
See "Warner Transmissions" in Transmission Section.
Transmission Control: *See "Transmission Controls" in Transmission Section.*
Removal: Remove clutch pedal return spring, clevis pins at cross shaft coupling and slide coupling onto cross shaft. Disconnect gear shift rods at transmission levers (If overdrive is installed, disconnect overdrive shift rod at overdrive unit). Disconnect speedometer cable at transmission (plug hole in transmission to prevent loss of lubricant). Disconnect wiring to overdrive. Support rear of engine using Tool KF-47 or suitable jack under clutch housing, and disconnect propellor shaft. Free engine rear support from crossmember by removing insulator bolts at transmission. Disconnect Master Cylinder. Disconnect hand brake cable to clear crossmember. Remove bolts from side rails holding crossmember and remove crossmember. Remove transmission to clutch housing mounting bolts and pull out transmission.

OVERDRIVE

Warner R10–*See "Warner R10" in Transmission Section.*
Overdrive Control:*See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

HYDRA-MATIC DRIVE

Dual Range. Four speed automatic transmission with fluid coupling.
See "Hydra-Matic Drive" in Transmission Section.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level every 1000 miles of operation. Drain & refill every 25,000 miles.

Capacity—Approximately 11 quarts.

Checking Fluid—To check fluid level, engine must be idling, transmission warm, parking brake set and selector lever in "DR" position. Dipstick located under hood on right side of engine. Add oil if level below "L" mark on dipstick to bring level to full mark.

►*CAUTION: Do not fill above "F" mark on dipstick.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer—Two used. Needle bearing cross type. Front yoke slides on transmission mainshaft splined extension.

REAR AXLE

Spicer (Salisbury) Model 44. Semi-floating with Hypoid gear.
See "Spicer Hypoid Semi-floating" in Rear Axle Section.

Axle Ratio: Varies with type of transmission used as follows:

Synchro-mesh Trans.—3.91-1, 4.09-1, 4.27-1.
Overdrive Trans.—4.55-1.
Hydra-Matic Drive—3.31-1, 3.54-1.

Rear Axle Ratio Note—Numbers stamped in tag attached to differential cover.

Tag Numbers	Ratio
43/13	3.31-1
47/12	3.91-1
45/11	4.09-1
47/11	4.27-1
41/9 or 50/11	4.55-1
46/13	3.54-1

Backlash—.003-.006".

Axle Shaft Removal: Remove rear wheel & drum using Puller C-319. Disconnect hydraulic brake line at backing plate and brake cable. Remove outer oil seal and backing plate (CAUTION—do not lose adjusting shims between backing plate and housing flange). Pull axle shaft and bearing assembly out.

Rear Axle Assembly Removal: Hoist rear end of car and place support under frame. Remove rear wheels and drums (use Puller C-319). Disconnect propellor shaft, hydraulic lines at axle housing, rear shock absorbers and parking brake cables. Disconnect both springs at front hanger and rear shackle, remove axle and spring assembly from beneath car. NOTE—Axle can be removed without disturbing springs by taking out spring "U" bolts.

Wheel Bearing Adjustment: Adjust end play by adding or removing shims located between backing plate and axle housing (shims .003", .005", .010" and .030" thick). Make certain that shim thickness at right wheel is .060" (to center thrust block of differential shaft), adjust endplay at left wheel.

End Play—.001-.006".

SHOCK ABSORBERS

Monroe. Direct-acting hydraulic. Serviced by replacement.

FRONT SUSPENSION

Independent. Linked parralelogram type with coil springs.
See "Kaiser" in Front Suspension Section.

Kingpin Inclination—5° (4¾-5½°) with 0° Camber.

Caster—(Manual Steering) 0° preferred (limits Pos. 1° to Neg. 1°) **(Power Steering)** Pos. ½° preferred (Limits 0° to Pos. 1°).

Camber—Pos. ½° preferred (limits 0° to Pos. ¾°).

Toe-In—1/8" preferred (1/16" to 1/8").

Toe-out on Turns—Inner wheel 20°, outer wheel 17½° (right turn), 18½° (left turn).

STEERING

Manual: Gemmer Model 305 Worm & Roller. With push pull adjustments.
See "Gemmer Steering Gears" in Steering Section.

Power Steering: Kaiser (Monroe) Power Steering. Linkage type.
See "Kaiser (Monroe) Power Steering" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix (Lockheed) Hydraulic Self-Centering. Hydraulic type with floating self-centering shoes (no anchor pin adjustment). Hand lever applies rear service brakes.
See "Bendix (Lockheed) Hydraulic Self-Centering" in Brake Section.

Drums—Diameter 10.995-11.005".

Wheel Cyl. Diameter	Front Bore	Rear Bore
Front wheel	1 1/8"	1"
Rear wheel	1"	1"

Replacement Lining & Shoes—Std. & .030" Oversize (in sets of 4 shoes & linings).

Lining—Width—2", **Length**—12.25" (primary Shoes), 10" (secondary shoes). **Thickness**—3/16" (Std.), 15/64" (Oversize).

Braking Power—Front 55.5%, Rear 44.5%.

Clearance—.010" between lining and drum at adjusting cam.

►*CAUTION:* Brake shoes should be "centered" by several brake applications before adjusting brakes and before checking for drag after adjustment.

Standard Master Cylinder: Located on left side of transmission. Attached to frame side rail.

Checking Fluid. Roll back floor mat, remove access plate. Check every 2000 miles, maintain level to ¼" of filler hole.

Removal—Remove from beneath car. Not necessary to disturb other parts.

MISC. MECHANICAL

Windshield Wipers: (1953 Models & 1954 Special)—Cable operated vacuum type.

1954-55 Manhattan Models—Auto-Lite EWJ-4012. Electric type with "Double-End" motor.
See "Windshield Wipers" in Miscellaneous Section.

MODEL IDENTIFICATION

Type	Model
Darrin 161 Sports Car	547

SERIAL NUMBER: Stamped on plate on front side of firewall in engine compartment.
Starting Serial Number–161-1001.

ENGINE NUMBER: Stamped on boss on top right front corner of cylinder block.

►*ENGINE NUMBER NOTE:* Letters following number denote the following:
A–Crankshaft journals (main & connecting rod) are .010" Undersize.
B–Cylinder bore & Pistons .010" Oversize.
AB–Both above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 115 lbs. minimum with all cylinders equal within 10 lbs.
VACUUM READING: Steady 18-21" at idling speed.

VALVE TAPPET CLEARANCE: Intake .018". Exhaust .016" (hot or cold).
MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1-5-3-6-2-4. See diagram.
SPARK PLUG GAP: .028-.032".
Spark Plug–Champion type J-8. 14 MM.
COIL: Delco-Remy 1115385.
Ignition Current–1.3 amperes idling, 5 amperes at 6.3 volts stopped.

DISTRIBUTOR: Delco-Remy 1112316.
Condenser–Delco-Remy 1869704. **Capacity** .18-.23 mfd.
Contact Point Set–Delco-Remy 1871362.
Breaker Gap–.022" (limits .018-.024").
Cam Angle–31-37° with .022" breaker gap.
Breaker Arm Spring Tension–17-21 ozs.
Rotation–Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	400	0-4	800
5-7	925	10-14	1850
9-11	1350	18-22	2700

Vacuum Spark Control: Delco-Remy 1116084.
Plunger Travel–7/64-1/8".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	4-6
6-7	12-14	14

IGNITION TIMING

Setting–5° BTDC at 500 RPM.
Timing Mark–Fifth graduation before top dead center mark "0" on vibration dampener in line with pointer on timing gear cover. Dampener marked with 15–1° graduations before top dead center mark "0" and 5–1° graduations after this point.

CARBURETOR

Carter YF 2094S. Single barrel downdraft type with manual choke control.
Idle Setting–1–2 turns open. Turn screw out for richer mixture.
Idle Speed–500 RPM.
Float Level–*9/32" (Gauge T109-126) from top of float* at free end to cover with assembly inverted and float hanging free. *CAUTION*–do not compress spring in intake needle (will give false setting).
Accelerating Pump–Not adjustable.

Fast Idle–With choke wide open, bend choke connector rod so that lip on fast idle arm contacts boss on body casting.
►*OTHER DATA: See "Carter YF Carburetors" in Carburetor Section.*
Fuel Pump Pressure: 5-1/4 lbs. maximum at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Mechanical diaphragm type.
Pressure–5-1/4 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Equipment Section.
Gasoline Gauge: Auto-Lite Electric Type.
Dash Unit–Auto-Lite 13420A.
Tank Unit–Auto-Lite 13487A.
See "Fuel Gauges" in Carburetion Equipment Section.

BATTERY

Auto-Lite 1M-100D. 6 Volt, 15 Plate, 100 Ampere Hour (20 hour rate).
Battery Ground–Positive (+) terminal.
Engine Ground–Strap at right front engine mounting.

STARTER

Delco-Remy 1107131. Armature–1917855.
Drive–Solenoid pinion shift & overrunning clutch.
Rotation–Counter-clockwise at commutator end.
Brush Spring Tension–24-28 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	5500	5.65	70
11 ft. lbs.	Lock	3.25	550

Starting Switch: Delco-Remy Solenoid 1118135 (No Relay). Controlled by ignition switch "key starting" (turn key to right beyond "Ignition On" point).
See "Delco-Remy Starter Controls" in Electrical Equipment Section.

GENERATOR

Delco-Remy 1102789. Armature–1921235.

Performance Data–Cold

Amperes	Volts	RPM
30 ①	8.0	2050

①Not maximum output. See Current Regulator.
***Brush Spring Tension**–28 ozs.*
Field Current–1.75–1.95 amperes at 6.0 volts.
Rotation–Counter-clockwise at commutator end.
Belt Adjustment: 1/2" deflection with thumb pressure midway between generator and pump pulleys.

REGULATOR

Delco-Remy 1118841. "1118825 Series" Regulator.
►*REGULATOR NOTE: Checking procedure is different than for previous models. See "Delco-Remy 1118825 Series Regulators" in Electrical Equipment Section. All specifications are for "Normal" settings.*

Cutout Relay

Cuts In–6.4 volts hot.
Contact Gap–.020".
Air Gap–.020" (with contacts just closed).

Voltage Regulator

Setting–7.3 volts hot.
Air Gap–.075" with armature pressed down to point where contacts just touching.
Checking & Adjusting–*See Electrical Equip. Section.*

Current Regulator

Setting–38 amperes (hot).
Air Gap–.075" with armature pressed down to point where contact points just touching.
Checking & Adjusting–*See Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Equip. Section.*
Directional Signal: *See Electrical Equip. Section.*
Lighting Switch Removal: Disconnect battery cable. Remove knob. Remove set screw or move clamp spring toward the head of knob. Remove nut that holds assembly to instrument panel. Detach cables noting color code for reinstallation.
Stop Light Switch Location: Adjacent to Master Cylinder.
FUSES: Located in line to item.
Heater–10 ampere. Near Ignition switch.
Overdrive–20 ampere. At Overdrive relay.
CIRCUIT BREAKER: On lighting switch. 30 ampere. Protects all lighting circuits except Map, Dome, Clock, and Glove Compartment Lights.
HORNS: Delco-Remy 1999649 (Low Note), 1999650 (High Note).

ENGINE

ENGINE SPECIFICATIONS: 6 cyl. in line, "F" head.
Bore–3.125". **Stroke**–3.500".
Displacement–121 cu. ins. **Rated HP**–23.4.
Compression Ratio–7.6 to 1.
Developed HP–90 at 4200 RPM.
Compression & Vacuum Reading–*See TUNE-UP.*
►*ENGINE IDENTIFICATION NOTE:* Letters following number denote the following: **"A"** Crankshaft journals (main & connecting rod) are .010" Undersize. **"B"** Cylinder bore and Pistons .010" Oversize. **"AB"** Both above conditions exist.
CYLINDER HEAD & TIGHTENING TORQUES: *See Kaiser Special Data.*

PISTONS

Aluminum alloy, T slot, cam ground, tin or brass plated.
►*PISTON SIZE NOTE:* Letters "A" or "AB" following engine number indicate .010" Oversize cylinder bore.
Weight–10.9 ozs.
Piston Removal–Pistons and rods removed from above.

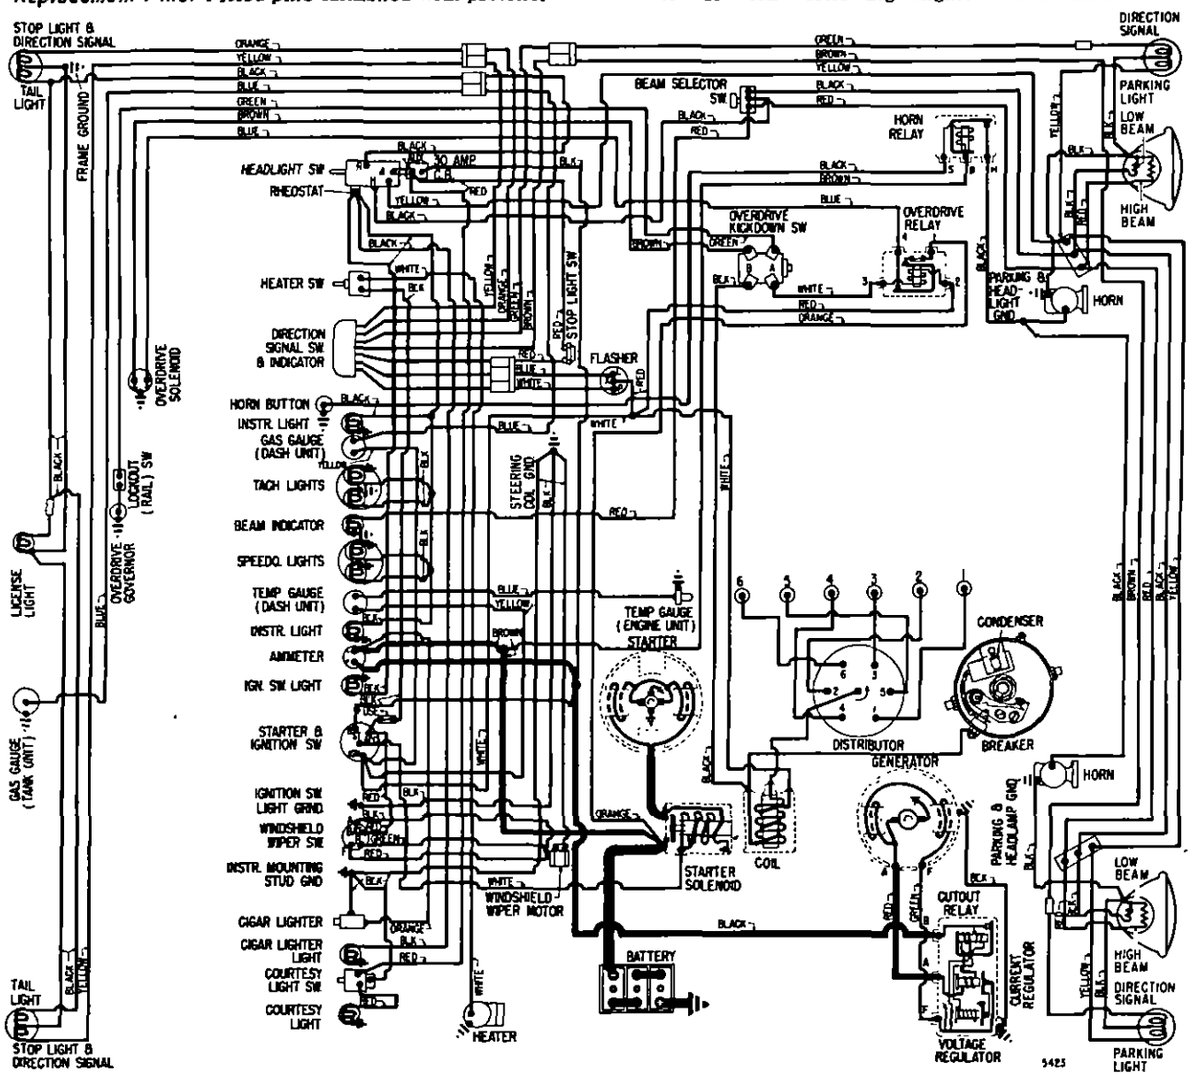
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fitting New Pistons: Use .003" feeler gauge 1/2" wide between piston and cylinder wall on side opposite slot. Pull required to remove feeler should be 5-10 lbs.
Replacement Pistons: Std., .010", .020", .030" and .040" Oversize.
Installing Pistons: T-slot toward left (valve side) of engine (opposite side from oil spray hole in rod). *See Rod Installation.*

PISTON PINS

Locked in rod by clamp screw.
Diameter–.7496-.7498". **Length**–2-21/32".
Clearance in Piston–.0002-.0006" or light thumb push at room temperature.
Replacement Pins: Fitted pins furnished with pistons.



PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.007-.015"	.002-.004"
Compr. (#2)	3/32"	.007-.015"	.0015-.0035"
Oil (#3)	3/16"	.007-.015"	.001-.0025"

Replacement Rings: Ring sets furnished in following sizes for oversize range noted: Std. (0-.010"), .020" (.011-.024"), .030" (.025-.034"), .040" (.035-.049").
Installing Rings: Compression ring mark "Top" (on side of ring) and bevel on inner edge must be up.

CONNECTING RODS

Length–6.345". **Weight**–22.5 ozs.
Crankpin Journal Diameter–1.874-1.875".
►*JOURNAL DIAMETER UNDERSIZE NOTE:* Letters "A" or "AB" following Engine Number denote .010" Undersize journals.
Bearings–Steel-backed, babbitt-lined.
Clearance–.001-.0025".
Side Play–.002-.008".
Replacement Bearings: Std., .001", .002", .010", .011", .012", .020" and .030" Undersize.
Installing Rods: Rods not offset. Install with spray hole in lower end toward right side (away from camshaft), on all rods.

CRANKSHAFT

Journal Diameter–2.25" Four bearings.
►*JOURNAL DIAMETER UNDERSIZE NOTE:* Letters "A" or "AB" following Engine Number denote .010" Undersize journals.
Bearings–Steel-backed babbitt.
Clearance–.0009-.003".
Replacement Bearings: Std., .001", .002", .010", .020" and .030" Undersize.
End Thrust: Taken by No. 1 (front) bearing, and thrust washer in back of crankshaft gear. Adjusted by adding or removing shims behind thrust washer. Shims .002" thick.
Endplay–.004-.006".
Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Kaiser Special Data.*

CAMSHAFT

Journal Diameter–(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-3/4".
Bearings–Steel-backed babbitt.
Clearance–.001-.0025".
End Thrust: Taken by thrust plate behind camshaft gear and space behind plate. **End Play**–.004-.006".
Timing Gears: Crankshaft gear Cast Iron, camshaft gear Fibre with steel hub.
Gear Backlash–.000-.002".
Camshaft Setting: Mesh marked tooth of camshaft gear with mark of crankshaft gear.

VALVES

Tappet Clearance: Intake .018", Exhaust .016" (Hot or Cold).

Valve	Head Diameter	Stem Diameter	Length
Intake	1.750"	.3733-.3738"	4.531"
Exhaust	1.281"	.3395-.3405"	4.625"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.300"	.0025-.0045"

Valve Seat Width–3/64" (all valves).
Valve Springs: *DIFFERENT springs used for Intake and Exhaust Valves.*

Valve Spring Specifications

Intake Valve	Lbs. Press.	Length
Closed	73	1.66"
Open	153	1.40"
Exhaust Valve	**Lbs. Press.**	**Length**
Closed	50	1.625"
Open	105	1.328"

Valve Guides: Drive guides out with tool W-240. To install, use tool W-240 with correct adapters, drive guides into head and cylinder block (taper end toward seat) until top of guide is 7/8" from top of valve seat.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rocker Arm Assembly: *See "Valve System" in Kaiser Special Data.*

VALVE TIMING

See "Camshaft Setting" under Camshaft above.
Intake Valves—Open 9° BTDC. Close 44° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC
Valve Timing Check—Set tappet clearance No. 1 intake valve at .027". Rotate crankshaft until No. 1 piston approaching top dead center on exhaust stroke, stop when 9° mark on vibration dampener (9th graduation before TDC mark "0") is at pointer. No. 1 intake valve should be just about to open at this point. Reset tappet clearance at .018" running clearance.

OILING SYSTEM

Crankcase Capacity: 5 quarts refill.
Normal Oil Pressure: 30-40 lbs. at 30 MPH.
Pressure Regulator—Located on oil pump housing. Adjustable by removing or adding shims from above spring within plug.
Oil Pressure Indicator—Auto-Lite 13419A. Not electrical.
Oil Pump: Internal rotor type. Mounted externally on left side of crankcase.
Oil Pump Overhaul—*See Kaiser Special Data.*

COOLING

Water Capacity: 12 quarts. Add 1 qt. for heater.
Pressure Valve: 7 lb. filler cap.
Thermostat: Choke type. Starts to open at 148-156°.
Water Pump: Centrifugal, packless type with special sealed ball bearing shaft (no lubrication required).
See "Kaiser Darrin" in Water Pump Section.
Temperature Gauge: Auto-Lite Electric type.
Dash Unit—Auto-Lite 13421A.
Engine Unit—Auto-Lite 11528A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Auburn. Single plate, dry disc type.
See "Auburn Clutches" in Clutch Section.

Pedal Adjustment: Pedal free travel should be 1-1/2". To adjust, loosen locknut and turn adjusting nut on connector link at clutch fork.

Removal—Remove transmission, remove flywheel bell housing. Mark pressure plate and flywheel to insure correct re-installation. Take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner. 3-speed synchro-mesh with optional Overdrive.
See "Warner Transmissions" in Transmission Section.
Transmission Control: *See "Transmission Controls" in Transmission Section.*

OVERDRIVE

Warner R10. *See "Warner R10" in Transmission Section.*
Overdrive Controls: *See "Warner R10 & R11 Overdrive Controls" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Range. Four speed automatic transmission with fluid coupling.
See "Hydra-Matic Drive" in Transmission Section.

PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.

TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.

Lubrication—Check fluid level every 1000 miles and drain & refill every 25,000 miles. Use only "Hydra-Matic Drive" fluid.
Capacity—8-1/2 quarts (9-1/2 quarts after overhaul).
Checking Fluid Level—Check only with engine and transmission at normal operating temperatures, engine running at idling speed, and selector lever in "N" position. Add fluid as necessary to bring level to the "F" mark on dipstick.

►*CAUTION:* Do not check fluid level when transmission is excessively hot and do not fill above "F" mark on dipstick.

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing "cross" type.

REAR AXLE

Spicer. Semi-floating, Hypoid gear type with Hotchkiss drive.
See "Spicer Hypoid Semi-floating" in Rear Axle Section.

Axle Ratio		
Standard	Overdrive	Hydra-Matic
4.10—1	4.55—1	3.54—1
(41-10)	(41-9)	(39-11)

NOTE—Axle ratio stamped on plate attached to cover.
Backlash—.004-.008".
Axle Shaft Removal: *See "Spicer Hypoid Semi-floating" in Rear Axle Section.*
Wheel Bearing Adjustment—.002-.007". Remove or add shims between backing plate and flange of housing. Use the same amount of shims on each side.

SHOCK ABSORBERS

Monroe. Direct acting hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs. *NOTE*—Springs mounted above upper end of knuckle support.
Kingpin Inclination—4.5° (4—4.75°) with 0° Camber.
Caster—0° preferred (Limits Pos. 1° to Neg. 1°).
Camber—Pos. 1/2° preferred (Limits Pos. 1/4° to Pos. 1°).
Toe-In—1/4" preferred (Limits 3/16" to 1/4").
Toe-out on Turns—Outer wheel 17.5°, Inner wheel 20°.

STEERING

Gemmer. Worm and Roller, with push-pull adjustments.
See "Gemmer Worm & Roller" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (with push-pull adjustments)" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller (with push-pull adjustments)" in Steering Section.*

BRAKES

Bendix (Lockheed) Hydraulic. Self-centering type. Parking lever applies rear wheel service brakes.
See "Bendix (Lockheed) Hydraulic Self-centering" in Brake Section.
Drums—Diameter 11".
Wheel Cylinder Diameter—Front Wheel 1.125" (Fwd. Shoe), 1.00" (Rear Shoe); **Rear Wheel** 1.00" (Both).
Replacement Lining & Shoes—Molded asbestos lining. **Width** 2". **Length** 12.25" (Primary Shoes), 10" (Secondary Shoes). **Thickness** .188".
Braking Power—55.5% (Front), 44.5% (Rear).
Clearance—.010" for each shoe.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite EMG-4104. Electric double end motor.
See "Windshield Wipers" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

1946-48 MODELS

	Ft. Lbs.	In. Lbs.
All Aluminum Heads	40	480
All Cast Iron Heads	50	600
Spark Plugs:		
7/8-18 Cast Iron Head	34-38	408-456
14 MM. Cast Iron Head	24-28	288-336
14 MM. Aluminum Head	20-24	240-288
18 MM. Aluminum Head	24-28	288-336

1949-51 MODELS

	Ft Lbs.	In. Lbs.
Cylinder Head Stud Nuts	50-55	600-660
Cylinder Head Capscrews	65-70	780-840
Main Bearing "Place Bolts"	120-130	1440-1560
Connecting Rod Nuts	52-60	624-720
Flywheel to Crankshaft	75-85	900-1020
Vib. Damper to Crankshaft	120-130	1440-1560

1952-55 MODELS

	Ft. Lbs.
Cylinder Head	①80-90
Intake Manifold	23-28
Exhaust Crossover Pipe	12-15
Oil Pan	12-15
Main Bearing Caps	120-130
Flywheel	75-85
Crankshaft Pulley	85-95
Con Rod Cap Nuts	45-50
Con Rod Cap Locknuts	3-3½
Camshaft Sprocket	15-18
Rocker Arm Support Bracket	12-15
Rocker Arm Cover	2-2½
Engine Front Cover (3/8")	23-28
Engine Front Cover (5/16")	12-15
Oil Filter	20-25
Flywheel Housing	45-50
Transmission Mounting	55-60

①—See Cylinder Head Installation (below) for tightening procedure. Three different torque applications must be made.

ENGINE

►*1955 SPECIAL ENGINE OVERHAUL CAUTION (Engines identified by yellow paint at water outlet connection housing):* Approximately 600 engines at close of 1955 production have special parts listed below which are not identical with regular engine parts. *Observe the following cautions when working on these engines:*

Special Engine Parts

Part	Part No.
Crankshaft	EAM-6303-B
Main Bearing (Rear)	① EAM-6331-J, ② EAM-6331-K
(Frt. & Int.)	① EAM-6333-J, ② EAM-6333-K
(Center)	① EAM-6337-J, ② EAM-6337-K
Rear Oil Seal	EAM-6701-A
Piston Pin	EAM-6135-A or D

①—Marked RED. ②—Marked BLUE.

Crankshaft & Main Bearings—Crankshaft main bearing journal diameters are .0005" smaller (increasing clearance from .0007-.0029" to .0015-.0033") and the main bearings listed below must be used with this crankshaft.

Piston Pin—Pins are heavier but they can be intermixed and used in any engine.

Crankshaft Rear Oil Seal—This seal is approximately .012" less in thickness than regular engine seal but can be used with either crankshaft.

1946-48 MODELS

ENGINE REMOVAL (For Servicing or Exchange): To remove engine from chassis, drain cooling system and crankcase, then proceed as follows:

1. Disconnect and remove battery.

2. Remove hood (disconnect horn lead at relay, mark hood hinge location on dash, remove hinges).

3. Disconnect all radiator hoses, remove hoses and thermostats, remove radiator.

4. Disconnect all electrical wires and cables at engine accessories (remove spark plug wires and conduits, disconnect ground strap at rear of engine).

5. Disconnect control cables (hand throttle and choke cables—free hand throttle cable clamp at dash and loop cable out of the way by hooking it back of generator regulator, dispose of choke cable similarly by hooking it back of battery box), disconnect fuel line at fuel pump.

6. Remove all engine accessories (except water pumps and starter), remove oil filler pipe.

7. Remove two engine front support bolts.

8. Loosen clamp on exhaust cross-pipe, disconnect both exhaust pipes at exhaust manifolds.

9. Attach hoist to engine sling, take up slack in sling and hoist cables.

10. Remove front floor pan, place support under front end of transmission case, take out capscrews mounting transmission on flywheel housing.

11. Move engine straight forward to disengage clutch shaft, then lift engine out of car.

1949-51 MODELS

ENGINE REMOVAL: Engine and transmission are removed as a unit as follows:

1. Drain oil and water.

2. Remove hood, battery, generator, air cleaner.

3. Remove air deflector top panel, radiator and hoses.

4. Remove carburetor fuel line, throttle rods, vacuum lines, engine to dash bonding strap.

5. Disconnect coil wire to distributor, temp. gauge wiring and starter cable.

6. Disconnect universal joint (rear) and remove drive line, (slip yoke at front end slides out of transmission).

7. Disconnect transmission shift rods, exhaust pipe at manifold, and remove front and rear engine mounting bolts.

8. Lift engine out, guiding the rear at the same time.

Hydra-Matic Cars—Follow steps 1 to 6 above and proceed as follows:

1. Remove transmission levers, bell crank rods, accelerator bell crank and accelerator cross shaft.

2. Support rear of engine on jack.

3. Remove cross member and rear mount supporting transmission.

4. Lift engine out with man beneath guiding the transmission.

1952-55 MODELS

ENGINE REMOVAL (With Transmission):

1.) Disconnect battery, drain radiator, remove hood assembly, and carburetor air cleaner. Remove top radiator air deflector, hood latch support brackets, horns, radiator hoses, and radiator assembly.

2.) Disconnect defroster blower motor wires, heater delivery chamber clips, and turn blower motor clockwise and remove entire assembly. Disconnect heater hoses, generator field and ground wires, windshield wiper hoses, flexible ground strap, throttle and accelerator linkage, and remove "Z" bar from dash. Remove wires from water temperature gauge and "BAT" terminal of coil.

3.) Place car on jack or hoist. Drain engine oil and transmission oil, remove flywheel cover and drain torus cover. Remove torus cover bolts, leaving a few to hold cover in place.

4.) Disconnect rear universal joint, remove drive shaft. Remove transmission throttle and manual lever rods and throttle lever from transmission. Disconnect speedometer cable, wire from oil pressure gauge sender unit, generator armature wire, starter cable, and battery ground strap.

5.) Disconnect flexible fuel line, disconnect exhaust pipe from exhaust manifold. Remove oil filter. Remove front and rear engine mounts allowing transmission to rest on detachable frame cross-member.

6.) Install engine hoisting sling Tool 6000-AA under exhaust manifolds, and raise engine enough to clear engine mounts. Remove detachable frame cross-member.

7.) While lifting engine out of car, rear of engine should be guided by forcing engine toward right side to clear oil pump.

OIL PAN

1946-48 MODELS

OIL PAN REMOVAL: Drain crankcase. Disconnect drag link at steering gear pitman arm. Loosen clamp on exhaust cross pipe, disconnect cross pipe at left cylinder bank exhaust manifold, remove cross-pipe. Remove capscrews in ball cap at rear end of front radius rods, lower radius rods to provide additional clearance at pan (rods can be held down by inserting wooden block between ball connection at rear end and frame). Remove right and left splash pan mounting screws and move pans out of the way. Remove starter motor. Disconnect oil filter return line at oil pan. Take out oil pan capscrews and remove pan from beneath car. NOTE—Front end of car can be raised by means of hoist attached to bumper bars (not axle) for additional pan clearance at front end.

Installation Caution—Install new packing in groove at front end of oil pan and use new pan gasket. Packing should be soaked in engine oil for two hours before it is used.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1949-51 LINCOLN

OIL PAN REMOVAL (LINCOLN): ***CAUTION—For access to oil pump and screen or for clean out, oil sump only can be removed. Oil sump secured by 4 lower capscrews on bell housing and 18 nuts to oil pan.***

Oil Pan Removal—Car manufacturer recommends following method be used:

1)—Drain oil, set #2 piston at top dead center (2nd cylinder right hand bank), turn wheels to extreme right, take off exhaust cross-over pipe (secure manifold heat valve with one nut).

2)—Remove steering idler arm bracket from right frame rail and pull down. Take off starter and oil dip stick tube.

3)—Remove oil sump (4 lower capscrews on bell housing and 18 nuts to oil pan). Take off oil pan baffle (clipped to oil pan). Disconnect filter return line on left side of pan.

4)—Remove 20 oil pan-to-block capscrews using 3/8" drive tools. Move outlet pipe to left after freeing bracket for access to front oil pan screws. Lower rear end of pan and slide out to rear.

1949-51 COSMOPOLITAN

OIL PAN REMOVAL (LINCOLN COSMOPOLITAN): Same as given for LINCOLN above except that front end of engine must be raised as follows:

1)—Drain radiator and remove lower radiator hoses.

2)—Turn fan so that wide angle between blades up.

3)—Remove fuel & vacuum pump from adapter.

4)—Take off 2 nuts from front engine mounts, raise front of engine 2¼-2⅜", block engine up by inserting blocks between brackets and engine mounts.

5)—When removing oil pan, pan should be turned so front oil seal will pass over left capscrew of front main bearing cap.

1952-53 MODELS

OIL PAN REMOVAL: Turn crankshaft so that rear counterweights on crankshaft are upwards, then remove oil pan from front of engine.

CYLINDER HEAD & MANIFOLD

1946-51 MODELS

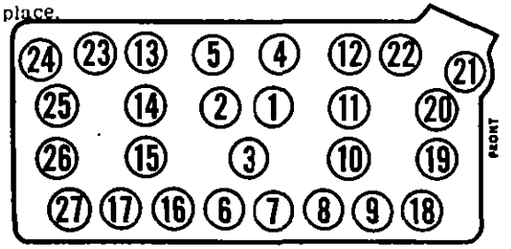
CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten head stud nuts. Tighten in sequence from center of head outwards.

Cast Iron Heads—With engine cold, tighten all nuts evenly to correct tension. Then run engine until it is thoroughly warmed up and recheck all nuts.

Aluminum Heads—With the engine cold, tighten all nuts to correct tension. Run engine until thoroughly warm, allow engine to cool off, and then recheck all nuts. Do not tighten aluminum heads when warm.

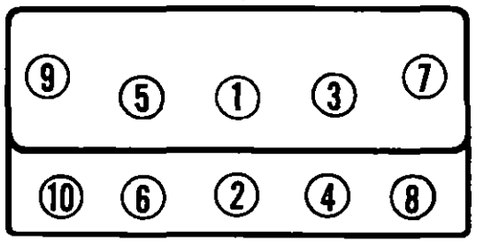
1952-55 MODELS

CYLINDER HEAD REMOVAL: Loosen all pushrod adjusting nuts and screws to relieve tension on pushrods. Remove all rocker arm bracket attaching screws and nuts, remove oil overflow pipe from end support (front end on right bank, rear end on left bank), lift rocker arm assembly up over studs and remove as an assembly (see Rocker Arm data under "Valve System" below). Remove all pushrods, remove oil baffle plates from rocker arm pads. Remove the two end cylinder head capscrews and install Pilot Studs, Part No. 6051-A, in these two holes. Install cylinder head holding fixture 6085-A (CAUTION—this fixture recommended to protect machined surfaces of head while it is off the engine AND SHOULD NOT BE REMOVED FROM HEAD UNTIL IT IS RE-INSTALLED ON ENGINE). Remove remaining cylinder head capscrews, lift head up and off the locating dowels and pilot studs. Remove gasket. ***CAUTION—Never pry between cylinder head and block.***



►***CYLINDER HEAD INTERCHANGEABILITY:*** Heads can be changed from one bank to the other if the rocker arm shafts and supports are changed to properly line up oil feed and drain passages. Water jacket plugs must be installed in hole at rear of the cylinder head. Use Tool 6085-C to install new plugs.

1952-55 MODELS



CYLINDER HEAD INSTALLATION: Install pilot studs, Tool 6051-A in two end capscrew holes in block, Coat NEW steel head gasket lightly with 8M-19554 gasket sealer and install gasket over pilot studs and dowels. Install cylinder head assembly over pilot studs and dowels **with plugged water jacket hole to rear of engine.** Install 8 cylinder head capscrews, then remove pilot studs and install remaining two capscrews in these holes. Tighten all capscrews evenly as follows: ***(CAUTION—Three torque applications must be made as indicated below).*** **Initial** COLD torque should be 75 ft. lbs., **Second** COLD torque to 80 ft. lbs.; **Third** HOT torque to 85 ft. lbs. should be made after 20-minute fast idle warm up. NOTE—After the above procedure has been completed the cylinder head capscrews require no additional torquing and should not be disturbed for installation of engine lifting hooks, etc.

►***CYLINDER HEAD GASKET INSTALLATION CAUTION:*** Gaskets are interchangeable from one cylinder bank to the other but MUST BE INSTALLED WITH MARK "FRONT" TOWARD FRONT OF ENGINE. Make certain that water passage holes in gasket and block line up.

►*1953-54 SERVICE REPLACEMENT CYLINDER HEAD NOTE:* Cylinder Head, Part No. EAD-6049-G is adaptable to either the 14mm or 18mm spark plugs. Spark plug holes are drilled and tapped for 18mm spark plugs and a special adapter, Part No. B5A-6060-A, is provided so that 14mm spark plugs may be used. Adapter can be installed by threading plug into adapter, then installing assembly in cylinder head and torquing to to 25-30 ft. lbs., which is sufficient to seal adapter in place.

1949-51 CYLINDER HEAD

1952-55 CYLINDER HEAD

CRANKSHAFT & MAIN BEARINGS

1949-51 MODELS

CRANKSHAFT REPLACEMENT: Use 8EL-6303-A or B for replacement engines with standard clutch and transmission, and 8EL-6303-B or C crankshaft in engines with Hydra-Matic drive. "C" shaft is same as "B" shaft except pilot bushing and retainer for the Hydra-Matic have been installed.

1949-51 MODELS

FLYWHEEL REPLACEMENT: If new crankshaft is installed with an old flywheel or a new flywheel used with an old crankshaft on Hydra-Matic cars, new oversize dowels must be installed. A special reaming tool is made for this purpose. Oversize dowels (.005" O.S., Part No. 8EL-6387-D, .015" O.S., Part No. 8EL-6387-E) are furnished for service.

1949-51 MODELS

REAR MAIN BEARING OIL SEAL: (Upper Seal)—Place upper rear main bearing seal retainer in Tool 6007-A and install packing, forming it in place with upper half of Tool 6007-A. Cut off ends of packing at cut-off point provided in Tool 6007-A (CAUTION—Do not soak packing in engine oil). Remove seal retainer from tool and install it in cylinder block, with a gasket between retainer and cylinder block. Coat gasket sparingly with Permatex No. 2. Secure retainer with capscrews and lockwashers. Torque capscrews to 5-8 ft. lbs. torque.

Lower Seal (In Oil Pan)—Install packing in oil pan using Tool 6007. Seat packing firmly in pan groove and then cut off ends of packing at cut-off slots in tool. Packing should extend approximately 1/16" from pan gasket surface. CAUTION—Do not soak packing in engine oil.

1952-55 MODELS

REAR MAIN BEARING OIL SEAL: Install new packing in crankcase and bearing cap using Tool 6701 to seat packing. Before removing tool cut off edges flush with surface. Make certain there are no ragged edges protruding. Install outer "L" shaped neoprene seal on bearing cap and coat with lubricant. Install Pilot Studs Tool 6336-A1, and place unit over pilot studs. Push bearing cap through tool and into position in block. Remove bearing replacing tool and trim vertical seals, leaving approximately 5/64" of seal above cap. Remove pilot studs and install the self locking main bearing cap bolts. Tighten to 120-130 ft. lbs. torque.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1952-55 MODELS

CRANKSHAFT THRUST BEARING ALIGNMENT: After #1, #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert. Install capscrews snug, then pry crankshaft toward rear of engine. Reverse this action by prying crankshaft forward (toward front of engine). This will align thrust surfaces of both halves of thrust bearing. RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 120-130 ft. lbs. torque. Check crankshaft endplay which should be .004-.008"

1952-55 MODELS

ENGINE FRONT COVER INSTALLATION: Coat new cover gasket with sealer, install gasket and front cover on engine. Align cover and oil seal on crankshaft, BEFORE installing capscrews by positioning Tool 6059 on crankshaft. Tighten cover capscrews to correct torque (see Tightening Specifications).

1952-55 MODELS

CRANKSHAFT FRONT OIL SEAL (In Timing Chain Cover): Coat new seal with engine oil and install on Tool 6700. Center seal and tool over front cover boss and drive in until seated. Make sure spring on inside of seal is properly seated.

CAMSHAFT & BEARINGS

1949-51 MODELS

►*1949-50-51 CAMSHAFT REMOVAL CAUTION*—Camshaft **cannot** be removed with engine in car. Fuel pump cam ring at rear end of camshaft will drop off cam and fall into pan.

Oversize Camshaft Bearings: Some engines in production have .080" oversize outside diameter camshaft bearings installed. Can be identified by the fact they are not the split type. Engines with these bearings are stamped on the valve cover gasket surface near the left water pump with an "F," "G," or "H" indicating front, center, or rear bearing is oversize. Part Nos. are #1 & #2, 8EL-6262-D, #3, 8EL-6263-D.

1952-55 MODELS

CAMSHAFT REMOVAL: Remove cylinder head covers and rocker arm asemblies from cylinder heads (see Cylinder Head Removal). Remove valve pushrods and hydraulic valve lifters. Remove timing chain and sprockets (see Timing Chain). Remove fuel pump drive sleeve from camshaft eccentric and remove timing chain oil deflection plate. With Tool 9400-B remove snap ring retainer from fuel pump push rod and remove rod. Carefully withdraw camshaft to avoid damaging camshaft bearings.

►*1952-55 SERVICE REPLACEMENT CAMSHAFT CHANGE (To provide better wear characteristics):* New camshafts, Part Nos. EAD-6250-G (1952-54), EBJ-6250-B identified by the letter "C" followed by two dimples between the first two cam lobes (from front of shaft).

TIMING GEARS

1946-48 MODELS

TIMING GEARS: Camshaft Gear. New type aluminum alloy camshaft gear is bolted on camshaft hub flange by four offset capscrews and can be replaced without removing camshaft from engine. To remove gear, remove screw in front end of crankshaft, pull fan and dampener assembly (use Puller 6360-A), remove timing gear cover. Bend back lockplate tangs and take out four camshaft gear mounting screws, remove gear. When replacing gear, make certain that marks on camshaft gear and crankshaft gear are lined up and see that lockplate tangs are bent up against flats on mounting screws. Use 6360-B Dampener Replacer tool to install dampener.

NOTE—Camshaft gear mounting screw holes are offset so that gear can only be installed in correct position.

Crankshaft Gear—To replace crankshaft gear, pull fan and dampener assembly (see Camshaft Gear Removal above), use 6306-C puller to remove crankshaft gear, 6306-D Gear Replacer to install gear.

Timing Gears: Camshaft Gear (Aluminum Alloy) furnished in .006" Oversize (1GA-6256-B), and .012" Oversize (1GA-6256-C).

1949-51 MODELS

TIMING GEARS: Removal & Installation—Follow same procedure as for 1946-48 models.

TIMING CHAIN

1952-55 MODELS

TIMING CHAIN REMOVAL & INSTALLATION: Remove radiator and then remove water pump assembly from engine front cover. Remove hex head capscrews from front of crankshaft, and using Tool 6313-FF, remove crankshaft dampener and woodruff key. Remove front cover and engine timing pointer. Remove thrust plunger and spring from front end of camshaft. Take out the three capscrews in camshaft sprocket. Remove lock plate, and then remove sprocket and timing chain together.

VALVE SYSTEM

1952-55 MODELS

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves):* Stem diameter has been decreased .0005" to provide greater stem clearance in guide. NEW stem diameters are:

Size	Stem Diameter
Std. (Marked Red)	.3400-.3405"
Std. (Marked Green)	.3405-.3410"
.003" Oversize	.3430-.3440"
.015" Oversize	.3550-.3560"
.030" Oversize	.3700-.3710"

1949-51 MODELS

VALVE TIMING CHECK: Remove the intake manifold and the right hand cylinder head. With intake valve (#1 cyl.) just opening, line up timing mark on dampener with pointer. Raise #1 exhaust valve and insert a piece of ⅛" stock between lifter plunger and valve stem, release the valve and allow the lifter to collapse completely. Crank engine backwards about 45° and place contact point of dial indicator on head of #1 exhaust valve and set indicator to ZERO. Crank engine forward until timing mark and pointer again line up. If the valve timing is correct the indicator will read .020" to .040". If the reading falls back it indicates the lifter is not completely collapsed and it will be necessary to repeat the procedure. If the camshaft is one or more teeth out of time the dial reading will be considerably outside the limits given.

1946-48 MODELS

VALVE SERVICING: Complete valve assembly (valve, spring, guide) should be removed from the engine and dismantled on the bench as follows:

Valve Assembly Removal—Use special bar type lifter, VZ-185, inserting end of lifter through spring coils to engage flanged lower end of guide, pull guide down slightly to release retaining 'C' washer, pull 'C' washer out, lift valve assembly out through top of block.

CAUTION—Mark valve assembly with cylinder number to insure re-installation in same position.

CAUTION—Mark valve guide halves to insure each assembly being kept together and re-installed in same cylinder.

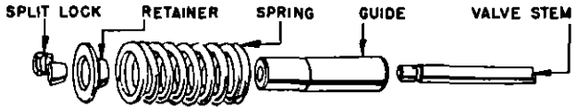
Valve Installation Note—Intake valve guides have relief groove cut on one edge of each guide half. Install guides with this relief groove up.

1949-51 MODELS

VALVE ASSEMBLY REMOVAL: Compress valve spring with Tool 6513 and remove retainer keys. (NOTE—Crank engine until tappet is at lowest point before compressing spring). Hold spring up and remove lower spring retainer, then drop spring over tappet and while holding upper retainer up, remove spring, then remove upper retainer. Install by reversing above procedure.

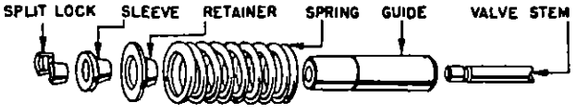
1952-55 MODELS

VALVE ASSEMBLY REMOVAL: Loosen push rod adjusting nuts and take off rocker arm assemblies by removing support bolts. Use Tool 6513-A or any suitable valve compressor and remove valve keepers, retainers, sleeves, neoprene seals and valve springs. ***Identify each part to insure return to original position.***



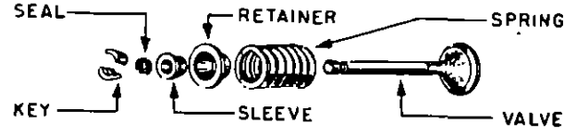
LATE 1951 & 1952-55 MODELS

ROTATABLE VALVES: *(NOTE—Rotatable Valves are standard on Late 1951 and Later Models. See Note below for installation on previous cars).* Consists of a two piece type retainer and sleeve which allows valve to rotate freely.



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



1949-50 & Early 1951 Rotatable Valve Installation (Cars not originally equipped with rotatable valves) —Install new type retainer and sleeve. Valve gap setting is not changed when rotatable valves installed.

1949-51 CONVENTIONAL VALVE ASSY.

1949-51 ROTATABLE VALVE ASSY.

1952-55 ROTATABLE VALVE ASSY.

1949-55 MODELS

VALVE SEAT WIDTH: Valve seat width should be held to 1/16-5/64". If wider than this they should be narrowed down by grinding the seat at bottom 30° and top 60°. Center valve head face contact is desired. Seat contact on valve can be raised by grinding block seat with 30° grinder and lowered with a 60° grinder. Check valve face using prussian blue to determine if seat is centered.

►**1949-50-51 Valve Replacement Note**—If the original seat has been ground to a point where contact with valve face is too near the outer edge of valve, a .070" intake valve should be installed. To install the oversize valve, grind the seat down with a 45° grinder until valve does not protrude more than .030" above block (for head clearance).

VALVE TAPPET ADJUSTMENT
1952-55 MODELS

INITIAL VALVE CLEARANCE: To insure valve being on the low side of the cam, make all adjustments in the following sequence, and with No. 1 & No. 6 pistons in the indicated position.

No. 1 Piston at TDC (Compression Stroke)—Adjust No. 1 In. & Ex., No. 2 In. & Ex., No. 5 In. & Ex., No. 7 In., No. 4 Ex.

No. 6 Piston at TDC (Compression Stroke)—Adjust No. 6 In. & Ex., No. 3 In. & Ex., No. 7 Ex., No. 8 In. & Ex., No. 4 In.

Turn valve adjusting screw clockwise while moving push rod up and down until **all slack is removed.** ***(CAUTION—Plunger unit of hydraulic lifter should not be forced down into body during this operation).*** With all slack removed, turn adjusting screw an **additional 2½ turns.** Hold adjusting screw, tighten locknut to 30-35 ft.lbs. torque. *NOTE*—If lifter is noisy in operation, adjustment can be varied by turning adjusting screw ±¼ turn from original 2½ turn setting. Repeat operation on all valves.

VALVE STEM SEALS
1952-55 MODELS

►*VALVE STEM SEAL REPLACEMENT NOTE:* On early type heads with tapered shoulder on valve guide boss, use Valve Stem Seal, Part No. B4Q-6571-A on intake and exhaust valves. On later type heads with square shoulder approximately ¼" below top of valve guide, use Valve Stem Seal, Part No. EAA-6571-C on intake and exhaust valves.

VALVE STEM SEAL INSTALLATION: Install valve stem seals on valve stem so seal is seated in position on valve guide boss. *See "Replacement Note" above for correct seal application.*

VALVE SEAT INSERTS
1946-50 MODELS

VALVE SEAT INSERT (Removal & Installation)—Valve seat inserts used only on 1949-50 model exhaust valves. To remove valve seat, drill two holes directly opposite each other at right angles to face of valve seat using a No. 30 drill. Drill as deeply as possible without breaking through insert. With a sharp chisel, cut into holes and use a screwdriver to pry upward to break insert. To install a new seat, first chill it in dry ice then quickly drive it into the counterbore

VALVE GUIDES
1952-55 MODELS

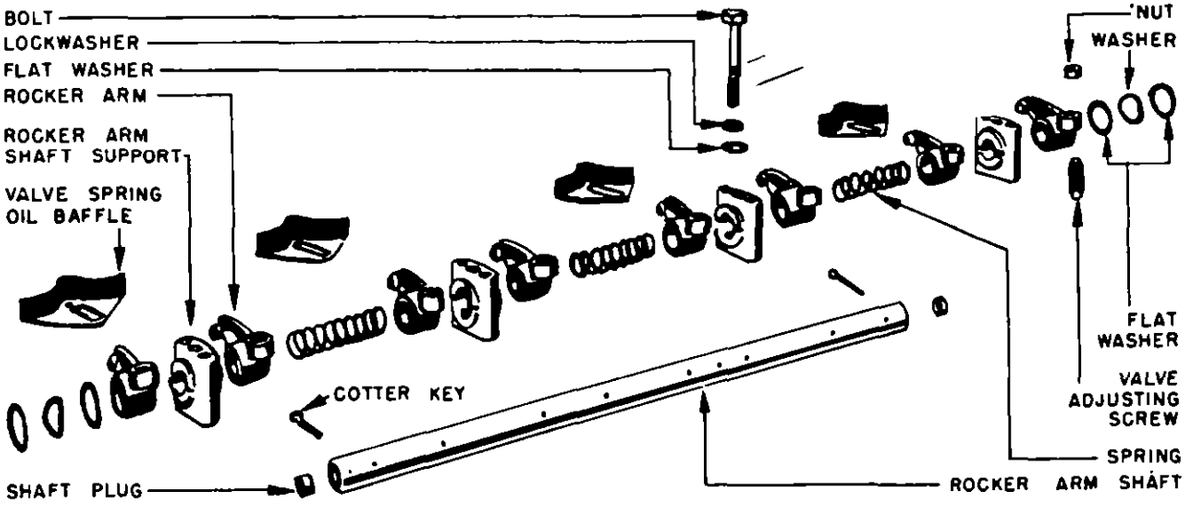
OVERSIZE VALVE STEM INSTALLATION: Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems. Reamers are furnished in .003", .015", & .030" oversizes. Pilots are furnished Std., .003", & .015". Use reamers in sequence with correct pilots when reaming from standard to oversize. Regrind valve seats AFTER reaming guides.

ROCKER ARMS
1952-55 MODELS

ROCKER ARM ASSEMBLY: *After assembly removed* from cylinder head (see Cylinder Head Removal above), disassemble and reassemble the assembly as follows:

Rocker Arm Disassembly: Remove cotter keys, washers, rocker arms, springs, supports and plugs from shaft. ***Keep all parts in order as removed so they may be reinstalled in same position.*** Inspect all parts for wear and replace worn parts. If rocker arm radius is scored, replace arm, do not try to regrind radius.

Rocker Arm Reassembly: Reverse disassembly procedure. Two types of rocker arms are used. These should be installed so valve ends of arms point outward away from support, see illustration.



HYDRAULIC LIFTERS
1946-48 MODELS

HYDRAULIC VALVE LIFTERS: ***(NOTE—Two types used: "One-Piece" type and "Two-Piece" type. For disassembly & Reassembly of "Two-Piece" type, see 1949-51 Hydraulic Valve Lifters below).***

Removal: Both type lifters are "Barrel Type" and can be lifted out of bore after valve and spring have been removed.

Disassembly: Force piston down slightly with a blunt instrument and pry out the retaining ring. If piston does not come out easily, soak in solvent, and if necessary, pry it out with a screwdriver. Remove return spring and valve assembly from body. Clean *thoroughly with solvent and dry with compressed*

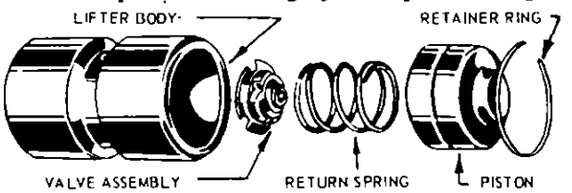
CONTINUED ON NEXT PAGE

LINCOLN 1952-55 ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

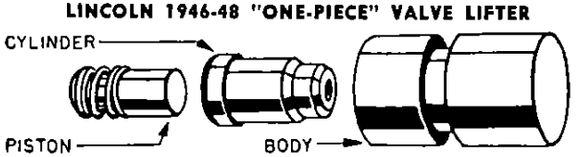
air. *CAUTION—It is important that lifter parts do not become mixed. Disassemble and clean one lifter at a time.*

Reassembly: Position valve assembly in place in lifter body with spring installed on top. Insert piston and depress sufficiently to install retainer ring.



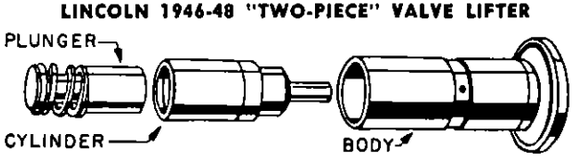
Adjustment: No adjustment required. Clearance should be zero with lifter filled with oil, and .030" to .070" clearance with lifter dry and compressed.

1949-51 MODELS

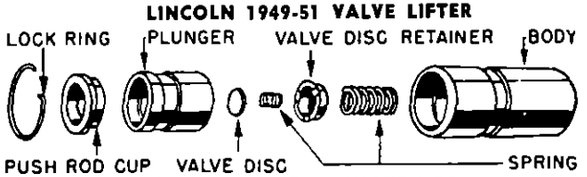


HYDRAULIC VALVE LIFTERS: "Two-Piece" type lifter consisting of a cylinder and plunger assembly and a "mushroom" type lifter body.

Removal: Cylinder and plunger assembly can be withdrawn from lifter body (mushroom type) after valves and springs have been removed. *Camshaft must be removed if lifter body is to be removed from engine.*



Disassembly: (Plunger and cylinder assembly removed from lifter body). *(NOTE—Disassemble one unit at a time to avoid the possibility of mixing the parts).* Unlock plunger spring by twisting in a clockwise direction. Pull plunger and spring out of cylinder. It may be necessary to insert a thin wire through oil hole under ball check to raise ball and drain oil from cylinder. Wash all parts in clean solvent and dry with a clean dry cloth or blow dry with air. If plunger or cylinder scored, replace as a unit (old lifter body may be used if clearance in block or guide bracket is not excessive). If there is evidence of scoring, or foreign matter in the oil, remove oil pan and thoroughly clean pan and engine.



LINCOLN 1946-48 "ONE-PIECE" VALVE LIFTER

LINCOLN 1946-48 "TWO-PIECE" VALVE LIFTER

LINCOLN 1949-51 VALVE LIFTER

LINCOLN 1952-55 VALVE LIFTER

1952-55 MODELS

HYDRAULIC VALVE LIFTERS: Lifters are "barrel type," integral units with a flat, disc type check valve.

Removal: Remove cylinder head covers. Take out rocker arm assembly support bolts and remove rocker arm assemblies, and valve push rods. Valve lifters can then be removed from lifter bores in block.

Disassembly: Immerse all lifters in solvent to remove all varnish and carbon deposits. DO NOT CUT OR SCRAPE CARBON FROM LIFTER. With needle nose pliers, remove lock ring from top of body. Remove push rod seat, plunger, valve disc assembly and spring from body. *(CAUTION—Disassemble one lifter at a time to avoid inter-mixing lifter parts).*

Reassembly: Place push rod seat upside down on bench. Install plunger on push rod seat and place valve disc assembly on plunger and set spring on valve disc retainer. Place body over assemblies and push body down over plunger. Lift assembly and push plunger and push rod seat up into body. Install lock ring using tool 6500-C.

OILING SYSTEM

1946-48 MODELS

LOW OIL PRESSURE NOTE: Low oil pressure may be caused by fuel pump push rod bushing being worn through, permitting oil to escape from main oil channel. Replace bushing by driving old bushing out of cylinder block and driving new bushing in until top of bushing is 7/8" above face of casting. New bushings need not be reamed.

OIL PUMP

1946-48 MODELS

OIL PUMP: Removal & Disassembly—To remove pump from engine, remove locking wire and take out mounting screw in pump mounting flange, pull pump down and out (NOTE—Pump body fits in recess in cylinder block and it may be necessary to jar it slightly to loosen it). To dismantle pump, remove 4 screen cover capscrews, take out screen cover, pump cover plate, screen, and screen cover gasket. Lift out pump driven gear. Remove relief valve plug, spring, and plunger (on side of pump housing). If pump shaft and driving gear are to be removed, drive out pin in drive (upper) gear, place pump in arbor press with support under oil screen cover gasket seat (below relief valve), press shaft and driving gear out through lower end of housing.

Servicing—Clean out all oil passages in pump housing with compressed air. Replace all worn parts when clearances exceed following limits:

Pump Shaft & Bushings—Shaft clearance in bushing should be .001-.003" and bushings should be replaced if clearance exceeds .005". Replace shaft if pump gear worn or if bearing surface worn to diameter of less than .497". Replace bushings if worn to inside diameter greater than .502" (check by pushing shaft gear from side-to-side in pump housing, replace bushings if play greater than .005". Remove old bushings with driver, press new bushings in place, line ream to inside diameter of .499".

Pump Driven Gear & Shaft—*Clearance between* driven gear and stub shaft in pump housing should be .002-.0035". Replace shaft if clearance exceeds .005" or shaft diameter under .434". To replace shaft, drive old shaft out of housing, press new shaft in place (make certain end of shaft will clear cover when installed).

Oil Pump Relief Valve—Check relief valve spring tension. Replace if not within limits as follows:

Spring Number	Pressure & Length
H-6670 ("H" & "86H" pumps)	134-144 ozs. @ 1.06"
06H-6670 (for "06H" pumps)	*95-101 ozs. @ 1.195"*
41A-6654 (for "56H" pumps)	78-87 ozs. @ 1.38"

Pump Assembly—Insert pump shaft in housing, press drive gear on shaft until clearance between gear hub and end of housing (endplay) is .017", drill new 5/32" hole through shaft in line with hole in gear, install 5/32" pin and peen both ends of pin. Complete assembly by reversing disassembly (above).

CAUTION—Make certain that pump mounting screw is locked with wire and lockwashers used under screen cover capscrews. Stake oil relief valve plug in place with punch.

1946-48 MODELS

OIL PUMP DRIVE (Camshaft Gear): Pump drive gear is pressed on rear end of camshaft. Remove old gear with gear puller, No. 6254-A, drive new gear on shaft with a fibre block (support shaft in vise with brass jaws). NOTE—Late design camshafts have flat on oil pump drive gear hub and gears have similar flat to prevent the gear turning in service. These gears and camshaft must be used together and flats must be lined up when installing gear. Drive gear on shaft until it is firmly seated against the shoulder on the shaft.

Oil Pump Idler Gear: This gear located in rear end of cylinder block between camshaft gear and oil pump drive gear on pump shaft.

Removal & Disassembly—Take out capscrews in cover on rear face of cylinder block, lift off cover and gear assembly, and gasket.

Servicing—Replace all worn parts when clearances exceed following limits:

Idler Gear & Bushing—Clearance on shaft should be .0005-.002". Replace bushing if worn to inside diameter greater than .752" or if clearance exceeds .005". To replace bushing, drive old bushing out, press new bushing in gear, ream bushing to provide shaft clearance of .0005-.002".

Idler Gear Shaft—Replace shaft if scored or worn to diameter less than .747". To replace shaft, press old shaft out of cover, press new shaft in until end of shaft is flush with face of cover.

1946-48 MODELS

OIL-PRESSURE REGULATOR (Relief Valve): Relief valve located under plug directly above **front** camshaft bearing (under valve cover) on all engines. Oil pump relief valve located on side of oil pump. Additional hydraulic lifter by-pass valve located above **rear** camshaft bearing (under valve cover) on cars with hydraulic valve lifters starting with 1939. Check relief valve spring tension and replace all springs which are not within limits listed below.

CAUTION—Correct type spring must be used.

Front Cylinder Block Relief Valve (Engines without Hydraulic Valve Lifters)—Replace valve spring if not within limits of 36-43 ozs. compressed to 1.38".

Front Cylinder Block Relief Valve (Engines equipped with Hydraulic Valve Lifters)—Replace valve spring if not within 33-36 ozs. compressed to .53".

Rear Cylinder Block Hydraulic Lifter By-Pass Valve—Replace by-pass valve if spring broken or if valve

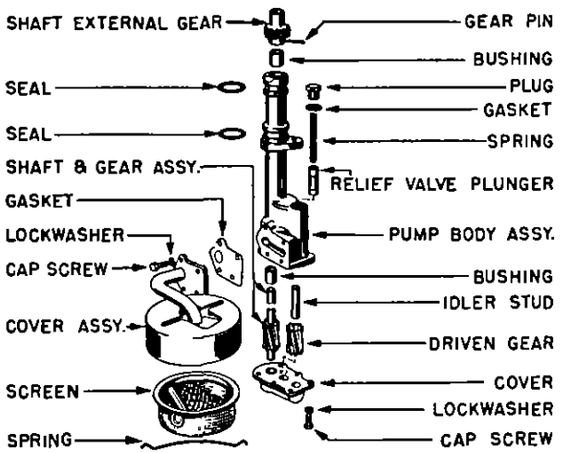
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

does not seat properly

Oil Pump Relief Valve—Three different spring used. See Oil Pump Removal & Disassembly data above.

1949-51 MODELS



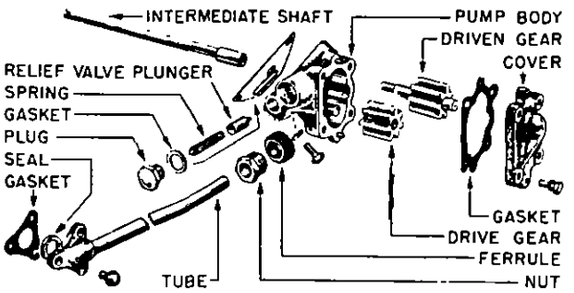
OIL PUMP: Located in engine crankcase, and driven by gear on end of camshaft, through an intermediate idler gear.

►***OIL PUMP DRIVE GEAR AND IDLER GEAR NOTE***—*Engine must be removed from car to replace pump drive gear (on end of camshaft), and idler gear assembly.*

Removal: Remove oil pan and remove pump attaching bolts. Withdraw complete pump assembly from engine recess.

Disassembly: Remove screen and cover assembly, then remove pump cover from pump body. Remove pump driven gear. Remove relief plug, gasket, valve spring and plunger. If external drive gear is worn or defective, file retaining pin flush with gear shoulder and drive pin out. Press gear from pump shaft. Remove rubber oil seal rings from body.

Inspection: Wash all parts in solvent. Examine oil pump gears and shaft for wear and scoring. Install shaft in bushing and check for sideplay. Check bushings for score marks. If bushings are worn, drive out old bushings and install new ones. Ream new bushings for a slip fit with shaft. Replace all other parts of pump found to be worn or defective. Check relief valve plunger for wear or scores, and check tension of relief valve spring which should be 12.4 lbs. at 2.175".



LINCOLN 1949-51 OIL PUMP

1952-55 MODELS

OIL PUMP: Externally mounted on lower left rear side of engine block. Pump is driven by distributor shaft.

►***OIL PUMP PRODUCTION CHANGE:*** Later type oil pump and driving gear assembly has been changed to a press fit. Early assemblies were keyed.

LINCOLN 1952-55 OIL PUMP

Removal: Disconnect external oil line. Remove attaching capscrews and remove pump and intermediate shaft.

Disassembly: Remove capscrews retaining bottom cover to pump body. Tap cover gently with a soft hammer if stuck. (CAUTION—Do not tap end of drive gear shaft). Remove gears from pump body, relief valve plug gasket, spring and relief valve. Pull oil inlet pipe ferrule assembly from large hole of pump body.

Inspection: Wash all parts in solvent. Check all parts for signs of wear, or grooves that might cause an oil leak. Check upper drive shaft clearance (.0015"-.0030"), and lower drive shaft clearance (.0010"-.0030"). If clearance is greater than above, replace pump body. Check oil pump relief valve spring tension which should be 9.82 lbs., at 1.71". Check gears, and if worn or scored, replace as necessary.

Reassembly: Install gears in pump body and install cover using a new gasket. Install new oil inlet tube ferrule assembly in large hole of pump body. Position relief valve in bore and install spring and plug with new gasket.

OIL FILTER

1952-55 MODELS

OIL FILTER SERVICING: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions).

►***REPLACEMENT CAUTION***—Use Replacement Kit, Part No. HCK-6731-A, which includes correct Filter Element and NEW GASKETS WHICH MUST BE USED.

►***OIL FILTER OIL ANTI-DRAIN BACK PRODUCTION CHANGE:*** Beginning with serial number 54WA-19137-H and 54LA-7558-H an oil anti-drain back and filter mounting bolt insert has been installed in the filter to replace the anti-drain back valve formerly installed in oil inlet passage of the block. NOTE—some cars may have both types installed and it is not necessary to remove the former type. To install later type assemblies on earlier cars proceed as follows: Remove oil assembly and discard mounting gasket and mounting bolt insert *(CAUTION—The new type insert must be used with the diaphragm assembly).* Thread the new insert, Part No. EAA-6890-C into diaphragm until it contacts flange. Clean cylinder block oil filter recess and assemble insert and diaphragm into block recess with the two slots and the word "top" toward the up position. Tighten insert firmly to insure diaphragm being clamped tightly between insert and block. *(CAUTION—Make sure that slots in diaphragm are in the uppermost horizontal position and that top edge of insert has no burrs which would prevent bottom of oil filter element from sealing against it).* Install filter assembly using a new gasket between diaphragm and filter container. *NOTE*—Removal of oil filter for normal service operations does not disturb diaphragm after it has once been properly installed.

Filter Removal: Take out center bolt in filter cover, remove filter assembly. Remove and discard cover mounting gasket from filter mounting pad, remove and discard filter element. Remove and discard neoprene gasket from center bolt, remove spring and seat assembly from center bolt, then remove center bolt from cover, remove and discard fiber center bolt-to-cover gasket. Wash all parts and filter pad on block with solvent and make certain they are clean.

Filter Installation: Install NEW fiber gasket on center bolt, install bolt in cover, install spring and seat assembly on bolt with open end of seat toward cover *(CAUTION*—seat must be attached to spring by tangs). Install NEW neoprene gasket on center bolt next to spring seat, install new filter element. Install NEW filter mounting gasket in block recess *(CAUTION*—DO NOT use sealing compound on this gasket). Install filter assembly on engine making certain that filter is seated in recess and not "cocked" over shoulder of recess. Tighten center bolt just enough to bring case up against gasket, rotate housing slightly to assure even seating, then tighten center bolt to 20-25 ft.lbs. torque. *CAUTION*—DO NOT overtighten the bolt which may strip threads, distort cover, or cause leaks. After engine started up, allow it to idle until lubrication established and normal oil pressure secured, then speed up engine and check for oil leaks.

COOLING SYSTEM

1949-51 LINCOLN & LINCOLN COSMOPOLITAN

PRODUCTION CHANGE FOR IMPROVED COOLING: New Cylinder Head Gasket No. 8EL-6051-D. This gasket required for new water holes added during production, 4 holes in block (1 in upper corners of each bank) with matching holes in each cylinder head. This gasket furnished for service on all engines (can be used on early engines without the additional holes).

Drilling of Additional Water Passage Holes on Early Cylinder Blocks and Heads for Improved Circulation—Allowed by car manufacturer where overheating conditions cannot be corrected by regular methods. Use new gasket No. 8EL-6051-D as template, drill 5/16" additional holes as follows: 4 in cylinder block (1 in upper corner front and rear of each bank), 2 in each cylinder head (1 in upper corner front and rear).

►***CAUTION—Holes in cylinder block should not be drilled deeper than ⅝".***

HOOD LOCK: Hood is Alligator type. To raise hood, pull out lock button on left side of instrument panel, press in on safety catch under front edge of hood.

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on top of clutch housing (visible through opening in floor) and on left side of frame front cross-member near left front engine support.

TUNE-UP

COMPRESSION: Pressure—105-125 lbs. at cranking speed.

VACUUM READING: Steady 18-20" idling at 6 MPH.

FIRING ORDER: 1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered 1-3-5-7-9-11—Left Bank, 2-4-6-8-10-12—Right Bank (front-to-rear).

SPARK PLUGS: Champion Type H-10. 14 mm. Metric. Gaps—.025"

IGNITION: See Coil, Condenser, and Distributor.
Breaker Gap—.014-.016" (both sets equal).
Cam Angle or Dwell—36.5° closed, 23.5° open (each set—contacts operate independently).
Breaker Arm Spring Tension—20-24 ozs.
Automatic Advance—Starts at 200 RPM. Max. advance 11-12° at 650 RPM (Distr. ° and RPM).

IGNITION TIMING: See Ignition Timing.
Std. Setting—2° BTDC.
Timing Marks—None. See Ignition Timing for *directions on setting and synchronizing of distributor* for correct timing when installed on engine.
Vacuum Brake Setting—Set to just eliminate ping with engine pulling load (back off adjusting screw until engine pings, then turn screw in just enough to eliminate pinging).

CARBURETION: See Carburetor & Carb. Equipment.
Idle Setting—With engine warm, set throttle stop-screw for 500 RPM idle speed. Set idle adjusting screws (1 for each barrel—adjust in succession) for smooth idle (turn screws in for leaner mixture).
Float Level—1.322-1.353" bottom of float to underside of bowl cover with needle valve seated (Gauge 9550-A). Fuel level 11/16" plus or minus 1/32" below top edge of bowl.
Accelerating Pump—Inner (#1) Hole—Summer, Center (#2) Hole—Winter, Outer (#3) Hole—extremely cold temperatures.

Fuel Pump Pressure: 1½-3½ lbs.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located at exhaust pipe connection to exhaust manifold for left hand cylinder bank. See that valve operates freely.

VALVES: See Valve Timing.
Tappet Clearance—None in service. Zero-lash type hydraulic lifter used.

STARTING: See Battery, Starter, Generator, and Regulator.

IGNITION

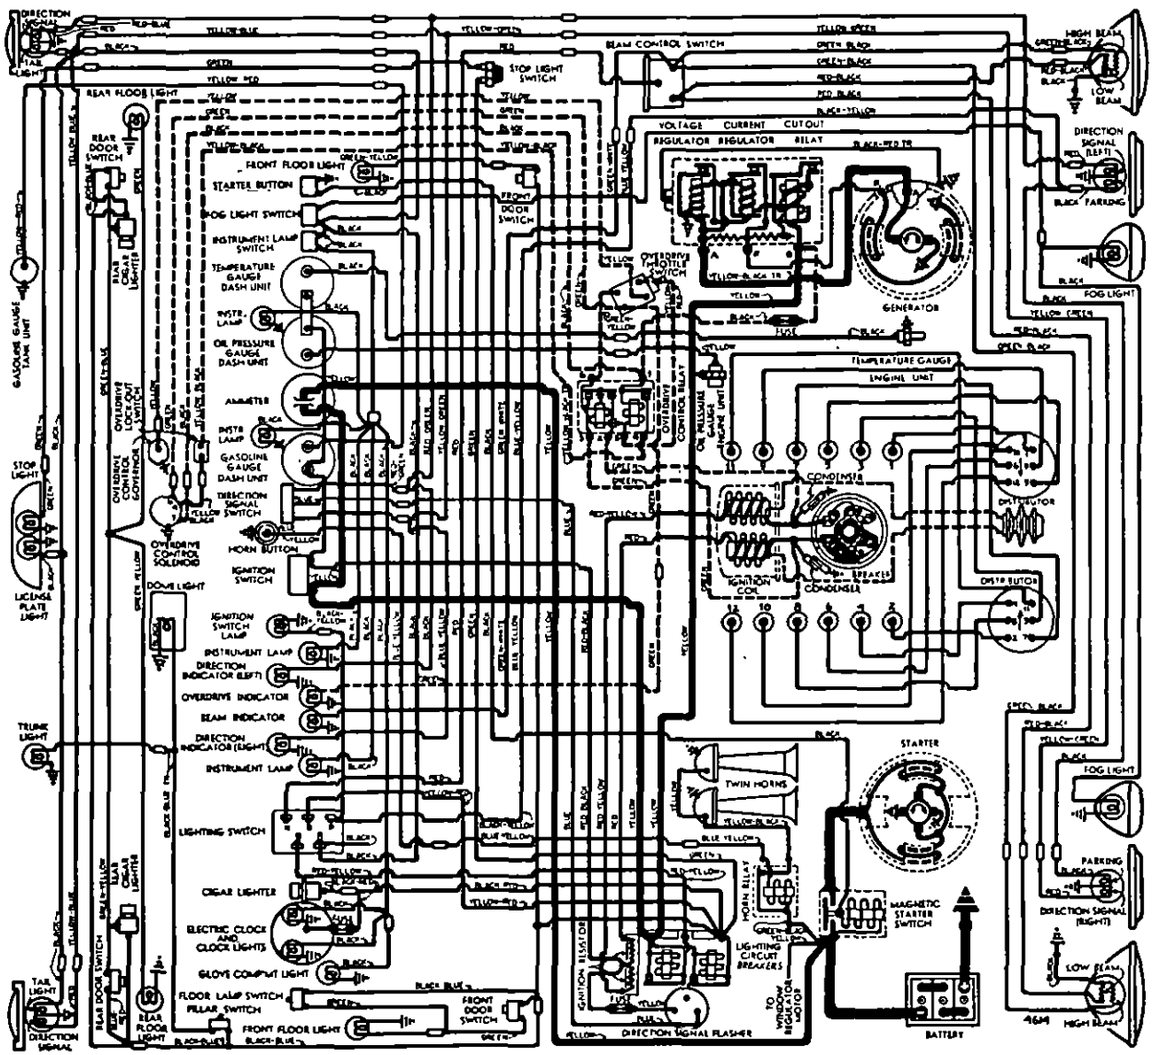
IGNITION SWITCH: Oakes Steering Column & Ignition Lock.

Assembly	Oakes No.	Ford No.
Lincoln	302945	5EH-3675-A
Continental	303000	5EH-3675-B
Lincoln RHD.	302964	5EHF-3675

Ignition Switch Assembly—Oakes No. 302440, Ford No. 16H-3680.
Lock Cylinder—Hurd.

COIL: Ford No. H-12024 (Part of Ignition Unit Assy.). Two-coil unit mounted on distributor.
Primary Resistor—One resistor connected in series with each coil primary (two used). Resistors are part of Lighting Circuit Breaker Assy. 16H-11624.
Ignition Current—*Approx. 3.2 amperes idling, 4.2* amperes stopped, for each coil. Primary circuit resistance 1.0-1.33 ohms.

CONDENSER: Ford Part No. H-12300 (two used).
Capacity—.30-.34 microfarad.



DISTRIBUTOR: Ford No. 16H-12127 (Less Coil, Distributor Caps, and Plates). Double breaker, 6 lobe cam, full automatic advance type with Vacuum Brake adjustment. Contacts open alternately at 37½° and 22½° intervals corresponding to unequal 75° & 45° firing intervals (must be synchronized).
Firing Interval—Movable contacts open 37½° after fixed set with unequal intervals of 37½° and 22½° (75° & 45° crankshaft rotation) caused by 75° included angle between cylinder banks.
Breaker Gap—.014-.016" (both sets set alike).
Cam Angle or Dwell—36.5° closed, 23.5° open (each set—operate independently).
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewed from drive end.

Distributor Automatic Advance Engine

Degrees	R.P.M.	Degrees	R.P.M
Start	200	0	400
11-12	650	22-24	1300

Distributor Removal:—Mounted on front of engine To remove, remove generator, disconnect vacuum line and primary leads, remove distributor caps, take out 3 capscrews in mounting flange.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Vacuum Brake: Consists of a spring-loaded, vacuum controlled brake piston which bears on edge of retard disc of breaker advance mechanism and acts as a "drag" to retard normal advance when engine is accelerated or operated under load. Piston is normally held out of engagement by manifold vacuum.

IGNITION TIMING

Std. Setting—All Engines.....2° BTDC. See Vacuum Brake Setting for service correction for operating conditions and octane rating of fuel used.

Ignition Timing (Basic Setting)—Distributor can be set for correct ignition timing when off engine as follows: Place a small straight edge or scale against the tang on the drive end of the shaft (scale must be on wide side of shaft), rotate distributor in direction of rotation (clockwise) until the trailing edge of the scale is exactly 11/32" past the nearest edge of the mounting hole in the flange which is nearest the vacuum brake. If left hand (fixed) breaker contacts do not open at this point, loosen adjusting screw on side of distributor housing, move screw up (to advance timing), down (to retard timing) until contacts begin to open, tighten adjusting screw. Then check synchronization of movable contacts as follows:

Synchronization (Basic Setting)—Remove timing adjusting screw and plate on side of distributor for access to synchronizing screw (visible in adjusting screw slot). Place a scale on the wide side of the shaft and against the tang (as for timing above), rotate distributor shaft in direction of rotation (clockwise) until leading edge of scale is exactly 27/32" before the nearest edge of the mounting hole in the flange which is nearest the vacuum brake. If right hand (movable) contacts do not open at this point, turn synchronizing adjusting screw until contacts begin to open. Replace adjusting screw and plate, recheck timing of left hand (fixed) contacts as directed above.

Timing (On Engine)—No flywheel marks or other means provided to check or adjust ignition timing on the engine. If basic setting (timing & synchronizing of contacts) is correct as directed above, all necessary adjustments for operating conditions and octane rating of fuel being used can be made by means of Vacuum Brake Setting as follows:

Vacuum Brake Setting:—Should be set for best performance with particular fuel and operating conditions. To adjust, loosen locknut and back off adjusting screw until engine pings when accelerated, then turn screw in just enough to eliminate this ping, tighten the locknut.

CARBURETOR

Holley (Chandler-Groves) Ford No. 26H-9510-C. Dual (double barrel) downdraft with manual choke. *See Carburetor Section for complete data.*

Idle Adjustment—With engine warm, choke valve wide open and Fast Idle inoperative, set throttle lever stopscrew for 6 M.P.H. idle speed. Turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Recheck idle speed.

NOTE—Set for highest reading on Vacuum Gauge.

Float Level—Use Gauge 9550-A to check float level. Invert air horn and float assembly, place gauge on face of bowl cover. Bottom of float should be 1.322-1.353" from face of cover (1.353" part of gauge "Go", 1.322" part of gauge "No Go"). Adjust by bending lip of float lever. Fuel level in bowl should be 11/16" plus or minus 1/32" below top edge of bowl.

Accelerating Pump Adjustment—Three holes provided in throttle lever for pump link connection. Inner (#1)—Min. stroke, Summer temperatures. Center (#2)—Medium stroke, Normal Temperature. Outer (#3)—Max. stroke, Extreme cold weather. NOTE—Pump link locked in pump rod by snap lock. Pull link shaft out of pump rod to disengage lock.

Metering Jets—*See Chandler-Groves (Ford) Jet Specification Table in Carburetor Section.*

Fast Idle:—Integral with carburetor. Operated by choke lever. No adjustment required.

CARB. EQUIPMENT

Air Cleaner: Ford No. 26H-9625-A (Lincoln), 26H-9625-B (Cont'l) Heavy duty Oil-bath type.

Servicing—Clean and re-fill (to level mark on case) with same grade engine oil used in crankcase at 3500 mile intervals (when crankcase drained) or more often if required. Wash filter element. NOTE—Clean and re-oil filter element in oil filler cap (crankcase breather) every 1000 miles.

Gasoline Gauge: King-Seeley Electric. Ford Nos. **Dash Unit:** 5EH-9280A ('46 Lincoln), 5EH-9280B ('46 Continental), 5EH-9280C ('47 All). **Tank:** 21C-9275A.

Fuel Pump: AC Type R, No. 1537709, Ford No. 26H-9350A. Diaphragm type. *See Carburetion Equipment Section for data.*

Pressure—3½ lbs. maximum (1½-3½ lbs.).

BATTERY

Ford Type 06H-10655-A. 6 Volt, 17 Plate, 120 Ampere Hour Capacity (20 hour rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) grounded to cylinder head stud of right hand bank.

Location—On right side in engine compartment.

Dimensions—Length 10.6". Width 7.3". Height 9.2".

STARTER

Ford Model No. 18-11002 or Ford No. 5EH-11001.

Armature No.—Ford No. 18-11005 (for 18-11001).

Drive—Bendix No. A1472 (Ford No. B-11350) or Bendix No. A-2100 (June 1947, starting Ser. No. 7H-165897).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch: Ford No. 21A-11450. Magnetic switch mounted on the dash and is controlled by panel pushbutton switch Ford No. 5EH-11500.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, remove bolts on commutator endplate

GENERATOR

Ford Model No. 21A-10000. Armature No. 01A-10005A. Two brush (shunt) type with vibrating voltage and current regulation. Ventilated by fan

Charging Rate Adjustment.—None. See Regulator.

Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine, check output at 2 speeds given in performance table below. Restore original connections after completing test.

Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.

Amperes	Engine RPM.
Start	520
30	1060
30	2500

Rotation—Counter-clockwise at commutator end.

Field Current—2.1 amperes at 6.0 volts (field resistance 2.88 ohms at 70°F.).

Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulley is ½" (thumb and finger pressure).

REGULATOR

Ford Model No. 01A-10505-C. Three Unit Type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash. *See Electrical Equipment Section for complete data.*

NOTE—Regulator case is grounded through braided wire 'pigtail' or separate ground wire extending from regulator to generator frame. Ground wire must be in place when generator operated.

Cutout Relay

Cuts In—5.8-6.3 volts at operating temperature.
Cuts Out—8 ampere discharge current (maximum).

Voltage Regulator

Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Electrical Equipment Section for voltages at other temperatures.

Checking & Adjusting—*Refer to Electrical Equipment Index for article on 'Ford Regulator—3-unit Type'*

Current Regulator

Setting—30-33 amperes hot (after 5 minutes run).

Checking&Adjusting—See Voltage Regulator above.

LIGHTING

Headlamps: Ford "Sealed Beam" type.

Controlled by Lighting Switch on instrument panel and Beam Selector Switch on toeboard.

See Electrical Equipment Section for complete data.

Beam Indicator—In upper center of speedometer dial. Lighted whenever upper beams in use.
Direction Signal: *See Electrical Equipment Section.*
Direction Indicators—Right and Left hand arrows on face of speedometer dial.
Direction Signal Flasher—Ford No. 16H-13350.

Switches

Lighting—R-B-M Model 2445, Ford No. 11A-11654 (switch only). Light Switch Knob No. 5EH-11666-A (Lincoln), 5EH-11666-B (Continental).
Beam Selector (Switch Only)—Ford No. 16H-13532-A (Lincoln), 16H-13532-B (Continental).
Beam Selector (With Headlamp & Horn Wiring)—Ford 26H-11653-A (Lincoln), 26H-11653-B (Contl.).
Instrument—Ford No. 5EH-13740-B.
Stop Light—Ford No. 11A-13480.
Direction Signal—Ford No. 16H-13335 (switch).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Park & Frt. Direc. Signal	21-3	1154
Instrument, Clock	1.5	55
Beam & Direc. Sig. Indicators	1	51
Tail & Rear Direc. Signal	21-3	1154
Stop	21	1129
Dome & Quarter	6	81
Rear License	3	63
Trunk (Luggage Comp't.)	6	81

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: RBM Model 6740, Ford No. 16H-11624. Combined with Ignition Resistor (twin unit) on block on dash under cowl (Direction Signal Flasher also mounted on same block). Consists of two separate circuit breaker units (one unit protects headlight circuits, second unit protects other lighting circuits) of the thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

WINDOW REGULATOR CIRCUIT BREAKER: Ford No. 51A-12250-A. 30 ampere capacity.

FUSES: Overdrive—20 ampere. In control relay lead. **Direction Signal**—10 ampere. In flasher lead.

HORNS: Ford No. 26H-13832 (High Note), 26H-13833 (Low Note). Air electric type twin horns operated by horn relay. **Horn Current**—24-28 amperes total.

Horn Relay: Ford No. 96H-13842.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE

►*ENGINE PRODUCTION CHANGE: See Engine Specifications below for TWO different engines used.*

►**ENGINE SPECIFICATIONS (To Eng. No. 138051):** Twelve Cylinder, "L" Head, 75° Vee type with both cylinder banks and crankcase cast Enbloc.
Bore—2.937" **Stroke**—3.75"
Displacement—305 cu. ins. **Rated H. P. 41.4.**
Developed Horsepower—130 at 3600 RPM.
Compression Ratio—7.2-1. Cast Iron Heads.

►**ENGINE SPECIFICATIONS (Beginning Engine No. 138052):** Twelve Cylinder, "L" Head, 75° Vee type with both cylinder banks and crankcase cast Enbloc.
Bore—2.875" **Stroke**—3.75"
Displacement—292 cu. ins. **Rated H. P.**—39.6
Developed Horsepower—120 at 3600 RPM.
Compression Ratio—7.2-1. Cast Iron Heads.
Compression & Vacuum Reading—*See Tune-up data.*

OIL PAN REMOVAL: *See Lincoln Shop Notes.*
ENGINE REMOVAL: *See Lincoln Shop Notes.*
TIGHTENING TORQUES: *See Lincoln Shop Notes.*
CYLINDER HEAD: Tightening. *See Lincoln Shop Notes.*
CYLINDER SLEEVE: *Cast iron, dry type cylinder* sleeves available for replacement where bore size worn beyond Oversize Piston limit.
Servicing—Press sleeve in cylinder rebored to .0012" smaller diameter than outside diameter of sleeve and counterbored at top for sleeve flange. Sleeve finished for std. pistons without honing.
PISTONS: Steel alloy, light weight, cam ground, with slipper type skirt. Recondition cylinders for finished replacement pistons (or sleeves if required).
Weight—442 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons: Furnished Standard size and .015", .030" Oversize.
Fitting New Pistons:—Use .002" feeler, .50" wide, inserted between piston and cylinder wall at right angle to pin. Pull to withdraw feeler must be within 5-8 lbs. NOTE—For New Pistons installed in Worn Bore use .004" feeler, or .005" for Worn Pistons in Worn Bore (all within 5-8 lbs. pull).
PISTON RINGS: Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes. NOTE—Expander used with #2 Compr. and oil ring. Install this #2 Compr. ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.093-.0935"	.008-.013"	.0015-.0035"
Compr. (#2)	.093-.0935"	.008-.013"	.001-.004"
Oil Cont. (#3)	.1845-.185"	.008-.013"	.001-.004"

Replacement Rings: Furnished Standard and .020", .030", .040" Oversize.
PISTON PIN: Diameter .7501-.7504". Length 2.607". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0003-.0009" clearance or light hand push fit with piston at 70°F.
Pin Fit in Rod Bushing—.0002-.0005" clearance (pin should pass through bushing slowly of own weight).
Replacement Pins: Std., .001", .002" Oversize.
CONNECTING ROD: Length 7.40". Weight 711 grams.
Crankpin Journal Diameter—2.250"
Bearing Type—Steel-backed, copper-lead lined bearing halves clamped in each rod.
Clearance—.001-.0025". **Sideplay** .014" (both rods).
Bearing Adjustment: None (no shims). Do not file bearing caps. Replace bearings if less than .08375" thick. NOTE—Rods and caps carry cylinder number. Engage tang on bearing in groove in rod and cap. Install long and short bearing cap bolts correctly.
Replacement Bearings: *Furnished Standard and* .0015", .003", .020", .040" Undersize.
CRANKSHAFT: Four bearing with integral counterweights. NOTE—Crankshafts furnished Std. and .020", .040" undersize.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. NOTE—See that tang on bearing engages groove in block and cap.
Replacement Bearings: Furnished Standard and .0015", .003", .020", .040" Undersize.
End Thrust:—Taken by rear main bearing. To adjust, replace bearing. **Endplay**—.002-.006".

CAMSHAFT: Four bearing with helical gear drive.
Bearing Diameters—1.797" (replace bearings if diameter more than 1.802", replace camshaft if journal diameter less than 1.7955".
Bearing Type—Steel-backed, babbitt-lined bushings pressed in block. **Clearance**—.001-.002".
End Thrust:—Taken by gear hub and coverplate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (Crankshaft), New Aluminum Alloy—bolted on shaft (Camshaft).
Backlash—.004" Maximum.
Timing Gear Replacement—*See Lincoln Shop Notes.*
Camshaft Setting:—Mesh marked tooth of crankshaft gear with space marked by line on camshaft gear (this line must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.292"	.0015-.0035"
Exhaust	45°	.292"	.0025-.0045"

NOTE—Service limit for valve stem diameter is .309" Intake, .3065" Exhaust. Valves interchangeable.
Valve Seat Inserts—Used for exhaust valves.
For Valve Servicing data, see Lincoln Shop Notes.
Valve Guides: Split type retained by "C" washer and valve spring. NOTE—Replace both halves of all guides measuring less than .6665" (thickness of guide half and valve stem at top of guide with valve of .311" stem diameter in place in guide half).
For Valve Servicing data, See Lincoln Shop Notes.
Valve Lifters: Barrel type hydraulic tappet take-up (Wilcox-Rich Zero-Lash type or Johnson type).
Diameter—.9995".
See Lincoln Special Data for complete data.

Valve Springs:	Pressure	Length
Valve Closed	51-57 lbs.	2.13"
Valve Open	111-121 lbs.	1.84"

NOTE—Replace springs which do not test to 47-57 lbs. at 2⅛" or if paint coating has been removed.

VALVE TIMING

Tappet Clearance:—None in service (hydraulic lifter). *See Valve Lifter Servicing in Lincoln Shop Notes.*
Valve Timing:—See Camshaft Setting above.
Int. Valves—Open 10.42° BTDC. Close 35.58° ALDC.
Exh. Valves—Open 50.92° BLDC. Close 8.08° ATDC.
To Check Timing—No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approx. 3.24 teeth before this point with piston .0389" before top dead center.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, valve lifters (hydraulic type) and timing gears. Oil pump mounted in crankcase at rear of engine.
Oil Pan Removal: *See Lincoln Shop Notes.*
Crankcase Capacity—5 qts.
Normal Oil Pressure—40-45 lbs. at 2000 RPM.
Oil Pressure Regulator—Located under plug above front camshaft bearing (under manifold) and on oil pump body (in crankcase).
NOTE—Check relief valve tension spring whenever engine overhauled. Replace cylinder block relief valve spring if tension not within limits of 33-36 ozs. at .53". Replace oil pump relief spring if tension not within limits of 78-87 ozs. at 1.38".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pump: Gear type. In crankcase at rear of engine.
Oil Pump Servicing—*See Lincoln Shop Notes.*

Oil Filter: Replace cartridge at 5000 mile intervals (Ford No. 01A-18662-A1).

Oil Pressure Gauge: King-Seeley Electric. Ford Nos.
Dash Unit: 5EH-9273A ('46 Lincoln), 5EH-9273B ('46 Continental), 5EH-9273C (All 1947).
Engine Unit—No. 48-9278 (All Models).
See Miscellaneous Section for complete data.

COOLING

Cooling System: Positive circulation with two water pumps at front of engine (pump for each bank), pressure system with relief valve in radiator cap.
Capacity—27 quarts.
Pressure Valve—In radiator filler cap. Opens at 3½-4½ lbs. Radiator Cap No. 26H-8100-B.

Water Pump: Packless type with ball bearing at pulley end (plain bushing at impeller). Two used.
See Water Pump Section for complete data.
Removal—Drain cooling system, loosen generator belt adjustment, remove belt. Disconnect and remove hose at water pump. Take out four capscrews mounting pump on cylinder block, lift pump out.
Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In outlet hose for each bank (2 used).
Setting—Start to open at 150-155°F. Fully open at 175-180°F.

Temperature Gauge: King-Seeley Electric. Ford Nos.
Dash Unit: 5EH-10883A ('46 Lincoln), 5EH-10883B ('46 Continental), 5EH-10883C (All 1947).
Engine Unit—No. 99A-10884 (All Models).
See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-TI, Ford No. 26H-7563. Semi-centrifugal, single plate, dry disc type.
See Clutch Section for complete data.
Facings—Woven asbestos composition. I. D. 6¾". O. D. 10". Thickness .125" (⅛").

Pedal Adjustment: Pedal free travel 1¼-2". To adjust, loosen locknuts and turn adjusting turnbuckle on connector rod between clutch throw-out lever and equalizer shaft lever. CAUTION—Opening in turnbuckle must be horizontal to prevent it binding on transmission case.

Removal: Remove transmission (see Transmission Removal below), block clutch release levers in disengaged position by inserting wedge between each lever and clutch cover. Take out six capscrews mounting clutch on flywheel, lift out assembly.

TRANSMISSION

Own Make No. 01A-7005 (Std.), 26H-7005-A (With Overdrive). All helical gear type, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).
See Transmission Section for complete data.

Transmission Control: Mechanical steering col. shift.
See Transmission Section for complete data.

Removal: Remove rear axle assembly (see Rear Axle Removal below). Disconnect Overdrive control and wires at solenoid, lockout switch and governor, remove solenoid as directed under Overdrive (cars with Overdrive Transmission only). Disconnect gearshift rods at transmission case levers, take out capscrew and washer mounting universal joint on transmission shaft, slide universal to rear and remove. Disconnect and remove clutch throw-out equalizer shaft. Remove nuts and flat washers on engine rear support bolts. Place support jack under rear end of engine (use wood block on jack), raise rear end of engine so that rear support clears mounting bolts. Take out eight capscrews mounting transmission on flywheel housing, pull transmission straight back and remove from car.

OVERDRIVE

Warner Model AS2-R10 (before Mar. 1, 1947), AS3-R10 (After Mar. 1, 1947). Optl. equipment, used with special Lincoln Transmission. Overdrive is solenoid operated with governor control and throttle operated "kick-down".
See Transmission Section for complete data.

Solenoid—Ford No. 16H-6916.

Control Relay—Ford No. 26H-6915-A.

Control Governor—Ford No. 16H-6919.

Throttle Kick-down Switch—Ford No. 16H-6918-A (Lincoln), 16H-6918-B (Continental).

Lock-out Switch—Ford No. 16H-6917.

Removal: Same as for Std. transmission (above) except for removal and installation of the solenoid.

►IMPORTANT SERVICE NOTE—Solenoid should be removed before transmission or overdrive removed from car (and installed after these units installed) and must be removed exactly as follows to avoid damage to unit: Disconnect wires at solenoid terminals, take out two mounting screws in base flange, **rotate solenoid approximately 60° to right** to disengage pawl rod from pawl (this will line up flats on end of rod with slot in pawl), withdraw solenoid and pawl rod assembly. To install solenoid, insert pawl rod in adapter with flats horizontal, make certain that short pilot on end of solenoid body enters counterbore in adapter casting, **rotate solenoid approximately 60° to left** to engage pawl rod in pawl and to line up solenoid flange mounting holes. Check engagement of pawl by attempting to pull solenoid out (solenoid should not come out and resistance of solenoid spring should be felt). Install solenoid mounting screws and connect wires.

UNIVERSALS

Spicer Model 2102-1X. Needle bearing type. Single universal in torque ball at rear of transmission.

REAR AXLE

Own Make. ¾ Floating, Hypoid Gear type with Torque Tube drive.
See Rear Axle Section for complete data.
Ratio—4.22-1 Std.
Backlash—.002-.004"

Removal: Raise rear end of car. Disconnect track bar. Disconnect rear spring (use spring spreader if available) by placing block under each rear spring eye and lowering car so that weight keeps spring extended, then remove spring shackle bolts and bars. Take out pin in hand brake equalizer and disconnect hand brake cable. Disconnect hand brake conduit retainer and hydraulic brake line at torque tube, disconnect shock absorber links. Remove front floor pan. Disconnect speedometer cable at torque tube. Take off nuts on four universal housing ball cap bolts, remove two bolts holding ball cap halves together, remove ball cap. Pull rear axle assembly straight back to disconnect torque tube from transmission, remove axle assembly from beneath car.
Axle Shaft Removal—*See Lincoln Rear Axle article in Rear Axle Section for complete data.*

SHOCK ABSORBERS

Houde (Houdaille). Double acting, hydraulic type.

	Houde Model	Right—Ford No.—	Left
Front	BBCHO-6	5EH-18045	5EH-18046
Rear	BBCLY-6	5EH-18080	5EH-18081

Adjustment—Std. setting marked by line on face of lever hub (pointer should be aligned with this mark). Adjustment can be varied by turning pointer clockwise (for more control), or counter-clockwise (for less control) not more than 1 or 2 serrations at a time. NOTE—Stops are provided to limit adjustment in either direction.

Refilling: Check at 5000 mile intervals and fill to level of filler plug hole. Use Ford No. M-4633-B fluid only (Houde L-1404) which is required for these new shock absorbers with **round top filler plug.**

FRONT SUSPENSION

Front Suspension:—Conventional I-beam section axle with Reverse-Elliott ends and transverse spring. Axle held by radius rods and anti-sway strut rod.
Kingpin Inclination—4° crosswise.
Caster—3° Min., 5° Max. Must be equal for both wheels within ½°. No adjustment.
Camber—¼° Min., ¾° Max. Must be equal for both wheels within ¼°, right wheel must not exceed left.
Toe In—1/16". Set at 1-10 ratio to Camber. To adjust, loosen clamp bolts, turn tie rod.
Steering Geometry—Outer wheel 20°, Inner 23° ± ½°

STEERING GEAR

Gemmer Model 330. Worm-and-Roller type.
See Steering Gear Section for complete data.

BRAKES

Service: Bendix Hydraulic, Duo-servo, Single Anchor type **without eccentric adjustment.** Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

Wheel Cylinders—Diameter 1.125" (front), 1.00" (rear). Not interchangeable between wheels.

Drums—Composite Cast Iron type. Diameter 12".

Lining—Molded (primary or forward shoe), Woven (secondary shoe). Width 1.75". Thickness .21". Length per shoe 11.95".

Clearance—.010" at each end of each shoe (adjusting screw in each wheel backed off 14 notches or "clicks" from point where shoes drag on drum.

Hand Brake:—See Service Brakes above.

MISC. MECHANICAL

Power Operated Convertible Top: Auto-Lite Electric type.
See Miscellaneous Section for complete data.

Window Regulators: Hydro-Electric type.
See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail to rear of front suspension upper control arm.

TUNE-UP

COMPRESSION PRESSURE: 110 lbs. at cranking speed.

VACUUM READING: *Steady 18-21" Idling at 500 RPM.*

FIRING ORDER: 1-5-4-8-6-3-7-2. See diagram.

SPARK PLUG GAPS: .030". Limits .029-.032".
Plug Type—Champion H-10. 14 mm.

DISTRIBUTOR: (1949) Auto-Lite Model No. IGT-4302-1.
Breaker Gap—.015-.018".
Cam Angle—28-30° (closed).
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad.

DISTRIBUTOR: (1950-51) Lincoln No. OEL-12127.
Breaker Gap—.014-.016".
Cam Angle—26-28½°.
Breaker Arm Spring Tension 17-20 ounces.
Vacuum Advance—*See Ignition.*
Condenser Capacity—.20-.25 microfarad

IGNITION TIMING: 4° BTDC.
Timing Procedure—*See Ignition Timing.*
Dampener Mark—"/" mark aligned with timing pin on front engine cover above top of dampener.

CARBURETION:
Idle Setting—Set for highest steady vacuum reading. 2 screws (turning out gives richer mixture).
Idle Speed (Std.)—400-500 RPM.
Idle Speed (Hydra-Matic)—375 RPM.
Float Level—Fuel level ½" ± 1/32" below top edge of bowl. Use Fuel Level Gauge No. 9550-B.
►*NEW "CLIP TYPE" FLOAT NEEDLE & SEAT ASSEMBLY*—Furnished for replacement.
Accelerating Pump—Center hole average setting. Inner hole for Hot weather, outer for cold weather.

Fuel Pump Pressure: 3½-4½ lbs.

Choke Setting: Index mark on coil cover aligned with center mark on housing (maximum variation one division either side).

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve located between right end of exhaust pipe cross over and right exhaust manifold.

VALVE TAPPET CLEARANCE: None in service (Hydraulic type lifters).
Valve Timing Check—*See Valve Timing.*

IGNITION

IGNITION SWITCH: Lincoln No. OL-11572-A.
Ignition Lock—Lincoln No. 8H-11582-A or B.

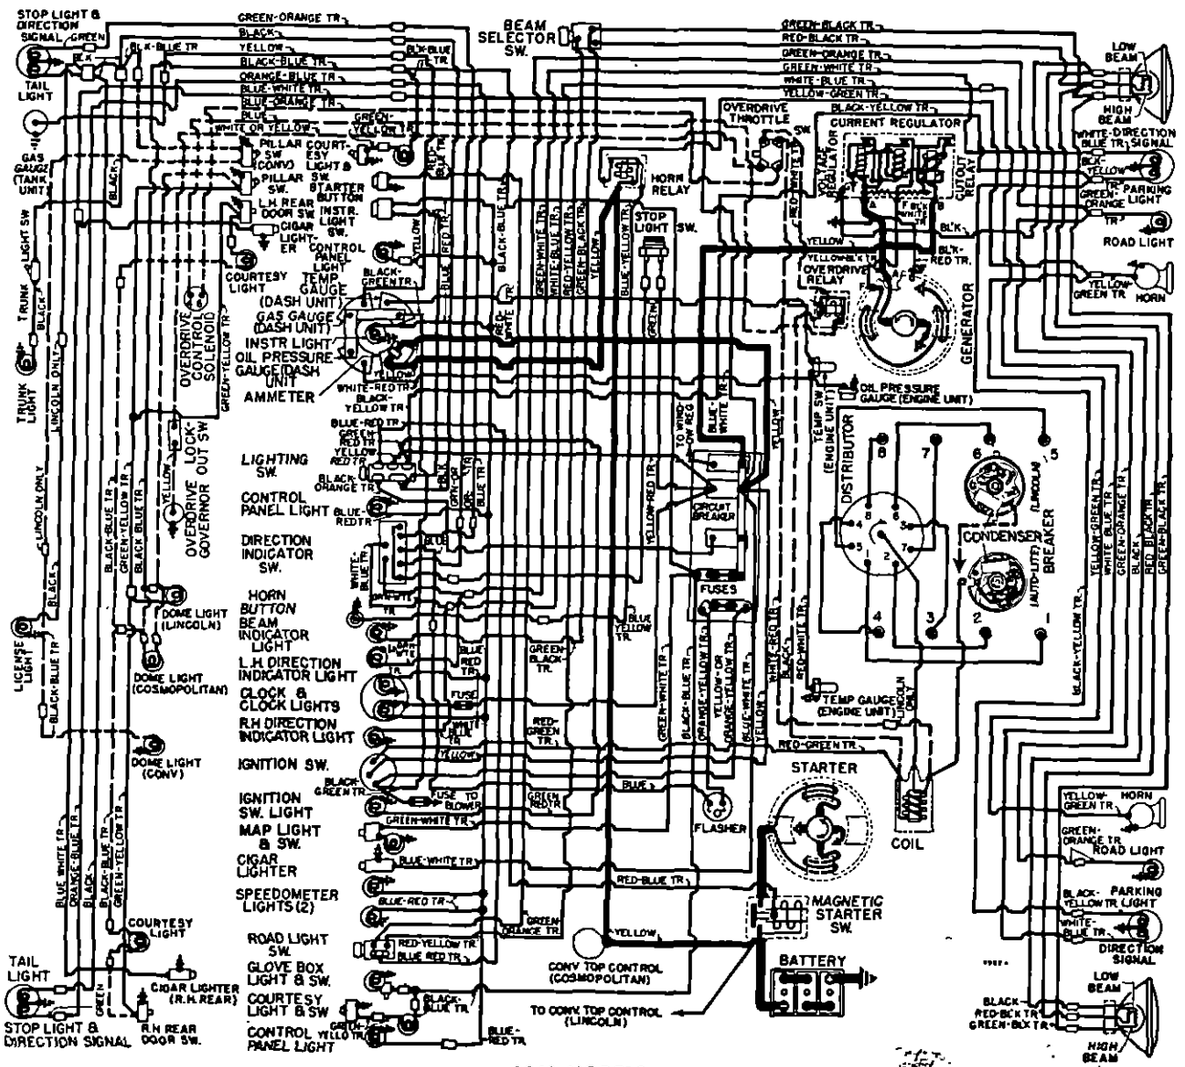
COIL: Lincoln No. 7RA-12029-A. Can type.
Ignition Current—5 amperes stopped, 3 amperes idling.

CONDENSER: (1949) Lincoln No. 8EL-12300-A. (1950-51) Lincoln No. 7RA-12300-B (use with Breaker Plate No. OBA-12150-A), 7RA-12300-C (use with Breaker Plate No. OBA-12150-B).
Capacity—.20-.25 microfarad.

DISTRIBUTOR 1949 MODELS: Auto-Lite Model No. IGT-4302-1 (Lincoln No. 8EL-12127) Automatic advance type with Vacuum Spark Control.
Breaker Plate Identification—No. 7 stamped on plate (vacuum advance limiting slot size).
Breaker Gap—.015-.018".
Cam Angle—28-30° (closed).
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Automatic Advance

Degrees Distr.	R.P.M.	Degrees Eng.	R.P.M.
Start	275	0	550
1	340	2	680
2	400	4	800
7	1000	14	2000
12	1600	24	3200



Vacuum Spark Control: Integral type (advances breaker plate).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	9"
2°	4°	10⅜"
4°	8°	11⅞"
6°	12°	13¼"
7°	14°	14"

DISTRIBUTOR 1950-51 MODELS: Lincoln No. OEL-12127. "Pressure Type" Distributor, fully vacuum controlled (no centrifugal advance). Diaphragm unit connected to breaker plate governs entire advance range in relation to engine vacuum.
See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.
Breaker Gap—.014-.016".

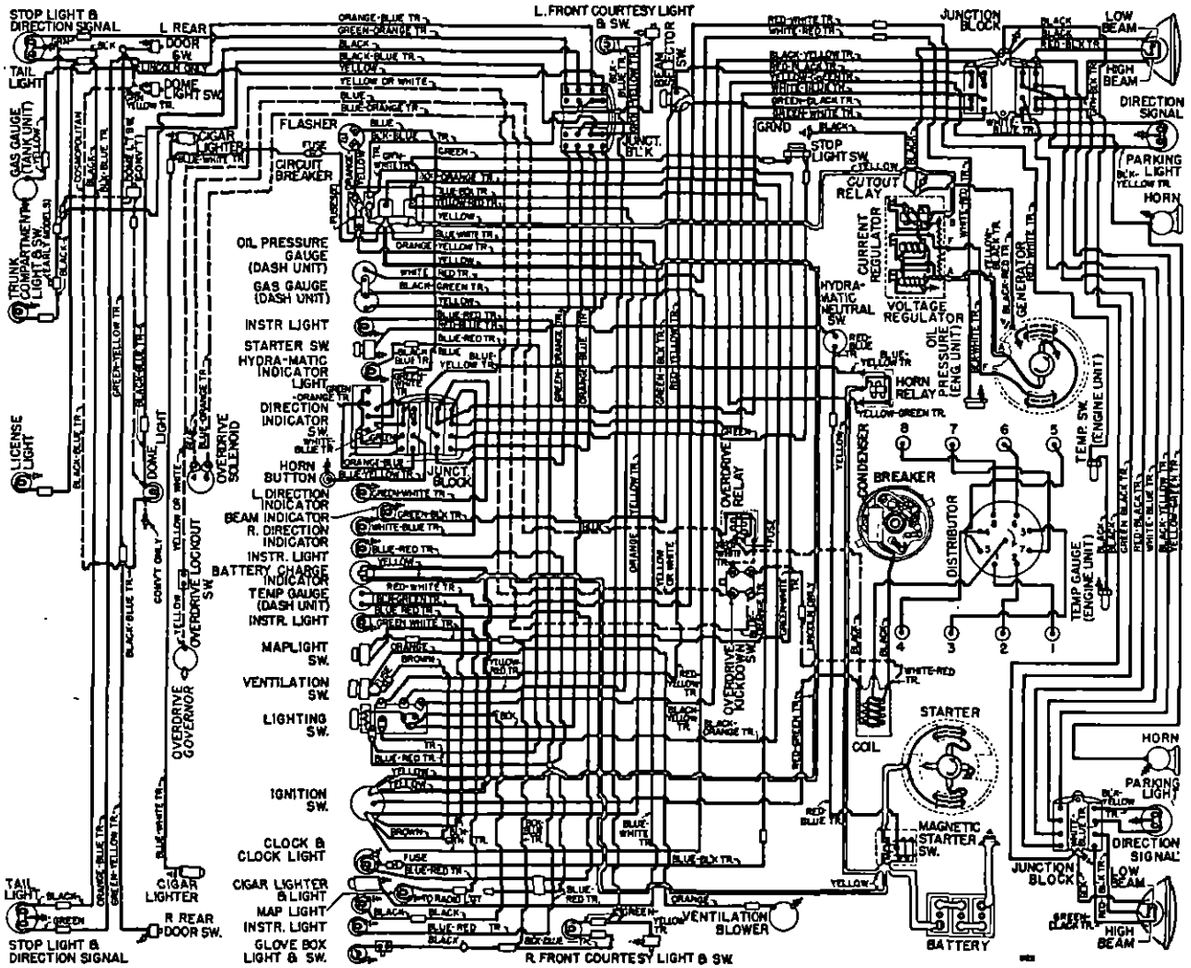
1949 MODELS

CONTINUED FROM PRECEDING PAGE

Cam Angle—26-28½°.
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise, viewed from above.

Advance Performance
▷With Distributor on Test Unit



Distributor Degrees	Vacuum	R.P.M.
0°	0"	200
1½-2½°	0.8"	600
5-6°	2.0"	1000
9½-10½°	5.8"	2000

IGNITION TIMING

Std. Setting.....4° BTDC.
Dampener Mark—"/" groove mark on edge of dampener with timing pin on front of engine.
Timing—With #1 piston at firing position and "/" groove mark on dampener aligned with timing pin on front of engine, loosen clamp screw in timing arm, rotate distributor until contacts begin to open, tighten clamp screw. Check spark plug connections (see diagram), see that rotor at #1 cap terminal.
Timing (with Neon Timing Light)—Mark timing pin and "/" groove mark on dampener with white chalk. Connect timing light to #1 spark plug. Idle engine below 550 RPM., adjust distributor (as directed above) until mark and timing pin aligned when light flashes.

CARBURETOR
1949 MODELS

Holley-Ford 8EL-9510—Dual downdraft with integral automatic choke.
See Carburetor Section for complete data.
▷New Float and Float Spring Change for Stabilizing Float Level—*See 1949 Lincoln in Carburetor Section.*
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
Hydra-Matic Throttle Adjustment: *See "Lincoln Hydra-Matic Drive" in Transmission Section.*

1950-51 MODELS

Fast Idle: Holley-Ford Carburetor type.
See Carburetion Equipment Section for complete data.
Automatic Choke: Holley-Ford Carburetor type.
See Carburetion Equipment Section for complete data.
Setting—Index mark on coil spring cover aligned with center mark on housing (maximum variation one division either side).

1950-51 MODELS

Holley-Ford 0EL-9510—Dual downdraft with separate automatic choke. Automatic choke unit located on intake manifold.
See Carburetor Section for complete data.
▷*NEW "CLIP TYPE" FLOAT NEEDLE & SEAT ASSEMBLY*—Furnished for replacement.
Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*
Hydra-Matic Throttle Adjustment: *See "Lincoln Hydra-Matic Drive" in Transmission Section.*
Fast Idle: Holley-Ford Carburetor type.
See Carburetion Equipment Section for complete data.
Automatic Choke: Holley-Ford Carburetor type.
Setting—Index mark on coil cover aligned with center mark on housing (maximum variation one division either side).
See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner (Oil Bath): Lincoln No. 8EL-9600.
Fuel Pump (Fuel-&-Vacuum): Lincoln 8EL-9350-A.
Pressure—3½-4½ lbs.
▷Fuel Pump Filter Change—Copper screen type changed to "Edge" type. Use "Edge" type when servicing pumps, Part No. 8EL-99360 Kit.
See Carburetion Equipment Section for complete data.
Gasoline Gauge: King-Seeley Electric.
Dash Unit—Lincoln No. (1949) 8EL-9280, (1950-51) OL-9280.
Tank Unit (Lincoln)—No. 99A-9275-B.
Tank Unit (Cosmopolitan)—Lincoln No. 21C-9275A.
See Carburetion Equipment Section for complete data.

BATTERY

Lincoln No. 06H-10655-A. 6 Volt, 17 Plate, 120 Ampere Hour Capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On right side in engine compartment.

STARTER

Standard.....Lincoln 7EH-11002-B. Arm. 18-11005
Hydra-Matic.....Lincoln 8EL-11002. Arm. 52-11005
Drive—(7EH) B-11350, (8EL) 29B-11350.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ounces.
Cranking Engine—100-180 RPM., 190-215 Amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load①	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

①—Manufacturer recommends taking "No Load" readings by inserting 0-600 range ammeter in battery circuit at battery and operating starter while engine is idling.

Starting Switch: Lincoln No. 21A-11450 Magnetic Switch mounted on right front fender apron and controlled by panel pushbutton switch Lincoln No. 6H-11500 (and 8L-15812 Neutral Safety Switch on Hydra-Matic Drive cars).
Hydra-Matic Neutral Safety Switch Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

Removal: On right front face of engine rear plate. To remove, take off right engine splash pan (if used), free starter-to-oil pan bracket, take out 2 starter through bolts.

GENERATOR

Lincoln No. 8EL-10002 (less pulley & bracket).
Armature No.—Lincoln No. 8EH-10005. Two brush type with current and voltage regulation.
Maximum Charging Rate—42 amperes, 7 volts, reached at approximately 19.5 MPH. Controlled by regulator and dependent on load and battery condition.
To Check Generator Output—Connect ammeter in series with charging line at regulator "ARM" terminal, connect short insulated jumper between generator "A" and "F" terminals (to short out regulator). Run engine at approximately 1500 RPM. and note ammeter reading. If generator output equals or exceeds rate output (below) generator performance is satisfactory. Remove jumper.

►***CAUTION—Do not operate generator at higher speeds or in service with jumper connected between generator armature and field terminals. This jumper eliminates all regulator action.***

Performance Data

Amperes	Engine R.P.M.
40	1500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-24 ozs.

Generator Belt Adjustment: Loosen nut on support mounting stud, raise generator up until side movement on belt midway between generator and water pump pulley is ¾" (thumb and finger pressure).

Fan Belt Adjustment: *See COOLING.*

REGULATOR

Lincoln No. 8L-10505. Voltage-current, 3 unit type. *See Electrical Equipment Section for complete data.*
NOTE—Separate ground wire extending to cowl must be in place when generator operated.

Cutout Relay

Cuts In——6.0-6.4 volts COLD (will be slightly higher when warm).
Cuts Out—8 ampere discharge current (maximum).
Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts open.

Voltage Regulator

Voltage Setting (8L-10505)—7.2-7.6 volts COLD. (7.4-7.8 volts after 20 minutes run).
Air Gap—.032-.035" between armature and core with contacts just closed.

►***CAUTION—Make certain gauge contacts armature and not brass rivet on underside of armature.***

Contact Spring Tension—5 ounces minimum with contacts just opening.
Checking & Adjustment—*See Electrical Equip. Section.*

Current Regulator

Current Setting—38-42 amperes COLD.
Air Gap—.032-.035" between armature and core with contacts just closed.
Contact Spring Tension—5 ounces minimum with contacts just opening.
Checking & Adjustment—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.

Direction Signal: Std. *See Electrical Equipment Section.*
Direction Signal Flasher—Lincoln No. 8L-13350-B.

Switches

Lighting—Lincoln No. (1949) 7RA-11654, (1950-51) OL-11654.
Beam Selector—Lincoln No. 8A-13532.
Instrument—Lincoln No. (1949) 8L-13740, (1950-51) OL-13740.
Map Light—Lincoln No. (1949) 8L-13764, (1950-51) OL-13764.
Dome Light (exc. Conv.)—Lincoln No. (1949) 8M-13752-A, (1950-51) OM-13752.
Dome (Convertible)—Lincoln No. 8H-13754.
Stop Light—Lincoln No. 91A-13480.
Directional Signal—Lincoln No. (1949) 8L-14486, (1950) OL-14486, (1951) 1M-14486-A.
Back-Up Light—(1949-50) 51A-15520-A, (1951) 1H-15520-A.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lincoln No. 8L-12258-A (Lincoln), No. 8H-12258-A (Lincoln Cosmopolitan, Lincoln Convertible). Three used on one mounting, located on dash behind instrument panel together with two fuses (see wiring diagram for positions on bracket).
30 Ampere CB. Protects main lighting system.
15 Ampere CB. Protects speedometer light, control panel light, instrument cluster light, electric clock and clock light.
15 Ampere CB. Protects hydraulic equipment.

FUSES: Courtesy, Dome, Glove Box and Map Lights—14 ampere. Located on circuit breaker behind instrument panel (see wiring diagram).
Direction Signal—14 Ampere. Located on circuit breaker behind instrument panel (see wiring diagram).
Overdrive—30 ampere. On "IGN" terminal of overdrive relay (on dash under hood).
Clock—3 ampere. In clock feed wire.

HORNS: Lincoln No. (1949) 51A-13832-A or B, (1950-51) OL-13801-A (High Pitch, Right Horn). Lincoln No. (1949) 51A-13833-A or B, (1950-51) O1-13802-A (Low Pitch, Left Horn)—Dual horns with relay.
Horn Current—13 amperes (High Pitch), 14 (Low).

Horn Relay: Lincoln No. 7RA-13853-A. On dash.

ENGINE

ENGINE SPECIFICATIONS: Own Make. Eight cylinder, "L" head, 90° Vee type with both cylinder banks and crankcase cast Enbloc.
Bore—3½". **Stroke**—4⅜".
Displacement—336.7 cu. ins. **Rated HP**—39.2.
Developed Horsepower—152 (1949-50), 154 (1951) at 3600 RPM.
Compression Ratio—7.0-1 cast-iron head.
Compression & Vacuum Reading—*See Tune-Up.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Lincoln Special Data.*

►***1949-50 CYLINDER HEAD GASKET PRODUCTION CHANGE: For improved cooling. See "Cooling System" in Lincoln Special Data.***

OIL PAN & ENGINE REMOVAL: *See Lincoln Special Data.*

PISTONS: Aluminum alloy, steel strut, flat head, split skirt, cam ground, tin-plated type.

►***PISTON PRODUCTION CHANGE:*** Early 1949 pistons were 4-ring type, 3-ring pistons used beginning late 1949.
Weight—548 grams. **Length**—3.84".
Removal—Pistons and rods removed from above.
Clearance—.0005-.001". See Fitting Pistons.

Replacement Pistons: Std. .0025", .020", .030", .040" OS.

Fitting Pistons: Use ½" wide feeler inserted between piston (on side opposite slot) and cylinder wall at right angles to pin. Feeler thickness .0015" (for new piston in new bore), .002" (for new piston in old bore), .003" for old piston in old bore). Pull to withdraw feeler should be 5-10 lbs. (all pistons).

Cyl. Bore Wear Limit—Out-of-round .003", Taper .006".

PISTON RINGS: Early 1949 engines used 2 Compr. and 2 Oil rings. Late 1949 & 1950 engines used 2 Compr. and one Oil ring. Compr. rings coated and Oil rings slotted.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	④.007-.015"	①.002-.0035"
Compr. (#2)	3/32"	④.007-.015"	②.0015-.003"
Oil (All)	3/16"	④.007-.015"	③.001-.003"

Worn Limit—① .0035", ② .0045", ③ .004".
④—End Gap .008-.016" for 1949-50 cars.
Replacement Rings—Std. and .020", .030", .040", .050", .060" Oversize.

PISTON PIN: Diameter .8501-.8504", **Length** 3.118". Floating type. Bronze bushing in rod.

►***PIN REMOVAL & INSTALLATION CAUTION:*** Heat piston in hot water (210°F) when removing or installing pin to avoid distorting piston. DO NOT drive pin in or out of piston.
Pin Fit in Piston—.0001-.00005" clearance (new), .001" (worn limit).
Pin Fit in Rod Bushing—.0001-.0003" clearance. Light thumb push fit. Worn limit .0012".

Replacement Pins: Std. size & .001", .002" Oversize.

CONNECTING ROD: Length—8.062".
Weight—773 grams (less bearings).
Crankpin Journal Diameter—(1949-50) 2.3995-2.400", (1951) 2.3991-2.400". Maximum Wear Limits—Out-of-round .0015". Taper .001".
Lower Bearing—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves are interchangeable.
Clearance—(1949-50) .0004-.0024" (1951) .0003-.0019". Worn limit .005".
Sideplay—.007-.013" (new), .022" (worn limit).

►***NOTE—Replace rod bearings less than .0745" thick.***

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings. Tang on bearing must engage groove in rod and cap.

Replacement Bearings: Standard size and .002", .010" .020", .030", .040" Undersize.

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Connecting Rod Installation: The numbered side of the connecting rods must be towards the outside of the engine. Left bank rod numbers must be towards the left side of engine and right bank rod numbers to the right side.

CRANKSHAFT: 3 bearing with 6 integral counterweights and vibration dampener on front end.

▷**Crankshaft Interchangeability:** *See "Crankshaft & Main Bearings" in Lincoln Special Data.*

▷*SLUDGE TRAPS—Crankpin throws equipped with sludge traps having removable plugs for cleaning.*

Main Journal Diameter—(1949-50) All bearings, 2.8735-2.8740", (1951) #1 & #2 2.8729-2.8740", #3 2.8724-2.8735". **Maximum Wear Limits**—Out-of-round .0015". Taper .001".

Clearance—#1 & #2 (1949-50) .0004-.0029", (1951) .0004-.0019". #3 (1949-50) .0009-.0034", (1951) .0009-.0024".

Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.

▷*NOTE—Replace main bearings less than .0938" thick.*

Bearing Adjustment: None (no shims). Do not file caps. Replace bearings. Tang on bearing must engage groove in block and cap.

▷*NOTE—Self-locking bearing cap bolts used.*

Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize.

End Thrust: Taken by rear main bearings. Adjust by replacing bearings if clearance excessive.

End Play—.004-.008". Worn limit .010".

Crankshaft Rear Main Bearing Oil Seals: *See "Crankshaft & Main Bearings" in Lincoln Special Data.*

FLYWHEEL REPLACEMENT: Special Dowels required. *See "Crankshaft & Main Bearings" in Lincoln Special Data.*

CAMSHAFT: *CAUTION—Two types used and have different valve timing (see Valve Timing).*

1) **To 1949 Eng. No. 9EL-43603**—Camshaft not marked. Use second type for replacement.

2) **Beginning 1949 Eng. No. 9EL-43603**—Camshaft No. 8EL-6251-B marked "P" on gear attaching flange at forward end.

Camshaft Journal Diameter—(1949-50) 1.9265-1.9270", (1951) 1.9262-1.9267". Out-of-round limit .001". Undersize bearings available for reground shafts.

Bearing Diameter—1.9285" (replace bearing if diameter greater than worn limit of 1.9315").

▷*OVERSIZE DIAMETER CAMSHAFT BEARINGS (Used in some production engines): Bearing O.D. .080" Oversize. See "Camshaft & Bearings" in Lincoln Special Data and Replacement Bearings below.*

▷*CAMSHAFT REMOVAL CAUTION: Camshaft can not be removed with engine in car (fuel pump drive cam ring will drop off end of shaft).*

Replacement Bearings: Three sizes as follows:

1—Std. size on both inside and outside diameter.

2—Std. on I. D., .080" Oversize on O. D.

3—.015" Undersize on I. D., Std. on O. D. (must be finished reamed in assembly).

End Thrust: Thrust plate bolted on front of block.

Camshaft End Play—.004-.0065".

Timing Gears: Helical cast aluminum camshaft gear bolted on camshaft, cast alloy iron crankshaft gear.

Back Lash—(1949-50) .002-.003", (1951) .002-004".

Timing Gear Removal & Installation—*See "Timing Gears" in Lincoln Special Data.*

Oversize Timing Gears—Furnished in the following sizes: .006" & .012" oversize.

Camshaft Setting: Mesh marked tooth of crankshaft gear with space marked by line on camshaft gear.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1.800"	.3412-.3422"	5.7145"
Exhaust	1.484"	.340-.341"	5.7145"

	Seat Angle	Lift	Stem Clearance
Intake	45°	①.350"	③.0009-.0024"
Exhaust	45°	②.350"	④.0021-.0036"

①—Lift .357" with first type 1949 camshaft.

②—Lift .340" with first type 1949 camshaft.

③—1951 only. .0015-.003" for 1949-50 cars.

④—1951 only. .002-.003" for 1949-50 cars.

Valve Disassembly & Removal—*See "Valve System" in Lincoln Special Data.*

Valve Seat Insert Servicing—*See "Valve System" in Lincoln Special Data.*

Valve Seat Width—1/16-5/64". NOTE—If valve seat bearing line is at extreme outer edge of valve head or if seat width is under above specifications install oversize valve. *See "Valve System" in Lincoln Special Data.*

▷*CAUTION—Top of valve must not be more than .030" above top face of block for head clearance.*

▷*ROTATABLE VALVE NOTE:* Used in Late 1951 engines, can be installed in earlier engines. *See "Valve System" in Lincoln Special Data.*

Valve Guides: One piece type pressed in block. Inside diameter .3431-.3436". Length 2.66".

Guide Installation—Press in block from above with small diameter end down. Distance from top of valve seat to upper end of valve guide 1.30".

Valve Lifters: Mushroom type, hydraulic tappet take-up (Wilcox-Rich Zero-Lash type).

Body Diameter—.7177" (new), .7167" (wear limit).

Clearance in Block—.0003-.0018" (new), .003" (worn). *See Lincoln Special Data for complete data.*

Initial Valve Clearance—*See "Valve System" in Lincoln Special Data.*

Valve Springs: Coated springs used.

Spring Pressure—62-68 lbs. (closed), 140-152 (open).

Spring Test—63-69 lbs. at 1.680". Free length 2.08".

VALVE TIMING

Tappet Clearance: None in service (Hydraulic lifters).

▷**Valve Timing**—*CAUTION—Two Camshafts used and have different valve timing.*

▷**Before Engine No. 9EL-43603**
(Camshaft not Marked)

Intake Valves—Open 14° BTDC. Close 60° ALDC.

Exhaust Valves—Open 62° BLDC. Close 16° ATDC.

▷**After Engine No. 9EL-43603**
(Camshaft Stamped "P" on front end)

Intake Valves—Open 5° BTDC. Close 49° ALDC.

Exhaust Valves—Open 49° BLDC. Close 8° ATDC.

Valve Timing Check—*See "Valve System" in Lincoln Special Data.*

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, valve lifters (hydraulic type) and timing gears. Oil pump mounted in crankcase at rear of engine.

Crankcase Capacity—6 quarts.

Normal Oil Pressure—45-65 lbs. at 2000 RPM.

Oil Pressure Relief Valves: Two used as follows:

1—Oil Pump Relief Valve—In oil pump body and regulates pressure to 50 lbs. for engine lubrication. Spring Tension 12.4 lbs. at 2.175".

2—Cylinder Block Oil Relief Valve—At front end of valve chamber and regulates pressure to 15 lbs. for hydraulic valve lifters.

Oil Pump: Gear type. In crankcase at rear of engine.

Oil Pump Servicing—*See Lincoln Special Data.*

▷*NOTE—Removable sump attached to oil pan for access to oil pump and screen.*

Oil Filter: On left cylinder head. Replace cartridge every 5000 miles or more often if required.

Oil Filter Cartridge—Lincoln No. 8CM-6731A Kit.

Oil Pressure Gauge: King-Seeley Electric.

Dash Unit—Lincoln No. (1949) 8L-9273, (1950-51) OL-9273.

Engine Unit—Lincoln No. 41A-9278.

See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler breather cap (inlet), and in upper end of outlet pipe at elbow connection just below generator on left side.

Servicing—Wash screen in cleaning fluid and wet with engine oil when dry at oil change period (2500 miles).

Outlet Pipe Air Filter Cartridge—Lincoln No. 8EL-6841.

COOLING

▷**New Cylinder Head Gasket for improved cooling:** *See "Cooling System" in Lincoln Special Data.*

Cooling System: Pressure type with relief valve in filler cap and two belt-driven pumps (one for each bank) with re-circulating by-pass.

Capacity—34½ quarts.

Pressure Valve—In radiator filler cap. Lincoln No. 26H-8100-B (AC #846740). Opens at 3½-4 lbs.

Water Pumps: Two used. Centrifugal, belt-driven, packless type. Shaft mounted on sealed duplex ball bearing.

NOTE—Bottom bolt must be installed prior to installing water pump pulley.

See Water Pump Section for complete data.

Fan Belt Adjustment—Loosen fan mounting bracket bolts, raise fan up until side movement on belt midway between fan and crankshaft pulleys is ½".

Generator (& Water Pump) Belt Adjustment—*See GENERATOR.*

Thermostats: Two used (one in each cylinder head water outlet). Lincoln No. 8EL-8575-A (std.), B & C (optl.).

Setting (std.)—148-170° maximum.

Settings (Optl.)—158-180° (B), 178-200° (C), max.

Temperature Gauge: King-Seeley Electric

Dash Unit—Lincoln No. (1949) 8L-10883, (1950-51) OL-10883.

Engine Unit—Lincoln No. 8A-10884 in left head.

Engine Switch—No. 8A-10990 in right hand head.

See Miscellaneous Section for complete data.

CLUTCH

Long Model 11CF-10½TI, Lincoln No. 8EL-7563. Semi-centrifugal, single plate, dry disc type.

See Clutch Section for complete data.

Facings—Moulded or Woven. Inside Diameter 7". Outside Diameter 10½". Thickness .125".

Pedal Adjustment: 1-1¼" free travel. Adjust by loosening locknut and turning adjusting screw on adjusting rod.

Removal: Remove transmission (see TRANSMISSION Removal below). Remove flywheel housing inspection cover. Remove transmission from flywheel housing, detach clutch release spring first, remove flywheel housing from engine plate and cylinder block. Take off clutch release bearing and hub. Prick punch flywheel and pressure plate so that these parts may be placed in original positions when reassembling. Use Tool 7563 to compress pressure plate. Take off 6 capscrews holding pressure plate assembly to flywheel.

TRANSMISSION

STANDARD

Warner Model AS1-T85B (Std.), AS2-T85B (with Overdrive). All helical gear type, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

Transmission Control: Steering column mounted shift.

See Transmission Section for complete data.

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame. Take out four transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model AS2-T85B (Transmission & Overdrive). Optl. equipment. Overdrive is solenoid operated type (no centrifugal pawls) with Governor Control and throttle operated "kick-down".

See Transmission Section for complete data.

►**Prolonged shorting-out of Ignition on Kick-down Correction**—*See "Ford, Lincoln, Mercury (Warner) Overdrive" in Transmission Section.*

Solenoid—Lincoln No. 8M-6916.

Control Relay—Lincoln No. 8M-6915. On engine side of dash. 30 ampere fuse at IGN terminal of relay.

Lock-Out Switch—Lincoln No. 8M-6917-A.

Throttle Kick-down Switch—Lincoln No. 8A-6918.

Governor Switch—Lincoln No. 8M-6919.

Removal: Same as for Std. transmission (above) after disconnecting overdrive control cable and wiring.

HYDRA-MATIC DRIVE

OPTIONAL EQUIPMENT

Description—Four-speed planetary type automatic transmission and fluid coupling. Similar to other Hydra-Matic Drive installations, with Modulated Line Pressure.

►*HYDRA-MATIC DRIVE PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level every 1000 miles. Add fluid, as required, to maintain level at "F" mark on dip stick. Drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type "A", furnished under Lincoln Part No. 8L-19582.

Capacity—11 qts. (approx.).

Checking Fluid Level—To check fluid level engine must be idling, transmission warm, parking brake set, and selector lever in "DR" position. Dipstick located under inspection cover placed on right side under floor mat. Add oil if below "L" mark on dipstick to bring level to "F" mark.

►***CAUTION—Do not check oil level when transmission temperature excessively high and do not fill above "F" on dip stick (will cause foaming when warm).***

Draining & Refilling—*See "Hydra-Matic Drive" in Transmission Section.*

Linkage Adjustment—*See "Hydra-Matic Drive Linkage Adjustment" in Transmission Section.*

►*OTHER HYDRA-MATIC DATA—See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer 1310. Needle bearing type. Two used.

REAR AXLE

• **Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive (separate carrier not used). Axle ends flanged (no separate hub). Wheel bearings are sealed ball, pre-lubricated (no lubrication required).

See Rear Axle Section for complete data.

Ratio—3.9-1 (43:11—Std.), 4.27-1 (47:11—with O.D.).

Ratio (Hydra-Matic)—3.31-1.

Backlash—.005-.008". Shim adjustment.

Removal: Raise rear of car. Remove axle shafts, and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers, spring U-bolts. Remove axle housing assembly from car.

Axle Shaft Removal: Remove rear wheels. Take out 3 capscrews holding brake drum to axle shaft flange. Remove hydraulic lines from brake backing plate. Take out 4 axle retainer nuts (work through opening in axle shaft flange). Use Tool 4235-A to remove axle shaft and bearing assembly from housing. Take off gasket and backing plate. Do not damage oil seal when removing axle shaft.

SHOCK ABSORBERS

Front—Lincoln No. 8L-18045-C (Monroe).

Rear—Lincoln No. 8L-18080 (Monroe).

Direct acting, hydraulic types. Two makes are used and are interchangeable.

►***NOTE—Shock absorbers are permanently sealed and cannot be refilled or repaired.***

►**Rear Shock Absorber Installation**—Lower tube has welded stone shield on lower end which must be installed toward front of car.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.

See Front Suspension Section for complete data.

►*CAUTION—Specifications listed below supersede earlier 1949 Lincoln Front End Specifications.*

Kingpin Inclination—5° crosswise with ¾° Camber.

Caster—0° to Neg. 1½°. Threaded bushing adjustment at lower pivot pin.

Camber—0° to Pos. ¾°. Eccentric adjustment at upper pivot pin.

Toe In—3/32-5/32". Adjusting sleeve on outer end of each tie rod. Adjust equally.

Steering Geometry (toe out on turns)—Inner wheel turned 23½° ± ½°, outer wheel 20°.

STEERING GEAR

Gemmer Model 335. "3-tooth" Worm-and-Roller type with "push-pull" adjustment.

See Steering Gear Section for complete data.

BRAKES

Service: Lincoln-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinders—Diameter: Front wheel 1.128" (hone limit 1.132"). Rear wheel .940" (hone limit .942").

Drums—Diameter 12".

Lining—Molded. Width 2¼" (front wheel), 2" (rear wheel). Thickness (1949) 3/16", (1950-51) 7/32". Length per wheel 23 7/64".

Clearance—.010" at each end of each shoe.

Braking Power—59% front wheels, 41% rear.

Hand Brake: See Service Brakes above.

Hand Brake Linkage Change 1949 Models (for easier application)—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Tops, Windows & Front Seat: Hydro-Lectric type (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders).

See Miscellaneous Section for complete data.

Windshield Wipers: Two types used:

Lincoln 9EL—Vacuum Link and Crank Arm type.

Cosmopolitan 9EH—Vacuum Cable Operated type.

See Miscellaneous Section for complete data.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on Patent Plate riveted to right front body pillar just below upper hinge opening. **Serial number includes identification in the following sequence:** *NOTE—Model year indicated on plate will be either 52 (1952), or 53 (1953).*

Year	Assembly Plant	Serial Number	Engine Type
53	See Below	5001①	H

①—Starting Serial Number (All Plants).

Assembly Plants (Indicated in serial number by the following code): **"LA"**—Los Angeles. **"LP"**—Lincoln Plant. **"SL"**—St. Louis.

TUNE-UP

COMPRESSION PRESSURE: (1952) 110-120 lbs., (1953) 135 lbs., at cranking speed.

VACUUM READING: Steady 16-19" idling at 400-425 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinder Numbering—Right Bank 1-2-3-4, Left Bank 5-6-7-8. Numbered from FRONT of engine.

SPARK PLUG GAP: (1952) .029-.032". (1953) .033-.037".

Plugs—Champion H-10.

CAUTION—Tighten plugs to 24-30 ft. lbs. torque.

DISTRIBUTOR: (1952)—**Lincoln No. FAB-12127.** Single breaker type with vacuum control (no centrifugal advance). Diaphragm unit linked to breaker plate governs entire advance in accordance with engine requirements.

Breaker Gap—.014-.016". **Cam Angle**—26-28½°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Automatic & Vacuum Advance—*See Ignition.*

Removal: *See Ignition.*

DISTRIBUTOR: (1953)—**Lincoln No. FAF-12127-A (Distr. less Cap & Rotor).** Single breaker plate with NEW double unit vacuum spark control and mechanical advance.

Vacuum Advance—Double diaphragm mounted on distributor with two vacuum lines from carburetor

Mechanical Advance—Distributor advance is operated by a cable between carburetor throttle linkage and distributor breaker plate.

Breaker Gap—.014-.016". **Cam Angle**—26-28½°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Automatic & Vacuum Advance—*See Ignition.*

Removal: *See Ignition.*

COIL: Lincoln No. 8BA-12029.

Ignition Current—2 amperes idling. 5 stopped.

▷***COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):*** This coil-to-distributor lead is SPECIAL SUPPRESSOR LEAD (non-metallic type with carbon impregnated nylon or rayon core) and the special length (approx. 14½") is required for proper radio reception. ***THIS LEAD MUST NOT BE SHORTENED AND OTHER TYPE IGNITION CABLES MUST NOT BE SUBSTITUTED FOR IT.***

CONDENSER: Lincoln No. FAB-12300-A.

Capacity—.21-.25 microfarad.

IGNITION TIMING: 3° BTDC.

Timing Mark—Dampener marked "TDC" with 10-2° graduations before this mark. Align 3° point with pointer on chain case cover.

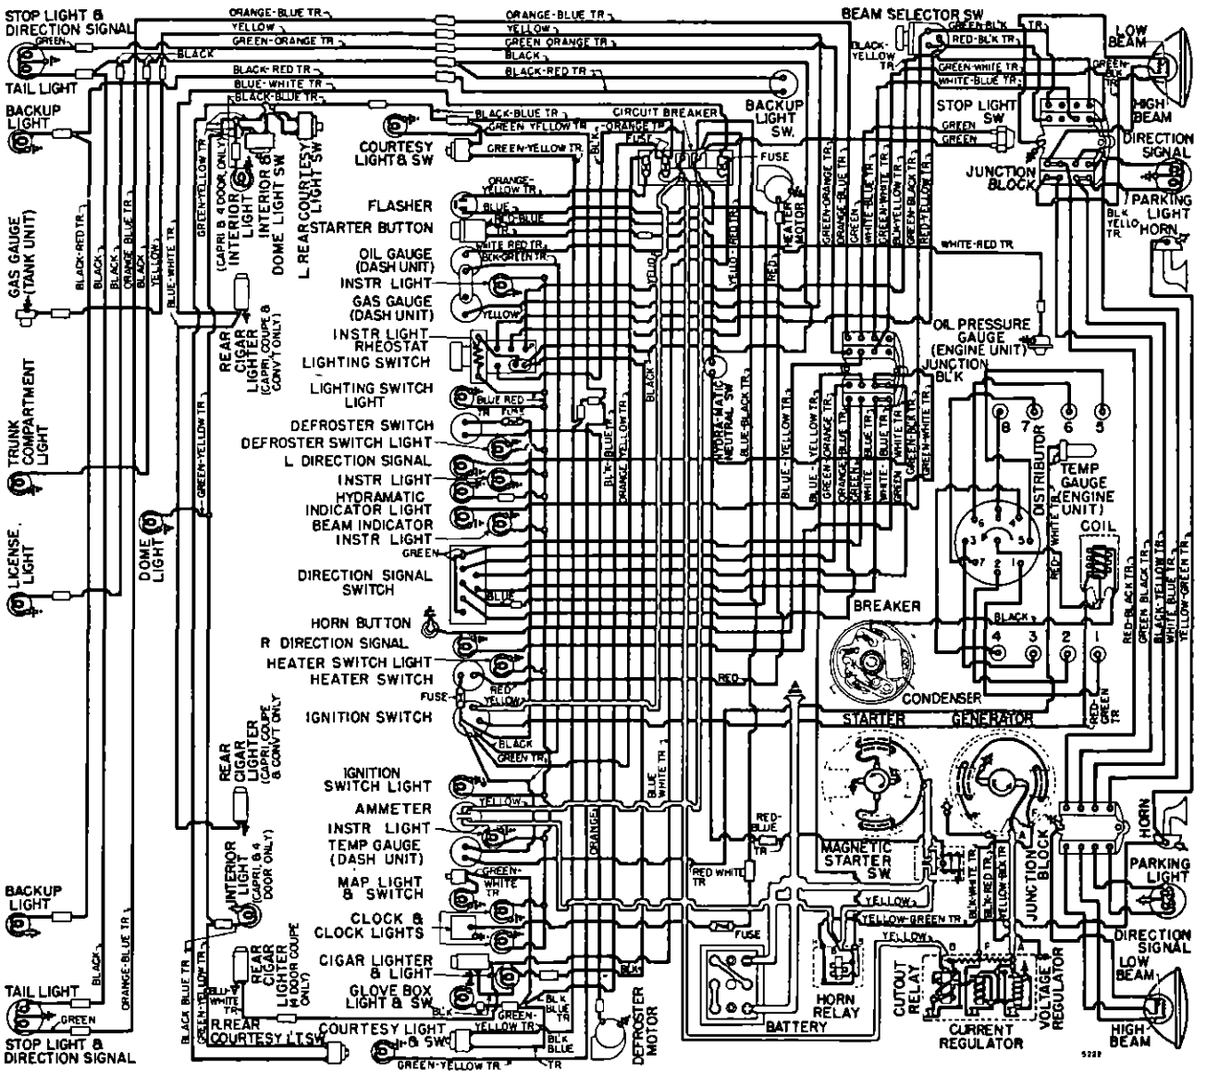
Timing Procedure—*See Ignition Timing.*

CARBURETION: (1952)—**Lincoln No. EAD-9510-B, D.** Dual downdraft "Centriflo" type with fast idle and separate automatic choke mechanism. All carburetors have vacuum passages for distributor control and EAD-9510-D has additional "Spark Control Valve."

▷***HARD STARTING CORRECTION (External Vent Conversion)—See "Lincoln-Mercury Centri-flo Carburetor" in Carburetor Section for complete data.***

▷***EXTERNAL VENT SEASONAL SETTING***—Spring type adjustable clip, Part No. EAD-99608-A provided for installation on accelerator pump rod (external vent hollow type). **Setting**—(Winter) Vent hole closed. (Summer) Vent hole open. *See "Lincoln-Mercury Centri-flow Carburetor" in Carburetor Section for complete data.*

▷***NEW CHOKE ASSEMBLY (To improve cold starting on cars with new type external vent—see Hard Starting Correction, above)—See Carburetor Section for complete data.***



▷***THROTTLE STICKING CORRECTION: See Carburetor Section.***

▷***ENGINE SURGE AT 20-25 MPH. CORRECTION (Idle Jet Change): See Carburetor Section.***

▷***ENGINE HESITATION OR LOSS OF POWER AT 30-35 MPH. CORRECTION: See Carburetor Section.***

▷***AUTOMATIC CHOKE CORRECTION (Exhaust Gas Leakage Correction): See Carburetor Section.***

Idle Setting—With engine at normal operating temperature (oil pressure and coolant temperature stabilized) so that choke valve wide open and fast idle inoperative, adjust throttle stopscrew for cor-

1952 MODELS

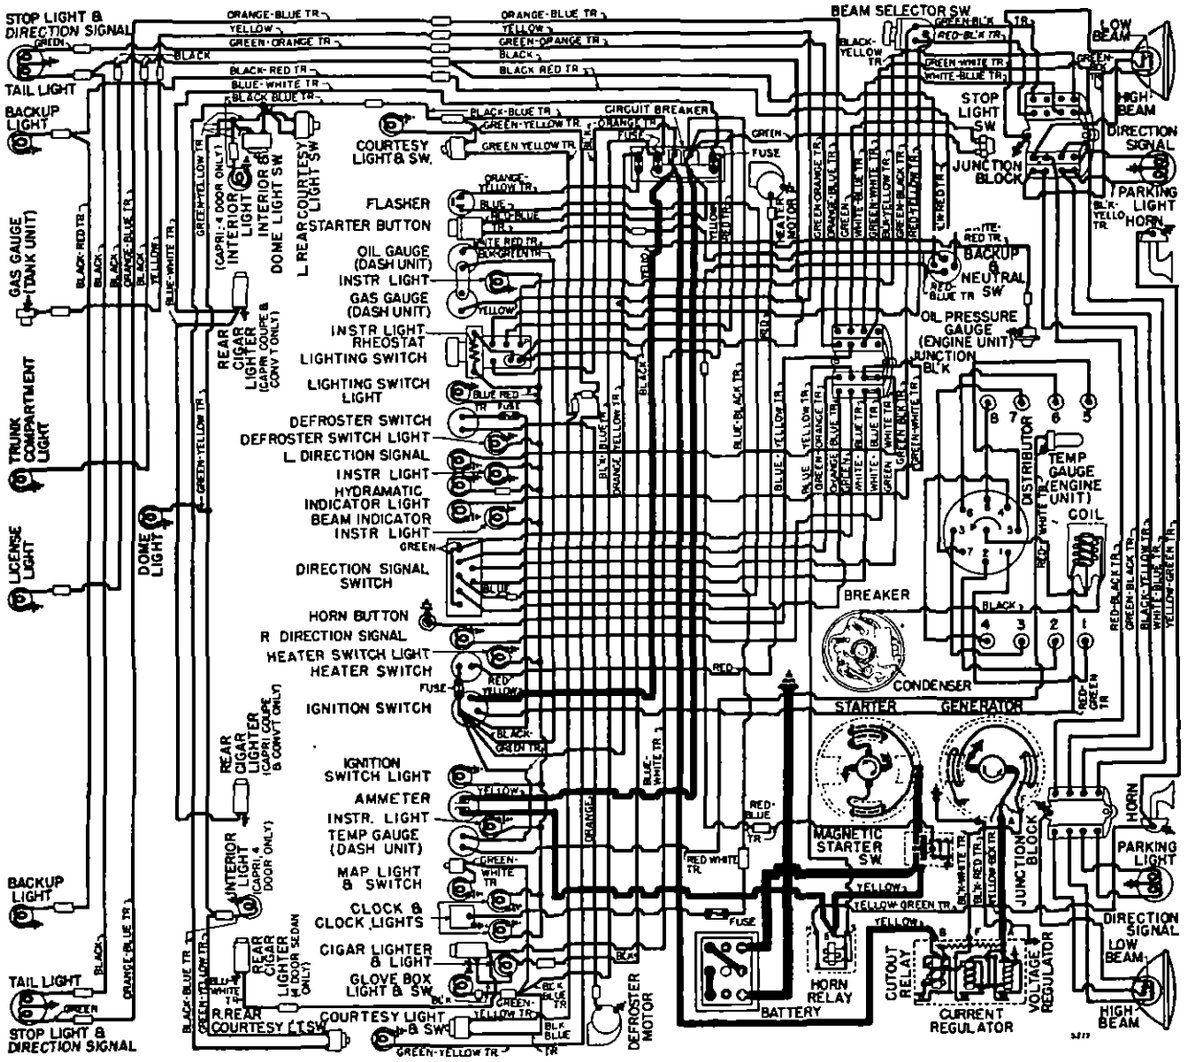
rect idling speed, then adjust both idle mixture screws for highest steady manifold vacuum. Recheck engine idle speed.

Idle Speed—400-425 RPM.

Float (Fuel) Level—1/2" ±1/32" below top edge of bowl with fuel pump pressure at 3½-4½ lbs. Use Fuel Level Gauge 9550-B to check fuel level, placing gauge squarely on top of main body so that gauge pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending tab on float lever which contacts intake needle.

CAUTION—Both floats must be at same height and floats must not contact float bowl walls.

Accelerating Pump—Seasonal adjustment provided by three holes in throttle shaft lever for pump link engagement. **Center Hole**—Normal operating. **Outer Hole**—Extreme cold. **Inner Hole**—Extreme hot.



Fast Idle Setting: No adjustment required.

Choke Setting: Mark on cover aligned with center mark of scale on choke housing.

Fuel Pump Pressure: 3½-4½ lbs.

CARBURETION: (1953)—Lincoln No. EAD-9510-H, M. Four barrel "Centri-Quad" carburetor with fast idle and separate automatic choke mechanism. *NOTE—EAD-9510-M carburetor has the External Vent modification noted below.*

►*HARD STARTING CORRECTION (External Vent Conversion)—See "Lincoln Centri-Quad Carburetor" in Carburetor Section for complete data.*

1953 MODELS

►*EXTERNAL VENT SEASONAL SETTING*—Spring type adjustable clip, Part No. EAD-99608-A provided for installation on accelerator pump rod (external vent hollow type). **Setting**—(Winter) Vent hole closed. (Summer) Vent hole open. *See "Lincoln Centri-Quad Carburetor" in Carburetor Section for complete data.*

►*NEW CHOKE ASSEMBLY (To improve cold starting on cars with new type external vent—see Hard Starting Correction, above)—See Carburetor Section for complete data.*

►*THROTTLE LOCKING IN PARTIALLY OPEN POSITION: May be caused by interference between carburetor choke lock-out lever and air cleaner. See "Air Cleaner Installation" in Lincoln Special Data.*

►*CARBURETOR COVER & PLUG ASSY. CHANGE (To correct faulty Power Valve Action due to air leakage): See "Lincoln Centri-Quad Carburetor" in Carburetor Section.*

Idle Setting—First set BOTH primary idle mixture adjusting screws EXACTLY 1¼ turns open (no screws used for secondary stage). Start engine and operate it until normal operating temperature secured with choke valve wide open and fast idle cam in slow idle position. Back off fast idle adjusting screw (inner screw on throttle lever) so that it clears the fast idle cam. Set engine speed to correct hot or slow idle speed (see below) by turning slow idle speed adjusting screw (outer screw on fast idle cam). Turn both idle mixture adjusting screws equally ⅛ turn at a time in or out until smoothest idle performance obtained with highest steady vacuum reading. If engine speed changes during this operation, reset speed and repeat idle mixture adjustment. Then adjust Fast Idle.

Idle Speed—400-425 RPM. With Selector lever in "Dr" position.

Float (Fuel) Level: To check fuel level with carburetor on car, remove air cleaner and main body cover from carburetor, crank engine with starter to fill bowl to operating level. Install Gauge 9550-B squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending float tab.

►*CAUTION—Both floats must be same height and floats must not contact side walls of float bowl.*

Fuel Level—1/2" ± 1/32" with fuel pump pressure at 3½-4½ lbs.

Fast Idle Setting: After completing slow idle setting (above) and with engine at normal operating temperature, so that fast idle cam in slow idle position, turn fast idle adjusting screw (inner screw on throttle lever) in until screw just contacts lowest step on fast idle cam. This will provide correct fast idle speed. NOTE—If fast idle speed is unnecessarily high with above setting, fast idle screw may be backed off *not to exceed one full turn.*

Choke Setting: Mark on cover aligned with center mark of scale on choke housing.

Fuel Pump Pressure: 3½-4½ lbs.

MANIFOLD HEAT CONTROL: "Duck-bill" type thermostatic valve located inside right end of cross-over pipe near the flange.

VALVE TAPPET CLEARANCE: No adjustment required in service. See Initial Adjustment if engine disassembled or rocker arms removed.

Initial Valve Clearance—*See "Valve System" in Lincoln Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

IGNITION

IGNITION SWITCH: Lincoln No. FAA-11572-A.

COIL: Lincoln No. 8BA-12029.

▷***COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):*** This coil-to-distributor lead is SPECIAL SUPPRESSOR LEAD (non-metallic type with carbon impregnated nylon or rayon core) and the special length (approx. 14½") is required for proper radio reception. ***THIS LEAD CABLE MUST NOT BE SHORTENED AND OTHER TYPE IGNITION CABLES MUST NOT BE SUBSTITUTED FOR IT.***

Ignition Current—5 amperes stopped, 3 amperes idling.

CONDENSER: Lincoln No. FAB-12300-A.

Capacity—.20-.25 microfarad.

DISTRIBUTOR: (1952)—Lincoln No. FAB-12127. Single breaker type with vacuum control (no centrifugal advance). Diaphragm unit linked to breaker plate governs entire advance in accordance with engine requirements.

Breaker Gap—.014-.016". **Cam Angle**—26-28½°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Advance Performance—FAB-12127
▷With Distributor on Test Unit

Distributor Degrees	Vacuum	R.P.M.
0°	0"	200
2-3°	.38"	400
9½-10½°	1.80"	1000
16¼-17½°	5.70"	1500
14¾-16°	4.85"	2000

Removal: *NOTE*—As distributor is removed, note the amount rotor turns. This will be helpful when installing.

Installation: Position No. 1 piston on TDC (firing position). Set distributor to fire No. 1 cylinder with points just breaking. Mark position of rotor on housing. Turn rotor counter-clockwise approximately ⅛ turn (or amount noted when distributor removed). As distributor is installed rotor should line up with mark on housing. If not repeat the operation.

DISTRIBUTOR: (1953)—Lincoln No. FAF-12127-A. Single breaker type with NEW double vacuum unit vacuum spark control and cable operated mechanical advance.

Breaker Gap—.014-.016". **Cam Angle**—26-28½°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Advance Performance—FAF-12127-A
▷With Distributor on Test Unit

Distr. Degrees	Vacuum	Distr. RPM.
0°	0"	200
3° to 4°	.38"	400
9½° to 10½°	1.80"	1000
12¼° to 13¼°	3.05"	1500
14¼° to 15¼°	4.85"	2000

Removal: Remove spark advance cable assembly from cable clamp and spark control arm on carburetor. Disconnect the two lines leading to vacuum diaphragm. Unsnap two ball clips and remove distributor cap. Scribe a line on distributor housing to indicate position of rotor and scribe a line on distributor housing in relation to position on engine. This will eliminate initial timing of distributor (see below) to engine providing engine is not rotated with distributor removed. To install distributor, reverse removal procedure and check distributor timing.

IGNITION TIMING

Std. Setting ..... **3° BTDC**

▷***1953 TIMING CAUTION***—Distributor has advance cable connected to carburetor throttle lever which must be adjusted when setting ignition timing. See Positioning of Advance Cable Conduit below.

Timing Mark—Dampener marked TDC with 5—2° (1952); 10—2° (1953) graduations ahead of this point. Set timing with 3° point in line with pointer on timing chain cover.

Initial Distributor Timing—Turn engine until timing mark on crankshaft damper is lined up with pointer and No. 1 piston is in firing position. Install the distributor with the points just breaking and the rotor in position to fire No. 1 cyl. (The vacuum connection boss should be at approximately right angles to crankshaft and pointing toward left side of engine). Installation must be done carefully in order that tang end of distributor shaft will engage slot in intermediate shaft at the same time the distributor gear begins to mesh with camshaft gear (intermediate shaft can be aligned by inserting long screwdriver in shaft slot to rotate shaft.

Timing (on Engine)—Disconnect vacuum line at vacuum advance unit on distributor, loosen distributor hold-down bolt just enough to permit distributor to be rotated, connect Power Timing Light to No. 1 cylinder spark plug. Run engine at idle speed (400-425 RPM), rotate distributor until timing mark on dampener appears in line with pointer on timing chain cover. Tighten distributor hold-down bolt and reconnect vacuum line.

Correct Positioning of Advance Cable Conduit (1953 Models—FAF-12127-A Distributor)—Hook end of spark control cable assembly on pin of spark control cable arm and place cable conduit loosely in clamp on carburetor flange. Place a .105" spacer between spark control arm and stop on carburetor. With a timing light connected, adjust cable conduit in the clamp in a direction to obtain a reading of 15° advance on crankshaft dampener. Tighten conduit clamp on carburetor. Recheck engine timing and adjust if necessary. Timing should have returned to initial setting of 3° advance.

CARBURETOR

1952 "CENTRI-FLO"

Lincoln No. EAD-9510-B, D. Dual downdraft "Centri-flo" type with fast idle and separate automatic choke mechanism. All carburetors have vacuum passages for distributor control and EAD-9510-D has additional "Spark Control Valve."

▷***HARD STARTING CORRECTION (External Vent Conversion)—See "Lincoln-Mercury Centri-flo Carburetor" in Carburetor Section for complete data.***

▷***EXTERNAL VENT SEASONAL SETTING:*** Spring type adjustable clip, Part No. EAD-99608-A provided for installation on accelerator pump rod (external vent hollow type).

Setting—(Winter) Vent hole closed. (Summer) Vent hole open. ***See "Lincoln-Mercury Centri-flo Carburetor" in Carburetor Section for complete data.***

▷***NEW CHOKE ASSEMBLY (To improve cold starting on cars with new type external vent—see Hard Starting Correction, above.)—See Caburetor Section for complete data.***

▷***THROTTLE STICKING CORRECTION: See Carburetor Section.***

▷***ENGINE SURGE AT 20-25 MPH. CORRECTION (Idle Set change): See Carburetor Section.***

▷***ENGINE HESITATION OR LOSS OF POWER AT 30-35 MPH. CORRECTION: See Carburetor Section.***

▷***AUTOMATIC CHOKE CORRECTION (Exhaust Gas Leakage Correction): See Carburetor Section.***

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***

Metering Jets—***See "Holley-Ford Jet Specification Table" in Carburetor Section.***

Hydra-Matic Throttle Linkage Adjustment: ***See "Hydra-Matic Drive" in Transmission Section for data.***

Fast Idle: Holley-Ford Carburetor Type.

See Carburetion Equipment Section for complete data.

Setting—No adjustment required.

Automatic Choke: ***See "Lincoln-Mercury Choke" in Carburetion Equipment Section for complete data.***

Setting—Mark on cover should be aligned with center mark on scale on choke housing. Adjust by loosening cover screws and rotating cover assy.

1953 "CENTRI-QUAD"

Lincoln No. EAD-9510-H, M. Four barrel "Centri-Quad" Carburetor with fast idle and separte automatic choke mechanism. ***NOTE—EAD-9510-M carburetor has the External Vent modification noted below.***

▷***HARD STARTING CORRECTION (External Vent Conversion)—See "Lincoln Centri-Quad Carburetor" in Carburetor Section for complete data.***

▷***EXTERNAL VENT SEASONAL SETTING***—Spring type adjustable clip, Part No. EAD-99608-A provided for installation on accelerator pump rod (external vent hollow type).

Setting—(Winter) Vent hole closed. (Summer) Vent hole open. ***See "Lincoln Centri-Quad Carburetor" in Carburetor Section for complete data.***

▷***NEW CHOKE ASSEMBLY (To improve cold starting on cars with new type external vent—see Hard Starting Correction above) See Carburetor Section for data.***

▷***THROTTLE LOCKING IN PARTIALLY OPEN POSITION: May be caused by interference between carburetor choke lock-out lever and air cleaner.***

▷***CARBURETOR COVER & PLUG ASSY. CHANGE (To correct faulty Power Valve Action due to air leakage): See "Lincoln Centri-Quad Carburetor" in Carburetor Section.***

Settings (Idle Setting, Float Level, and Accelerating Pump): ***See Tune-Up data.***

Metering Jets—***See "Holley-Ford Jet Specification Table" in Carburetor Section.***

Hydra-Matic Throttle Adjustment: ***See "Hydra-Matic Drive" in Transmission Section.***

Fast Idle: Holley-Lincoln type.

Setting—After completing slow idle setting and with engine at normal operating temperature, so that fast idle cam in slow idle position, turn fast idle adjusting screw (inner screw on throttle lever) in until screw just contacts lowest step on fast idle cam. This will provide correct fast idle speed. NOTE If fast idle speed too high, back off fast idle screw ***not to exceed one full turn.***

See Carburetion Equipment Section for complete data.

Automatic Choke: Separate unit on manifold.

Setting—Mark on cover should be aligned with center mark of scale on choke housing. Adjust by loosening cover screws and rotating cover assembly.

See Carburetion Equipment Section for complete data.

CARB. EQUIPMENT

Air Cleaner: Oil bath type.
Installation—*See "Air Cleaner" in Lincoln Special Data.*

►***THROTTLE STICKING CORRECTION (Due to Air Cleaner interference)—See "Air Cleaner".***

Fuel Pump: Lincoln No. (1952) EAD-9350-A & D, (1953) EAD-9350-E. Combination fuel and vacuum pump.

►**Fuel Pump Rod Removal Note**—Timing chain cover must be removed to gain access to snap ring at lower end of push rod, for push rod removal.

►***CAUTION—Pump has laminated paper filter (in metal sediment bowl) and bowl must be removed and cleaned at each chassis lubrication period.***
Pressure—3½-4½ lbs.
See Carburetion Equipment Section for complete data.

Gasoline Gauge: King-Seeley Electric type.
Dash Unit—Lincoln No. FAA-9280-B.
Tank Unit—Lincoln No. FAB-9275-A.
See Carburetion Equipment Section for complete data.

BATTERY

Lincoln No. FAA-10655-A. 21 plate, 6 volt, 110 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive.
Location—Under toeboard on right hand side.

STARTER

Lincoln No. FAC-11002-B. Armature No. 52-11005.
Drive—Bendix "Folo-thru" type.
See Electrical Equipment Section for complete data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs.
Cranking Speed—100-180 RPM, 210 amps. max.

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	①	5.0	40-60
16	ft. lbs.	Lock	3.5	700

①—With starter mounted on engine and engine running.

Starting Switch: Lincoln No. FAB-11450-B. Magnetic switch mounted on right fender apron. Controlled by pushbutton switch Lincoln No. FAA-11500-A, and Hydra-Matic Neutral Safety Switch, No. FAB-15812-A.
Hydra-Matic Neutral Safety Switch Adjustment—*See "Hydra-Matic Drive" in Transmission Section.*

GENERATOR

Lincoln No. FAB-10002-A (Less pulley and bracket). Two brush type with voltage and current regulation.
Armature—Lincoln No. 8EH-10005.
Maximum Charging Rate—42 amperes, 7 volts reached at approximately 21.3 MPH. Controlled by regulator and dependent on load and battery condition.
To Check Generator Output—Connect ammeter in series with charging line at regulator "ARM" terminal, connect short insulated jumper between generator "A" and "F" terminals (to short out regulator). Run engine at 1675 RPM and note ammeter reading. If generator ouput equals or exceeds rated output (below), generator performance is satisfactory.

►***CAUTION—Do not operate generator at higher speeds or in service with jumper connected between generator armature and field terminals. This jumper eliminates all regulator action.***

Performance Data

Amperes	*Engine RPM.*
40	1675

Rotation—Counter-clockwise at commutator end.
Field Current—1.7-2.0 amperes
Brush Spring Tension—26-34 ozs.
Belt Adjustment: ½" deflection midway between generator and fan pulley.

REGULATOR

Lincoln No. FAD-10505-A. Voltage-current 3 unit type.
See Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—6.0-6.6 volts.
Cuts Out—8 amperes discharge current (max.).
Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts just closed.

Voltage Regulator

Setting—7.2-7.6 volts.
Air Gap—.032-.035" between armature and core with contacts just closed.
Contact Spring Tension—5 ozs. minimum with contacts just opening.
Checking & Adjusting—*See Electrical Equipment Sec.*

Current Regulator

Setting—38-42 amperes.
Air Gap—.032-.035" between armature and core with contacts just closed.
Contact Spring Tension—5 ozs. minimum with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.

Directional Signal: Std. See Electrical Equip. Section.
Direction Signal Flasher—Lincoln No. (1952) 8L-13350-B, (1953) FAA-13350-A.

Switches

Lighting—Lincoln No. (1952) OL-11654, (1953) FAA-11654-A.
Beam Selector—Lincoln No. 8A-13532-B.
Instrument—Lincoln No. (1952) OL-13740, (1953) FAA-13740-A.
Map Light—Lincoln No. 21C-13740.
Glove Box—Lincoln No. OM-14413-A.
Door Switches—Lincoln No. OA-12713.
Stop Light—Lincoln No. 11A-13480-A.
Road Light—Lincoln No. 1C-15224-A.
Direction Signal—Lincoln No. FAB-14486-A.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Lincoln No. FAB-12258-A (30 amp. & 15 amp.) Headlights (30 amp.); Stop & Tail Lights (15 amp.). Assembly is mounted back of instrument panel.
Convertible Top Control—40 ampere circuit breaker.
Window Regulators—Lincoln No. FAA-12258-B. Assembly consists of four 30 ampere circuit breakers.

FUSES: Courtesy & Interior Lights—14 amperes. Located on circuit breaker behind instrument panel.
Direction Signal—14 amperes. Located on circuit breaker behind instrument panel.
Overdrive—30 amperes. Mounted on overdrive relay.
Heater—20 amperes. In lead wire.
Blower—20 amperes. In lead wire.
Clock—3 amperes. In clock wire lead.
Cigar Lighters—30 amperes.

HORNS: Lincoln No. FAA-13832-A (Low Note, Left Horn); **FAA-15833-A** (High Note, Right Horn). Dual horns operated by relay.
Horn Relay: Lincoln No. FAA-13853-A. On right fender apron.

ENGINE

ENGINE SPECIFICATIONS: 90° V8, Valve-in-head.
Bore—3.8". **Stroke**—3.5".
Displacement—317.5 cu. in.
Rated Horsepower—48.2.
Developed Horsepower—(1952) 160 at 3900 RPM. (1953) 205 at 4200 RPM.
Compression Ratio—(1952) 7.5-1. (1953) 8.0-1.
Compression & Vacuum Reading—*See Tune-Up.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Lincoln Special Data.*

►***1953 CYLINDER HEADS ARE NOT INTERCHANGEABLE WITH PREVIOUS MODELS.***

HEAD GASKET INSTALLATION CAUTION—See Lincoln Special Data.

►***CYLINDER HEAD INTERCHANGEABILITY—See Lincoln Special Data.***

ENGINE & OIL PAN REMOVAL: *See Lincoln Spec. Data.*

PISTONS: Aluminum alloy, Auto-thermic, slipper type skirt, with three rings (all above pin).
NOTE—Pin hole in piston offset.
Weight—22.9 ozs. **Length**—4.15".
Original Bore & Piston Sizes—*See Lincoln Special Data.*
Removal—Pistons and rods removed from above.
Clearance—.0007-.0013". See Fitting Pistons.
Cyl. Bore Wear Limit: Out-of-round .003". Taper .006".

Fitting Pistons: Use ½" wide feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Pull to withdraw should be 6-12 lbs. with following feeler thickness:
New Piston in New Bore—.0015" feeler.
New Piston in Used Bore—.002" feeler.
Used Piston in Used Bore—.003" feeler.
Piston Installation: *Install piston with "F" (embossed on piston) and dimple on head toward front of engine.*
Replacement Pistons: Furnished Standard (3 sizes) and .005", .020", .030", .040" Oversize.

PISTON RINGS: 2 compression rings and one oil ring.

Ring	Width	End Gap	Side Clearance
#1 Comp.	.0775-.0780"	.010-.020"	.0015-.003"
#2 Comp.	.0775-.0780"	.010-.020"	.001-.0025"
#3 Oil	.186-.1865"	.010-.020"	.0015-.003"

Replacement Rings: Standard, (no oversizes).
PISTON PIN: *Floating type (lock ring each end).*
Diameter—.912-.9123".
Pin Fit in Piston—.0001-.0003" loose (tight fit at 70°F).
Pin Fit in Rod—.0003-.0004" loose. (Light thumb press fit).
Replacement Pins: *Std., .001", .002" oversize.*

CONNECTING ROD: Length—7.066-7.064".
Crankpin Journal Diameter—2.2482-2.2490".
Clearance—.0004-.0020".
Side Clearance—.006-.014" (two rods).

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

Connecting Rod Installation: The numbered side of the connecting rod must be toward the outside of the engine. Left bank rod numbers must be toward the left side of the engine and the right bank rod numbers toward the right side.

Replacement Bearings: Std., .010", .020", .030".

CRANKSHAFT: 5 bearing, with integral counterweights and vibration damper.
Main Journal Diameter—2.6235-2.6243".
Bearings—Steel-backed babbitt lined.
Clearance—.0008-.0026".
Adjustment—None. Replace bearings.

►*MAIN BEARING CAP CAUTION*—Bearing caps numbered #1 through #5 from FRONT of engine and must be installed with ARROW ON CAP TOWARD FRONT OF ENGINE.
NOTE—Main bearing cap bolts are self-locking type.
Rear Bearing Oil Seal Installation—*See Lincoln Special Data.*

Replacement Bearings: Std., .010", .020", .030", .040" undersize.

Endthrust: Taken by No. 3 (center main bearing). Adjust by replacing bearing.
End Play—.004-.008".

CAMSHAFT: 5 bearing. Chain driven.
Camshaft Journal Diameter—2.1240-2.1250".
Clearance—.0013-.0028". Wear limit .005".

Replacement Bearings: Furnished Std. & .015" Undersize.

►*BEARING INSTALLATION CAUTION*—Use Tool 6261-C to install bearings with notch on edge facing front of engine and at bottom of bore. See that oil holes in bearing line up with oil holes in block.

Camshaft Removal: *See "Camshaft & Bearings" in Lincoln Special Data.*

Endthrust: Taken by hydraulic plunger in forward end of camshaft. Excess oil lubricates timing chain, sprockets and front cover thrust boss.
End Play—Zero.

►**Eccentric Sleeve (Fuel Pump)**—Inspect and replace if clearance exceeds .006".

Timing Chain: Width 1.25". Pitch .5". Length 25".

Timing Chain Removal: *See "Timing Gears" in Lincoln Special Data.*

Camshaft Setting: Timing marks on camshaft and crankshaft gears adjacent and in line with straightedge across shaft centers.

VALVES (1952):	Head Diameter	Stem Diameter
Intake	1.80"	.3415-.3425"
Exhaust	1.505-1.515"	.3405-.3415"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.354"①	.0010-.0020"②
Exhaust	45°	.354"①	.0015-.0025"②

①—Replace camshaft if lift less than .333".
②—See Valve Stem Clearance Note below.

VALVES (1953): *CAUTION—1953 valves not interchangeable with previous type (intake valves larger, all vaves longer).*

	Head Diameter	Stem Diameter	Length
Intake	2.000-2.010"	.3415-.3425"	5.18"
Exhaust	1.505-1.515"	.3405-.3415"	5.18"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.354"①	.0010-.0020"②
Exhaust	45°	.354"①	.0020-.0030"②

①—Replace camshaft if less than .333".
②—See Valve Stem Clearance Note following.

Valve Stem Clearance Note—Install valves with oversize stems if clearance exceeds .004" (Intake), .005" (Exhaust). *See Valve Guides (below).*
Replacement Valves—Furnished with stems Std. and .003", .015", .030" Oversize.
Valve Seat Width—.060-.070" (1/16-5/64"). *See "Valve System" in Lincoln Special Data.*

►*1952-53 LINCOLN REPLACEMENT VALVE STEM CHANGE:* New "Umbrella" type valve stem seals, Part No. EAD-66571-B, should be installed on BOTH INTAKE & EXHAUST VALVES. These seals supersede previous type neoprene seal ring installed in valve stem groove.

Oversize Valve Stem Installation: *See "Valve System" in Lincoln Special Data.*

Valve Assembly Removal & Installation: *See "Valve System" in Lincoln Special Data.*

Valve Guides: Integral with cylinder head. For Installing oversize valves, *see "Valve System" in Lincoln Special Data.*

Valve Lifters: Hydraulic type. Removable from above. *See "Hydraulic Valve Lifters" in Lincoln Special Data.*

►*HYDRAULIC VALVE LIFTER PRODUCTION CHANCE (1953)*—New lifter, Part No. EAB-6800-D is interchangeable with previous 1952-53 lifters, either singly or in complete sets. *CAUTION—Do not interchange hydraulic valve lifter parts.*
Body Diameter—.8740-.8745".
Clearance in Block—.0005-.0020". Selective fit.
Initial Valve Clearance—*See "Valve System" in Lincoln Special Data.*

Valve Springs: Free Length—2.21".

	Spring Length	①Pressure
Valve Open	1.47"	133-147 lbs.
Valve Closed	1.80"	64-70 lbs.

①—A 10% pressure loss allowable in service.

Rocker Arm Assembly: *See "Valve System" in Lincoln Special Data.*

VALVE TIMING

VALVE TAPPET CLEARANCE: None in service. Hydraulic lifters. *See "Valve System" in Lincoln Special Data.*

VALVE TIMING: See Camshaft Setting above.
Intake Valves—Open 18° BTDC. Close 58° ALDC.
Exhaust Valves—Open 56° BLDC. Close 20° ATDC.

LUBRICATION

Engine Oiling System: Pressure through a "Full-flow" type oil filter to main bearings, connecting rod bearings, camshaft bearings, hydraulic valve lifters, rocker arms, and timing gears.

Crankcase Capacity—5 qts. (refill), 6 qts. (when new filter installed).
Normal Oil Pressure—40 lbs. at 40 MPH.

Oil Pump: Gear type. Mounted externally on left rear side of crankcase. Driven by distributor shaft. Oil screen assembly in front of crankcase and connected by an external pipe to oil pump.

Oil Pump Overhaul: *See "Oil Pump" in Lincoln Special Data.*

Oil Filter (Std. Equip.): "Full-flow" type mounted on crankcase adjacent to oil pump. Filter has pressure relief valve in filter center bolt which by-passes the oil to main oil gallery when filter becomes dirty. Replace filter element every 4000-5000 miles or more often if required.
Oil Filter Cartridge—Lincoln No. HCK-6731-A.
Oil Filter Installation—*See "Oiling System" in Lincoln Special Data.*

Oil Pressure Gauge: King-Seeley Electric (not CV).
Dash Unit—Lincoln No. FAA-9273-B.
Engine Unit—Lincoln No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler cap and in upper end of breather outlet pipe at elbow.
Servicing—Wash with solvent and saturate with engine oil every 2000 miles.
Outlet Pipe Air Filter Cartridge—Lincoln No. EAD-6841-A.

COOLING

Cooling System: Pressure type with single water pump mounted on engine front cover and thermostat in water outlet manifold on head. External bypass between water outlet manifold and pump recirculates water in engine when thermostat closed.
Capacity—22.5 qts. (total), 21.5 qts. (recommended water level). 2 qts. addtl. with heater.
Pressure Valve—Lincoln No. LA-8100-A3 (stamped 14). Radiator Filler Cap. Opens at 12-15 lbs.

Water Pump: Packless, sealed ball-bearing shaft. Pump mounted on front engine cover.
See Water Pump Section for complete data.

Belt Adjustment: ½" belt deflection midway between generator and water pump pulley.

Thermostat: Lincoln No. EAD-8575-B in cylinder head water manifold.
Setting—Starts to open at 148-153°F., fully open at 169-174°F.

Temperature Gauge: King-Seeley Electric (Not "CV").
Dash Unit—Lincoln No. FAA-10883-B.
Engine Unit—Lincoln No. FAA-10884-A.
See Miscellaneous Section for complete data.

HYDRA-MATIC TRANSMISSION

"Dual Range" (1952)—Type L-52 *(After first 2700 cars. See Note below for first 2700 cars).* **(1953)—Type L-53.** Four speed planetary type automatic transmission and fluid coupling. Modulated throttle pressure and hydraulic type reverse.

►*1952 NOTE—1951 Type L-51 transmission (not "Dual-Range") used on first 2700 cars.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level every 1000 miles. Add fluid as required to maintain level at full mark on dipstick. Drain and refill every 25000 miles. Use Automatic Transmission Fluid Type "A," furnished under Lincoln Part No. 8L-19582.

Checking Fluid Level—To check fluid level, engine must be idling, transmission warm, parking brake set and selector lever in "DR" position. Dipstick located under hood on right side of engine (1952 NOTE—First 2700 cars same as 1951 Models). Add oil if below "L" mark on dipstick to bring level to full mark.

►*CAUTION—Do not check oil level when transmission temperature excessively high and do not fill above "F" on dipstick (will cause foaming).*

►*OTHER HYDRA-MATIC SERVICE DATA—See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer 1310. Needle bearing type. Two used.

REAR AXLE

Own Make. Semi-floating hypoid gear type with Hotchkiss drive (**separate carrier not used**). Axle end flanged (no separate hub). Wheel bearings are sealed ball-bearing, pre-lubricated.

See Rear Axle Section for complete data.

Rear Axle Ratios

L-51 Hydra-Matic Cars	3.15-1 (41-13)
L-52 Hydra-Matic Cars	3.07-1 (43-14)
L-53 Hydra-Matic Cars	3.31-1 (43-13)

Backlash—.005-.008". Shim adjustment.

Removal: Raise rear of car. Remove axle shafts, and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers, and spring U-bolt. Remove axle housing assembly from car.

Axle Shaft Removal: Remove rear wheels. Take out 3 capscrews holding brake drum to axle shaft flange. Remove hydraulic brake lines from brake backing plate. Take out 4 axle retainer nuts (working through opening in axle shaft flange). Use Tool 4235-A to remove axle shaft and bearing assembly from axle housing. Take off backing plate and gasket. Do not damage oil seal when removing axle.

SHOCK ABSORBERS

Direct acting Hydraulic type. Shock absorbers are permanently sealed and require no servicing.

Front—Lincoln No. LA-18045-A (Standard); LA-18045-B (for heavy duty springs).

Rear—Lincoln No. LA-18080-A or LA-18080-C (Std.), LA-18080-B (Heavy Duty Springs).

REPLACEMENT CAUTION—Manufacturer recommends that replacement shock absorber of **same suffix letter** as original type be used.

FRONT SUSPENSION

Independent linked parallelogram type with coil springs, direct acting shock absorbers and front stabilizer.

See Front Suspension Section for complete data.

Kingpin Inclination—7°10' with Pos. ¾° camber.
Caster—0° to Neg. 1½°. Caster must not vary more than ½° from one side to the other.
Camber—0° to Pos. ¾°. Camber must not vary more than ¼° from one side to the other.
Toe-In—3/32" to 5/32".

STEERING GEAR

Standard: Gemmer Model 335. "3-Tooth" Worm & Roller type with "push-pull"adjustment.

See Steering Gear Section for complete data.

Power Steering (Optl. 1953): *See "Saginaw (G.M.) Power Steering" in Steering Gear Section for complete data.*

Lubrication (Power Steering Reservoir)—Maintain level to "Full" line on dipstick using Automatic Transmission Fluid Type "A".

Steering Gear Housing—Use only Ford Motor Co. specification M-4748 lubricant. *NOTE—This lubricant is "Alemite Special Steering Gear Lubricant No. 7".*

Belt Adjustment—Check each 10,000 miles. Correct tension is ¼" belt deflection with 5-7 lbs. pull on belt midway between pulleys.

BRAKES

Service: Lincoln-Bendix Hydraulic, Duo-Servo, Single anchor type **without eccentric adjustment.** Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

Wheel Cylinders—Diameter: Front Wheel 1 1/8". Rear Wheel 15/16".

Drums—Diameter 11".

Lining—Molded type. **Width**—2½" (front wheels). 2" (rear wheels). **Thickness**—7/32". **Length Per Wheel**—23 7/64".

Clearance—.010" at each end of each shoe.

Braking Power—59% Front wheels, 41% Rear wheels.

Brake Pedal Free Play—.220-.440". Master cylinder rod is connected to brake pedal with an eccentric bolt. Rotate bolt for desired clearance.

Hand Brake: See Service Brakes above.

Power Brakes (Optl. 1953): Special vacuum power cylinder combined with hydraulic master cylinder Mounted on engine side of dash and directly connected to brake pedal.

See "Power Brakes" in Brake Section for complete data.

►*POWER BRAKE UNIT PRODUCTION CHANGE (& Installation of Later Type on first cars): See "Power Brakes" in Brake Section for complete data.*

MISC. MECHANICAL

Air-Conditioning: Optl. *See "Lincoln Air-conditioning" in Miscellaneous Section for complete data.*

Four-Way Seat Control: Electric type (separate motors for up-and-down and fore-and-aft movement).

See Miscellaneous Section for complete data.

Power Operated Top: Reversible type motor (mounted under seat) drives two screw type jacks (one on each side) through flexible cables. Controlled by relay and two-way switch.

See Miscellaneous Section for complete data.

Power Operated Window Regulators: Electric type. Individual motor and relay mounted in each door. Controlled by door switch and master control switch.

See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum, Link & Crank arm type.

See Miscellaneous Section for complete data.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to right front body pillar between door hinges.

First Number—5001 up (each year). At both plants.

►*SERIAL NUMBER NOTE: Serial number (example #55LA5001H#) includes following identification data in sequence.*

Year①	Assy. Plant②	Serial No.	Eng. Type
55	LA	5001	H

①—Last two digits of model year.

②—Assembly Plant Code: **LA** (Los Angeles), **WA** (Wayne).

TUNE-UP

COMPRESSION PRESSURE: 135 lbs. ± 10 lbs. at cranking speed.

VACUUM READING: (1954) 18-21" at 450 RPM in neutral. (1955) 19-20" at 500 RPM in neutral.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: (Early 1954)—"Duckbill" type thermostatic valve located inside right end of cross-over pipe near flange.

Late 1954 & 1955 (Single Exhaust)—"Butterfly" type valve located at right end of cross-over pipe at flange.

1955 Dual Exhaust—"Butterfly" type located at rear flange on right manifold.

►*BUTTERFLY TYPE MANIFOLD VALVE INSTALLATION CAUTION:* When installing valve assembly, make sure counterweight portion is toward right front of engine.

►*BUTTERFLY TYPE MANIFOLD VALVE INSTALLATION ON EARLY CARS:* Crossover pipe, Lincoln Part No. EAD-5267-F; Right hand exhaust manifold, Part No. EAD-9430-D; and longer studs, Part No. 354055-S must be used when installing later type heat control valve, Part No. EAD-9685-C.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.

Cylinders—RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .033-.037" (Champion H-10). .032-.036" (Champion 870).

Spark Plugs (1954)—Champion H-10. 14mm., or equivalent. Tighten plugs to 24-30 ft. lbs.

Spark Plugs (1955)—Champion 870. 18mm. special.

►*1955 SPARK PLUG CAUTION: Spark plug is new type with a tapered seat and does not require a sealing gasket. It is important that plugs be tightened to 15 ft. lbs. exactly.*

COIL: Lincoln No. 8BA-12029.

Ignition Current—3 amps. idling, 5 amps. stopped.

►*COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):* Coil-to-Distributor lead is SPECIAL SUPPRESSOR LEAD (non-metalic with carbon impregnated nylon or rayon core) and the special length (approx. 14-1/2") is required for proper radio reception. *DO NOT SHORTEN LEAD OR USE ANOTHER TYPE FOR REPLACEMENT.*

DISTRIBUTOR: (Early 1954)—Lincoln No. FAF-12127-B; (Late 1954)—FDD-12127-A; (1955)—FDL-12127-B.

►*1954 DISTRIBUTOR (FAF-12127-B) OVER-ADVANCING WHEN ENGINE STARTED AT LOWER TEMPERATURE CORRECTION:* This condition noted when engine detonates excessively after starting under low temperature conditions. Install Pin and Post Assembly, Lincoln Part No. FDC-12357-A which limits distributor advance to 15° to 15½°. FAF-12127-B distributors that have been reworked in production are identified by the part number prefix "ED". *CAUTION—When calibrating a corrected distributor refer to Automatic Advance Table for FDD-12127-A distributor. See "Ford, Lincoln, Mercury Distributor" in Electrical Section.*

Condenser—Lincoln No. FAB-12300-A. **Capacity** .21-.25 microfarad.

Contact Point Set—Lincoln No. FAB-12171-B.

Breaker Gap—.014-.016"

Cam Angle—26-28.5°.

Breaker Arm Spring Tension—17-20 ozs.

Rotation—Counter-clockwise viewed from above.

Advance Performance—FAF-12127-B①

►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
2-3	0-19	300
5½-6¾	0-51	500
10¼-11¼	1-32	1000
11¼-12¾	1-63	1400
15¼-16¼	2-65	2000

①—Distributors **without** correction for "Over-Advance" See Distributor Correction (above).

Advance Performance—FDD-12127-A②

►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
2-3	0-19	300
5½-6¾	0-51	500
10¼-11¼	1-32	1000
11¼-12¾	1-63	1400
15-15¼	2-65	2000

②—Use this table for FAF-12127-B distributors that have been corrected for "Over-Advance". See Distributor Correction (above).

Advance Performance—FDL-12127-B

►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
4-1/2—5-1/2	.62	500
10-11	1.76	1000
11-1/2—12-3/4	2.17	1500
12-1/4—13-1/2	2.35	2000

►*DISTRIBUTOR INSTALLATION NOTE:* It may be necessary to crank engine slightly to engage oil pump hex shaft with distributor shaft. Procedure will not disturb timing because distributor engages camshaft gear before distributor shaft starts to engage with oil pump drive.

Initial Distributor Timing: Rotate engine until timing mark on crankshaft dampener is lined up with pointer and #1 piston is in firing position. Install distributor with points just breaking and the rotor in position to fire #1 cylinder (vacuum advance connection boss should be at approximately right angles to crankshaft and pointing toward left side of engine).

IGNITION TIMING

Setting—3° BTDC (1954); 5° BTDC (1955).

Timing Mark—Crankshaft pulley marked TDC with ten lines (each line representing 2°) before this point. Align correct timing mark (see Setting above) with pointer on engine front cover.

CARBURETOR
1954 MODELS

Lincoln EAD-9510-N "Centri-Quad" four-barrel downdraft type with automatic choke.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*CARBURETOR SERVICE REPLACEMENT NOTE:* Carburetor Assembly, Lincoln Part No. ED-EAD-9510-S (with new type bowl cover to prevent fuel spill-over on sharp right turns) available for service replacement.

►*EXTERNAL VENT PRODUCTION CHANGE:* An adjustable spring clip, Lincoln Part No. EAD-99608-A used in production, and available for service on earlier carburetors to provide a means of closing off lower vent holes in accelerator pump rod for better starting in cold weather. *See "Lincoln-Mercury Centri-Quad" in Carburetor Section.*

►*CARBURETOR "SPILL-OVER" ON SHARP RIGHT TURN CORRECTION:* To prevent spill-over on cars with external vent, replace carburetor bowl cover assembly with Lincoln No. ED-EAD-99983-F. *See "Lincoln-Mercury Centri-Quad" in Carburetor Section.*

►*CHOKE HEAT TUBE ASSEMBLY & INTAKE MANIFOLD PRODUCTION CHANGE:* New assemblies entered production in early June to prevent exhaust gas leakage into choke control heat tube assembly. Previous type heat tube assemblies are retained for service replacement on early cars, and later type heat tubes and manifold assemblies can be installed if desired.

Idle Setting—Exactly 1¼ turns open (set both screws alike).

Idle Speed—400-425 RPM with selector lever in "Drive".

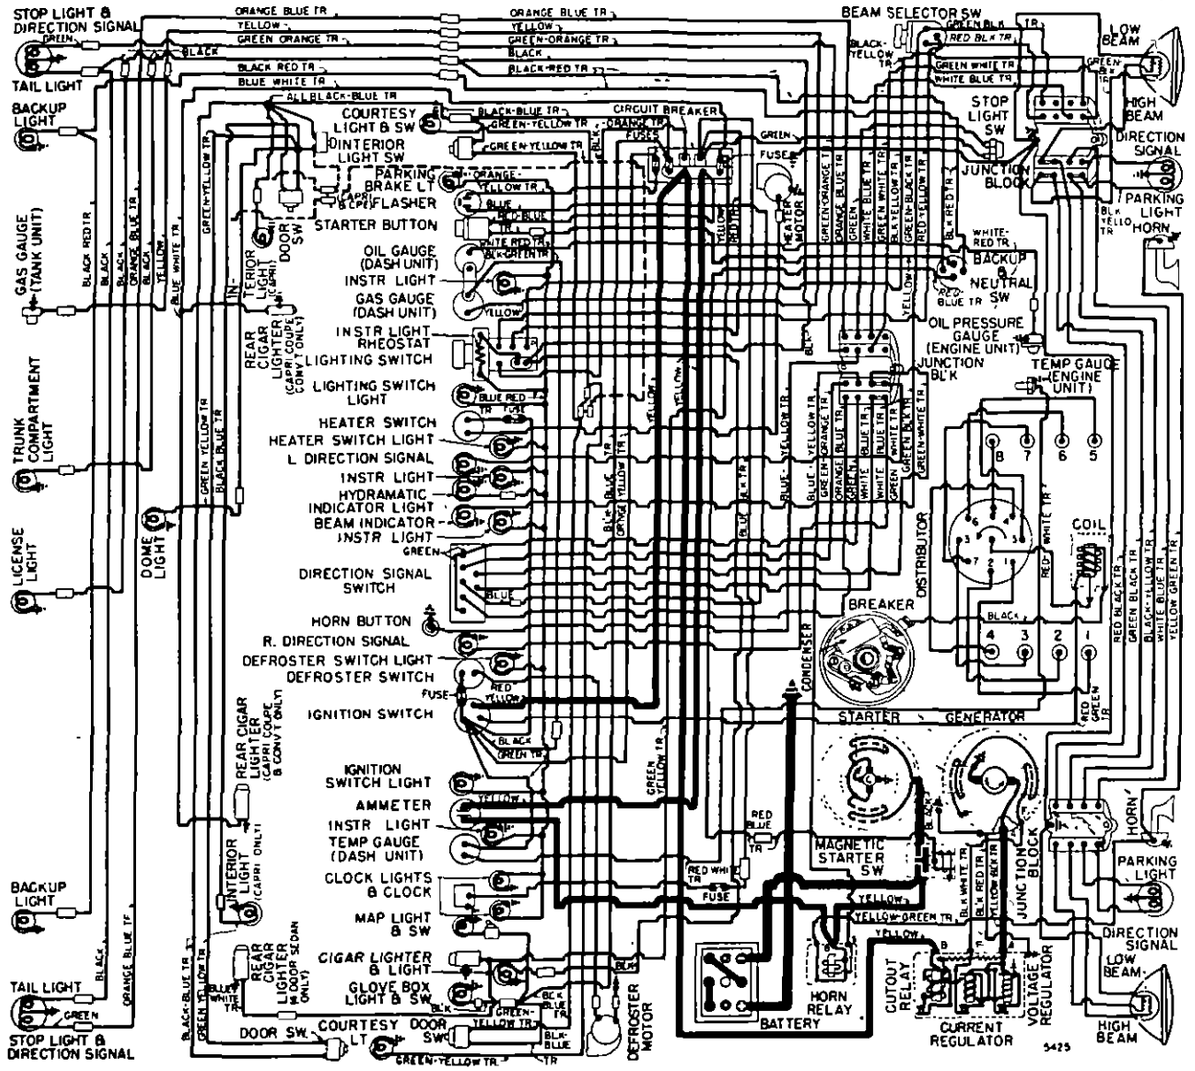
External Vent Seasonal Adjustment: (See "External Vent Production Change" above). On carburetors where spring clip is provided on hollow accelerator pump rod to control vent opening, adjust clip to open or close vent hole for best operation as follows:

Winter Operation (Temperatures below 50°F)—Slide clip down on pump rod so that vent hole is CLOSED.

Summer Operation (Temperatures above 50°F)—Slide clip upward on pump rod so that full diameter of vent hole is OPEN.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



Hydra-Matic Throttle Linkage Adjustment: With engine at normal operating temperature (choke valve wide *open and fast idle inoperative*) adjust engine idle speed to 400-425 RPM with transmission selector lever in "N" (Neutral) and turn off engine. Disconnect transmission throttle rod at forward end by taking out clevis pin. Adjust carburetor throttle rod by loosening locknut and turning adjusting clevis on rod so that carburetor throttle lever stop screw is against stop, and control shaft assembly is against its stop. Tighten locknut against adjusting clevis. *(CAUTION—Throttle rod ends must be in alignment to prevent binding).* Hold throttle lever in slow idle position (stop screw against its stop), and push down firmly on transmission throttle rod so that lever is in its stop position, adjust clevis on forward end of rod so that clevis pin enters freely, then remove pin and **shorten the rod three full turns of clevis.** Connect rod and tighten clevis locknut. Check shift points by road testing car.

►*OTHER DATA: See "Lincoln & Mercury Centri-Quad" in Carburetion Section.*

Fuel Pump Pressure: 3.5-4.5 lbs. at 900 RPM.

1955 MODELS

Lincoln EBJ-9510-D (Early); EBJ-9510-F, H (Late).

1954 MODELS

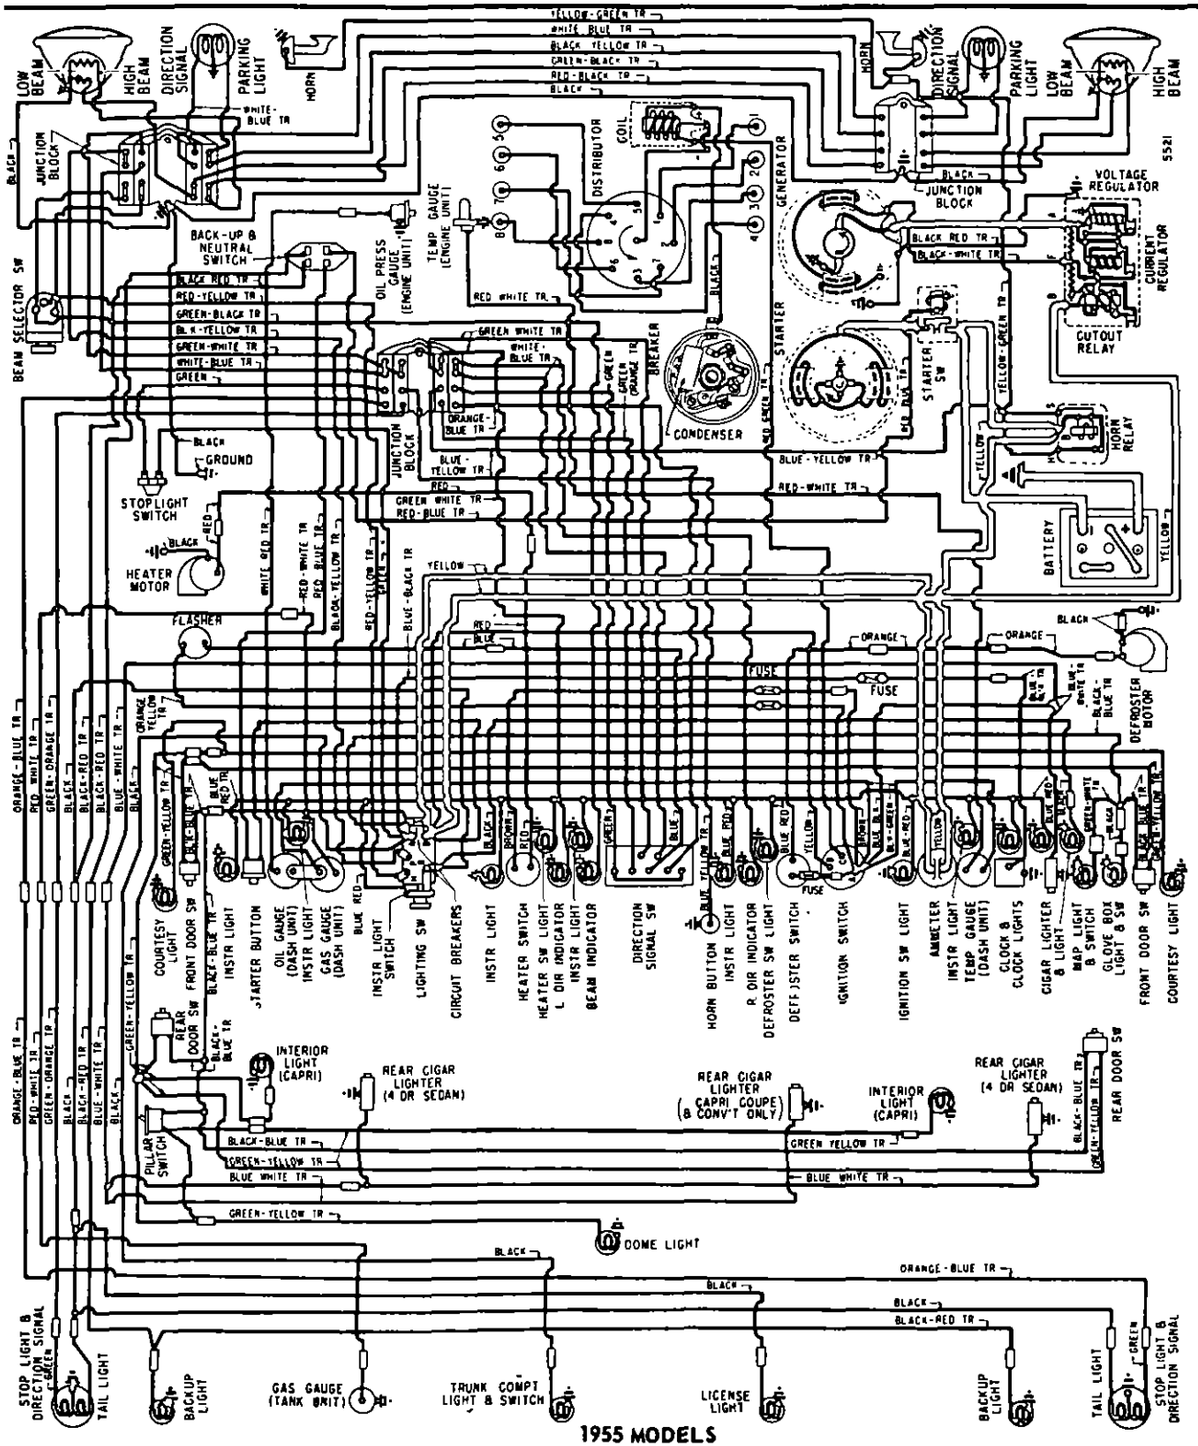
"Centri-Quad" four-barrel downdraft type with automatic choke.

►*CARBURETOR INSTALLATION CAUTION (First cars with Choke Inlet Air Tube Washer in Throttle Body): See "Lincoln & Mercury Centri-Quad" in Carburetor Section.*

►*AUTOMATIC CHOKE ROD ADJUSTMENT: Must be correct for proper starting and automatic choke operation. See "Lincoln & Mercury Centri-Quad" in Carburetor Section.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting—1-1/2 turns open (set both screws alike).
Idle Speed—425-450 RPM with selector lever in "Drive"



Dashpot Adjustment: Hold dashpot piston in to limit of travel, turn adjusting screw in or out until clearance between screw and dashpot piston rod is .045-.064".

Automatic Throttle Control Adjustment (Air-Conditioned Cars): With engine adjusted to normal idle speed (425-450 RPM., selector lever in "D"), and engine at normal operating temperature, turn air-conditioner "ON" and place transmission selector lever in "N" (Neutral) position. Loosen adjusting screw locknut on end of operating rod and adjust knurled adjusting nut to provide an idle speed of 800 RPM. Tighten locknut. Check operation of Automatic Throttle Control to make sure idle speed return to normal idle when transmission is shifted out of "N" (Neutral), or air-conditioner is turned off.

Turbo-Drive Throttle Linkage Adjustment: Adjust the engine idle speed to 425-450 RPM with fast idle cam in low idle position and transmission in "Dr" range. Disconnect clevis pin from transmission control-to-accelerator shaft assembly and transmission control shaft-to-transmission rod assembly. Disconnect carburetor-to-transmission control shaft rod assembly. Insert gauge pin through bracket and bellcrank tab. Adjust carburetor-to-transmission control shaft rod assembly so that it fits freely. Reassemble rod assembly and remove gauge pin. Pull upward on transmission control shaft-to-transmission rod assembly to position throttle lever against its internal stop. Adjust transmission control shaft-to-transmission rod clevis so that clevis pin enters clevis and lever on transmission control-to-accelerator shaft assembly freely. Lengthen rod by turning clevis 2-1/2 turns and reassemble. With ignition off and accelerator pedal depressed to full kickdown position, adjust length of toggle rod assembly so that nylon bushing fits in the slot in the transmission control-to-accelerator shaft lever assembly within .25" clearance (approximately). Adjust toggle rod assembly so that it is in a vertical plane when viewed from front of vehicle. This is done by loosening jam nut and turning stud with a screwdriver in desired direction. Retighten jam nut after making adjustment.

Turbo-Drive Throttle Linkage Adjustment (Optional Method): *See "Turbo-Drive" in Transmission Section.*

CONTINUED ON NEXT PAGE

1955 MODELS

CONTINUED FROM PRECEDING PAGE

▷*OTHER DATA: See "Lincoln & Mercury Centri-Quad" in Carburetor Section.*

Fuel Pump Pressure: 3.5-4.5 lbs. at 900 RPM.

CARB. EQUIPMENT

▷*CARBURETOR AIR CLEANER INSTALLATION CAUTION: The indentation at bottom of air cleaner and the words "Front" on side of cleaner must face front of engine.*

▷*1954 AIR CLEANER GASKET & HOLD-DOWN WING SCREW PRODUCTION CHANGE (To Correct Air Cleaner "Flexing" and Wing Screw Breakage):* The paper gasket has been replaced in production and for service by a neoprene gasket, Part No. EAD-99654-B, and the previous wing screw has been replaced by a longer screw. Part No. 354535-S8B. When installing the neoprene gasket, apply a coat of cement to both surfaces before inserting in air cleaner.

Fuel Pump: Lincoln No. EAD-9350-E (1954); EAD-9350-F (1955). Fuel & Vacuum type with magnetic type filter.
Pressure—3.5-4.5 lbs., at 900 RPM.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: King-Seeley Electric type.
Dash Unit—Lincoln No. FAF-9280-A (1954); FDL-9280-A (1955).
Tank Unit—Lincoln No. FAB-9275-A.
See "Fuel Gauges" in Carburetion Section.

BATTERY

▷*LINCOLN BATTERY REPLACEMENT CAUTION: Use only a replacement battery with terminal posts on same side. Damage to battery will result if battery with diagonal terminal posts used.*

Lincoln No. FAA-10655-E. 6 volt, 21 plate, 110 ampere hour capacity (20 hr. rate).
Location—Under front compartment toe-boards on right side of car.
Battery Ground—Positive, to frame side rail.
Engine Ground—Engine cylinder head to dash.

STARTER

Lincoln No. FAC-11002-B (1954); FAC-11002-G (1955).
Armature—Lincoln No. 52-11005 (FAC-11002-B); FAC-11005-B (FAC-11002-G).
Drive—Lincoln No. 1CM-11350-C. Bendix "Folo-Thru".
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs.
Cranking Speed—115-125 RPM.

Performance Data—FAC-11002-B

Torque	RPM	Volts	Amperes
0 ft. lbs.	Ⓒ	6.0	70
14 ft. lbs.	Lock	3.5	700

Performance Data—FAC-11002-G

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	6.0	70
14 ft. lbs.	Lock	3.5	700

① —With starter on engine and engine running.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Remove battery-to-starter cable. Remove attaching bolts holding steering idler arm support to frame lower support and remove idler arm assembly. Remove capscrews holding endplate to converter housing and remove starter by pulling out and down until starter drive clears housing.

Starting Switch: Lincoln No. B5A-11450-A *(NOTE—This relay is a sealed type and replaces the relay formerly used).* Mounted on frame side rail adjacent to starter, and controlled by Ignition Switch and Automatic Transmission Neutral Safety Switch.

Neutral Safety & Back-up Light Switch (1954): Lincoln No. FAB-15812-A (Without Power Steering); FAD-15812-A (With Power Steering). Located at lower end of steering column.
Adjustment—See *"Hydra-Matic Drive" in Transmission Section.*

Neutral Safety & Back-up Light Switch (1955): Lincoln No. FDK-15825-B (Switch Terminal). Located on steering column inside passenger compartment. Supersedes previous switch location.
Adjustment—See *"Turbo-Drive" in Transmission Section.*

GENERATOR

Lincoln No. FBB-10002-A. Armature—FAB-10005-A.

Performance Data

Generator	Amperes	Gen. RPM.
FBB-10002-A	50 ①	1850

① —See Regulator for maximum charging rate.

Brush Spring Tension—26-34 ozs.
Field Current—2.25-2.50 amps. at 6.0 volts.
Rotation—Counter-clockwise at commutator end.

Belt Adjustment: Approximately ½" deflection midway between generator and pump pulleys with normal thumb pressure.

REGULATOR

Lincoln No. FAJ-10505-A.

►*SETTING NOTE:* Settings below are for regulator at *NORMAL OPERATING TEMPERATURE* (after 1/2 hour operation) with room temperature at 70-80° F.

Cutout Relay

Cuts In—6.0-6.6 volts.

Voltage Regulator

Setting—7.4-7.8 volts.
Checking & Adjusting—See *Electrical Equip. Section.*

Current Regulator

Setting—48-52 amperes.
Checking & Adjusting—See *Electrical Equip. Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. See *Electrical Equip. Section.*
Direction Signal: See *Electrical Equipment Section.*

Automatic Headlight Dimmer: See *"Lincoln-Mercury" Headlight Control" in Electrical Equipment Section.*

Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut, remove switch and disconnect all wires.

Stop Light Switch Location: On forward end of brake master cylinder (Conventional or Power Brakes). Master cylinder located on firewall in engine compartment.

FUSES: Turn Signal—14 amps. (1954); 9 amps. (1955).
Dome & Courtesy Lights—14 amps. (1954); 9 amps. (1955).
Glove Box—14 amps.
Cigar Lighter (Front & Rear)—Special fuse in lighter base.
Clock—3 amps. (in clock lead) (1954); None (1955).
Heater—20 amps.
Spotlight—14 amps.
Windshield Washer (1955)—14 amps. (or special 3 amps.).

CIRCUIT BREAKERS (1954): Two circuit breakers (30 amps. for headlights, 15 amps. for auxiliary) mounted on signal panel located behind instrument panel.

CIRCUIT BREAKERS (1955): On headlight switch. One circuit breaker protects headlight circuit and second circuit breaker protects instrument panel lights, parking lights, and stop and tail light circuits.

HORNS: Dual Horns operated by relay.

Lincoln Nos.	Without Air Cond.	With Air Cond.
High Pitch	FAE-13832-B	B5A-13832-A
Low Pitch	FAE-13833-B	B5A-13833-A

Horn Relay—Lincoln No. FAA-13853-A.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION:* Before disconnecting any part of air conditioning equipment or lines for access to engine, see *"Air Conditioning Service Cautions" in Miscellaneous Section.*

►*1954 CYLINDER HEAD & VALVE STEM SEAL PRODUCTION CHANGE:* Beginning with April 1954 production, a new cylinder head, Part No. EAD-6049-F (identified by a square shoulder ¼" below top of valve guide), and a new valve stem seal, Part No. EAA-6571-C, replaced earlier cylinder head, Part No. EAD-6049-D (identified by tapered shoulder on valve guide boss), and valve stem oil seal, Part No. EAD-6571-A. Early and late cylinder heads are interchangeable. *CAUTION*—Use later type valve stem seal with late type head, and early type seals with early head.

►*1955 SPECIAL ENGINE OVERHAUL CAUTION (Engines identified by yellow paint at water outlet connection housing):* Approximately 600 engines at close of 1955 production have special parts listed below which are not identical with regular engine parts. Special instructions must be followed when working on these engines. See *"Engine" in Lincoln Special Data.*

ENGINE SPECIFICATIONS: 90° V8 Valve-in-head.

Model	Bore	Stroke	Displacement
1954	3.8"	3.5"	317.5 cu. ins.
1955	3.94"	3.5"	341 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
1954	8.0-1	46.2	205 at 4200 RPM
1955	8.5-1	49.6	225 at 4400 RPM

Compression & Vacuum Reading—See *TUNE-UP.*

CYLINDER HEAD: See *"Cylinder Head & Manifold" in Lincoln Special Data.*

TIGHTENING TORQUES: See *"Tightening Specifications" in Lincoln Special Data.*

ENGINE REMOVAL: See *"Engine" in Lincoln Special Data.*

OIL PAN REMOVAL: Turn crankshaft so that rear counterweights on crankshaft are upwards, then remove oil pan from front of car.

PISTONS

Aluminum alloy, autothermic slipper type with three rings above pin.
Removal—Rod and piston assembly removed from above.
Fitting New Pistons: Use 1/2" wide feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side. Feeler thickness as follows:
New Piston in New Bore—.0015" feeler, 6-12 lbs. pull.
New Piston in Used Bore—.002" feeler, 6-12 lbs. pull.
Used Piston in Used Bore—.0025" feeler, 6-12 lbs. pull.

Replacement Pistons: Standard size (see note following), .005", .020", .030", .040" Oversize. Pistons furnished only with fitted pins.

STANDARD SIZE PISTON NOTE: Standard size pistons furnished in eight different sizes ranging from 3.7990" to 3.8014" for selective fitting.

Installing Pistons: Install piston with "F" (embossed on piston) and dimple on head toward front of engine.

PISTON PINS

Floating type with lock rings at each end.
Diameter—.9120-.9123".
Pin Fit in Piston—.0001-.0003".
Pin Fit in Rod—.0002-.0004" loose, (Light thumb press fit).

Replacement Pins: Standard size, .001", .002" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	.0775-.0780"	.010-.027"	.0015-.0030"
Compr. #2	.0775-.0780"	.010-.027"	.0010-.0025"
Oil	.1860-.1865"	.010-.027"	.0015-.0030"

Replacement Rings: Standard size, .020", .030", .040" Oversize.

►*PISTON RING REPLACEMENT NOTE: Install Compression Rings with groove on inner edge of ring UPWARD.*

CONNECTING RODS

Length—7.064-7.066". **Weight**—28.36 ozs.
Crankpin Journal Diameter—2.2482-2.2490".
Lower Bearing—Steel backed, copper lead alloy lined type. Upper and lower halves interchangeable.
Clearance—.0005-.0025".
Side Clearance—.006-.014" (two rods).

Replacement Bearings: Standard (2 sizes marked red & blue for selective fitting) and .010", .020", .030", .040" Undersize.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Installing Rods: Oil squirt hole in rod toward camshaft side of bore on all rods. Numbers on rods and bearing caps should be together and installed in same numbered cylinder.

CRANKSHAFT

Journal Diameters—2.6235-2.6243".
Out-of-Round Limits—.00025". **Taper Limits**—.0005".
Bearings—Steel backed copper lead alloy lined.
Replacement Bearings: Standard size (2 sizes marked red and blue for selective fitting) and .010", .020", .030", .040" Undersize.
End Thrust: Taken by #3 main bearing. Replace bearing if end play excessive.
Thrust Bearing Alignment—*See "Crankshaft & Main Bearings" in Lincoln Special Data.*
Endplay—.004-.008" (service maximum .012").
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bedrings" in Lincoln Special Data.*
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Lincoln Special Data.*

CAMSHAFT

►*CAMSHAFT IDENTIFICATION NOTE: Camshafts used in 1954-55 production and for service replacement are as follows:*

1954 (Std. Camshaft)—EAD-6250-F. "EAD" cast between No. 12 cam lobe and No. 4 cam bearing; also letter "L" stamped on front face of camshaft fuel pump eccentric.

1954 (Heavy Duty Camshaft)—EAD-6250-E. "EAD" cast in same location as for Std. Camshaft (above). Letter "L" not stamped on shaft.

1955 (Early)—EBJ-6250-A. "EBJ" cast between No. 5 cam bearing and distributor drive gear; also letter "J" stamped on front face of camshaft fuel pump eccentric. Specifications are same as for later camshaft.

1955 (Late)—EBJ-6250-B. "EBJ-B" cast between No. 5 cam bearing and distributor drive gear; also letter "J" stamped on front face of camshaft fuel pump eccentric, and the letter "C", with two dimples cast between No. 4 cam lobe and No. 2 cam bearing. Specifications are same as for early camshaft.

►*1954-55 SERVICE REPLACEMENT CAMSHAFT CHANGE (To provide better wear characteristics):* Camshafts, Part Nos. EAD-6250-G (1954 Models), and EBJ-6250-B (1955 Models) are furnished for service replacement. These camshafts are identified by the letter "C", with two dimples, cast between the first two cam lobes, counting from front of engine.

Journal Diameter—2.1263-2.1268".

Bearings—Steel-backed babbitt-lined bushings.
Clearance—.0011-.0028". Wear limit .005".
End Thrust: Taken by hydraulic plunger in front end of camshaft. Excessive oil lubricates timing chain, sprockets, and front cover thrust boss. **Endplay**—.000".
Replacement Bearings: Standard size, and .015" Undersize.
Camshaft Removal: *See "Camshaft & Bearings" in Lincoln Special Data.*
Timing Chain: Width 1.25". Pitch .5". Length 25".
Camshaft Setting: Timing marks on camshaft and crankshaft sprockets adjacent and in line with straight edge across shaft centers.
Timing Chain Cover Seal Installation (Crankshaft Front Seal): *See "Engine Front Cover" in Lincoln Special Data.*

VALVES

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves): Stem diameter decreased .0005" for greater stem clearance in guide. See "Valve System" in Lincoln Special Data.*

Tappet Clearance: None in service (hydraulic).

Valve	Head Diam.	①② Stem Diam.	Length
Intake	2.000-2.010"	.3415-.3425"	5.18"
Exhaust	1.505-1.515"	.3405-.3410"	5.18"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	③	④ .0010-.0020"
Exhaust	45°	③	⑤ .0020-.0030"

①—Exhaust valve stems (service replacement) decreased .0005" in diameter. See Exhaust Valve Change above.
②—Valves furnished with .003", .015", .030" oversize stems for service replacement.
③—.354" (1954); .384" (1955).
④—.004" service maximum.
⑤—.005" service maximum.

Valve Seat Width: 1/16" to 5/64".
Oversize Valve Stem Installation: *See "Valve System" in Lincoln Special Data.*

►*ROTATABLE VALVE NOTE: All valves are rotatable type.*

►**Valve Stem Oil Seals:** For Replacement Notes and Installation, *see "Valve System" in Lincoln Special Data.*

Valve Springs: (1954)—Free Length 2.21". Spring pressure, with spring compressed to 1.80", pressure should be 64-67 lbs. Compressed to 1.47", pressure should be 133-147 lbs.
1955—Free Length 2.11-2.13". Spring pressure with spring compressed to 1.80", pressure should be 67-74 lbs. Compressed to 1.42", pressure should be 165-183 lbs.

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" intake, .005" exhaust), ream guides and install oversize valves. *See "Valve System" in Lincoln Special Data.*

Valve Lifters: Hydraulic, Barrel type. Lifters can be removed from above with camshaft in engine.

►*1954 MODEL NOISY VALVE LIFTER CORRECTION:* On cars built before Serial Nos. 54WA-19137-H & 54LA-7558-H, install an anti-drain back diaphragm B4A-6751-A and oil filter mounting bolt insert, EAA-6890-C in oil filter assembly. *See "Oil Filter" in Lincoln Special Data.*

►*1954 HYDRAULIC VALVE LIFTER PRODUCTION CHANGE:* Beginning with Sept. 1954 production a new lifter EBJ-6500-A replaced former lifter EAD-6500-D. Later lifter has three oil holes in outside diameter groove and four holes in plunger, compared to one hole at each point on former lifter. Later type lifters are furnished in unit packs of eight.

►*1954 VALVE PUSH ROD PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* A new pushrod, Part No. EBJ-6565-A has been released for service replacement for use with later type lifters (see Valve Lifter Production Change above). The new type pushrod can be identified by a spherical tappet end (early type had a flat end). *Later type pushrod must not be used with early type hydraulic lifter.*

►*1954 ROCKER ARM COVER SEAL NOTE:* A new seal, Part No. EBU-6570-A and a longer stud, Part No. 354053-S has been released for service to minimize engine noises.

Diameter—.8740-8745". **Clearance in Block**—.0005-.0020".
Initial Valve Clearance—*See "Valve System" in Lincoln Special Data.*
Lifter Overhaul—*See "Valve System" in Lincoln Special Data.*
Rocker Arm Assembly: *See "Valve System" in Lincoln Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: The following valve opening and closing points are with a camlift as indicated.*

1954 Models

Intake Valves—Open 18° ① BTDC. Close 58° ② ALDC.
Exhaust Valves—Open 56° ① BLDC. Close 20° ② ATDC.

1955 Models

Intake Valves—Open 8° ① BTDC. Close 56° ② ALDC.
Exhaust Valves—Open 52° ① BLDC. Close 12° ② ATDC.
①—Camlift .002". ②—Camlift .005".

Valve Timing Check—Slide rocker arm to one side and install dial indicator so reading can be taken from end of valve push rod (use an indicator that will read .300" or more). Install a quadrant (reading in degrees) on crankshaft pulley to check amount of crankshaft rotation. Rotate engine slowly until dial indicator reading for valve being checked is same as indicated in table above. Amount of crankshaft rotation should be the same as shown in valve timing table. As an example, check intake valve opening by rotating engine until dial indicator reads .002" camlift. Quadrant on crankshaft should indicate 18° (1954); 8° (1955). Continue to rotate engine to check valve closing degrees. Dial indicator should read .005" and quadrant should indicate 58° (1954); 56° (1955).

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill), 6 qts. (when filter changed).
Normal Oil Pressure: 35-45 lbs. at 40 MPH.
Pressure Regulator Valve—In pump body, not adjustable.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pressure Indicator–King-Seeley Electric.
Dash Unit (1954)–Lincoln No. FAG-9273-A.
Dash Unit (1955)–Lincoln No. FDL-9273-A.
Engine Unit (1954-55)–Lincoln No. 41A-9278. (Use FAA-13785-A Clip).
See "Oil Gauges" in Miscellaneous Section.

Oil Pump: Gear type pump located on left side of engine crankcase and driven by distributor drive gear.

Pump Overhaul–*See "Oiling System" in Lincoln Special Data.*

Oil Filter: Full-flow type with pressure relief valve in center filter bolt. Replace filter element at 4000-5000 miles or when oil becomes dirty or polluted.

►*1954 OIL FILTER PRODUCTION CHANGE (New anti-drain back diaphragm): See "Oiling System" in Lincoln Special Data.*

Replacement Filter Element–HCK-6731-A (Kit includes new gaskets).

See "Oiling System" in Lincoln Special Data.

CAUTION–Special "full-flow" filter element must be used for replacement (use of by-pass type filter element will restrict engine oil flow and result in insufficient engine lubrication).

Crankcase Ventilation: Filter element in oil filler cap and in road draft tube. Clean and oil filters every 2000 miles or more often in dusty areas.

►*1954 CRANKCASE VENTILATOR OIL LEAKAGE CORRECTION:* Install gasket, Part No. B4A-6872-A, which is a firmer type gasket and will not distort when tightened.

COOLING

Water Capacity: 22.5 qts. (1954); 23 qts. (1955), without heater (21.5 qts. recommended).
Pressure Valve: Lincoln No. LA-8100-A3 (14 lbs.); LA-8100-A4 (13 lbs.). Radiator filler cap, stamped with figure "13" or "14".
Thermostat: **(1954)**–EAD-8575-B (157-162°). EAD-8575-C (168-173°). **(1955)**–EAD-8575-D (157-162°). B4Q-8575-B (168-173°). *NOTE–When installing 1955 thermostats on 1954 cars, use gasket, Part No. EAD-8590-B.*
Water Pump: Packless type with sealed ball bearing. *See "Lincoln" in Water Pump Section.*

Temperature Gauge: King-Seeley Electric.
Dash Unit (1954)–Lincoln No. FAG-10883-A.
Dash Unit (1955)–Lincoln No. FDL-10883-A.
Engine Unit–FAB-10884-A (Early 1954); 1A-10884-A (Late 1954 & 1955).
See "Temperature Gauges" in Miscellaneous Section.

HYDRA-MATIC DRIVE

"Dual-Range" four speed automatic transmission with fluid coupling.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication–Check fluid level every 1000 miles. Drain & refill every 25,000 miles. Use only Automatic Transmission Fluid Type A, furnished under Lincoln Part No. 8L19582.

Checking Fluid Level–Check fluid level with engine idling, transmission at normal operating temperature, and selector lever in "Dr" range. Dipstick located under hood on right side of engine. Add fluid to bring level to "Full" mark on dipstick.

►*CAUTION–Do not check fluid level when transmission excessively hot, and do not fill above "Full" mark on dipstick.*

THROTTLE LINKAGE ADJUSTMENT: *See CARBURETOR above.*

►*OTHER DATA: See "Hydra-Matic Drive" in Transmission Section.*

TURBO-DRIVE TRANSMISSION

Torque converter and three-speed automatic transmission with hydraulic control and mechanical parking lock.
See "Turbo-Drive" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Turbo-Drive" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Turbo-Drive" Transmission in Transmission Section.*

Lubrication–Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 15,000 miles. **Use only Automatic Transmission Fluid Type A.**

Checking Fluid Level–With selector lever in "N" (Neutral) and emergency brake applied, run engine approximately four minutes at idle speed. Check to see that emergency brake is applied and that engine is on slow idle, move selector lever to the "P" (Park) position. *(NOTE*–When engine and transmission are at normal operating temperature, move selector lever through all ranges to assure fluid distribution throughout transmission). Raise hood and wipe top of oil level indicator. Remove indicator and read fluid level. Add Automatic Transmission Fluid "Type A" if necessary to bring fluid level to "Full" mark on indicator. Replace fluid level indicator.

THROTTLE LINKAGE ADJUSTMENT: *See CARBURETOR above.*

►*OTHER "TURBO-DRIVE" SERVICE DATA: See "Turbo-Drive" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

REAR AXLE

Own. Semi-floating hypoid gear, with Hotchkiss drive.
See "Lincoln, Mercury, Ford (Integral Carrier)" in Rear Axle Section.

Ratios–3.31-1 (1954); 3.07-1 (Std. 1955); 3.31-1 (Optl. 1955).

Backlash–.003-.008" with .002" maximum variation per gear set.

Axle Shaft Removal: Remove rear wheels and take out screws holding brake drum to axle shaft flange. Remove hydraulic brake lines from brake backing plate. Take out axle retainer nuts (working through opening in axle shaft flange). Use Tool 4235-A to remove axle shaft and bearing assembly from axle housing. Take off backing plate and gasket and remove axle being careful not to damage oil seal.

Axle Assembly Removal: Raise rear of car and remove axle shafts and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers and spring U-bolts. Remove axle housing assembly from car.

Wheel Bearing Adjustment: None required.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

►*1954 SHOCK ABSORBER REPLACEMENT CAUTION:* Both Gabriel and Monroe shock absorbers used. Valve action is different in each make and it is recommended that single shock be replaced with the same make removed. Either make may be installed in pairs on front or rear.

Model	Front	Rear
Standard (1954)	LA-18045-F	LA-18080-F
Standard (1954)	LA-18045-G	LA-18080-G
Standard (1955)	LE-18045-A	LE-18080-E
Heavy Duty (1954)	LA-18045-H	LA-18080-H
Heavy Duty (1954)	LA-18045-J	LA-18080-J
Maximum Hvy. Duty (1954)	LA-18045-E	LA-18080-E
Special (1954) Ⓒ		LA-18080-B

Ⓒ–Use with Hvy. Duty Springs.

FRONT SUSPENSI N

Independent. "Ball-Joint" suspension with direct acting shock absorbers mounted within front coil springs.
See "Lincoln, Mercury, Ford (Ball Joint)" in Front Suspension Section.

Kingpin Inclination–7°10' with Pos. 3/4° camber.

Caster–0° to Neg. 1-1/2°. Caster must not vary more than 1/2° from one side to the other.

Camber–0° to Pos. 3/4°. Camber must not vary more than 1/4° from one side to the other.

Toe-In–3/32" to 5/32".

Toe-Out on Turns–With outer wheels at 20°, inner wheel should be 23½°.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STEERING

Manual: Gemmer Model 335. "3-Tooth" Worm & Roller type with "push-pull" adjustment.
See "Gemmer Worm & Roller (Type 335)" in Steering Section.

Power Steering: Saginaw (GM) Hydraulic. Recirculating ball nut and worm type plus extended pitman shaft with gear sector in mesh with power rack. Power rack pinned to piston rod of hydraulic power cylinder.
See "Saginaw (GM) Power Steering" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (Type 335)" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller (Type 335)" in Steering Section.*

BRAKES

►*1955 FRONT BRAKE PRODUCTION CHANGE: Front brake eccentric adjustment has been eliminated on Late 1955 cars.*

Bendix Hydraulic (Single Anchor). With Eccentric (Front Wheels—See 1955 Production Change above). **Without Eccentric (Rear Wheels).** Parking lever applies rear wheel service brakes.
See "Ford-Bendix (Ford, Lincoln, Mercury)" in Brake Section.
Drums—Diameter 12".
Wheel Cyl. Diameter—1-1/8" (front), 15/16" (rear).
Lining—Molded type riveted to shoe
Width—2-1/2" (front whls.), 2" (rear whls.).
Thickness—7/32" (all whls.).
Length—11-33/64" (primary shoes, front & rear whls.), 12-15/16" (secondary shoes, front & rear wheels.).
Braking Power—59% (front whls.), 41% (rear whls.).
Clearance—.010" at each end of both primary and secondary shoes (.003" maximum variation).

Brake Pedal Free Play Adjustment: .240" to .440". If play not correct after brake adjustment, loosen lock nut on the eccentric bolt attaching brake pedal to master cylinder pushrod, rotate eccentric bolt for desired clearance.

Standard Master Cylinder: Located on engine side of fire wall.
Checking Fluid—Maintain fluid level to within 1/2" of top of reservoir.
Removal—Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to fire wall.

Power Brakes: Bendix Vacuum Power Unit (combination vacuum power unit and master cylinder). Unit mounted on engine side of fire wall and replaces regular master cylinder.
See "Bendix Power Unit" in Brake Section.
Checking Fluid—Same as for regular master cylinder.
Removal of Power Unit—Disconnect valve pushrod from brake pedal assembly in drivers compartment. Remove master cylinder outlet fitting bolt from master cylinder. (NOTE—It is not necessary to remove stop light switch, wires or hose assembly from outlet fitting. Do not disturb outlet fitting in master cylinder). Loosen clamp securing manifold vacuum hose to check valve on power unit. Remove hose from valve. Loosen clamp securing vacuum reserve tank hose to fitting on check valve. Remove four capscrews securing power brake assembly to bracket on dash panel and remove power brake assembly.

MISC. MECHANICAL

Windshield Wipers: Cable operated vacuum type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Own. *See "Lincoln Air-Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Reversible type motor (mounted under seat) drives two screw type jacks (one on each side) through flexible cables. Controlled by relay and two-way switch. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: Electric type. Individual motor for vertical and horizontal adjustment. *See "Power Seat Adjusters" in Miscellaneous Section.*

HO D ASSEMBLY

1949-51 MODELS

HOOD ALIGNMENT: Fore-and-Aft Adjustment—3 hood hinge bracket-to-hood screws at each hinge. Loosen screws just enough to allow hinge to hold hood in place when raised. Lower hood, shift hood fore and aft until correctly positioned. Raise hood without disturbing alignment, tighten screws. Check hood safety catch action (bend catch if necessary).

Up-and-Down Adjustment—Loosen locknut on top of latch dowel. Turn dowel with screwdriver **down** if hood fits too tight, **up** if hood loose on dowel or too much clearance at lower edge of hood. Tighten locknut.

RADIATOR GRILLE REMOVAL: (1949-50)—Remove center grille ornament by taking out four bolts holding right and left hand grilles to center ornament. Remove capscrew holding center grille ornament to grille opening panel and take out sheet metal screws holding ornament to stone deflector. Disconnect parking lamp wire. Remove four sheet metal screws holding radiator grille extension (1950) to fender and opening panel. (Accessible from inside front wheel opening). Remove extension including lamp assembly. Remove sheet metal screw securing grille to grille opening and take out bolts securing grille to bracket. Remove bolts holding grille to center ornament.

(1951)—Center Grille Section Removal—Remove 8 bolts holding right and left hand grilles to center section and remove bolt holding center section to stone deflector. Push center grille backward and remove through opening between opening panel and radiator.

(1951) Right or Left Hand Grille Removal—Working from inside fender, remove two bolts holding grille to opening panel, and take out bolt holding grille to stone deflector bracket. Remove the lower bolts holding grille to center section.

1952-53 MODELS

HOOD ALIGNMENT: For "fore & aft" adjustment of hood, loosen capscrews securing rear hood reinforcement to hood and shift hood as necessary. Hood may be raised or lowered at front end by adjusting front hood bumpers. To adjust guide plate, loosen three bolts securing guide plate to latch support. Lower hood carefully and center the lock dowel in guide plates. Raise hood and tighten the bolts. Locking tension of hood lock dowel can be adjusted by loosening locknut on dowel and turning dowel in either direction.

TIGHTENING SPECIFICATIONS

1946-48 MODELS

①—See Cylinder Head Installation (below) for tightening procedure. Three different torque applications must be made.

ENGINE REMOVAL

1946-51 MODELS

ENGINE REMOVAL: For Engine Servicing—Drain cooling system and crankcase. Remove engine as follows:

1. Disconnect and remove radiator hoses and thermostats, remove radiator.
2. Disconnect cables and remove battery.
3. Remove engine hood by taking out capscrews in hood hinges and bolts in support arms at each side.
4. Disconnect all wires and cables at engine accessories (remove spark plug wires and conduits), disconnect ground cable at rear of engine.
5. Disconnect hand throttle and choke cables at carburetor (free hand throttle cable clamp at dash and loop cable out of way by hooking it back of regulator, free choke cable clamp at dash and hook cable back of battery box), disconnect fuel line at fuel pump.
6. Remove all engine accessories (except water pumps and starter), remove oil filler pipe.
7. Loosen clamp on exhaust crosspipe, disconnect both exhaust pipes at exhaust manifold connections, remove crosspipe.
8. Remove two engine front support bolts.
9. Install sling on engine, attach hoist and take up slack in cables.
10. Remove front floor pan, take out capscrews mounting transmission on flywheel housing.
11. Remove engine straight forward to disengage clutch shaft, then lift engine out of chassis.

1952-53 MODELS

ENGINE REMOVAL: Drain radiator and engine oil pan, then proceed as follows:

1) Mask edge of hood, fender, and cowl to protect the paint. Take out hinge assembly-to-hood capscrews and remove hood.

2) Disconnect battery cables and remove battery.

3) Remove heater blower motor by disconnecting clips attaching delivery chamber to dash and turning entire assembly clockwise. Remove air cleaner.

4) Remove heater hose from water pump and cylinder head. Disconnect fuel pipe at flexible hose, and windshield wiper hose at vacuum booster pump. Disconnect throttle rod from throttle lever and remove "Z" bar from dash.

5) Disconnect the following wires: battery and overdrive wires from coil, wire from temperature gauge sender unit on left cylinder head, all generator wires, wire from oil pressure gauge sender unit.

6) Free wiring cable from clip at crankcase ventilator pipe and from retainer on cylinder head. Remove overdrive cable from clip at rear of left cylinder head.

7) Remove both upper radiator hoses. Remove generator and fan assemblies from engine.

8) Loosen lower radiator hose clamps and slide hose toward water pump as far as possible.

9) Take out three bolts at each side of radiator attaching radiator to support, remove horns and place them behind grille, remove upper radiator air deflector, remove radiator.

10) Disconnect battery cable at starter, remove kick-down switch (overdrive cars only).

11) Raise car on hoist for following operations: Drain transmission. Remove speedometer drive cable. Disconnect shift rods at transmission case levers, disconnect clutch pedal retracting spring and release rod from clutch release lever, disengage equalizer bar tension spring and remove equalizer bracket assembly. Remove overdrive solenoid, governor, and control cable (overdrive cars only).

12) Disconnect propeller shaft at rear universal joint (detach joint from companion flange).

13) Remove front and rear engine mounting bolts.

14) Detach exhaust pipe from right hand bank exhaust manifold.

15) Lower car to floor for following operations: Remove oil filter. Install engine lifting hooks, lift engine out of car (*CAUTION*—guide rear of engine assembly out carefully).

ENGINE INSTALLATION: Reverse removal procedure

1954-55 MODELS

ENGINE REMOVAL (LESS TRANSMISSION): 1) Mask edge of hood, fender and cowl, place fender covers on fenders. Remove capscrews that retain hinge assembly to hood, remove hood.

2) Remove carburetor air cleaner, disconnect and remove battery.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

3) Drain cooling system and oil pan. (Drain cocks in engine assembly are located on each side and to front of cylinder block).
4) Disconnect both upper and lower radiator hoses, then remove radiator. (Radiator is retained by three bolts, nuts and lockwashers at each side). Remove fan assembly.
5) Disconnect heater hoses at water control valve and water pump. Disconnect and remove heater blower and duct assembly.
6) Disconnect starter cable at starter motor (On Merc-O-Matic disconnect transmission fill tube bracket at exhaust manifold). Disconnect primary ignition wire to coil, water temperature gauge sending unit and oil pressure sender unit wires.
7) Disconnect flexible fuel line at fuel pump and windshield wiper vacuum hose from vacuum booster pump. If car equipped with windshield washer, disconnect and remove windshield washer.
8) **On Standard or Overdrive Transmissions,** disconnect clutch pedal retracting spring and release rod from clutch release lever. Disengage equalizer bar tension spring and remove equalizer bracket assembly from flywheel housing. Let equalizer bar and clutch release rod hang from frame.
9) **On Merc-O-Matic Transmissions,** disconnect accelerator linkage (Z-bar) at firewall and throttle valve rod at clevis (linkage remains on engine).
10) Disconnect engine ground strap at firewall. *NOTE*—If vehicle equipped with power brake or power steering, remove these units at this time.
11) From underneath car, remove splash shield in front of linkage and the end and lower converter access covers from transmission bell housing.
12) Disconnect accelerator pedal linkage at accelerator shaft.
13) Remove starter assembly. To remove starter, turn wheels to extreme left turn position and pull starter down between tie rods and tubular engine support crossmember.
14) Disconnect generator field and ground wires from generator.
15) Disconnect exhaust manifold-to-muffler inlet pipe.
16) Remove hex bolts (6) and nuts securing flex plate to converter (Merc-O-Matic only).
17) Remove capscrews (2) securing engine assembly to flywheel housing.
18) Position transmission lift under transmission to support transmission while engine is out of vehicle.
19) Remove capscrews (2), each side, securing engine to front engine mounts, and loosen self-locking nuts retaining engine mounts to engine front cover support.
20) Inside of vehicle, pull front carpet and insulation away from floor pan and remove rubber grommets (2) covering openings to two upper capscrews securing engine assembly to flywheel housing and remove capscrews.
21) Attach hoisting sling to engine, positioning sling to properly lift engine without transmission, and take up load of engine with hoist. Adjust transmission lift and gently pull engine away from transmission. Raise engine, carefully pull it forward and lift out of engine compartment. *CAUTION*—When removing engine, be sure oil pump pickup tube and oil filter are clear of engine mount.

Installation: Reverse removal procedure above.

OIL PAN REMOVAL

1946-48 MODELS

OIL PAN REMOVAL: Drain oil. Disconnect steering drag link at steering gear pitman arm. Loosen clamp on exhaust pipe at left manifold and remove cross-pipe. Take out capscrews in ball joint at rear end of front radius rods, lower rear end of rods and block down. Take out engine splash pan mounting screws and move pan to side out of way. Remove starter. Disconnect oil filter return line at oil pan connection, remove oil level indicator stick and tube. Take out oil pan screws and lower pan.

NOTE—Additional clearance can be secured by attaching hoist to front bumper bars and raising front end of car slightly.

1949-51 MODELS

OIL PAN REMOVAL: Car manufacturer recommends following method be used (pan can be removed without draining oil).

1)—Take off exhaust pipe cross-over (secure manifold heat valve with one nut).

2)—Remove steering idler arm bracket from right frame rail and pull down.

3)—Remove starter.

4)—Take off flywheel housing lower front cover (cover drops straight down after removing nuts and bolts). Remove oil dip stick tube from pan.

5)—Remove 16 oil pan-to-block capscrews using ⅜" drive tools. Lower rear end of pan and slide out to rear.

NOTE—Front end of engine does not have to be raised to remove pan.

1952-53 MODELS

OIL PAN REMOVAL (With Engine in Car): Take out two bolts attaching steering idler arm support to frame, pull steering linkage down. Remove starter. Remove front and bottom flywheel housing cover (pull straight down after removing attaching nuts and bolts). Remove oil level indicator tube. Take out all pan-to-block capscrews, lower rear end of pan and slide pan out to rear. NOTE—Lower section of crankcase ventilator tube should be removed if work being performed on engine.

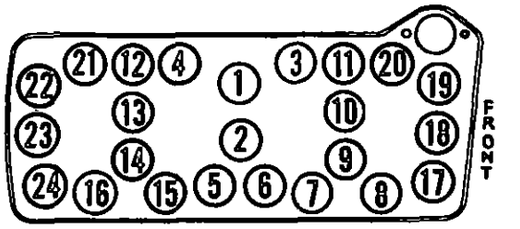
CYLINDER HEAD & MANIFOLD

1946-48 MODELS

CYLINDER HEADS: Heads are new design as listed below. These heads are interchangeable (Right & Left) and have larger water passages and increased valve clearance required for use with the new "41A" and "59A" Cylinder blocks.

CAUTION—New design head gaskets must be used with these new type heads.

Part No.	Cylinder Heads	Used on
59A-6050-B	(2 used—Stmpd. 59A-B)	90 & 100 HP.



NOTE—Head may be identified by part number prefix "59A" cast on top surface.

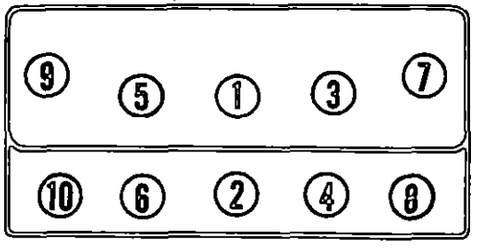
1946-53 MODELS

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head capscrews in correct sequence as shown in diagram. Tighten all screws to correct tension and recheck after engine has been run and thoroughly warmed up.

▷*CAUTION—Coat cylinder head capscrew threads with sealer before installing.*

Tightening Torques—See Tightening (Torque Wrench) specifications.

1946-53 CYLINDER HEAD



1954 MODELS

▷*1954 SERVICE REPLACEMENT CYLINDER HEAD*

NOTE: Cylinder Head, Part No. B4A-6049-E is adaptable to either the 14mm or 18mm spark plugs. Spark plug holes are drilled and tapped for 18mm spark plugs and a special adapter, Part No. B4A-6060-A, is provided so that 14mm plugs may be used. Adapter can be installed by threading plug into adapter, then installing assembly in cylinder head and torquing to 25-30 ft. lbs. which is sufficient to seal adapter in place.

1954-55 MODELS

CYLINDER HEAD INSTALLATION: Install pilot studs (made from cylinder head bolts with head cut off) in two end capscrew holes in block, coat NEW steel head gasket lightly with 8M-19554-A Sealer and install gasket over studs and dowels. Install cylinder head assembly over studs and dowels with plugged water jacket hole to rear of engine. Install cylinder head capscrews and tighten screws as follows: Tighten all screws to 55 ft. lbs. torque, engine cold, then retighten to 65 ft. lbs., with engine cold. After engine assembly has been completed, run engine for a minimum of 20 minutes at fast idle and retighten all head screws to 75 ft. lbs. torque. Use Tool S-8663-A to tighten all screws on right bank and lower screws on left bank. Use Tool P-8675 to tighten screws under rocker arm on left bank.

1954-55 CYLINDER HEAD

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CYLINDER SLEEVES

1946-48 MODELS

CYLINDER SLEEVES: Dry type steel or cast iron cylinder sleeves used in production on some engines. On engines with sleeves, engine may be marked with letters 'HS' stamped on top of block beside inner front corner of left cylinder head.

Service Limits: Steel sleeves should be replaced if worn more than .003" or if ridged at top due to wear. Sleeves which have been buckled (visible waves or burned spots) must also be replaced.

Steel Sleeve Installation: Sleeves should be removed and installed with a puller which applies pressure evenly (do not use arbor press). Use Sleeve Replacer tool, No. 6055-A, to install new sleeves, check sleeves after installation for buckling using a plug gauge or new piston. If piston sticks at any point, remove sleeve and install another new sleeve.

Cast Iron Sleeve Installation: These sleeves are thicker than steel type and cylinder must be bored out for sleeve installation. Rebore cylinder to size .0012" smaller than outside diameter of sleeve to provide correct press fit, counterbore top of cylinder to fit flange on upper end of sleeve, press sleeve in place.

NOTE—These sleeves are furnished with finished cylinder bore to fit a standard size piston. No finishing operations are necessary.

Fitting Pistons on Sleeve Equipped Engines:—Special gauge thicknesses used (not same as for engine without sleeves). See Piston Fitting Instructions on each car model page for complete instructions.

CONNECTING ROD & BEARINGS

1946-48 MODELS

CONNECTING ROD BEARING SERVICING: Bearings float between connecting rod and crankpin and have bearing surface on both sides. Running clearance for oil film must be provided at inner face (on crankpin) and outer face (in connecting rod bore) and replacement bearings are furnished both Undersize (on crankpin) and Oversize (in connecting rod) as indicated in Replacement Bearing data (following). Check crankpin diameter, connecting rod bore diameter, and bearing thickness with micrometer and select replacement bearings to give correct clearances as follows:

Connecting Rod—If bore worn more than .0015" over original size of 2.220" (2.2195-2.2220"), rod should be replaced (or honed for oversize replacement bearing).

CAUTION—Both rods used on each connecting rod bearing **must be same size.** Replace or hone both rods to same size (one bearing used for two rods).

Connecting Rod Bearing—Measure bearing thickness with micrometer gauge by placing a piece of round stock on inner face of bearing and measuring total thickness of bearing and stock (measure stock separately and subtract from micrometer reading for bearing thickness figure). Replace bearings measuring less than .1085" thick. New bearing thicknesses are .1095".

Crankshaft Crankpins—Check crankpins for condition, replace crankshaft or re-machine crankpins if scored or grooved, tapered more than .001", or out-of-round more than .0015". Shafts should be re-machined as noted under "Crankshaft & Main Bearing" section below. NOTE—If crankpins worn evenly, and to less than maximum limits given above, crankshaft will be satisfactory for service providing that connecting rod bearings installed which provide bearing clearance of less than .005" (desired bearing clearance .0015-.0035").

1949-51 MODELS

CONNECTING ROD INSTALLATION: Install connecting rods with oil squirt holes as follows—Left bank rods with oil squirt holes to front side and right bank rods with oil squirt holes on rear side. Left bank rod numbers must be towards the left side of engine and right bank rod numbers towards right side of engine.

1949-51 MODELS

CONNECTING ROD BEARINGS: Two types used, early 1949 bearing has no oil squirt hole. Late 1949 and later bearings have squirt hole and carry different part numbers.

CRANKSHAFT & MAIN BEARINGS

1954 MODELS

REAR MAIN BEARING OIL SEALS: ***(NOTE—Two different type seals have been used in production, and they are not interchangeable.)***

Early Cars—Remove old seal material from cylinder block and from retainer cap. Remove oil seal retainer to block seals. Install new journal seal in cylinder block and in oil seal retainer cap with Tool 6701-A. Seals must be cut flush with block and retaining cap with no frayed edges overlapping. Install new retainer cap to cylinder block seals in retainer and install retainer with seals in position in Tool 6335. Place assembly over pilot studs of tool and push into position in block. After assembly has been in position a few minutes, trim vertical seals so approximately 5/64" of seal remains above retainer. Install retainer bolts and oil pan.

Later Cars—Remove oil seal material from cylinder block and seal retainer cap. Remove oil seal retainer to block seals. Install new journal seal in cylinder block and in oil seal retainer cap with Tool 6701-A. Cut seals flush with block and retaining cap with no frayed edges overlapping. Install new retainer to block seals after installing retainer cap in cylinder block by dipping seals in oil and slipping them up between block and retainer in the holes provided. It may be necessary to tap them into place for the last ½". Allow .050" to .070" of retainer to block seals to protrude past oil pan to retainer mating surface. This portion will embed itself into oil pan gasket. Install oil pan.

1955 MODELS

REAR MAIN BEARING OIL SEALS: *NOTE*—Crankshaft seal is installed in groove in block and in Seal Retainer (directly behind rear main bearing). Retainer is sealed in block by special sealing strips inserted in grooves in sides of retainer after it is installed in the block.

►***SEAL RETAINER PRODUCTION CHANGE:*** Aluminum retainer used on later engines (previous type was zinc). When installing this aluminum retainer, a ⅜" flat washer must be used under the head of each retaining bolt.

Seal Installation: With crankshaft out, install new packing in groove in block and in groove in retainer using Tool 6701-A to seat packing. Cut packing off flush with surface before removing tool ***(CAUTION*** —do not leave frayed edges which may prevent proper seating of retainer in block). After crankshaft installed, coat retainer-to-block mating surface lightly with oil resisting sealing compound, install retainer **without** side seals, tighten retainer screws securely (see Seal Retainer Production Change above). Dip side seal strips in engine oil and install immediately (seals are special graphite coated rubber asbestos composition and will swell immediately on contact with engine oil). Side seals may be tapped in place with a mallet but should project approximately .050-.070" below oil pan gasket surface after installation. DO NOT cut off this excess length.

Testing Seal Installation—Squirt engine oil along seal retainer-to-block parting line, direct compressed air nozzle at inner upper corners of retainer. If air bubbles noted, remove and clean retainer thoroughly, install new side seals.

1954-55 MODELS

CRANKSHAFT THRUST BEARING ALIGNMENT: After #1, #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert. Install capscrews snug, then pry crankshaft toward rear of engine. Reverse this action by prying crankshaft forward (toward front of engine). This will align thrust surfaces of both halves of thrust bearing. RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 80-90 ft. lbs. torque. Check crankshaft endplay which should be .002-.006".

ENGINE FRONT COVER

1954-55 M DELS

CRANKSHAFT FRONT OIL SEAL INSTALLATION: Coat seal with engine oil, place seal on Tool 6700-B. Center tool and seal over inner end of bore in front cover, drive seal in until it is seated.

1954-55 MODELS

ENGINE FRONT COVER INSTALLATION: Use new gasket and position Tool 6059 on crankshaft to align cover with block before installing cover capscrews. Tighten screws to correct torque (see Tightening Specifications).

CAMSHAFT & BEARINGS

1946-48 MODELS

CAMSHAFT BEARING SERVICING: Camshaft bushings should be replaced if scored or worn to inside diameter greater than 1.7985". Replace bushings as follows:

Bushing Removal & Installation—Use puller, No. 6261-A, to remove bushings so that bushing is drawn out evenly. Install new bushings with same tool making certain that oil holes in bushing line up with oil channels in cylinder block. New bushings are finished type and need not be reamed.

Bearing Clearance—.001-.002" (new), .004" (worn limit).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1949 MODELS

CAMSHAFT PRODUCTION CHANGE (1949 MERCURY VEHICLE NO. 9CM-826 UP): Change to REVERSE helix timing gears giving forward thrust at front end of camshaft for silencing backlash (was toward rear on early engines with normal gears). Oiling at front end modified with a change in front camshaft bearing position (same bearing used). Parts for both types are as follows:

CAMSHAFT PRODUCTION PARTS CHANGES

	Early Type	9CM-826 UP Type
Camshaft	8CM-6250	8CM-6250-B
Camshaft Gear	7RA-6256	8BA-6256-A
Crankshaft Gear	48-6306	8BA-6306
Oil Line Plug	8BA-6026	7HA-6026

NOTE—Beginning Vehicle #145,832 new fiber camshaft timing gears used. Part No. 8BA-6256-D (Std.), E (.006" oversize), F (.012" oversize).

Following modifications made for use of new REVERSE helix timing gears:

1)—**Timing Gears.** Reverse helical gears (L.H. teeth on camshaft gear, R.H. teeth on crankshaft gear).

2)—**Camshaft.** Oil hole in front bearing journal moved 1/16" (center of hole .440-.450" to rear of flange on shaft, was .507-.512" on early shafts). Inside diameter increased to 3/16" (was ⅛" on early shafts). Outer end of hole is at front of shaft on both types of camshafts.

NOTE—Beginning vehicle #145832 new fiber camshaft timing gear is used. Mercury Part No. 8BA-6256-D (Std.), E (.006" oversize), F (.012" oversize).

►3)—**Camshaft Front Bearing Position**—***CAUTION—Same bearing used but position in block different for each type camshaft. This is important to provide correct lubrication for front end of camshaft (alignment of upper oil hole in bearing with oil hole in camshaft front bearing journal). Bearing positioned as follows:***

Bearing Position for Late (8CM-6250-B) Camshaft—Installed with front edge **flush** with front face of block to align upper oil hole in bearing with relocated hole in camshaft front bearing journal (see No. 2 above).

Bearing Position for Early (8CM-6250) Camshaft—Installed with front edge **1/16" back** from face of block for oil hole alignment.

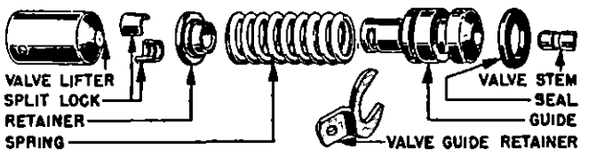
4)—**Cylinder Block Front Oil Line Plug.** Solid plug in oil line (above camshaft). Early type plug equipped with oil hole for front end gear lubrication. With this new plug front end gears and thrust surfaces lubricated from front end of camshaft (oil fed from main oil line lead at front camshaft bearing into oil lead in shaft and out through front end of shaft).

1949-53 MODELS

CAMSHAFT BEARING SERVICING: Replace camshaft bearings if scored or worn beyond limits.
Removal—With Tool 6261-B, drive front bearing inward. Slide tool pilot into front bearing hole and drive out center and rear bearings.

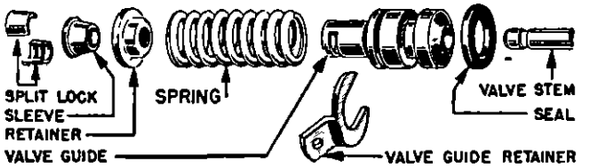
Installation—With Tool 6261-B, install rear bearing so that the larger of the two oil holes is at the top. Install center bearing so the two equal size oil holes will be in a vertical position. Install front bearing with the larger of the two oil holes at bottom and front face of bearing flush to .010" below face of block.

1949-53 MODELS



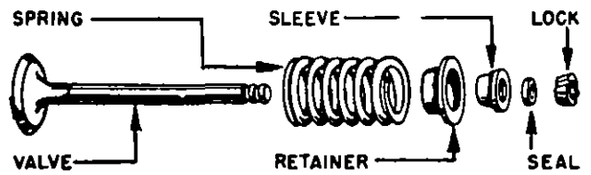
CAMSHAFT OIL PUMP & DISTRIBUTOR DRIVE GEAR (Removal & Installation): Remove camshaft (see Camshaft Removal following). Using Tool 6254-C (gear puller) remove oil pump drive gear and distributor drive gear.

Installation—Install both gears with Tool 6354-B (Installer). CAUTION—Make sure that both gears are seated against shoulder on camshaft, and that marks on front end of shaft line up with mark on distributor drive gear.



1949-53 MODELS

CAMSHAFT REMOVAL & INSTALLATION: Camshaft can be removed with engine in car, as follows: Remove radiator, cylinder heads, and intake manifold. Remove valves, guides, and spring assemblies. Remove valve lifters. Remove fan assembly, crankshaft pulley and front engine cover. Withdraw camshaft being careful not to damage camshaft bearings. Install camshaft by reversing removal procedure.



►***REMOVAL NOTE—If new camshaft is not to be installed, or if valves are not to be ground, wedge valves open with a wooden wedge placed under valve head. Raise valve lifters and insert a cotter pin in lifter oil hole to hold lifters up. Camshaft can then be removed by rotating cam to clear lifters.***

1946-50 CONVENTIONAL VALVE ASSY.

1951-53 ROTATABLE VALVE ASSY.

1954-55 ROTATABLE VALVE ASSY.

1954-55 MODELS

CAMSHAFT BEARING REMOVAL & INSTALLATION:
Removal—Remove camshaft and drill a ½" hole through plug at rear bearing bore and remove plug. Remove bearings from block with Camshaft Bearing Remover & Installer 6261-C and adapter pilots 6261-F.

Installation—Install bearings with same tool used for removal making sure that oil holes in bearings are in line with holes in cylinder block web. Notch on edge of bearing should face front of engine at bottom of bore. *(CAUTION—*#1 camshaft bearing must be flush with front face of block or not more than .010" below surface of face). After all bearings have been installed, coat a new camshaft rear bearing plug with sealer and install in block.

TIMING GEARS

1946-53 MODELS

TIMING GEARS: Bolted-on type gear used, which can be removed without removing camshaft from engine as follows:

Camshaft Gear Removal and Installation:—Gear is bolted on camshaft hub flange by 4 offset capscrews. To remove gear, remove crankshaft pulley —use Puller 6312-N, and timing gear cover. Bend back lock plate tangs, take out four camshaft gear mounting capscrews, remove gear. When replacing gear, make certain that marks on camshaft and crankshaft gears are lined up and see that lockplate tangs are bent up against flats on mounting screws. NOTE—Camshaft gear mounting screw holes offset so gear can only be installed in correct position. Use 6312-B Pulley Replacer to install crankshaft pulley.

Replacement Gears: Crankshaft gears are Cast Alloy Steel and are furnished in one size only. Camshaft gears are Fibre or Aluminum and are furnished Standard, .006", .010" Oversize.

VALVE SYSTEM

1951-55 MODELS

ROTATABLE VALVES: Standard equipment on 1951 and later engines. A two-piece type retainer (retainer and sleeve) and shorter valve spring used. Valve locks are same as previous type.

►***ROTATABLE VALVE INSTALLATION ON 1949-50 MODELS—Rotatable valves and parts can be installed in engine equipped with conventional valves by changing the valve spring, spring retainer, exhaust & intake valves, and installing new retainer sleeve. VALVE GAP SPECIFICATIONS ARE NOT CHANGED WHEN ROTATABLE VALVES INSTALLED.***

1954-55 MODELS

►*EXHAUST VALVE STEM DIAMETER CHANGE (Production & Service Replacement Valves):* Stem diameter has been decreased .0005" to provide greater stem clearance in guide. NEW stem diameters are:

Size	Stem Diameter
Std. (Marked Red)	.3400-.3405"
Std. (Marked Green)	.3405-.3410"
.003" Oversize	.3430-.3440"
.015" Oversize	.3550-.3560"
.030" Oversize	.3700-.3710"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1946-53 MODELS

VALVE ASSEMBLY SERVICING: Complete valve assembly (valve, spring, and guide) should be removed and installed as a unit.

Disassembly: Install the valve assembly in Tool 6505-C, compress spring, remove valve spring retainer locks, release spring tension, remove valve spring retainer, sleeve, spring, guide, and valve.

►*ROTATABLE VALVE NOTE—Rotatable type valves used on all 1951 and later engines.*

Reassembly (Rotatable Valves): Place valve, guide, spring, and spring retainer in compressing tool. Assembly valve locks in valve retainer sleeve, hold locks in sleeve and start sleeve over end of valve stem. Compress valve spring and work sleeve and locks up into place with fingers until locks engage groove in valve stem

Valve Assembly Installation: Turn crankshaft so that valve lifter is at lowest position (on heel of cam). Lubricate intake guides and seals and all valve stems. Insert valve assembly in cylinder block, use compressor bar engaged in groove in lower end of guide to pry guide downward, install retainer. Make certain that retainer engages groove in guide and that it seats properly when guide released.

1954-55 MODELS

VALVE SERVICING: Valves are "Rotatable" type operating directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal—Use Tool 6513-EE to compress valve springs, remove valve spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.

Valve Assembly Installation—Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

VALVE GUIDES

1949-53 MODELS

►**VALVE GUIDE OIL SEALS:** Late type engines are equipped with rubber seals on intake valve guides. Use late type guides for replacement on all 1949 engines. Mercury Part numbers 8BA-6510-B (Guide) and 8BA-6571 (Seal).

1954-55 MODELS

OVERSIZE VALVE STEM INSTALLATION: Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems. Reamers are furnished in .003", .015", .030" oversizes. Pilots are Std., .003", .015". Use reamers in sequence with correct pilot when reaming from standard to oversize. Regrind valve seats after reaming guides.

VALVE TAPPET ADJUSTMENT

1946-53 MODELS

TAPPET CLEARANCE ADJUSTMENT: After installing valve assembly (above), check tappet clearance with lifter on heel of cam. If clearance not within limits, grind end of valve stem (to increase clearance), install a new valve or grind valve in (to decrease clearance).

Valve Grinding and Tappet Clearance Note:—To perform these operations with minimum amount of hand cranking, note which valves are fully open (first column in table below), grind or check valves listed on same line of table—then turn shaft until next 'valve open' point reached.

Valves Open	Valves to Grind
1. 4X & 1N	3X, 8N, 6N, 7X, 3N, 2X
2. 3X & 8N	1X, 7N, 5X, 2N, 4X, 1N
3. 1X & 7N	8X, 5N, 6X, 4N
OR	
1. 8X & 5N	1X, 7N, 6N, 7X, 3N, 2X
2. 6N & 7X	5X, 2N, 4X, 1N, 8X, 5N
3. 5X & 2N	6X, 4N, 3X, 8N

NOTE—'X' Exhaust Valve. 'N' Intake Valve.

1954-55 MODELS

INITIAL VALVE CLEARANCE: To insure valve being on low side of the cam, make all adjustments in the following sequence and with No. 1, 3, & 4 pistons in the indicated position:

No. 1 Piston at TDC (Compression Stroke)—Adjust No. 1 Intake & Exhaust, No. 2 Intake, No. 4 Exhaust, No. 5 Exhaust, and No. 7 Intake.

No. 4 Piston at TDC (Compression Stroke)—*(NOTE—Rotate engine 180° from the point where No. 1 piston is at TDC).* Adjust No. 6 Exhaust, No. 4 Intake, No. 8 Exhaust, No. 5 Intake.

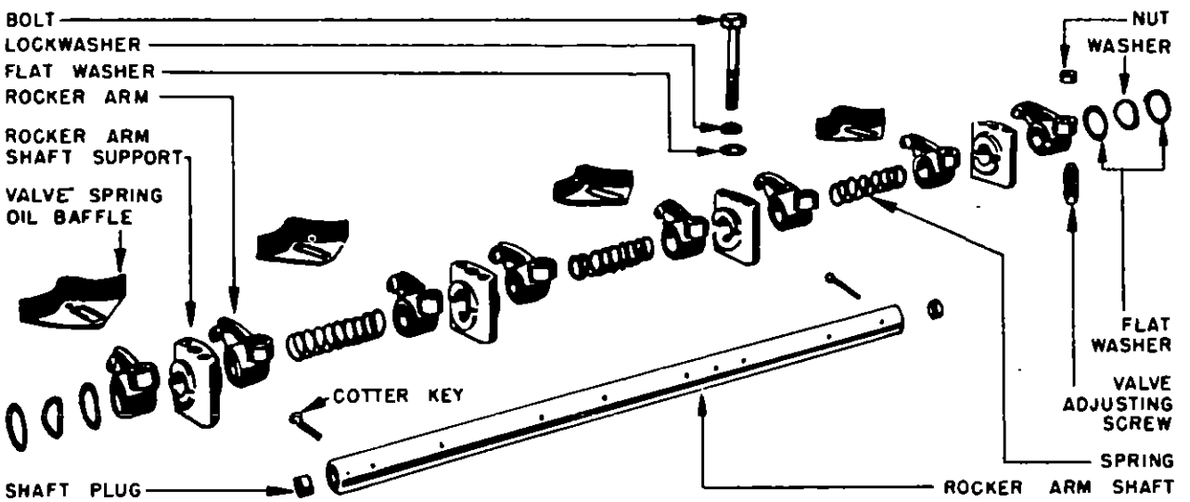
No. 3 Piston at TDC (Compression Stroke)—*(NOTE—Rotate engine 270° from the point where No. 4 piston is at TDC).* Adjust No. 2 Exhaust, No. 3 Intake & Exhaust, No. 6 Intake, No. 7 Intake, No. 8 Intake.

►*CAUTION*—Final tappet adjustment is made after engine assembly is completed and with engine at normal operating temperature. The final setting is .019".

VALVE TIMING

1949-53 MODELS

VALVE TIMING CHECK: Remove valve cover (intake manifold) and right cylinder head. Crank engine over until intake valve #1 cylinder is opening. Line up pointer with timing mark on front dampener. Insert a piece of .020" stock between the exhaust valve (#1) stem and lifter. Crank the engine forward about 45°. Place contact point of dial indicator on head of #1 exhaust valve, and set dial to ZERO. Crank engine backward until timing marks are again lined up. If the valve timing is correct indicator will read .033" to .050" (1949-50), .026" to .044" (1951-53). If camshaft is one or more teeth out of time the dial readings will be considerably outside the limits given.



ROCKER ARMS

1954-55 MODELS

ROCKER ARM SERVICING: Disassembly—Remove assembly from head by taking out rocker arm shaft bracket retaining screws. Remove cotter pins at each end of rocker arm shaft and remove flat washers and spring washers. Slide rocker arms, springs, and washers off shaft *(Be sure to identify each part for assembly in same position).* Pull oil tube out of end rocker arm support to remove shaft from support.

Rocker Arm Shaft Assembly—Oil moving parts with engine oil. Install a plug at each end of shaft. **Do not peen plugs to make them tight.** Assemble rocker arm shaft parts in order shown in illustration. Install oil outlet tube in end of rocker arm support and make certain end of tube enters hole in shaft. Tighten rocker arm shaft support-to-cylinder head bolts to 45-55 ft. lbs. torque. Install rocker arm covers and tighten hold down bolts finger tight after making preliminary valve adjustment. Make final adjustment after engine warmed up to normal operating temperature. Install new gaskets (cement to cover only), install cover, and tighten hold down bolts to 2-2½ ft. lbs. torque.

1954-55 ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

OILING SYSTEM

OIL PUMP

1946-48 MODELS

OIL PUMP: Removal & Disassembly—To remove pump from engine, remove locking wire and take out mounting screw in pump mounting flange, pull pump down and out (NOTE—Pump body fits in recess in cylinder block and it may be necessary to jar it slightly to loosen it). To dismantle pump, remove strainer screen retainer spring, remove screen cover and gasket. Take out four capscrews in pump cover, remove cover, lift out pump driven gear. If pump shaft and pump driving gear are to be removed, drive out pin in drive gear, place pump in arbor press with support under drive gear, press shaft and driving gear out through lower end of housing.

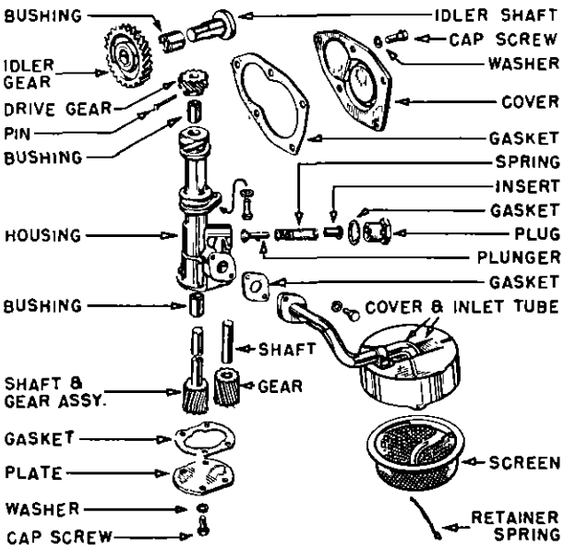
Oil Pump Relief Valve—(Pressure Regulator) Note—On pumps with relief valve located on side of pump housing, remove locking wire, take out relief valve nut, spring and valve plunger.

Pump Shaft and Bushings—Shaft clearance in bushing should be .001-.003" and bushings should be replaced if clearance exceeds .005". Replace pump shaft if gear worn or if bearing surface worn to diameter of less than .097". Replace bushings if worn to inside diameter greater than .502". Remove old bushing with driver, press new bushing in place, line ream bushings to inside diameter of .500".

Pump Driven Gear & Shaft—Clearance between driven gear and stub shaft in pump housing should be .002-.0035". Replace shaft if clearance exceeds .005". To replace shaft, drive old shaft out of housing, press new shaft in place making certain that end of shaft will clear pump cover when it is installed.

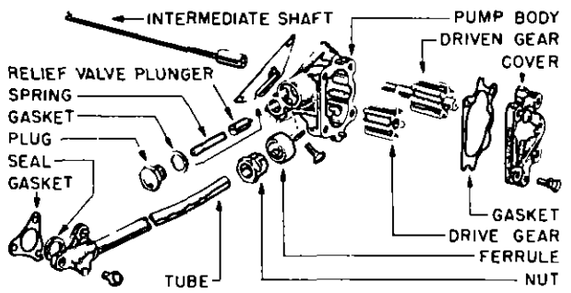
Oil Pressure Regulator (Relief Valve)—Check relief valve spring tension and replace spring if tension less than 78 ozs., or more than 87 ozs. when compressed to length of 1.380".

Pump Assembly—Insert pump shaft on housing, press drive gear on shaft until clearance between gear hub and end of housing (endplay) is .017", drill new 5/32" hole through shaft in line with hole in gear, install 5/32" pin and peen both ends of pin to prevent loosening in service. Complete assembly by reversing disassembly instructions above.



1949-53 MODELS

OIL PUMP: Gear type pump mounted on cylinder block inside oil pan at rear of engine. Pressure relief valve mounted in pump housing. NOTE—Early 1949 pumps have spur gears, and later type has helical gears.



Removal: Drain oil, remove oil pan (see Oil Pan Removal), remove oil pump retaining screw and remove pump and strainer assembly.

Disassembly: Remove strainer assembly retaining screw, strainer and gasket. Remove cover plate and pump driven gear. Remove lock wire and pressure relief valve (plug, gasket, spring and valve). Drive out pin and remove upper driven gear. Slide shaft and drive gear assembly out of housing. Wash all parts in solvent and dry thoroughly, making sure that no dirt or metal particles remain in housing.

Inspection: Check pump housing for cracks or excessive wear. Pump shaft should have a free running fit without excessive endplay in bushings (.0005" to .0025" clearance). Check pump gear teeth for scratches and wear. Measure clearance between pump gears and pump body, which should be no greater than .005". Check compression relief valve spring which should be 12 lbs. ±2 ozs., when compressed to 1.14". Clearance between oil pump driven gear and shaft should be .005" maximum.

1946-53 MERCURY OIL PUMP

1954-55 MERCURY OIL PUMP

Reassembly: Apply a thin coating of engine oil to all moving parts. Slide shaft and drive gear assembly into housing. Install upper drive gear, insert retaining pin, and rivet end of pin (NOTE—When installing new shaft and drive gear assembly, it will be necessary to drill a retaining pin hole in the shaft. Set the end clearance to .016" and use a No. 30 drill for the retaining pin hole). Install pump driven gear, cover plate and gasket. Tighten cover plate screws to 7-10 ft. lbs. torque. Install pressure relief valve, spring, gasket, and plug. Insert a piece of lockwire through hole in plug and twist wire around extension housing. Install strainer and gasket and tighten screws securely.

Installation: Slide pump into cylinder block, making sure upper drive gear meshes properly, and install retaining screw with a lockwasher. Tighten screw to 12-15 ft. lbs. torque. Install oil pan and fill crankcase with engine oil.

1954-55 MODELS

OIL PUMP: Gear type pump mounted on left hand side of engine crankcase and driven by intermediate shaft from distributor shaft. Pressure relief valve in oil pump housing.

Removal: Remove oil pump inlet pipe. Remove capscrews and lockwashers securing pump to engine block. Remove pump and gasket, and the intermediate shaft (if shaft comes out with pump).

Disassembly: Remove capscrews retaining pump cover to body and remove cover plate and gasket. Do not tap pump drive shaft to drive cover off pump. Remove oil pump gear and shaft assembly and oil pump idler gear. Remove oil pressure relief valve plug, gasket, spring and plunger.

Inspection: Check oil pump housing for cracks or wear. Pump shaft should have a free running fit without excessive play in pump housing (clearance is .0015-.0029" upper end, and .001-.002" lower end). Check pump gear teeth for scratches and wear. Check compression of relief valve spring which should be 10.86 lbs., at 1.40". Replace any worn or defective parts. Short end of drive gear shaft should be .500" ± 030". If longer than .530" replace drive gear assembly.

Reassembly: Oil all parts thoroughly. Install oil pressure relief valve plunger, spring, and cover plug and gasket. Install idler gear and oil pump gear and shaft assembly. Install cover plate with new gasket, and tighten cover plate screws to 12-15 ft. lbs. torque.

Installation: Reverse removal procedure using a new gasket between pump mounting flange and engine.

OIL FILTER

1954-55 MODELS

OIL FILTER SERVICING: Filter is full-flow type and should be replaced at 4000-5000 mile intervals (or more often if required by operating conditions).

▷*REPLACEMENT CAUTION:* Use Replacement Kit, Part No. HCK-6731-A, which includes correct Filter Element and NEW GASKETS WHICH MUST BE USED.

Filter Removal: Take out center bolt in filter cover, remove filter assembly. Remove and discard cover mounting gasket from filter mounting pad, remove and discard filter element. Remove and discard neoprene gasket from center bolt, remove center bolt from cover, remove and discard fibre center bolt-to-cover gasket. Wash all parts and filter pad on block with solvent and make certain they are clean.

Filter Installation: Install NEW fibre gasket on center bolt, install bolt in cover, install spring and seat assembly on bolt with open end of seat toward cover (*CAUTION*—Seat must be attached to spring by tangs). Install NEW neoprene gasket on center bolt next to spring seat, install filter element. Install NEW filter mounting gasket in block recess (*CAU-*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TION—DO NOT use sealing compound on this gasket). Install filter element on engine, making sure that filter is seated in recess and not "cocked" over recess of shoulder. Tighten center bolt just enough to bring case up against gasket, rotate housing slightly to seat evenly, then tighten center bolt to 20-25 ft. lbs. torque. *CAUTION*—DO NOT overtighten the bolt which may strip threads, distort cover, or cause leaks. After engine started up allow it to idle until lubrication established and normal oil pressure secured, then speed up engine and check for oil leaks.

NOTE—An adapter is provided in cylinder block which can be easily replaced in case of stripped threads.

COOLING SYSTEM

1949-51 MODELS

WATER PUMP LUBRICATION: 1949 Models, with oil cup. Use a length of wire inserted in oil cup when oiling with oil can. Ordinary oil cans will not reach properly, and the wire allows air trapped in the reservoir to escape by the oil wick. No oil cup used on late 1949 and later models.

1949-52 MODELS

►*1949-52 MERCURY CYLINDER HEAD LEAKS (Caused by distributor hold-down bolt preventing proper seating of cylinder head):* If leaks noted near distributor, or if correct ignition timing not maintained, check hold-down bolt for bottoming on face of cylinder block and preventing head from seating. Replace original 1¼" long bolt with new type 1" bolt. NOTE —This 1" bolt used in later 1952 production.

1952-53 MODELS

►*COOLING SYSTEM PRODUCTION CHANGES:* During 1952 production, following changes were made in the cylinder block for a more constant coolant flow at high speeds and high temperatures:

Cylinder Block Water Bypass Holes (Right and Left Banks): Reduced from ½" to 11/32" diameter.

Water Pump Impeller Holes: Two 5/16" diameter holes have been added between impeller vanes.

►*REWORKING OF EARLY 1952 ENGINES FOR IMPROVED COOLING:* Production changes listed above can be incorporated in earlier engines as follows:

Cylinder Block Water Bypass Hole (Right & Left Banks): Make up reducer or adapter tubes:
Adaptor Tubes—Use ½" O.D., 11/32" I.D. tubing. Cut one end off at 45° angle, cut angle end of tubing back .17" and chamfer resulting square end portion of tubing for .06" x 45° chamfer. Cut tubing off to overall length of 1.90" (for RIGHT HAND BANK), 1.54" (for LEFT HAND BANK).

Adaptor Tube Installation—Insert correct adaptor tube in cylinder block water bypass hole with taper end in and open portion upward to align with hole opening in upper face of block. Drive tube in until it bottoms in block. *CAUTION—Angle end opening MUST BE UPWARD (bypass flow from cylinder head will be cut off if angle end opening downward).*

Water Pump Impeller Holes—Locate hole centers 43/64" in from outer edge of impeller between vanes and at two points diametrically opposite, drill completely through impeller using 5/16" drill.

FUEL SYSTEM NOTES

1949-50 MODELS

►*1949-50 MERCURY FUEL PUMP PUSHROD BUSHING INSTALLATION (To correct wear and excessive looseness of pushrod):* On cars **without pushrod bushing,** correct looseness of rod by installing bushing as follows: Remove ⅛" pipe plug on rear of cylinder block in line with main oil gallery. Drill through this opening to enlarge original .125" diameter oil hole leading from pushrod hole into end of main oil line to new size of .312" *(CAUTION*—use extreme care not to damage pipe plug threads in block). Bore or ream original pushrod bore hole in block to .593-.594", remove all chips and foreign material from hole, press new bushing No. 8BA-6025 in flush with upper boss. Replace ⅛" pipe plug using a suitable sealer to prevent oil leaks. *NOTE*—This bushing used in production beginning with later 1950 cars (can be identified by engine not having pipe plug at rear of block).

ENGINE HOOD NOTE: Hood is alligator type with release knob under instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood, lift hood up.

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on top of clutch housing and on left frame side member near generator.

TUNE-UP

COMPRESSION: Pressure—105-125 lbs. at cranking speed of 100 RPM (Std. 6.75-1 Cast Iron Head).

VACUUM READING: Steady 18-20" idling at 500 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2 (Cyl. Nos. 1-2-3-4 Right Bank, 5-6-7-8 Left Bank, front-to-rear). See diagram.

SPARK PLUGS: Champion Type H-10. 14 mm. Metric. **Gaps**—.025"

IGNITION: See Coil, Condenser, and Distributor.

Breaker Gap—.014-.016" (both sets).

Cam Angle—36° (both sets operating together).

Breaker Arm Spring Tension—20-24 ozs.

Rotation—Clockwise viewed from drive end (distributor off engine).

Automatic Advance—Starts at 200 RPM. Maximum 11° at 600 RPM (distr. degrees & RPM).

IGNITION TIMING: See Ignition Timing.

Std. Setting—4° BTDC.

Timing Marks—None. See Ignition Timing for directions on setting of distributor for correct timing when installed on engine.

Vacuum Brake Setting—Set to just eliminate pinging when engine operated under load (back off screw until engine pings, then turn screw in until ping is eliminated).

CARBURETION: See Carburetor & Carb. Equipment.

Idle Setting—Both idle screws ⅝-¾ turn open and set for smooth idle and highest steady reading of vacuum gauge (when used). Idle speed 500 RPM. (can be judged by marking fan belt and setting speed for 25 revolutions of the belt in 10 seconds).

Float Level—Fuel level 11/16" (21/32 - 23/32") below top edge of bowl.

Accelerating Pump—Center (#2) hole Normal. Inner (#1) hole—Summer, Outer (#3) hole—Winter, for temperature extremes.

Fuel Pump Pressure: 3½ lbs. maximum (1½-3½ lbs.).

MANIFOLD HEAT CONTROL: Automatic thermostatic control type. Located in exhaust manifold outlet connection of left hand cylinder bank, diverts exhaust gases through by-pass in intake manifold to right cylinder bank when valve closed. See that valve operates freely.

VALVES: See Valve Timing.

Tappet Clearance—.010-.012" Intake, .014-.016" Exhaust, Cold. No adjustment.

STARTING: See Battery, Starter, Generator, and Regulator.

IGNITION

IGNITION SWITCH: Oakes Steering Column & Ignition Lock Assembly No. as follows:

	Steering Col. & Ign. Lock Oakes No.	Ignition Switch Ford No.	Oakes No.	Ford No.
LHD. Cars①	302995	59A-3676A	302494	11A-3680
LHD. Cars②	302960	59A-3676B	302494	11A-3680
RHD. Cars①	302998	59AF-3676D	302494	11A-3680
Sportsman	302992	*59A-3676C*	*302494*	*11A-3680*
Canadian Cars	302970	C59A-3676	302494	11A-3680

①—With Brown Trim. ②—With Grey-Green Trim.

Lock Cylinder—Hurd or Briggs & Stratton No. 80935. Ford No. 91A-3686A (with Keys).

Key Series—FK000 to FK999. **Groove**—No. 17.

COIL: Ford No. 1GA-12024. Mounted separately on left front corner of cylinder block.

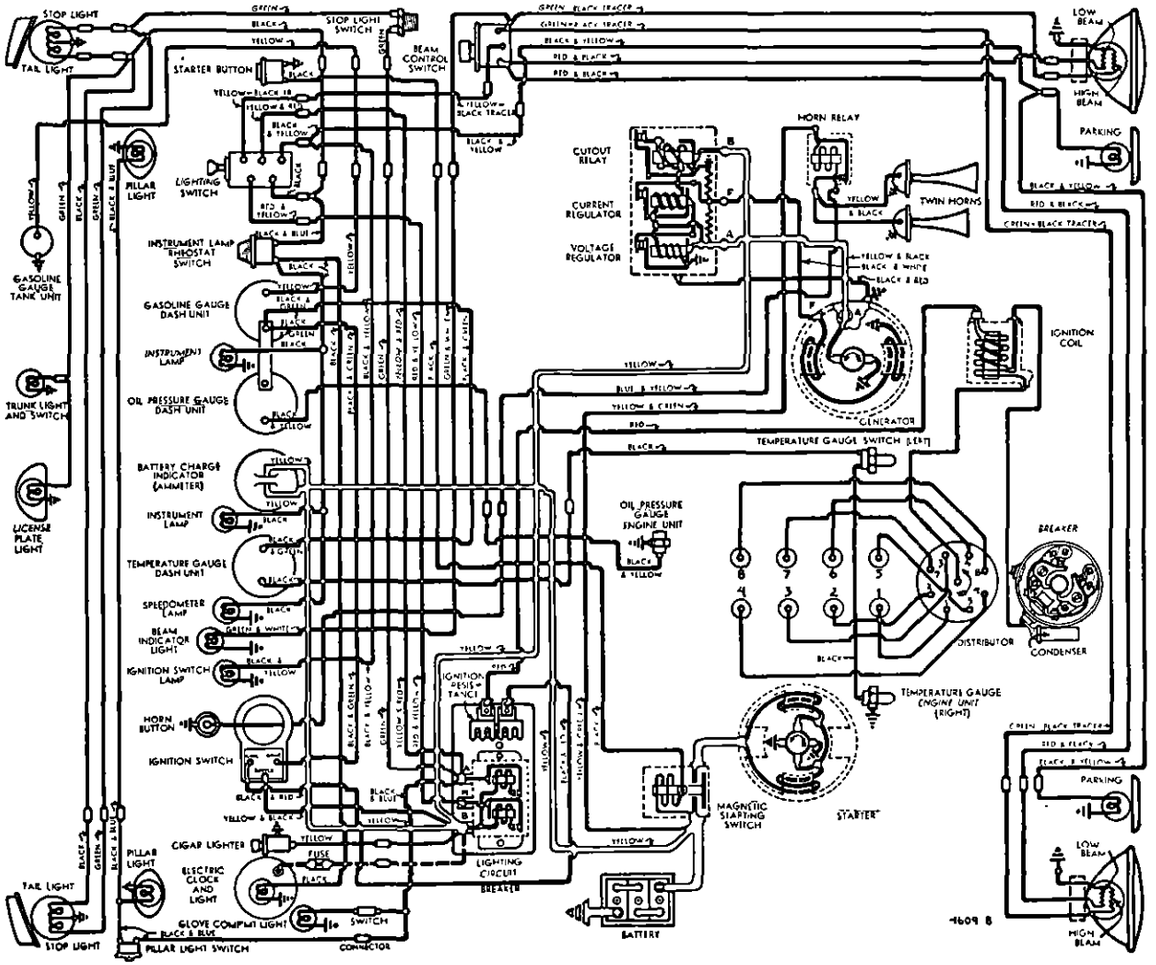
Resistor Unit—Connected in coil primary circuit. Mounted on Circuit Breaker Assembly No. 11A-12250.

Ignition Current—4½-6 amperes (engine stopped). Ignition primary circuit resistance 1-1⅓ ohms.

CONDENSER: Ford Part No. 1GA-12300-B. Capacity—.29-.32 microfarad.

DISTRIBUTOR: Ford No. 59A-12127 (Less Terminal Housing, Cap, and Rotor). New flat type, single cap, "Sealed Dry" type with "V" outlet. Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake adjustment. Breaker "loading" and "timing" contacts operation unchanged.

Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step "Go", .016" "No Go".



Cam Angle or Dwell—36° closed, 9° open. For both sets operating together with correct coil-loading lead. NOTE—Cam Angle for each set operating singly approximately 22½° closed, 22½° open (50%).

Breaker Arm Spring Tension—20-24 ounces.

Rotation—Clockwise viewed from drive end of unit.

Distributor Degrees	R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	200	0	400
11	600	22	1200

Vacuum Brake: Consists of a spring-loaded, vacuum controlled, brake piston which bears on edge of

retard disc of breaker advance mechanism and acts as a "drag" to retard normal advance when engine is accelerated or operated under load. Piston is normally held out of engagement by manifold vacuum.

Removal: Distributor mounted on front of engine. To remove, disconnect coil primary lead, unsnap bail clip and remove terminal housing and conduit assembly, remove distributor rotor. Take out two capscrews mounting distributor on engine, remove distributor and gasket. NOTE—Vacuum connection (for Vacuum Brake operation) is through hole in face of mounting flange.

IGNITION TIMING

Std. Setting—See Vacuum Brake Setting for service correction for operating conditions.

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

Ignition Timing (Basic Setting)—Distributor can be timed for correct ignition timing when off engine as follows: Place a small straight edge or scale against tang on drive end of distributor shaft (scale must be on wide side of shaft), rotate distributor in direction of rotation (clockwise) until trailing edge of scale is exactly ⅜" past the nearest edge of the small mounting hole (left hand hole—nearest vacuum brake) on the mounting flange. If left hand (timing) contacts do not begin to open at this point, loosen adjusting screw on side of distributor housing, move screw down (to advance spark), up (to retard spark), in slot until contacts begin to open, tighten adjusting screw. This setting will provide correct 4° BTDC. ignition timing when distributor installed on engine.

NOTE—Timing is controlled by opening of **left hand breaker contacts only** (right hand contacts "load" coil and open and close earlier than the left hand contacts).

Timing (On the Engine)—No flywheel marks provided. With basic timing of distributor properly set (above), ignition timing will be correct when distributor installed on engine and all necessary adjustments for operating conditions and octane rating of fuel being used can be made by means of the Vacuum Brake adjustment as follows:

Vacuum Brake Setting:—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, turn screw in just enough to eliminate ping.

CARBURETOR

Holley (Chandler-Groves) Ford No. 59A-9510-A. Dual (double barrel), downdraft type with manual choke control.

See Carburetor Section for complete data.

Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 500 RPM. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-¾ turn of screw from inner seated position. Readjust stopscrew for correct idling speed. NOTE—Idling speed can be estimated by marking spot on fan belt and setting speed for 25 revolutions of the belt in 10 seconds.

NOTE—Vacuum gauge recommended for idling adjustment. Set for highest steady gauge reading.

Float Level—Use 9550-A gauge to set float level (1.353" end "Go", 1.322" end "No Go") measuring from underside of bowl cover to bottom of float with cover and float assembly inverted. Fuel level in bowl should be 11/16" plus or minus 1/32".

Accelerating Pump Setting—Three holes provided for pump link connection as follows:
Inner (#1)—Min. stroke, Summer Temperatures.
Center (#2)—Medium Stroke, Normal temperature.
Outer (#3)—Max. stroke, Extreme Cold Weather.
NOTE—Link locked in pump rod by snap-lock. Pull link shaft out of pump rod to disengage this lock.

Metering Jets—*Refer to Carburetor Index for Chandler-Groves (Ford) Carburetor Jet Specification Table.*

Fast Idle: Integral with carburetor. Operated by Choke Valve lever. No adjustment required.

CARB. EQUIPMENT

Air Cleaner: Ford No. 91A-9600-A. Oil-bath type.
Servicing—Clean and refill (to level mark on case) with same grade engine oil used in crankcase at 3500 mile intervals (when crankcase drained) or more often if required. Clean filter element by washing in cleaning fluid.
NOTE—Clean and re-oil filter element in oil filler cap (crankcase breather) every 1000 miles.

Fuel Pump: AC. Type R, Ford No. 11A-9350. Diaphragm type. Exchange Pump AC No. 541 ('46), 571 ('47).
See Carburetion Equipment Section for data.
Pressure—3½ lbs. maximum (1½-3½ lbs.).

Gasoline Gauge: King-Seeley Electric. Ford Nos.
Dash Unit—No. 59A-9280 ('46), No. 6M-9280 ('47).
Tank Unit—No. 99A-9275-B.
See Carburetion Equipment Section for data.

BATTERY

Ford Type No. 01A-10655-A. 6 Volt, 17 Plate, 120 Ampere Hour Capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes.
Grounded Terminal—Positive (+) grounded to dash.
Engine Ground—Strap connector between right rear cylinder head and dash.
Dimensions—Length 10.56". Width 7.28". Height 8.25".
Location—On right side in engine compartment.

STARTER

Ford Model No. 18-11002. Armature No. 18-11005
Drive—Inboard Bendix Drive No. A1472, Ford No. B-11350.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch: Ford No. 21A-11450 Magnetic Switch mounted on the dash and controlled by pushbutton switch on instrument panel, Ford No. 19A-11500.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR

Ford Model No. 21A-10000. Armature No. 01A-10005A. Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment. See Regulator data below.
Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine, check output at 2 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine RPM.
Start	520
30	1060
30	2500

Rotation—Counter-clockwise at commutator end.
Field Current—2.1 amperes at 6.0 volts (field resistance 2.88 ohms at 70°F.).
Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulley is ½" (thumb and finger pressure).

REGULATOR

Ford Model No. 01A-10505-C. Three-Unit Type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash.
See Electrical Equipment Section for complete data.
NOTE—Regulator case is grounded through braided wire 'pigtail' or separate ground wire extending from regulator to generator frame. This ground connection must be in place when regulator being operated or tested (disturbed by removal of regulator cover).

Cutout Relay

Cuts In—5.8-6.3 volts at operating temperature.
Cuts Out—8 ampere discharge current (maximum).

Voltage Regulator

Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Electrical Equipment Section for voltages at other temperatures.
Checking and Adjusting—*Refer to Electrical Equipment Index for article on 'Ford Regulator—3-unit Type' for complete instructions.*

Current Regulator

Setting—30-33 amperes hot (after generator has been operating for 5 minutes).
Checking & Adjusting—See Voltage Regulator (above).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

LIGHTING

Headlamps: Ford "Sealed Beam" type.
Controlled by Lighting Switch on instrument panel and Beam Selector Switch on toeboard.
See Electrical Equipment Section for complete data.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height at 25 ft.
Beam Indicator—Red Jewel on lower edge of speedometer dial. Lighted whenever upper beam in use.

Switches

Lighting—Ford No. 11A-11652 (Switch & Wiring), Light Switch Knob & Insert Ford No. 59A-11661.
Beam Selector—Ford No. 11A-13532 (Switch only), No. 29A-11653 (Switch & Wiring).
Instrument—Ford No. 19A-13740.
Stop Light—Ford No. 11A-13480.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking	3	63
Instrument, Clock	1.5	55
Beam Indicator	1	51
Dome, Luggage Comp't.	3	63
Stop & Tail	21-3	1154
Rear License	3	63

MISC. ELECTRICAL

LIGHTING CIRCUIT BREAKER: Ford No. 11A-12250A Combined with Ignition Resistor on block on dash under cowl. Consists of two separate circuit breaker units (one unit protects headlight circuits, second unit protects other lighting circuits) of the thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

HORNS: Ford No. 91A-13832 (High Note), 91A-13833 (Low Note). Air electric type dual horns operated by horn relay.
Horn Current—24-28 amperes total.

Horn Relay: Ford No. 11A-13842D.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE

ENGINE SPECIFICATIONS: Own "100". Eight Cylinder, 90° Vee, "L" Head type. Cylinder banks and crankcase cast Enbloc.
Bore—3.187". **Stroke**—3.75".
Displacement—239 cu. ins. **Rated H. P. 32.5.**
Developed Horsepower—100 at 3800 RPM.
Compression Ratio—6.75-1 Cast Iron Heads.
Compression Pressure & Vacuum Reading—*See Tune-up data.*

▷**1946-47 ENGINE SERVICE NOTES: Cylinder Head.** New type, Part No. 59A-6050-A or -B, is interchangeable right-and-left. May be identified by figures "59A" or "59A-B" on top. Heads have greater valve clearance for new cylinder block (below) and larger water holes for improved cooling (¾" hole at top center and ⅝" hole at center between #2 and #3 cylinders).

▷**Cylinder Head Gasket**—New type, Part No. 59A-6051, may be identified by 5/16" round hole instead of blunt cone shaped opening at lower edge between #2 and #3 cylinder bores. ***This gasket must be used with new 1946 type Cylinder Head (above).***

▷**Cylinder Block**—New type, Part No. 59A-6010-C with valve ports located .09" farther from center line of block. May be identified by number or by oblong water passages just above valves (round on previous types).

OIL PAN & ENGINE REMOVAL—*See Mercury Special Data.*

TIGHTENING TORQUES & CYLINDER HEAD: *See Mercury Special Data.*

CYLINDER SLEEVE: Cast iron, dry type cylinder sleeves may be used (engine may have mark "HS" on block beside inner front corner of left cyl. head). *See Mercury Special Data.*

PISTONS: Steel or aluminum alloy, light weight, cam ground, dome head type. Pistons are new four-ring type. Recondition engines to take finished replacement pistons (if sleeves used, replace sleeves, install new std. size pistons).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Replacement Pistons: Std., .0025", .005", .015", .020", .030", .040".

Fitting New Pistons: Use .50" wide feeler stock of correct thickness (see Table below) inserted between piston and cylinder wall at right angles to pin to check clearance. Pull required to withdraw feeler should be 6-10 lbs. (all types).

Engine With Sleeves	Feeler Thickness Steel Piston	Aluminum Piston
New Piston & Sleeve	.003"	.003"
New Piston—Worn Sleeve	.004"	.004"
Worn Piston & Sleeve	.005"	.005"
Engines Without Sleeves		
New Piston & Bore	.0025"	.002"
New Piston—Worn Bore	.004"	.004"
Worn Piston & Bore	.005"	.005"

PISTON RINGS: Two compression, two slotted oil rings per piston (lower oil ring below pin). Upper oil ring groove slotted, lower ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. (#1)	.0915-.0920"	.012-.017"	.0015-.003"
Compr. (#2)	.0915-.0920"	.012-.017"	.001-.0025"
Oil (#3, 4)	.1540-.1550"	.012-.017"	.001-.0025"

Replacement Rings: Std., .020", .030", .040", .060".

PISTON PIN: Diameter .7501-.7504" Length 2.975" (with steel pistons), 2.850" (aluminum pistons). Floating type with locking ring in piston at each end. Pin hole in rod is bronze-bushed.
Pin Fit in Piston—.0001-.0002" clearance (aluminum pistons), .0003-.0009" clearance (steel pistons) or light hand push fit with piston at 70°F.
Pin Fit in Rod Bushing—.0002-.0005" clearance (pin should pass through bushing slowly of own weight).

Replacement Pins: Std., .002" Oversize, .002" Undersize, .001" Undersize.

CONNECTING ROD: Length 7.000". Weight 492 grams.
Crankpin Journal Diameter—2.1390". Connecting rod bore diameter 2.360" (2.3597-2.3603").
Lower Bearing Type—Steel-backed, special alloy lined with bearing surface on both inner and outer face. Bearing floats in both rods (side-by-side mounting). Bearing Dimensions—Length 1.747", Thickness .1095".
Clearance—.0015-.0035" (see Bearing Adjustment).
Sideplay—.003-.007" (bearing endplay), .006-.014" (side clearance for both rods).
Bearing Adjustment: None (no shims). Do not file bearing caps. Replace bearings if less than .1085" thick, replace or hone rods for oversize bearings if worn more than .0015" over original size of 2.3597-2.3603". CAUTION—Both rods must be same size.

Connecting Rod Bearing Servicing: *See Mercury Special Data.*

Replacement Bearings: Std., .003", .010", .015", .020". Also furnished Oversize on O.D. for oversize rods.

Installing Rods: Marks on rods and bearing caps (R1, L1, etc.) must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT: Three bearing type with integral counter-weights.

Replacement Bearings: Std., .005", .010", .015", .022", .030".
Journal Diameters—2.4990" (all main bearings).
Bearing Type—Steel-backed, special alloy lined.
Clearance—.001-.003"

Bearing Adjustment: None (no shims). Replace bearings. Do not file bearing caps.
MAIN BEARING NOTE—Some cylinder blocks have been manufactured with main bearing bore .015" Oversize. These blocks can be identified by mark 'ERP' stamped on oil pan gasket flange at left front corner of block.
CAUTION—All bearings installed in these engines must be special "O.D. .015"" Oversize type.

End Thrust: Taken by rear main bearing flanges. Adjust by replacing bearing. **Endplay .002-.006".**

CAMSHAFT: Three bearing type. Helical gear drive.
Bearing Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitted bushings.
Clearance—.001-.002"
End Thrust: Taken by gear hub and thrust surface on inner face of cover plate. Adjusted by replacing cover plate. **Endplay**—.005-.015"

Camshaft Bearing Removal & Installation: *See Mercury Special Data.*

Camshaft Oil Pump & Distributor Drive Gear Removal & Installation: *See Mercury Special Data.*

Camshaft Removal & Installation: *See Mercury Special Data.*

Timing Gears: Crankshaft Gear—Cast alloy iron. *Camshaft Gear—Aluminum alloy bolted-on type.*
Backlash—.004" maximum.

Replacement Gears: *See Mercury Special Data.*

Camshaft Setting: Mesh marked tooth of crankshaft gear in similarly marked space between teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
All Valves	1.510"	.3095-.3105"	4.577"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.292"	.0015-.0035"
Exhaust	45°	.292"	.0025-.0045"

NOTE—Service limit for valve stem diameter is .309" Intake, .3065" Exhaust. Valves interchangeable.

Valve Guides: Split type retained by "C" washer and valve spring. *NOTE—Replace both halves of all guides measuring less than .6665" (thickness of guide half and valve stem at top of guide with valve of .311" stem diameter in place in guide).*
See Mercury Special Data.

Valve Lifters: Barrel type operating in guide holes in cylinder block.
Diameter—.9995". Replace if worn to less than .998" in diameter or length less than 1.710" after any necessary resurfacing of ends (cast type can be resurfaced on both ends, pressed steel type on bottom end only).

ENGINE

CONTINUED FROM PRECEDING PAGE

Clearance—.0005-.0015". Lifter should slip into hole in block of own weight.

Valve Springs: Replace springs if pressure less than 30 lbs. when compressed to 2.125".

	Spring Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

VALVE TIMING

Tappet Clearance: 010-.012" Intake, .014-.016" Exhaust, Cold. No adjustment.

Valve Timing: See Camshaft Setting above.

Intake Valves—Open AT TDC. Close 44° ALDC.

Exhaust Valves—Open 48° BLDC. Close 6° ATDC.

Valve Timing Check—No flywheel marks or other means provided to check timing. #1 intake valve should open with #1 piston on top dead center entering the intake stroke.

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, and timing gears. Oil pump mounted in crankcase at rear of engine.

Crankcase Capacity—5 quarts.

Normal Oil Pressure—30 lbs. at 2000 RPM.

Oil Pressure Regulator—Located under plug above front camshaft bearing (under manifold) and on oil pump housing (some models). Not adjustable. NOTE—Check relief valve tension spring whenever engine overhauled. Replace the cylinder block relief valve spring if tension not within limits of 43-50 ozs. at 1.380" (engines without oil pump relief valve), or 78-80 ozs. at 1.380" (engines with oil pump relief valve). Replace oil pump relief valve spring tension not within 78-87 ozs. at 1.380".

Oil Pump: Gear type. In crankcase at rear of engine.

►NOTE—This new type pump, No. 41A-6600-A (for engines without oil pan baffles), has oil pressure regulator (relief valve) in pump body.

See Mercury Special Data.

Oil Filter: Replace cartridge at 5000 mile intervals (Ford No. 01A-18662-A Unit).

Oil Pressure Gauge: King-Seeley Electric. Ford Nos.

Dash Unit—No. 59A-9273 ('46), No. 6M-9273 ('47).

Engine Unit—No. 41A-9278 (80 lbs. type).

See Miscellaneous Section for complete data.

COOLING

Cooling System: Positive circulation with two water pumps at front of engine (pump for each bank).

Capacity—22 quarts.

Pressure Valve—In radiator filler cap. Opens at 3½-4½ lbs.

Water Pump: Packless, centrifugal type (2 used). Mounted on front of engine (pump housing integral with front engine mounting).

See Water Pump Section for complete data.

Removal—Drain cooling system, place support jack under engine (use wood block on jack to avoid damaging pan), remove bolt from front engine support, raise engine until no weight rests on front support. Loosen generator mounting bolt, remove drive belt. Disconnect and remove hose at pump. Remove four capscrews mounting pump on engine, lift pump out. CAUTION—One mounting screw located within water pump inlet connection (accessible with hose removed).

Belt Adjustment—*See Generator Belt Adjustment.*

Thermostat: In each cylinder head water outlet (two used). Start to open at 150-155°F. Fully open at 175-180°F.

Temperature Gauge: King-Seeley Electric Ford Nos.

Dash Unit—No. 59A-10883 ('46), No. 6M-10883 ('47).

Engine Unit—No. 01A-10990 (Temperature Gauge Switch—in left hand cylinder head), No. 99A-10884 (regular Engine Unit—in right cylinder head).

See Miscellaneous Section for complete data.

CLUTCH

Long Model 10CF-TI, Ford No. 19A-7563. Single plate, semi-centrifugal, dry disc type.

See Clutch Section for complete data.

Facings—Woven asbestos composition. I. D. 6¾". O D 10". Thickness ⅛".

Pedal Adjustment: Pedal free travel 1-1¼". To adjust, disconnect clevis at equalizer (throw-out) shaft end of pedal connector rod, turn clevis on rod.

Removal: Remove Transmission (see Transmission Removal below). Install wooden wedges between each release lever and cover to hold the clutch in released position, take out six capscrews mounting cover assembly on flywheel, lift out cover assembly

TRANSMISSION

Own Make. Three-speed, all-helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

Transmission Control: Remote control type with gearshift lever on steering column.

See Transmission Section for complete data.

Removal: Remove Rear Axle (see Rear Axle Removal below), remove capscrews mounting front seat track on floor move front seat back for necessary room. Take out mounting screws in front floor pan spacer, remove spacer. Disconnect gearshift connecting rods at transmission case, disconnect and remove equalizer (clutch release) shaft. Remove capscrew and washer on end of transmission shaft (in universal joint), remove universal joint. Remove nuts and washers on engine rear support bolts. Support engine by placing jack (use wood block on jack) under rear end and raise engine sufficiently so that rear support clears mounting bolts (NOTE—remove nuts holding lower half of engine rear support assembly and remove the assembly). Take out eight capscrews mounting transmission case on flywheel housing, pull transmission straight back

UNIVERSALS

Spicer Model 202-6X, Ford No. B-7090. Steel bushing type. Single joint in torque ball at transmission.

REAR AXLE

Own Make. ¾ Floating. Spiral Bevel Gear type with Torque Tube Drive.

See Rear Axle Section for complete data.

Ratio—3.54-1 Std. 3.78-1 & 4.11-1 Opti.

Backlash—.012" maximum.

Removal: Raise rear end of car. Disconnect track bar Disconnect rear spring (use spring spreader if available) by placing block under each rear spring eye and lowering car so that weight keeps spring extended and then removing spring shackle bolts and bars Take out pin in hand brake equalizer and disconnect hand brake cable. Disconnect hydraulic brake line at torque tube and rear shock absorber links at each wheel Disconnect accelerator pedal, remove pedal pads, floor mat, beam control switch (take out two mounting screws), and floor pan. Disconnect speedometer cable at torque tube. Remove nuts on four universal joint ball housing bolts and two bolts holding ball cap halves together, remove ball cap. Pull rear axle back to disconnect torque tube from transmission and remove from beneath car.

SHOCK ABSORBERS

Houde. Double acting, hydraulic, adjustable type.

Houde Model	Right — Ford No.	— Left
Front BBCN-3	51A-18045	51A-18046
Rear① BBCZ-3	51A-18080A	51A-18081A
Rear② BBCZ-3	51A-18080B	51A-18081B

①—Except Sedan Delivery and Station Wagon.

②—Sedan Delivery & Station Wagon only.

Adjustment: Standard setting marked by line on face of lever hub (pointer should be aligned with this mark). Adjustment can be varied by turning pointer clockwise (for more control) or counter-clockwise (for less control) not more than 1 or 2 serrations at a time. NOTE—Stops are provided to limit adjustment in either direction.

Refilling: Check every 5000 miles, fill to level of the filler plug hole. Use Ford No. M-4633-B fluid only (Houde L-1404) required for these new shock absorbers (identified by round top filler plug).

FRONT SUSPENSION

Front Axle: Conventional "I" beam section type with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods.

Kingpin Inclination—8° crosswise.

Caster—3°. Axle may be bent cold for minor corrections providing correct tools used to prevent crushing of axle flange.

Camber—¾° Adjust as for Caster (above).

Toe In—1/16" Adjust in usual manner by changing length of tie rod.

STEERING GEAR

Gemmer design (Model 305), Ford Make. Worm-&-Roller type with push-pull adjustments.

See Steering Gear Section for complete data.

BRAKES

Service: Lockheed Hydraulic, self-centering, double anchor type. Hand lever applies rear wheel brakes.

►These brakes do not have anchor pin adjustments.

See Brake Section for complete data.

Drums—Composite iron and steel. Diameter 12".

Clearance—Least possible amount without drag.

Lining—Width 1.75". Thickness .187". Length per shoe 13.12" (forward shoes), 10.08" (rear shoes).

Hand Brakes: See Service Brakes (above).

MISC. MECHANICAL

Power Operated Convertible Top: 2 types as follows:

1—Convertible—Auto-Lite electric type.

2—Sportsman Convertible—Hydro-Lectric type.

See Miscellaneous Section for complete data.

Power Window Regulators (Sportsman Convertible): Hydro-Lectric type.

See Miscellaneous Section for complete data.

HOOD ALIGNMENT & RADIATOR GRILLE REMOVAL: *See Mercury Special Data.*

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on plate attached to engine side of dash and on top of right frame side rail to rear of front suspension upper control arm.

TUNE-UP

▷**Fuel Pump Pushrod Bushing Installation (To correct wear and excessive looseness)**—*See Mercury Special Data.*

COMPRESSION PRESSURE: 115 lbs. at cranking speed.

VACUUM READING: Steady 18-21" idling at 500 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2. See diagram.

SPARK PLUG GAPS: .030" Limits .029-.032".
Plug Type—Champion H-10. 14 mm.

DISTRIBUTOR: Breaker Gap—.014-.016".
Cam Angle—28-30° (closed).
Breaker Arm Spring Tension—17-20 ounces.
Advance Performance—*See Ignition.*
Condenser Capacity—.21-.25 microfarad.
Distributor Line (Carburetor Connection) Vacuum—.25" at 800 RPM., .8" at 1000 RPM., 1.7" at 1200 RPM., 2.4" at 1400 RPM., 2.8" at 1600 RPM.

▷**NOTE**—Cars with "1CM" carburetors will have a higher distributor line vacuum at high speed or full open throttle than cars with "OCM" carburetor. *See "Lincoln & Mercury Dual Concentric Carburetor" in Carburetor Section.*

IGNITION TIMING: 2° BTDC.
Timing Procedure—*See Ignition Timing.*
Crankshaft Pulley Mark—Small circular button on rim of pulley.

CARBURETION: Dual-concentric carburetor.
Idle Setting—Approx. 1 turn open. Two screws—turning screws out gives richer mixture.
Idle Speed—(Std. Trans.) 400-450 R.P.M. (Merc-o-matic) 425 R.P.M. Max.
Float Level—Fuel level ½" ± 1/32" below top edge of bowl. Use Fuel Level Gauge No. 9550-B.

▷***NEW "CLIP TYPE" FLOAT NEEDLE & SEAT ASSEMBLY***—furnished for replacement.
Accelerating Pump—Center Hole average setting. Inner Hole for hot weather, Outer for cold weather.

Choke Setting: Index mark on coil cover aligned with center mark on housing (maximum variation one division either side).

Fuel Pump Pressure: 3½-4½ lbs.

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve located between right end of exhaust pipe cross over and right exhaust manifold.

VALVE TAPPET CLEARANCE: ***CAUTION—Different camshafts used in 1950 & 1951. Valve tappet clearances are different.***
1949-50—Intake .010"-.012". **Exhaust** .014"-.016"
1951—Intake .013"-.015". **Exhaust** .017"-.019".
Valve Timing Check—***See Valve Timing.***

STARTING: ***See Battery, Starter, Generator, Regulator.***

IGNITION

IGNITION SWITCH: Mercury No. (1949) 6A-11572-A, (1950-51) OL-11572-A.
Ignition Lock—Mercury No. (1949 Early 1950) **8H-11582-A,** (1950-51) **8H-11582-B.**

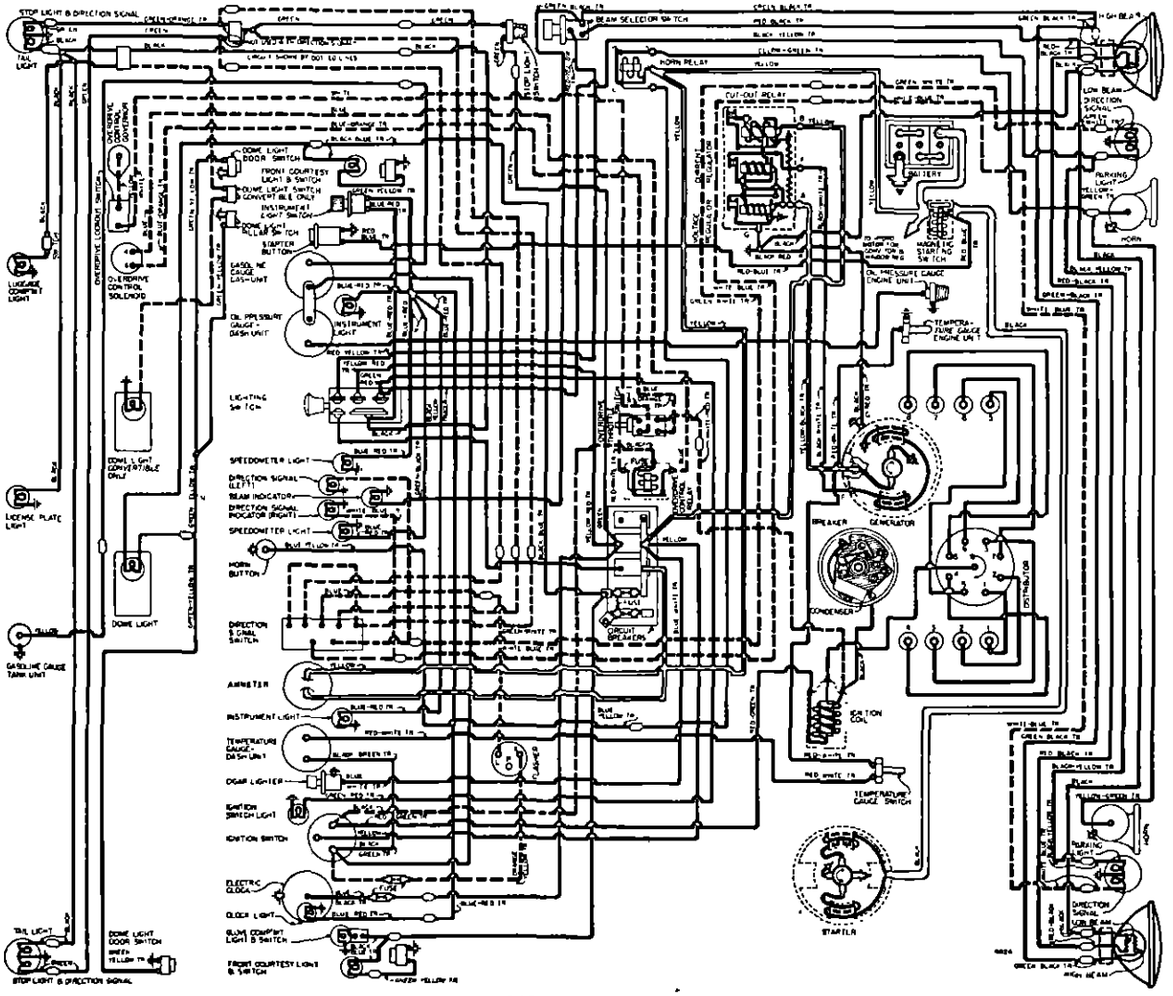
COIL: Mercury No. (1949) 7RA-12029-A, (1950-51) 8BA-12029. Primary resistance 1.05 ohms (75°). Secondary resistance 4100 ohms (75°).

Location—On front lower corner of right cyl. hd.
Ignition Current—***2.75-3.0 amperes idling. 5.0-5.5*** amperes stopped.

CONDENSER: Mercury No. 7RA-12300-B.
Capacity—.21-.25 microfarad.

DISTRIBUTOR: Mercury No. (1949-Early 1950) 7RA-12127-C (less Cap and Rotor). (1950-51) OCM-12127. "Pressure Type" distributor with spark controlled by diaphragm.

▷***DISTRIBUTOR REPLACEMENT CAUTION—When replacing Distributor No. 7RA-12127C with Distributor OCM-12127, the new front cylinder cover, Part No. OBA-6059A MUST BE INSTALLED.***
See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.



▷**Excessive Pinging Correction & Retarded Spark Complaints on first cars**—*See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section.*

Breaker Gap—.014-.016".
Cam Angle—28-30° (closed).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.

Advance Performance
▷With Distributor on Test Unit

Distr. Degrees	Vacuum	R.P.M.
0°	0"	200
1¼-2¼°	0.4"	500
4¼-5¼°	1.7"	1000
6¼-7¼°	2.8"	1500
7½-8½°	3.7"	2000

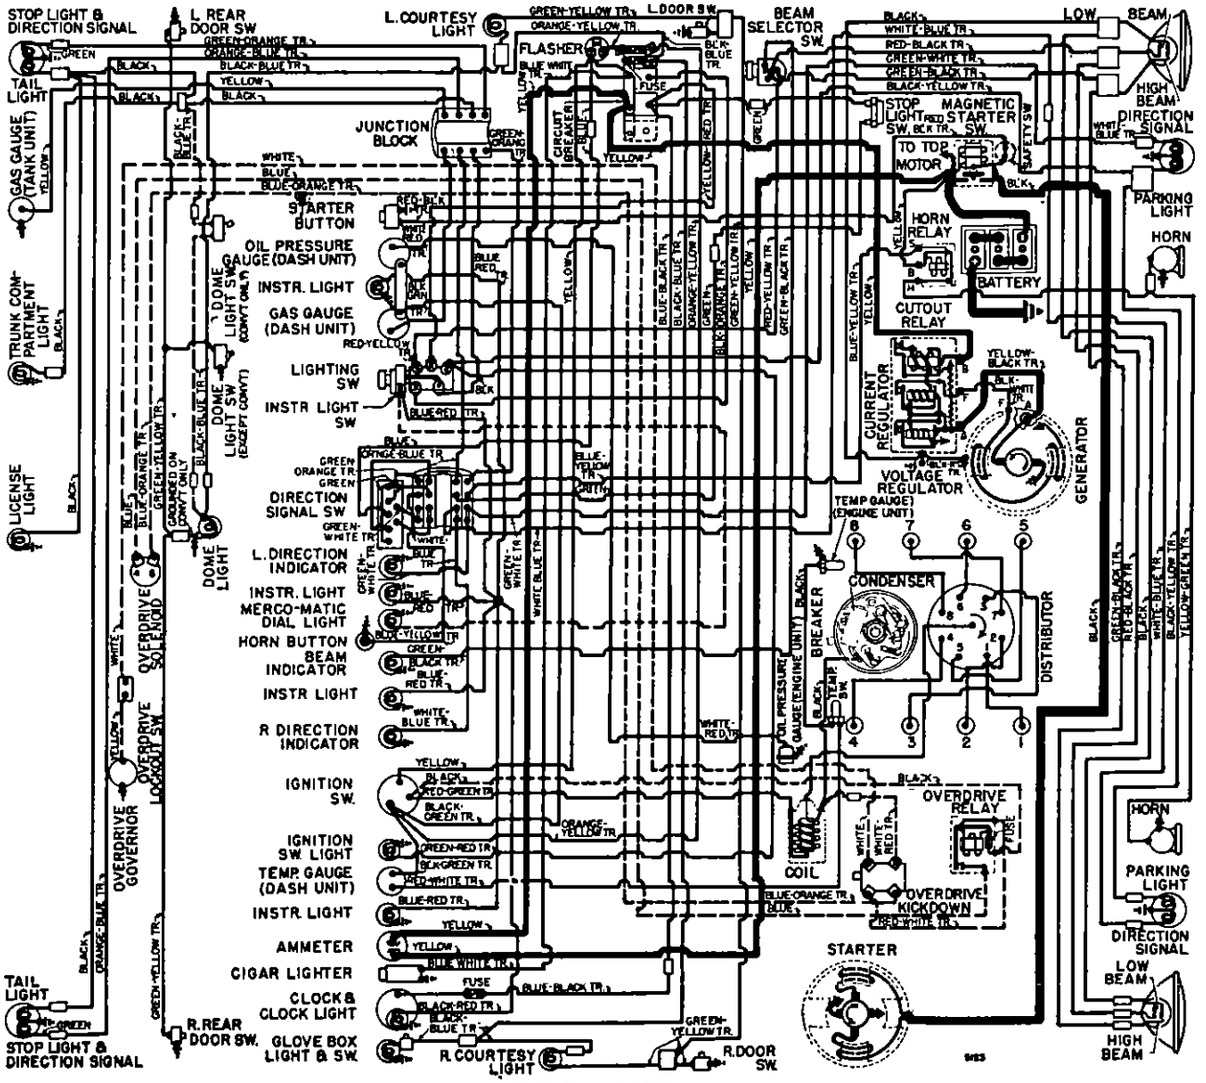
Distributor Removal: Mounted at front of engine on right side. To remove, disconnect vacuum line, take out hold down screw, lift off.

1949 MODELS

IGNITION TIMING

Std. Setting ..... **2° BTDC.**

►*IGNITION TIMING NOTE*—Improved performance can be obtained by advancing timing 4° (total advance will be 6° indicated on dampener). Paint ¼" wide stripe on ADVANCE side of timing mark to indicate new setting. (Edge of line indicates 6° point).



Crankshaft Pulley Mark—Small circular button on rim of pulley. Timing pin above pulley on right side.

►*DISTRIBUTOR TIMING INDICATOR PLATE PRODUCTION CHANGE—(Used beginning June 1951, and can be installed on 1949 & later cars)*—Indicator plate, Part No. 1CM-12182-A can be installed on right front water outlet support capscrew under wire clip. Time engine as outlined under "Initial Timing" (below). Note position of end of distributor clamping flange in relation to timing marks on indicator plate. Then proceed as indicated in "Final Timing" (below).

Initial Timing—With #1 piston in firing position, timing mark on pulley aligned with timing pin on front of engine, loosen hold down screw on distributor, rotate distributor until contacts begin to open, tighten hold-down screw. Check spark plug connections (see diagram), see that rotor at #1 position in distributor cap. Then make "Final Ignition Timing" as directed below.

Initial Timing (With Neon Timing Light)—Disconnect vacuum line to prevent automatic advance operating, idle engine and adjust as above so that timing mark appears to be at pointer on front of engine. Then make "Final Ignition Timing":

Final Ignition Timing—After Initial Timing (above), note position of end of distributor clamping flange with relation to scale on Indicator Plate on cylinder head water outlet. ADVANCE timing by moving distributor in direction of arrow (counter-clockwise) one graduation on scale. Road test car for objectionable or engine roughness under load. Repeat until ping or roughness noted, then RETARD distributor until pinging and roughness eliminated.

1950-51 MODELS

CARBURETOR

Holley-Ford dual concentric (double barrel) downdraft with automatic choke.

1949-Early 1950 Std. Trans..... **8CM-9510-G, H, J**
1950-1951 Std. Trans..... **1CM-9510-G,H,J**
1950 (Early) Merc-O-Matic..... **1CM-9510-K,L,M**
1950-1951 Merc-O-Matic ①**1CM-9510-N,P,R**
①Automatic choke mounted on intake manifold.
See Carburetor Section for complete data.

►*ADAPTING LATE TYPE (Stamped 8-49 & Later) CARBURETOR TO EARLIER MODELS—See Carburetor Section for complete data.*

►*NEW "CLIP TYPE" FLOAT NEEDLE & SEAT ASSEMBLY*—furnished for replacement.

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*

Metering Jets—*See Holley-Ford Jet Specification Table in Carburetor Section.*

Fast Idle: Holley-Ford Carburetor type.
See Carburetion Equipment Section for complete data.

Automatic Choke: Holley-Ford Carburetor type.

►*AUTOMATIC CHOKE PRODUCTION CHANGE*—Automatic choke moved to position on intake manifold on late 1950 & 1951 Merc-O-Matic cars.
See Carburetion Equipment Section for complete data.

Setting—Index mark on coil cover aligned with center mark on housing (maximum variation one division either side).

CARB. EQUIPMENT

Air Cleaner (Oil Bath): Mercury No. (1949) 8CM-9600-A1, (1950-51) 8CM-9600-A5.

►*CAUTION: Oil Bath Air Cleaners stamped "HH" on underside should be serviced with ½ pint of engine oil only. Disregard level mark or 1 pint specifications.*

Fuel Pump (std.): Mercury No. 7RA-9350-C.

►**Fuel Filter Change to "Edge" type**—*See Lincoln Mercury Dual Concentric" in Carburetor Section.*

Optl. (Fuel-&-Vacuum)—Mercury 8CM-9350-A, C.
Pressure—3½-4½ lbs. (both types).
See Carburetion Equipment Section for complete data.

►**Fuel Pump Pushrod Bushing Installation (To correct Wear and Excessive Looseness):** *See Mercury Special Data.*

Gasoline Gauge: King-Seeley Electric.
Dash Unit—Mercury No. (1949) 8M-9280, (1950-51) OM-9280.
Tank Unit (exc. Sta. Wgn.)—Mercury 99A-9275-B.
Tank Unit (Sta. Wagon)—Mercury No. 01A-9275-A.
See Carburetion Equipment Section for complete data.

BATTERY

Mercury No. 8M-10655-A. 6 volt, 17 plate, 100 A. H. Zero Capacity—300 amperes for 3.3 minutes. Five Second Voltage—4.2 volts.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Grounded Terminal—Positive (+) terminal.
Location—On left side in engine compartment.
Dimensions—L. 10 9/16". W. 7¼". H. 8 1/16".

STARTER

Mercury No. (Std. Trans.) 7RA-11002. Armature No 18-11005. **(Merc-O-Matic Trans.) 1CM-11002.** Armature No. 1CM-11005-A.
Drive—Mercury No. (Std. Trans.) B-11350. (Merc-O-Matic) 1CM-11350-B.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ounces.
Cranking Engine—100-180 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
No Load①	4000-6000	5.8	45-60
15 ft. lbs.	Lock	3.5	600

①—Manufacturer recommends taking "No Load" reading by inserting 0-600 range ammeter in battery circuit at battery and operating starter while engine is idling.

Starting Switch: Mercury No. 21A-11450 Magnetic Switch mounted on left front fender apron and controlled by panel pushbutton switch 6H-11500.

Removal: On right front face of flywheel housing cover. To remove, take off right engine splash pan (if used), free starter-to-oil pan bracket, take out 2 starter through bolts.

GENERATOR

Mercury No.	Armature No.
8BA-10002-D	OA-10005-A
OM-10002	8HJ-10005
8EL-10002-B	8EH-10005
8BA-10002-C	8BA-10005-B

2 Brush type with current and voltage regulation.
Charging Rate Adjustment—None. See Regulator.
Maximum Charging Rate—Controlled by regulator (dependent on battery condition).
To Check Generator Output—Connect ammeter in series with charging line at regulator "ARM" terminal, connect short insulated jumper between generator "A" and "F" terminals (to short out regulator). Run engine at approximately 1500 RPM. and note ammeter reading. If generator output equals or exceeds rate output (below) generator performance is satisfactory. Remove jumper.

▷***CAUTION—Do not operate generator at higher speeds or in service with jumper connected between generator armature and field terminals. This jumper eliminates all regulator action.***

Performance Data

Generator	Amperes	Engine R.P.M.
8BA-10002-D	30	1500
OM-10002	32	1500
8EL-10002-B	40	1500
8BA-10002-C	60	1500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-24 ozs.

Generator Belt Adjustment: Loosen 2 bolts on fan mounting bracket, loosen generator support mounting stud nut, raise generator up until side movement on belt midway between generator and water pump pulley is ¾" (thumb and finger pressure), tighten stud nut.

Fan Belt Adjustment: *See COOLING.*

REGULATOR

Mercury Numbers

Regulator No.	Generator No.
51A-10505-A	8BA-10002-D
8A-10505-A	OM-10002
8L-10505	8EL-10002-B
8BA-10505-A	8BA-10002-C

Voltage-current 3-Unit types.
See Electrical Equipment Section for complete data.

NOTE—Separate ground wire extending to cowl must be in place when generator operated.

Regulator Settings (Cold)

	①Cut-in Volts	Voltage Regulator Volts	Current Regulator Amperes
51A-10505-A	6.6-7.0	7.2-7.6	30-34
8A-10505-A	6.0-6.4	7.2-7.6	30-34
8L-10505	6.0-6.4	7.2-7.6	38-42
8BA-10505-A	5.9-6.2	7.1-7.3	55-60

①—Cuts Out at 0-8 amperes discharge (all).
Checking & Adjustment—*See Electrical Equip. Section*
Cut Out Relay Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts open.
Voltage Regulator Air Gap—.032-.035"①.
Current Regulator Air Gap—.032"-.035"①.
①—Between armature and core with contacts just closed.

▷***CAUTION—Make certain gauge contacts armature and not brass rivet on underside of armature.***

Contact Spring Tension (voltage & current regulators) 5 ounces minimum with contacts just opening.

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.
Adjustment—Aim upper beams straight ahead (hot spot centers 3" below lamp center height at 25 ft.).
Beam Indicator—Bulb between 50 and 60 on speedometer. Lighted with Upper Beam "on".

Direction Signal: Std. *See Electrical Equipment Section.*
Direction Indicators—Right and Left indicators on lower edge of speedometer.
Direction Signal Flasher—Mercury No. 8L-13350-B.

Switches

Lighting—Mercury No. (1949) 7RA-11654. (1950-51) OL-11654.

Beam Selector—Mercury No. (1949) 7RA-13532. (1950-51) 8A-13532.

Instrument—Mercury No. (1949) 5EH-13740-B. (1950-51) OL-13740.

Glove Box—Mercury No. (1949) 8L-14413. (1950-51) OM-14413-A.

Dome Light—Mercury No. (1949) 8M-13752-A. (1950-51) OM-13752.

Dome Light (Convertible)—Mercury No. (1949) 8H-13752-A. (1950-51) OH-13752.

Door Switches—Mercury No. 8M-13713.

Stop Light—Mercury No. 11A-13480.

Trunk Light—Mercury No. (1949) 8M-13546. (1950-51) OM-13546.

Directional Signal—Mercury No. (1949) 8L-14486. (1950) OL-14486. (1951) 1M-14486.

MISC. ELECTRICAL

CIRCUIT BREAKERS: Mercury No. 8L-12258-A, No. 8H-12258-A (Convertible). Three used on one mounting, located on dash behind instrument panel together with two fuses (see wiring diagram for positions on bracket).
30 Ampere CB—Protects main lighting system.
15 Ampere CB—Protects speedometer light, control panel light, instrument cluster light, electric clock and clock light.
15 Ampere CB—Protects hydraulic equipment.

FUSES: Courtesy, Dome, Glove Box and Map Lights—14 ampere. Located on circuit breaker behind instrument panel (see wiring diagram).
Direction Signal—14 ampere. Located on circuit breaker behind instrument panel (see wiring diagram).
Clock—3 ampere. In clock feed wire.
Overdrive—30 ampere. On IGN terminal of overdrive relay (on dash under hood).
Heater—20 ampere. In lead to heater switch.

HORNS: Mercury No. 51A-13832-A, B (High Pitch, Right Horn). 51A-13833-A, B (Low Pitch, Left Horn). Dual horns operated by relay.
Air Gap—.027-.029" for high pitch (right horn), .032-.034" for low pitch (left horn).
Horn Current—13 amperes (high pitch), 14 (low).

Horn Relay: Mercury No. 7RA-13853-A. On dash.
Contact Gap—.015-.025".
Contact Closing Voltage—4 volts max.

ENGINE

ENGINE SPECIFICATIONS: Own Make. Eight cylinder "L" head, 90° Vee type with both cylinder banks and crankcase cast Enbloc.
Bore—3 3/16". **Stroke**—4".
Displacement—255.4 cu. ins. **Rated HP**—32.5.
Developed Horsepower—110 at 3600 RPM.
Compression Ratio—6.8-1 cast-iron head.
Compression & Vacuum Reading—*See Tune-Up.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Mercury Special Data.*

▷***CYLINDER HEAD LEAKS (Caused by Distributor Hold-down bolt)—See Mercury Special Data.***

OIL PAN & ENGINE REMOVAL: *See Mercury Special Data.*

PISTONS: Aluminum alloy, steel strut, dome head, U-slot, cam ground type.

▷***CAUTION—Mercury and Ford Pistons or Rings are not interchangeable.***

Weight—370 grams. **Length**—2.89" (exclud. dome).
Removal—Pistons and rods removed from above.
Clearance—.0005-.001". See Fitting Pistons.
Cyl. Bore Wear Limits—Out-of-round .003", Taper .006".

Replacement Pistons: Furnished Standard, .0025", .020", .030" & .040" Oversize.

Fitting Pistons: Use ½" wide feeler inserted between piston and cylinder wall at right angles to pin. Feeler thickness .0015" for New Piston in New Bore, Pull to withdraw feeler 6 to 12 lbs.

PISTON RINGS: Two compression, two slotted oil rings per piston (lower oil ring below pin). Rings are taper faced. Upper oil ring groove slotted, lower ring groove drilled for oil drainage.
NOTE—Top compression ring Chrome plated.

▷***CAUTION—Mercury and Ford Piston Rings are not interchangeable (heavier rings used on Mercury).***

ENGINE

CONTINUED FROM PRECEDING PAGE

Ring	Width	End Gap①	Side Clearance
Compr. #1	3/32"	.010-.017"	.0015-.003"⑧
Compr. #2	3/32"	.010-.017"	.001-.0025"③
Oil #3 & #4	3/16"	.010-.017"	.0015-.003"⑧

Worn Limit—① .035", ⑧ .004", ③ .0035".
Ring Thickness—Compr. .154", Oil .142".

Installing Rings: Top compression ring assembled with counterbore to top. Lower compression ring assembled with side marked "TOP" to face top of piston.

Replacement Rings: Ring sets furnished standard size and .020", .030", .040" Oversize.
NOTE—Service Rings have expander behind top oil ring, not the bottom.

PISTON PIN: Diameter—.7501-.7504". **Length**—2.847". Floating type. Pin hole in connecting rod bronze bushed.
Pin Fit in Rod—.0002-.0004" clearance. Light thumb push fit. Worn Limit .0015".

Replacement Pins: Std. size & .001", .002" Oversize.

CONNECTING ROD: Length—7".
Weight—524 grams (less bearings).
Crankpin Journal Diameter—2.138-2.139". Maximum wear limit out of round .0015", Taper .001".

►**Lower Bearing**—*Locked in (not floating type as used on earlier engines)*, steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves interchangeable.
Clearance—.0005-.003" (new), .005" (worn limit).
Side Play—(2 rods) .006-.020". Worn Limit .022".

►*NOTE—Replace bearing shells less than .0745" thick.*
Bearing Adjustment—None. Replace bearings.

►**CONNECTING ROD INSTALLATION**—*See "Connecting Rod & Bearings" in Mercury Special Data.*

Replacement Bearings: Standard size and .002", .010", .020", .030", .040" Undersize.

CRANKSHAFT: 3 bearing, 6 integral counterweights.

►*SLUDGE TRAPS—Crankpin throws equipped with sludge traps having removable plugs for cleaning.*
Journal Diameters—2.498-2.499" (all main journals).
Wear Limits: .0015" Out-of-round, .001" Taper.
Bearings—Steel-backed, copper-lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.001-.0026".

►*NOTE—Replace main bearing shells when less than .0835" thick.*
Bearing Adjustment—None. Replace bearings.

Replacement Bearings: Standard size and .002", .010", .020", .030" Undersize. Rear mains also furnished .015" longer for taking up excessive endplay.

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.002-.006" (new), .008" (worn).

CAMSHAFT: *CAUTION—Different Camshafts used in 1950 & 1951.* Three bearing. Helical gear drive. Distributor drive gear pressed on front end of shaft, oil pump drive gear on rear end.

►*CAMSHAFT PRODUCTION CHANGE VEHICLE NO. 9CM-826 UP (1949)—Change to REVERSE helix timing gears. See Mercury Special Data.*
Camshaft Journal Diameter—1.7965-1.797".
Bearing Diameter—1.7985" (replace bearing if diameter greater than worn limit of 1.8015").

Replacement Bearings: Standard size and .010", .015" Undersize. Undersize bearings require finish reaming.

End Thrust: Taken by front end of camshaft and thrust surface on inner face of front cover. Adjust by replacing front cover. **End Play**—.007-.016".

Camshaft Bearing Removal & Installation: *See Mercury Special Data.*

Camshaft Oil Pump & Distributor Drive Gear Removal & Installation: *See Mercury Special Data.*

Camshaft Removal & Installation: *See Mercury Special Data.*

Timing Gears: L.H. helical. Fiber camshaft gear.
Replacement Camshaft Gears—Standard, .006" & .012" Oversize. *See "Timing Gears" in Mercury Special Data.*

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diam.	Stem Diam.	Length
Intake	1.515"	.342"	4.8175"
Exhaust	1.515"	.3405-.3415"	4.8175"

	Seat Angle	Lift	Stem Clearance
Intake	45°	①	.0006-.0026"
Exhaust	45°	①	.0011-.0031"

①—(1949-50) .338", (1951) .333".

►*ROTATABLE VALVES USED IN 1951 ENGINES (Can be Installed in 1949 & 1950 Engines)—See "Valve System" in Mercury Special Data.*

►*REPLACEMENT VALVES—Exhaust valves furnished for replacement to be used for ALL VALVES.*
Valve Seat Inserts—Used on all valves.
Valve Seat Width—1/16-5/64".

Valve Guides: One piece type positioned and retained by "C" washer. Inside diameter .344". Outside diameter 1.031". Distance from top of valve seat to upper end of guide 1.116".
Valve Guide Bushing—Rubber seal used around outer diameter of intake valve guide bushings.

Valve Lifters: Barrel type operating in guide holes in cylinder block.
Diameter—.9992" (replace if worn to less than .9977"). Length limit after resurfacing end 1.728".
Clearance—.0007-.0016" (new), .003" (worn limit).

Valve Springs: Coated springs used.
Spring Test—37-40 lbs. at 2.125". Free length 2.41".

VALVE TIMING

VALVE TAPPET CLEARANCE: *CAUTION—Different camshafts used in 1950 & 1951. Valve tappet clearances are different.*
1949-50—Intake .010"-.012". Exhaust .014"-.016".
1951—Intake .013"-.015". Exhaust .017"-.019".

Valve Timing: See Camshaft Setting above.

1949-50

Intake Valves—Open 10° BTDC. Close 50° ALDC.
Exhaust Valves—Open 50° BLDC. Close 10° ATDC.

1951

Intake Valves—Open 5° BTDC. Close 51° ALDC.
Exhaust Valves—Open 47° BLDC. Close 9° ATDC.
Valve Timing Check—*See "Valve System" in Mercury Special Data.*

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, timing gears and distributor drive gear. Piston pins and valve lifters lubricated by splash. Oil pump mounted in crankcase at rear of engine.
Crankcase Capacity—5 quarts (refill).
Normal Oil Pressure—55 lbs. at 2000 RPM.

Oil Pressure Relief Valve: In oil pump body. Not adjustable.
Spring Tension—12 lbs. at 1.14".
NOTE—Cylinder block oil relief valve not used.

Oil Pump: Gear type. In rear of crankcase.

Oil Filter: On left cylinder head. Replace cartridge each 5000 miles or more often if required.
Oil Filter Cartridge—Mercury No. 8CM-18662.

Oil Pressure Gauge: King-Seeley Electric.
Dash Unit—Mercury No. (1949) 8M-9273. (1950-51) OM-9273.
Engine Unit—Mercury No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler breather cap (inlet), and in outlet pipe below fan.
Servicing—Wash screen in cleaning fluid and wet with engine oil when dry at oil change period (2500 miles).
Outlet Pipe Air Filter Cartridge—Mercury No. 8CM-6841.

COOLING

Cooling System: Pressure type with relief valve in filler cap and two belt-driven pumps (one for each bank) with re-circulating by-pass.
Capacity—22.25 quarts.
Pressure Valve—In radiator filler cap. Mercury No. 26H-8100-B (AC #846740). Opens at 3½-4 lbs.

Water Pumps: Two used. Centrifugal, belt driven packless type. Shaft mounted on pre-packed ball bearings. Require no lubrication service.

►*WATER PUMP REMOVAL CAUTION*—One pump attaching bolt located within water inlet.
NOTE—Bottom bolt must be installed prior to installing water pump pulley.
See Water Pump Section for complete data.
Fan Belt Adjustment—*Loosen 2 fan mounting bracket bolt nuts, raise fan up until side movement of belt midway between fan and crankshaft pulleys is ½".*
Generator (& Water Pump) Belt Adjustment—*See GENERATOR.*

Thermostats: Two used (one in each cylinder head water outlet). Mercury No. 8RT-8575-A.
Setting—Starts to open 148-153°F. Fully open 168-173°F.

Temperature Gauge: King-Seeley Electric.
Dash Unit—Mercury No. (1949) 8M-10883. (1950-51) OM-10883.
Engine Unit—Mercury No. 8A-10990 (switch in right bank), No. 8A-10884 (reg. unit left bank).
See Miscellaneous Section for complete data.

CLUTCH

Borg & Beck Model 10A7 Mercury No. (1949) 8CM-7563-A. (1951) 8CM-7563-B, C. Single plate. Dry disc type with Borglite driven member.
Cover Number—988 stamped on cover.
See Clutch Section for complete data.

►*IMPROPER CLUTCH DISENGAGEMENT CORRECTION (1949 & 1950 Cars)*—New ball type clutch pilot bearing Part No. B-7600-A used in production beginning Aug. 1950, and can be used to replace previous solid bronze type bearing.
Facings—Moulded. Inside diameter 6¾". Outside diameter 10". Thickness .125".

Pedal Adjustment: 1-1¼" free travel. Adjust by loosening locknut and turning adjusting screw on adjusting rod.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal: Remove transmission (see TRANSMISSION Removal below). Remove flywheel housing. Prick punch flywheel and pressure plate so that these parts may be placed in original positions when reassembling. Compress pressure plate assembly with Tool 7563 and remove capscrews. Take off clutch assembly.

TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse).

See Transmission Section for complete data.

▷*TRANSMISSION GEAR SHIFT INTER-LOCK PIN PRODUCTION CHANGE (To reduce possibility of shifting into two gears at once)—See "Ford, Lincoln, Mercury Transmission" in Transmission Section for complete data.*

Transmission Control: Steering column mounted shift.

See Transmission Section for complete data.

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame. Take out eight transmission-to-flywheel housing capscrews and remove transmission.

OVERDRIVE

Warner Model (1949-50) AS1-R10C, (Early 1951) AS1-R10E, (Late 1951) AS4-R10E. (NOTE—AS4-R10E is not equipped with "Lock-out Switch"). Overdrive is solenoid operated type (no centrifugal pawls) with governor control and throttle operated Kick-down Switch.

See Transmission Section for complete data.

▷*LOCKOUT SWITCH NOTE—In the event of lockout switch faulure, it is only necessary to by-pass switch by connecting the two wires together. Leave switch in place or install a plate over transmission opening.*

▷**Prolonged shorting-out of Ignition on Kick-down Correction**—*See "Ford, Lincoln, Mercury (Warner) Overdrive" in Transmission Section.*

Solenoid—Mercury No. 8M-6916-A.

Control Relay—Mercury No. 8M-6915. On engine of dash. 30 ampere fuse at IGN terminal of relay.

Lock-out Switch—Mercury No. 8M-6917-A (Not used on AS4-R10E Overdrive).

Throttle Kick-down Switch—Mercury No. 8A-6918.

Governor Switch—Mercury No. 8M-6919.

Removal: Same as for Std. transmission (above) after disconnecting overdrive control cable and wiring.

MERC-O-MATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication—Check transmission oil level every 1000 miles and maintain oil level at "Full" mark on dip stick. Drain and refill every 15000 miles. Use only Automatic Transmission Fluid, Type A.

Capacity—Approx. 9 qts.

Checking Oil Level—With transmission selector lever in "Neutral," run engine approximately four minutes at idle speed. Clean floor mat and lift right side to expose plate in floor boards, remove plate. When engine and transmission are at normal operating temperature, move selector lever through all ranges to assure distribution of oil throughout the transmission. Clean all dirt away from fluid indicator cap and remove indicator. Wipe indicator and insert in transmission making sure that it is seated and locked. Remove indicator and check level. Add fluid to bring level to "Full" mark on the indicator. Replace indicator and tighten properly. Replace plate and floor mat.

CAUTION—Do not fill above "FULL" mark.

Linkage Adjustment—*See "Mercury Merc-O-Matic" in Transmission Section.*

▷*OTHER MERCOMATIC DATA: See "Fordomatic & Mercomatic" in Transmission Section.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used.

▷***NOTE—Slip joint formed by splined yoke of front universal engaging transmission mainshaft (or overdrive shaft). One-piece propeller shaft used.***

REAR AXLE

Own Make. Semi-floating, hypoid gear type with Hotchkiss drive **(separate carrier not used).** Axle ends flanged (no separate hub). Wheel bearings are sealed-ball pre-lubricated (no lubrication required).

See Rear Axle Section for complete data.

Ratio—Standard: 3.9-1 (43-11). With Overdrive: 4.27-1 (47-11). Station Wagon: 4.55-1 (50-11).

Backlash—.003-.008". Shim adjustment.

Removal: Raise rear of car. Remove axle shafts, and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers, spring U-bolts. Remove axle housing assembly from car.

Axle Shaft Removal: Remove rear wheels. Take out 3 capscrews holding brake drum to axle shaft flange. Remove hydraulic lines from brake backing plate. Take out 4 axle retainer nuts (work through opening in axle shaft flange). Use Tool 4235-A to remove axle shaft and bearing assembly from housing. Take off gasket and backing plate. Do not damage oil seal when removing axle shaft.

SHOCK ABSORBERS

Std.—Mercury 8M-18045-A1, A2 (front), 8M-18080-A1, A2 (rear).

Heavy Duty (special equip.)—Mercury 8M-18045-C1, C2, D (front), 8M-18080-C1, C2, D (rear). Direct acting, hydraulic types. Two makes are used and are interchangeable except station wagon.

▷***NOTE—Shock absorbers are permanently sealed and cannot be refilled or repaired.***

Rear Shock Absorber Installation—Lower tube has welded stone shield on lower end which must be installed toward front of car.

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram type with coil springs, direct acting shocks, and front stabilizer.

See Front Suspension Section for complete data.

▷**FRONT SPRING PRODUCTION CHANGE:** *See "Ford Pass. Cars, Lincoln, Mercury" in Front Suspension Section.*

Kingpin Inclination—5° crosswise with ¾° Camber.

Caster—Pos. ½° to Neg. 1°. Threaded bushing adjustment at lower pivot pin.

Camber—0° to +¾°. Eccentric adjustment at upper pivot pin.

Toe In—3/32-5/32". Adjusting sleeve on outer end of each tie rod. Adjust equally.

Steering Geometry (toe out on turns)—Inner wheel turned 23½° ± ½°, outer wheel 20°.

STEERING GEAR

Gemmer Model 305—"3-tooth" Worm-and-roller type with "push-pull" adjustment.

See Steering Gear Section for complete data.

BRAKES

Service: Mercury-Bendix Hydraulic, Duo-Servo, Single Anchor type without ecentric adjustment. Hand lever applies rear wheel service brakes.

See Brake Section for complete data.

▷*BRAKE DRUM SILENCER SPRING INSTALLATION (To correct Brake Squeal): See "Ford-Lincoln-Mercury Bendix Hydraulic" in Brake Section.*

Wheel Cylinders—Diameter: Front wheel 1.128" (hone limit 1.132"). Rear wheel 1.003" (hone limit 1.005").

Drums—Diameter 11".

Lining—Molded or woven. Width 2" (front wheel), 1¾" (rear wheel). Thickness 3/16". Length per shoe 11 15/16".

Clearance—.010" at each end of each shoe.

Braking Power—56% front wheels, 44% rear.

Hand Brake: See Service Brakes above.

▷**HAND BRAKE LINKAGE CHANGE: For easier application**—*See "Ford-Bendix Hydraulic" in Brake Section.*

MISC. MECHANICAL

Power Operated Convertible Tops, Windows, & Front Seat: Hydro-Lectric type (hydraulic actuation with motor-driven pump supplying oil under pressure for power cylinders).

See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum Link & Crank Arm Type.

See Miscellaneous Section for complete data.

HOOD ALIGNMENT: *See Mercury Special Data.*

M DEL IDENTIFICATI N

SERIAL NUMBER: Stamped on Patent Plate riveted to right front body pillar just below upper hinge opening. Serial number includes identification in the following sequence: *NOTE—Model year indicated on plate will be either 52 (1952), or 53 (1953).*

Year	Plant Assembly	Number Serial	Type Engine
53	See below	10001①	M

①—Starting Serial Number (All Plants).

Assembly Plants—(Indicated in serial number by the following code): "LA"—Los Angeles. "LP"—Lincoln Plant. "ME"—Metuchen. "SL"—St. Louis.

TUNE-UP

COMPRESSION PRESSURE: 105-125 lbs. at 120 RPM.

VACUUM READING: 21" at 425 RPM.

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinder Numbering—Right Bank 1-2-3-4, Left Bank 5-6-7-8. Numbered from FRONT of engine.

SPARK PLUG GAP: .029-.032".
Plugs—Champion H-10.
CAUTION—Tighten plugs to 24-30 ft.lbs. torque.

DISTRIBUTOR: (1952)—Mercury No. 7RA-12127-C or OCM-12127. (1953)—Mercury No. 7RA-12127-D or OCM-12127-B. *(CAUTION—Use "7RA" type with Cast Iron Cylinder Front Cover, "OCM" with Aluminum Cylinder Front Cover).* "Loadomatic" type with spark advance controlled by vacuum diaphragm which moves breaker plate.
Breaker Gap—.014-.016".
Cam Angle—26-28½° closed.
Rotation—Clockwise viewed from above.
Breaker Arm Spring Tension—17-20 ozs.
Automatic & Vacuum Advance—*See Ignition.*

COIL: Mercury No. 8BA-12029. At distributor.

►***COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):*** This coil-to-distributor lead is SPECIAL SUPPRESSOR LEAD (non-metallic type with carbon impregnated nylon or rayon core) and the special length (approx. 14½") is required for proper radio reception. ***THIS LEAD CABLE MUST NOT BE SHORTENED AND OTHER TYPE IGNITION CABLES MUST NOT BE SUBSTITUTED FOR IT.***
Ignition Current—3 amperes idling, 5 stopped.

CONDENSER: Mercury No. 7RA-12300-C.
Capacity—.21-.25 microfarad.

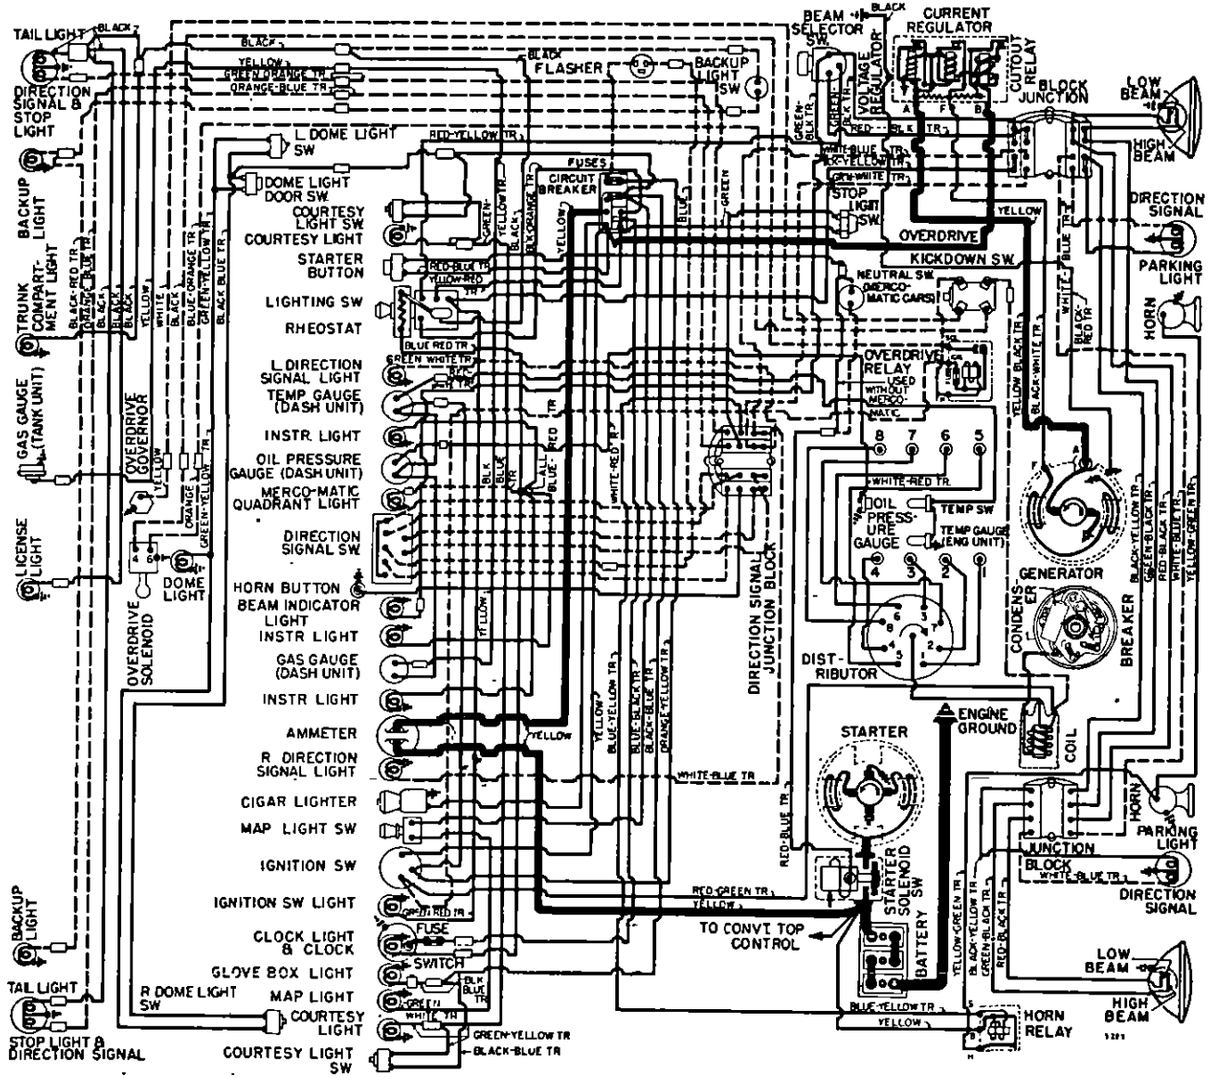
IGNITION TIMING: 2° BTDC.
Timing Mark—Small circular button on rim of pulley. Timing pin above pulley on right side. With No. 1 piston in firing position, align timing mark with timing pin (Initial Timing), adjust distributor for best engine performance without objectionable ping (Final Ignition Timing).

►***IGNITION TIMING CAUTION—If neon timing light used,*** disconnect vacuum line to prevent automatic advance operating.
Timing Procedure—*See Ignition Timing.*

CARBURETION: Mercury No. EAC-9510-E, F (Synchro-mesh Trans.), EAC-9510-G, H, J (Merco-matic Trans.) "Centri-flo" dual down-draft carburetor with fast idle and separte automatic choke control.

►***CARBURETOR-TO-INTAKE MANIFOLD AIR LEAK CORRECTION—See Carburetor Section for complete data.***

►***RECOMMENDED REMOVAL OF AIR CLEANER HOLD-DOWN BOLT NUT (First 1953 Cars): See "Mercury Centri-flo Carburetor" in Carburetor Section.***



►***THROTTLE STICKING CORRECTION: See Carburetor Section.***

►***ENGINE HESITATION OR LOSS OF POWER AT 30-35 MPH CORRECTION: See Carburetor Section.***

►***1952 DASHPOT REPLACEMENT CAUTION***—Dashpot assembly No. EAC-99560-B used on late 1952 cars has nylon check ball and spring located in dashpot body (instead of carburetor). ***If this EAC-99560-B dashpot installed on earlier cars, CHECK BALL, SPRING, AND RETAINER MUST BE REMOVED FROM CARBURETOR AND DISCARDED.*** *See Carburetor Section for complete data.*

►***CARBURETOR COVER & PLUG ASSY. CHANGE (To prevent Lean Mixture at off-idle or transfer point): See "Mercury Centri-flo Carburetor" in Carburetor Section.***
Idle Setting—With engine at normal operating temperature (oil pressure and coolant temperature stabilized) so that choke valve wide open and fast rect idling speed, then adjust both idle mixture idle inoperative, adjust throttle stopscrew for corscrews for highest steady manifold vacuum. Recheck engine idle speed.
Idle Speed—400-450 RPM (Synchro-mesh Trans.), 425 RPM maximum (Merc-O-Matic), in "N".
Float (Fuel) Level—1/2" ±1/32" below top edge of bowl with fuel pump pressure at 3½-4½ lbs. Use Fuel Level Gauge 9550-B to check fuel level, placing

CONTINUED ON NEXT PAGE

1952 MODELS

CONTINUED FROM PRECEDING PAGE

gauge squarely on top of main body so that gauge pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending tab on float lever which contacts intake needle.

CAUTION—Both floats must be at same height and floats must not contact float bowl walls.

Accelerating Pump—Seasonal adjustment provided by three holes in throttle shaft lever for pump link engagement. **Center Hole**—Normal operating. **Outer Hole**—Extreme cold. **Inner Hole**—Extreme hot.

Fast Idle Setting: No adjustment required.

Choke Setting: Mark on cover aligned with center mark of scale on housing.

Fuel Pump Pressure: 3½-4½ lbs.

VALVE TAPPET CLEARANCE: Intake .013-.015". Exhaust .017-.019. *See Mercury Special Data.*

MANIFOLD HEAT CONTROL: Automatic. No adjustment. Valve located between right end of exhaust pipe cross-over and right exhaust manifold.

IGNITION

IGNITION SWITCH: Mercury No. FAA-11572-A.

COIL: Mercury No. 8BA-12029.

▷***COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):*** This coil-to-distributor lead is SPECIAL SUPPRESSOR LEAD (non-metallic type with carbon impregnated nylon or rayon core) and the special length (approx. 14½") is required for proper radio reception. ***THIS LEAD CABLE MUST NOT BE SHORTENED AND OTHER TYPE IGNITION CABLES MUST NOT BE SUBSTITUTED FOR IT.***

Ignition Current—5 amperes stopped, 3 amperes idling.

CONDENSER: Mercury No. 7RA-12300-C.
Capacity—.21-.25 microfarad.

DISTRIBUTOR: Mercury No. 7RA-12127-C, or D (use with Cast Iron Cylinder Front Cover), OCM-12127 or OCM-12127-B (use with Aluminum Cylinder Front Cover). "Loadomatic" full advance type with single breaker. *See "Ford, Lincoln, Mercury Distributor" in Electrical Equipment Section for complete data.*

▷***DISTRIBUTOR REPLACEMENT CAUTION—When replacing distributor, use 7RA-12127-C or D with CAST IRON cover, OCM-12127 or OCM-12127-B with ALUMINUM cover.***

Breaker Gap—.014-.016".
Cam Angle—26-28½° closed.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Clockwise viewed from above.

Advance Performance
▷With Distributor on Test Unit

Distr. Degrees	Vacuum	R.P.M.
0°	0"	200
2-3°	0.57"	600
4½-5¼°	1.70"	1000
7½-8½°	3.70"	2000

IGNITION TIMING

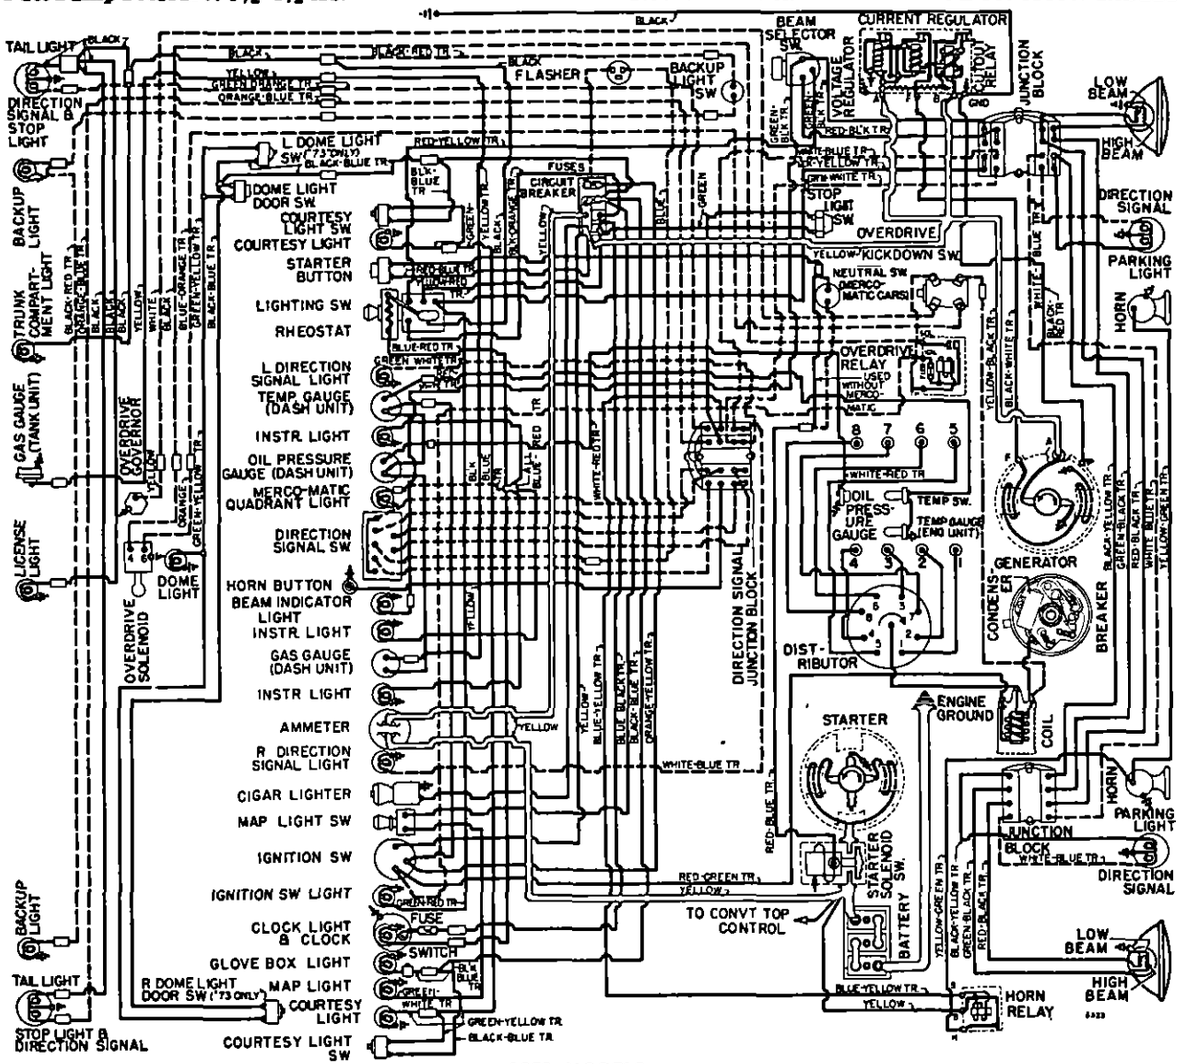
Initial Setting① ..... **2° BTDC**

①—See "Final Ignition Timing" below.

Crankshaft Pulley Mark—Small circular button on rim of pulley. Timing pin above pulley on right side.

Initial Timing—With #1 piston in firing position, timing mark on pulley aligned with timing pin on front of engine, loosen hold down screw on distributor, rotate distributor until contacts begin to open, tighten hold down screw. Check spark plug connections (see diagram), see that rotor at #1 position in distributor cap. Then make "Final Ignition Timing" adjustment as directed below.

Initial Timing (With Neon Timing Light)—Disconnect vacuum line to prevent automatic advance operating, idle engine and adjust distributor as above so that timing mark appears to be at pointer on chain case cover. Then make "Final Ignition Timing" as follows:



Final Ignition Timing—After initial timing (above), note position of end of distributor clamping flange with relation to scale on Indicator Plate on cylinder head (mounted on right front water outlet support capscrew), ADVANCE timing by moving distributor counter-clockwise one graduation on the scale. Road test car for objectionable pinging under load and for engine roughness. Repeat this procedure (advancing distributor one graduation at a time) until pinging or roughness noted, then RETARD distributor slightly until pinging and roughness eliminated.

CARBURETOR

Mercury No. EAC-9510-E, F (Synchro-mesh Trans.), EAC-9510-G, H, J (Mercomatic Trans.) "Centri-flo" dual downdraft type carburetor with fast idle and separate automatic choke.

See "Lincoln-Mercury Centri-flo Carburetor" in Carburetor Section for complete data.

▷***CARBURETOR-TO-INTAKE MANIFOLD AIR LEAK CORRECTION—See Carburetor Section for complete data.***

1953 MODELS

►*RECOMMENDED REMOVAL OF AIR CLEANER HOLD-DOWN BOLT NUT (First 1953 Cars): See "Mercury Centri-flo Carburetor" in Carburetor Section.*

►*THROTTLE STICKING CORRECTION: See Carburetor Section.*

►*ENGINE HESITATION OR LOSS OF POWER AT 30-35 MPH CORRECTION: See Carburetor Section.*

►*1952 DASHPOT REPLACEMENT CAUTION*—Dashpot assembly No. EAC-99560-B used on late 1952 cars has nylon check ball and spring located in dashpot body (instead of carbureor). *If this EAC-99560-B dashpot installed on earlier cars, CHECK BALL, SPRING, AND RETAINER MUST BE REMOVED FROM CARBURETOR AND DISCARDED. See Carburetor Section for complete data.*

Settings (Idle Setting, Float Level, and Accelerating Pump): *See Tune-Up data.*
Metering Jets—*See "Holley-Ford Jet Specification Table" in Carburetor Section.*

Merc-O-Matic Throttle Adjustment: *See "Fordomatic & Merc-O-Matic Transmission" in Transmission Section.*

Fast Idle: Holley-Ford Carburetor type.
Setting—No adjustment required.
See Carburetion Equipment Section for complete data.

Automatic Choke: *See "Lincoln-Mercury Choke" in Carburetion Equipment Section for complete data.*
Setting—Mark on cover should be aligned with center mark of scale on choke housing. Adjust by loosening three cover screws and rotating cover assembly.

CARB. EQUIPMENT

Air Cleaner: Oil bath type.

Fuel Pump: (1952) Mercury No. 1CM-9350-A; (1953) EAB-9350-A. Fuel and vacuum type.
Pressure—3½-4½ lbs.
See Carburetion Equipment Section for complete data.

Gasoline Gauge—King-Seeley Electric (not "CV").
Dash Unit—Mercury No. FAC-9280-B.
Tank Unit—Mercury No. FAA-9275-A (Exc. Sta. Wgn.). No. FAA-9275-B (Sta. Wgn.).
See Carburetion Equipment Section for complete data.

BATTERY

Mercury No. 8M-10655-A. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).
Zero Capacity—300 amperes for 3.3 minutes. Five second voltage—4.2 volts.
Grounded Terminal—Positive (+) terminal.
Location—Right side of engine under hood.

STARTER

Mercury No. FAD-11002-A (Synchro-mesh Trans.), FAE-11002-A (Merc-O-Matic Trans.).
Armature—Mercury No. 18-11005 (for FAD-11002-A), 1CM-11005 (for FAE-11002-A).
Drive—Mercury No. B-11350 (Synchro-mesh Trans.); 1CM-11350-C Bendix "Folo-Thru" Drive (Merco-matic Trans. Cars).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—48-56 ozs.
Cranking Speed—100-180 RPM. 210 amps. max.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	①	5.0	40-60
16 "	Lock	3.5	700

①—With starter on engine and engine running.

Starting Switch: Mercury No. FAB-11450-B. Magnetic Switch mounted on right front fender apron and controlled by Pushbutton Switch No. FAA-11500-A. Neutral Switch, Mercury No. 1M-15812-B, used on Merc-O-Matic cars.

Removal: To remove, take off right engine splash pan, free starter to oil pan bracket, take out two starter through bolts.

GENERATOR

Mercury No. FAA-10002-A. Two brush type with current & voltage regulation.
Armature—Mercury No. OA-10005-A.
Maximum Charging Rate—Controlled by regulator (dependent on battery condition).
Charging Rate Adjustment—None. See Regulator.
To Check Generator Output—Connect ammeter in series with charging line at regulator "ARM" terminal, connect short insulated jumper between generator "A" & "F" terminals (to short out regulator). Run engine at approximately 1500 RPM and note ammeter reading. If generator output equals or exceeds rated output of 35 amperes, generator performance is satisfactory.

►*CAUTION—Do not operate generator at higher speeds or in service with jumper connected between generator armature and field terminals. This jumper eliminates regulator action.*

Performance Data

Amperes	Engine RPM.
35	1500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-24 ozs.

Generator Belt Adjustment: Loosen two bolts on fan mounting bracket, loosen generator support mounting stud nut, raise generator up until side movement on belt midway between generator and water pump pulley is ¾" (thumb and finger pressure), tighten stud nut.

Fan Belt Adjustment: *See COOLING.*

REGULATOR

Mercury No. FAC-10505-A. Voltage current, 3 unit type.
See Electrical Equipment Section for complete data.

Cutout Relay
Cuts In—6.0-6.6 volts.
Cuts Out—8 amperes discharge current (max.)
Contact Gap—.010" (armature against upper stop).
Air Gap—.014" between armature and core with contacts just closed.
Checking & Adjusting—*See Electrical Equip. Section.*

Voltage Regulator
Setting—7.4-7.8 volts.
Air Gap—.032-.035" between armature and core with contacts just closed.
Contact Spring Tension—5 ozs. minimum with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

Current Regulator
Setting—34-38 amperes.
Air Gap—.032-.035" between armature and core with contacts just closed.
Contact Spring Tension—5 ozs. minimum with contacts just opening.
Checking & Adjusting—*See Electrical Equip. Section.*

LIGHTING

Headlamps: Ford "Sealed Beam" type.
See Electrical Equipment Section for complete data.

Direction Signal: Std. *See Electrical Equipment Section.*
Direction Signal Flasher—Mercury No. 8L-13350-B.

Switches
Lighting—(1952) Mercury No. OL-11654; (1953) FAA-11654-A.
Beam Selector—Mercury No. 8A-13532.
Instrument—(1952) Mercury No. OL-13740; (1953) FAA-13740-A.
Glove Box—OM-14413-A.
Map Light—OA-13752.
Stop Light—11A-13480.
Direction Signal—1M-14486-A.

MISC. ELECTRICAL

CIRCUIT BREAKERS: (Lighting) Mercury No. FAA-12258-C (30 amp. & 15 amp.). Headlights (30 amp.); Stop & Tail Lights (15 amp.). Assembly mounted on back of instrument panel.
Convertible Top Control—40 ampere circuit breaker.

FUSES: Courtesy & Interior Lights—14 amperes. Located on circuit breaker assembly behind instrument panel.
Direction Signal—14 amperes. Located on circuit breaker assembly behind instrument panel.
Overdrive—30 amperes. Mounted on overdrive relay.
Heater—20 amperes. In lead wire.
Clock—3 amperes. In clock lead wire.

HORNS: Mercury No. 51A-13832-A,B High Pitch, Right Horn). **51A-13833-A,B** (Low Pitch, Left Horn). Dual horns operated by relay.

►*HORN NOT BLOWING OR CONTINUED BLOWING CORRECTION—See "Mercury Steering Gear" in Steering Gear Section.*
Horn Relay—Mercury No. FAA-13853-A. On engine side of dash panel.

ENGINE

ENGINE SPECIFICATIONS: Eight cylinder "L" head 90° "V" type with both cylinder blocks and crankcase cast enbloc.
Bore—3 3/16". **Stroke**—4".
Displacement—255.4 cu. ins. **Rated HP**—32.5.
Developed Horsepower—125 at 3700 RPM.
Compression Ratio—7.2-1.

►*1952 COOLING SYSTEM IMPROVEMENTS & PRODUCTION CHANGE: See "Cooling System" in Mercury Special Data.*

CYLINDER HEAD & TIGHTENING TORQUES: *See Mercury Special Data.*

►*CYLINDER HEAD LEAKS (Caused by Distributor Hold-down bolt)—See "Cooling System" in Mercury Special Data.*

OIL PAN & ENGINE REMOVAL: *See Mercury Special Data.*

PISTONS: (First Cars) Aluminum alloy, steel strut, dome head, U-slot, cam ground type.
(Later Cars)—Aluminum alloy, solid skirt type with offset piston pin.

►*PISTON & PIN ASSEMBLY PRODUCTION CHANGE—New SOLID SKIRT pistons with OFFSET PINS used in production on later cars, and can be used as service replacement on 1949-53 engines in either full sets or intermixed with "split-skirt" pistons. CAUTION—Piston fit is different. See Piston Clearance following.*

►*CAUTION—Mercury and Ford Pistons or Rings are not interchangeable.*
Weight—13.1 ozs. **Length**—2.89" (exclud. dome).
Removal—Pistons and rods removed from above.
Clearance—(Split-Skirt Type) .0000-.0006" loose.

CONTINUED ON NEXT PAGE

ENGINE

CONTINUED FROM PRECEDING PAGE

(Solid-Skirt Type) .0005-.0011" loose. See Fitting Pistons.
Cyl. Bore Wear Limits—Out-of-round .003", Taper .006".

Replacement Pistons: Furnished Std., .0025", .020," .030", .040" Oversize.

Fitting Pistons: Use ½" wide feeler inserted between piston and cylinder wall at right angles to pin. Use feeler thickness listed below. Pull to withdraw feeler should be 6-12 lbs. (all pistons).
New Piston in New Bore—.0015".
New Piston in Old Bore—.002".
Old Piston in Old Bore—.003".

▷*NOTE*—Pounds pull to withdraw feeler should be 6-12 lbs.

Installing Pistons: **(First—Split Skirt)**—Split in skirt toward left side of engine (viewed from rear). **(Later—Solid Skirt)** Small indentation in piston head toward front of engine on all pistons.

PISTON RINGS: Two compression, two slotted oil rings per piston (lower oil ring below pin). Rings are taper faced. Upper oil ring groove slotted, lower oil ring groove drilled for oil drainage.
NOTE—Top compression ring is chrome plated.

▷***CAUTION—Mercury and Ford Piston Rings are not interchangeable (heavier rings on Mercury).***

Ring	Width	End Gap①	Side Clearance
Comp. No. 1	3/32"	.007-.017"	.0015-.003"②
Comp. No. 2	3/32"	.010-.017"	.001-.0025"③
Oil Nos. 3 & 4	3/16"	.010-.017"	.0015-.003"②

Worn Limit—①.035", ②.004", ③.0035".

Installing Rings: Top compression ring assembled with counterbore to top. Lower compression ring mark "TOP" should be up toward head of piston.

Replacement Rings: Ring sets furnished Standard size and .020", .030", .040" oversize.
NOTE—Service rings have expander behind top oil ring, none on bottom ring.

PISTON PIN: Diameter—.7501-.7504". Length—2.839-2.845". Floating type. Pin hole in connecting rod bronze bushed.
Pin Fit in Rod—.0002-.0004" (Select for light thumb push fit). Worn Limit .0015".
Pin Fit in Piston—.0001-.0003" loose.

Replacement Pins: Standard size, .001", .002" oversize.

CONNECTING ROD: Length 7".
Weight—18.5 ozs. (less bearings).
Crankpin Journal Diameter—2.138-2.139". Maximum wear limit out-of-round .0015". Taper .001".
Lower Bearing—Locked in (not floating type), steel backed, copper lead alloy lined, replaceable shells. Upper and Lower halves interchangeable.
Clearance—.0005-.003" (new), .005" (worn limit).
Side Play—(2 rods) .006-.020". (Worn limit .022").

Replacement Bearings: Standard size, .002", .010", .020", .030" & .040" undersize.

Installing Rods: Numbers on rods must be toward right side of engine (Right Hand bank), toward left side (Left Hand Bank). Assemble rods to pistons so that oil squirt hole in lower end of rod is on rear side (Right Hand Bank), front side (Left Hand Bank).

CRANKSHAFT: 3 bearing, integral counterweights. ***CRANKSHAFT SLUDGE TRAPS—Crankpin throws have sludge traps with removable plugs for cleaning.***
Main Bearing Journal Diameter—2.498-2.499".
Wear Limits—.0015" Out-of-round. .001" Taper.
Bearings—Steel backed, copper lead alloy lined, replaceable shells. Upper and lower halves alike.
Clearance—.001-.0026".
Bearing Adjustment—None. Replace bearings.

Replacement Bearings: Standard size, .002", .010", .020", .030" undersize.

▷***MAIN BEARING CAUTION—Main bearing caps marked with BLUE paint indicate that the engine block main bearing bore is .0005" oversize and A SPECIAL MAIN BEARING IS REQUIRED.***

End Thrust: Taken by rear main bearing. Adjust by replacing bearing if endplay excessive.
Endplay—.002-.006" (new), .008" (worn).

CAMSHAFT: Three bearing. Helical gear drive. Distributor drive gear pressed on front end of shaft, oil pump drive gear on rear end.
Camshaft Journal Diameter—1.7965-1.797".
Bearing Diameter—1.7985" (replace bearing if diameter greater than worn limit of 1.8015").

Replacement Bearings: Standard size, .010", .015" undersize. Undersize service bearings do not require finish reaming.

End Thrust: Taken by front end of camshaft and thrust surface on inner face of front cover. Adjust by replacing front cover. **Endplay**—.007-.016".

Camshaft Oil Pump & Distributor Drive Gear Removal & Installation: *See Mercury Special Data.*

Timing Gears: L.H. helical, fibre camshaft gear. Cast iron crankshaft gear.

Replacement Camshaft Gears: Furnished Standard size, .006", .012" oversize. *See Mercury Special Data.*

Camshaft Removal & Installation: *See Mercury Special Data.*

Camshaft Setting: Mesh marked tooth of crankshaft gear with marked space on camshaft gear.

VALVES:	Head Diam.	Stem. Diam.	Length
Intake	1.505-1.515"	.341-.342"	4.8175"
Exhaust	1.505-1.515"	.3405-.3415	4.8175"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.319"	.0014-.0034"
Exhaust	45°	.315"	.0019-.0039"

Seat Width—.065-.080" (1/16-5/64") and centered on valve face.

▷***ROTATABLE (FREE TYPE) VALVES USED—See "Valve System" in Mercury Special Data.***

▷***REPLACEMENT VALVES—Exhaust valves furnished for service replacement of ALL VALVES.***

Valve Guides: One piece type positioned and retained by "C" washer. Inside diameter .344". Outside diameter 1.031". Distance from top of valve seat to upper end of valve guide 1.116".
Intake Valve Guide Seal—Rubber seal installed in groove on outer diameter of intake guide bushing.

Valve Lifters: Barrel type operating in guide holes in block.
Diameter—.9992" (replace if worn to less than .9977"). Length limit after resurfacing end 1.728".
Clearance—.0007-.0016" (new), .003" (worn limit).

Valve Springs: Free length 2 13/64" (2.20"). 9⅛ coil type. Install closed-coil end up toward valve.

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Open	85-89	1.57"
Closed	40-43	1.89"

VALVE TIMING

VALVE TAPPET CLEARANCE: Intake .013-.015". Exhaust .017-.019. *See Mercury Special Data.*

VALVE TIMING: See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 51° ALDC.
Exhaust Valves—Open 47° BLDC. Close 9° ATDC.
Valve Timing Check—*See "Valve System" in Mercury Special Data.*

LUBRICATION

Engine Oiling System: Pressure to main bearings, connecting rod lower bearings, camshaft bearings, timing gears and distributor drive gear. Piston pins and valve lifters lubricated by splash. Oil pump mounted in crankcase at rear of engine.
Crankcase Capacity—4 qts. (refill); 5 qts. (dry).
Normal Oil Pressure—57 lbs. at 40 MPH.

Oil Pressure Relief Valve: In pump. No adjustment.
Spring Tension—12 lbs. at 1.14".
NOTE—Cylinder block oil relief valve not used.

Oil Pump: Gear type in rear of crankcase.
Oil Pump Overhaul—*See Mercury Special Data.*

Oil Filter: By-pass type. On left cylinder head. Replace filter element each 4000 miles or more often as required.
Oil Filter Cartridge—Mercury No. 8CM-6731-A (Kit includes element and gaskets).

Oil Pressure Gauge: King-Seeley Electric (not CV).
Dash Unit—Mercury No. FAC-9273-B.
Engine Unit—Mercury No. 41A-9278.
See Miscellaneous Section for complete data.

Crankcase Ventilation: Filter element in oil filler breather cap. Outlet pipe (below fan) does not have a filter element.

COOLING

▷*1952 COOLING SYSTEM IMPROVEMENTS & PRODUCTION CHANGE: See "Cooling System" in Mercury Special Data.*

Cooling System: Pressure type with relief valve in filler cap and two belt driven pumps (one for each bank) with re-circulating by-pass.
Capacity—21.5 qts. (No heater). Recommended operating capacity—20.5 qts.
Pressure Valve—Mercury No. OL-8100-A. Radiator Filler Cap opens at 6-8 lbs.

Water Pumps: 2 used. Centrifugal belt driven packless type. Shaft mounted on pre-lubricated ball bearings. Requires no lubrication service.

▷*WATER PUMP REMOVAL CAUTION*—One pump attaching bolt located inside water outlet.
NOTE—Bottom bolt must be installed before installing water pump pulley.
See Water Pump Section for complete data.

Fan Belt Adjustment: Loosen two fan mounting bracket bolt nuts, raise fan up for ½" side movement of belt midway between fan and crankshaft pulley.
Generator & Pump Belt Adjustment: *See Generator.*

Thermostats: Mercury No. 1BA-8575-B (157°-162°), 1BA-8575-B (177°-182°). Two thermostats are used (one in each cylinder head water outlet).

Temperature Gauge: King-Seeley Electric (not CV).
Dash Unit—Mercury No. FAC-10883-B.
Engine Unit—Consists of **Sender** (in right bank cyl. head), and **Switch** (in left bank cyl. head).
Sender—Mercury No. 1A-10884A (stamped 233F).
Switch—Mercury No. 1A-10990 (stamped 226F).
See Miscellaneous Section for complete data.

CLUTCH

Borg & Beck Model 10A7. Mercury No. MA-7563-A. Single plate, dry disc, Borglite Driven Member.
See Clutch Section for complete data.
Facings—Molded. Inside diameter 6¾". Outside diameter 10". Thickness .125".

Pedal Adjustment: 1-1¼" Free travel. Adjust by turning pedal-to-equalizer shaft link adjusting screw. **Toe-Board Clearance**—Move clutch pedal bumper bracket as required to bring clutch pedal pad same distance from floor as the brake pedal pad.

Removal: Remove transmission (see Transmission Removal below). Remove flywheel housing. Prick punch flywheel and pressure plate so that these parts may be placed in original positions when reassembling. Compress pressure plate assembly with Tool 7563, take out capscrews, remove clutch.

SYNCHRO-MESH TRANSMISSION

Own Make. 3-speed, all helical gear type. Constant mesh synchro-mesh (second & high), sliding gear (low & reverse).
See Transmission Section for complete data.

Transmission Control: Mounted on steering column.
See Transmission Section for complete data.

►*TRANSMISSION GEAR SHIFT INTER-LOCK PIN PRODUCTION CHANGE (To reduce possibility of shifting into two gears at once)—See "Ford, Lincoln, Mercury Transmission" in Transmission Section for complete data.*

Removal: Disconnect rear universal, slide propeller shaft out of transmission. Disconnect clutch, transmission and speedometer linkage. Support rear of engine and disconnect rear engine mounting from frame. Take out transmission-to-flywheel housing capscrews (remove two rubber plugs under floor mat for access to two top capscrews).

OVERDRIVE

Warner Model AS1-R10F. Overdrive is solenoid operated type (no centrifugal pawls) with governor control and throttle operated kick-down switch.
See Transmission Section for complete data.
Solenoid—Mercury No. FAA-6916-A.
Control Relay—Mercury No. 1M-6915-A.
Kick-down Switch—Mercury No. FAA-6918-A.
Governor Switch—Mercury No. 8M-6943.

Removal: Same as for Standard transmission after disconnecting overdrive control cable and wiring.

MERC-O-MATIC TRANSMISSION

Torque converter combined with a hydraulically operated transmission (3 speed forward, 1 reverse).

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic Transmission" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING—See Transmission Section.*

Lubrication—*Note—Oil level dipstick and oil filler tube located under engine hood on right side near dash panel. Check transmission oil level every 1000 miles and maintain oil level at full mark on dipstick. Drain and refill every 15000 miles. Use only Automatic Transmission Fluid Type "A."*

►*TRANSMISSION CASE VENT ASSEMBLY PRODUCTION CHANGE: New vent (identified by mushroom shaped cap) used for faster filling of case. May be installed on all previous transmissions.*

Capacity—Approximately 9 qts.

Checking Oil Level—Run engine with transmission selector lever in 'N' (Neutral) until both engine and transmission are at normal operating temperature (approx. 4 minutes), then move selector lever through all ranges to assure distribution of oil. Remove oil filler dipstick, wipe clean and insert in filler tube, making sure that it is seated securely. Remove dipstick and check fluid level. Add necessary amount of fluid to bring level to "Full" mark on indicator. Replace oil level dipstick.

►*CAUTION—Do not fill above 'Full' mark.*

►*OTHER MERC-O-MATIC SERVICE DATA: See "Fordomatic & Merc-O-Matic" in Transmission Section.*

UNIVERSALS

Mechanics Type 2CR. Needle bearing type. 2 used.

REAR AXLE

Own. *TWO different types used as follows:*

1) All Models except Station Wagon—Semi-floating, hypoid gear type **with separate carrier.** Axle shaft ends flanged (no separate hub). Wheel bearings are sealed, pre-lubricated (no lubrication required).

2) Station Wagon—Semi-floating, hypoid gear type **(no separate carrier used).** Axle shaft design same as other cars (above).

See Rear Axle Section for complete data.

Rear Axle Ratios

	Standard	Optional
All (Exc. Sta. Wgn. & Convt.)		
Std. Trans	3.73-1 (41-11)	①
Overdrive	4.10-1 (41-10)	②
Merc-O-Matic	3.54-1 (39-11)	3.31-1 (43-13)
Station Wagon:		
Std. Trans.	4.27-1 (47-11)	4.55-1 (50-11)
Overdrive	4.55-1 (50-11)	4.27-1 (47-11)
Merc-O-Matic	3.54-1 (46-13)	
Convertible:		
Std. Trans.	3.90-1 (39-10)	4.10-1 (41-10)
Overdrive	4.10-1 (41-10)	3.90-1 (39-10)
Merc-O-Matic	3.54-1 (39-11)	3.31-1 (43-13)

①—4.10-1 (41-10) or 3.54-1 (46-13)
②—3.73-1 (41-11) or 3.54-1 (46-13)

Removal: Raise rear of car. Remove axle shafts, and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers, spring U-bolts. Remove axle housing assembly from car.

Axle Shaft Removal: Remove rear wheels. Take out three capscrews holding drum to axle shaft flange. Remove hydraulic brake line from brake backing plate. Take out four axle retainer nuts (work through opening in axle shaft flange). Use Tool 4235-A to remove axle shaft and bearing assembly from housing. Take off gasket and backing plate. Do not damage oil seal when removing axle shaft.

SHOCK ABSORBERS

Direct acting hydraulic. Service by replacement.

All (exc. Sta. Wgn.)	Front	Rear
Std.	MA-18045-B	MA-18080-B
Heavy Duty	MA-18045-G	MA-18080-G
Station Wagon:		
Std.	MA-18045-D	MA-18080-D
Heavy Duty	MA-18045-H	MA-18080-H

FRONT SUSPENSION

Front Suspension: Independent, linked parallelogram with coil springs and direct acting shock absorbers.
See Front Suspension Section for complete data.
Kingpin Inclination—5° with ¾° Camber.
Caster—0° to Neg. 1½°. Threaded bushing adjustment at lower pivot pin. Must not vary more than ½° from side to side.
Camber—0° to Pos. ¾°. Eccentric adjustment at upper pivot pin. Must not vary more than ½° from side to side.
Toe-In—3/32"-5/32". Adjusting sleeve at outer end of each tie rod. Adjust equally.

STEERING GEAR

Std. Steering Gear: Gemmer Model 305. 3-Tooth, Worm and Roller type with push-pull adjustments.
See Steering Gear Section for complete data.

POWER STEERING (Optional 1953)—Bendix hydraulic "Linkage Type" with power cylinder and control valve incorporated in steering linkage.
See "Ford & Mercury Power Steering" in Steering Gear Section for complete data.

BRAKES

Service: Mercury-Bendix Hydraulic, Duo-Servo, Single Anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See Brake Section for complete data.

►*BRAKE DRUM SILENCER SPRING INSTALLATION (To correct Brake Squeal): See "Ford-Lincoln-Mercury Bendix Hydraulic" in Brake Section.*

Wheel Cylinders—Diameter: Front Wheel 1⅛". Rear Wheel—⅞".
Drums—Diameter 11" (Front & Rear).
NOTE—Drum grinding limit .060" (on diameter).
Lining—Molded. **Width** 2" (front wheels), 1¾" (rear wheels). **Thickness** 3.16". **Length per Shoe** 11 5/16".
Clearance—.010" at each end of each shoe.

Hand Brake: See Service Brakes above.

►**POWER BRAKES: (Optional 1953)**—Special vacuum power cylinder combined with hydraulic master cylinder. Unit is mounted on toe-board in place of conventional master cylinder.
See "Power Brakes" in Brake Section for complete data.

MISC. MECHANICAL

Four-Way Seat Control (1953): Electric type. Separate motors for up-and-down and fore-and-aft movement.
See Miscellaneous Section for complete data.

Power Operated Top: Reversible type motor (mounted under seat) drives two screw type jacks (one on each side) through flexible cables.
See Miscellaneous Section for complete data.

Power Operated Window Regulators: Electric type.
See Miscellaneous Section for complete data.

Windshield Wipers: Vacuum, Link & Crank Arm type.
See Miscellaneous Section for complete data.

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine see "Air Conditioning Service Cautions" in Miscellaneous Section.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to left front body pillar extension.

First Number–10001 up (each year). At both plants.

►*SERIAL NUMBER NOTE: Serial number (example #55LA10001M#) includes following identification data in sequence.*

Year①	Assy. Plant②	Serial No.	Eng. Type
55	LA	10001	M

①–Last two digits of model year.

②–See Assembly Plants following.

Assembly Plants–Indicated in serial number by following codes: **LA**–Los Angeles. **ME**–Metuchen. **SL**–St. Louis. **WA**–Wayne.

ENGINE IDENTIFICATION: One compression ratio used in 1954 engines (no specific identification). In 1955, two compression ratios were used (controlled by cylinder head design). Engine with 7.6-1 head is designated "ECK". Engine with 8.5-1 head is designated "ECL". 1955 Car model engine application is as follows:

1955 Car Model	Engine Designation
Custom	ECK
Monterey	ECK
Montclair	ECL

1955 Engine Identification Mark Location–"ECK" or "ECL" indicated on head between center rocker arm supports and in depression on lower surface. Effective Jan. 3, 1955 (ECK-B or C; or ECL-B), mark included between 1 & 2 and 7 & 8 exhaust ports toward top of head above spark plug shield (visible with mirror). All early engines had tan rocker arm covers. Beginning production Oct. 18, 1954, "ECL" engines have yellow covers, and "ECK" engines continue with tan covers.

TUNE-UP

COMPRESSION PRESSURE: (1954)–120 lbs. **(1955)**–130 lbs. (ECK); 135 lbs. (ECL). At cranking speed on all engines.

VACUUM READING: (1954)–19" at 450 RPM. **(1955)**–19-20" at 500 RPM.

VALVE TAPPET CLEARANCE: .019" (Intake & Exhaust), with engine hot. *This setting supersedes previous 1955 setting of .018" for all valves.* Preliminary cold setting .020" (Intake & Exhaust).

►*1954 VALVE TAPPET ADJUSTING SCREW LOCKNUT CAUTION:* If adjusting screw is found **not** to extend up through rocker arm sufficiently to provide full thread engagement with locknut replace pushrods with Part No. EBU-6565-A and locknuts, Part No. EAA-6549-B.

MANIFOLD HEAT CONTROL: "Butterfly" type valve. Located at right end of crossover pipe at flange (single exhaust system), at flange joining right exhaust manifold to muffler inlet pipe (dual exhaust system). *CAUTION*–When installing, make sure counterweight portion is toward right front of engine.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders–RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .029-.033" (Champion H-10). .032-.036" (Champion 870).
Spark Plugs (1954)–Champion H-10. 14mm., or equivalent. Tighten plugs to 24-30 ft. lbs.
Spark Plugs (1955)–Champion 870. 18mm., special.

►*1955 SPARK PLUG CAUTION: Plug is new type with tapered seat and does not require a sealing gasket. It is important that plugs be tightened to torque of 15-20 ft. lbs.*

COIL: Mercury No. 8BA-12029.
Ignition Current–3 amps. idling, 5 amps. stopped.

►*COIL HIGH TENSION LEAD CAUTION (Radio Equipped Cars):* Coil-to-Distributor lead is SPECIAL SUPPRESSOR LEAD (non-metalic with carbon impregnated nylon or rayon core) and the special length (approx. 14-1/2") is required for proper radio reception.

DO NOT SHORTEN LEAD OR USE ANOTHER TYPE FOR REPLACEMENT.

DISTRIBUTOR: Mercury No. FAE-12127-C (Early 1954); FDC-12127-A (Late 1954). FDK;12127-C (1955 "ECK" Engine); FEC-12127-A (1955 ECL Engine).

►*1954 FAE-12127-C DISTRIBUTOR OVER-ADVANCE WHEN ENGINE STARTED AT LOWER TEMPERATURE CORRECTION:* This condition noted when engine detonates excessively after starting under low temperature conditions. Install Pin & Post Assembly, Mercury Part No. FDC-12357-A which limits distributor advance to 15°-15½°. FAE-12127-C distributors that have been reworked in production are identified by the part number prefix "ED". *CAUTION*–When calibrating a corrected distributor refer to Automatic Advance Table for FDC-12127-A distributor. *See "Ford, Lincoln, Mercury Distributor" in Electrical Section for installation of Pin & Post Assembly.*

Condenser–Mercury No. FAB-12300-A. **Capacity** .21-.25 microfarad.
Contact Point Set–Mercury No. FAB-12171-B.
Breaker Gap–.014-.016".
Cam Angle–26-28.5°.
Breaker Arm Spring Tension–17-20 ozs.
Rotation–Counter-clockwise viewed from above.

Advance Performance–FAE-12127-C①
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
1½-2½	0.24	500
4¼-5¼	0.43	700
7¼-8¼	0.64	1000
11¾-12¾	1.13	1500
15¼-16½	1.52	2000

①–Distributors **without** correction for "Over-Advance". See Distributor Correction (above).

Advance Performance–FDC-12127-A②
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
1½-2½	0.24	500
4¼-5¼	0.43	700
7¼-8¼	0.64	1000
11¾-12¾	1.13	1500
15-15½	1.52	2000

②–Use this table for FAE-12127-C distributors that have been corrected for "Over-Advance". See Distributor Correction above.

Advance Performance–FDK-12127C, FEC-12127A
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	0	200
1/2–1-1/2	0.19	300
11-1/4–12-1/4	1.36	1000
12-1/2–13-3/4	1.59	1400
14-1/4–15-1/2	1.95	2000

►*DISTRIBUTOR ADVANCE NOTE:* Advance data above is for distributor on TEST STAND. On the engine, advance is dependent on the carburetor used (number and location of vacuum takeoff ports and Spark Control Valve vary).

►*DISTRIBUTOR INSTALLATION NOTE:* It may be necessary to crank engine slightly to engage oil pump hex shaft with distributor shaft. This will not disturb timing because distributor engages camshaft gear before distributor shaft starts to engage the oil pump drive.

Initial Distributor Timing: Rotate engine until timing mark on crankshaft dampener is lined up with pointer and #1 piston is in firing position. Install distributor with point just breaking and the rotor in position to fire #1 cylinder (vacuum advance connection boss should be at approximately right angles to crankshaft and pointing toward left side of engine).

IGNITION TIMING

Setting (1954)–3° BTDC (normal).
Setting (1955)–3° BTDC (Std. & Overdrive Trans.). 6° BTDC (Merc-o-Matic).

Timing Mark–On crankshaft dampener and pointer on engine front cover. *See Initial Distributor Timing under DISTRIBUTOR above.*

CARBURETOR

1954 MODELS

Mercury No. EBY-9510-A (Std. & O.D. Trans.). EBY-9510-H (Merc-o-Matic). "Centri-Quad" four barrel downdraft type with vacuum controlled secondary throttle valve and separate automatic choke.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*CARBURETOR SERVICE REPLACEMENT NOTE:* Carburetor Assembly, Mercury Part No. ED-EBY-9510-K (with new type bowl cover to prevent fuel spill-over on sharp right turns) available for service replacement.

►*CARBURETOR "SPILL-OVER" ON SHARP RIGHT TURN CORRECTION:* To prevent spill over on cars with external vent, replace carburetor bowl cover assembly with Mercury No. ED-EBY-99983-C. *See "Lincoln-Mercury Centri-Quad" in Carburetor Section.*

►*EXTERNAL VENT PRODUCTION CHANGE:* An adjustable spring clip, Mercury Part No. EAD-99608-A used in production, and available for service on earlier carburetors to provide a means of closing off lower vent holes in accelerator pump rod for better starting in cold weather. *See "Lincoln-Mercury Centri-Quad" in Carburetor Section.*

►*CHOKE HEAT TUBE ASSEMBLY & INTAKE MANIFOLD PRODUCTION CHANGE:* New assemblies entered production in early June to prevent exhaust gas leakage into choke control heat tube assembly. Previous type heat tube assemblies are retained for service replacement on early cars, and later type heat tubes and manifold assemblies can be installed if desired. *See "Lincoln-Mercury Centri-Quad" in Carburetor Section.*

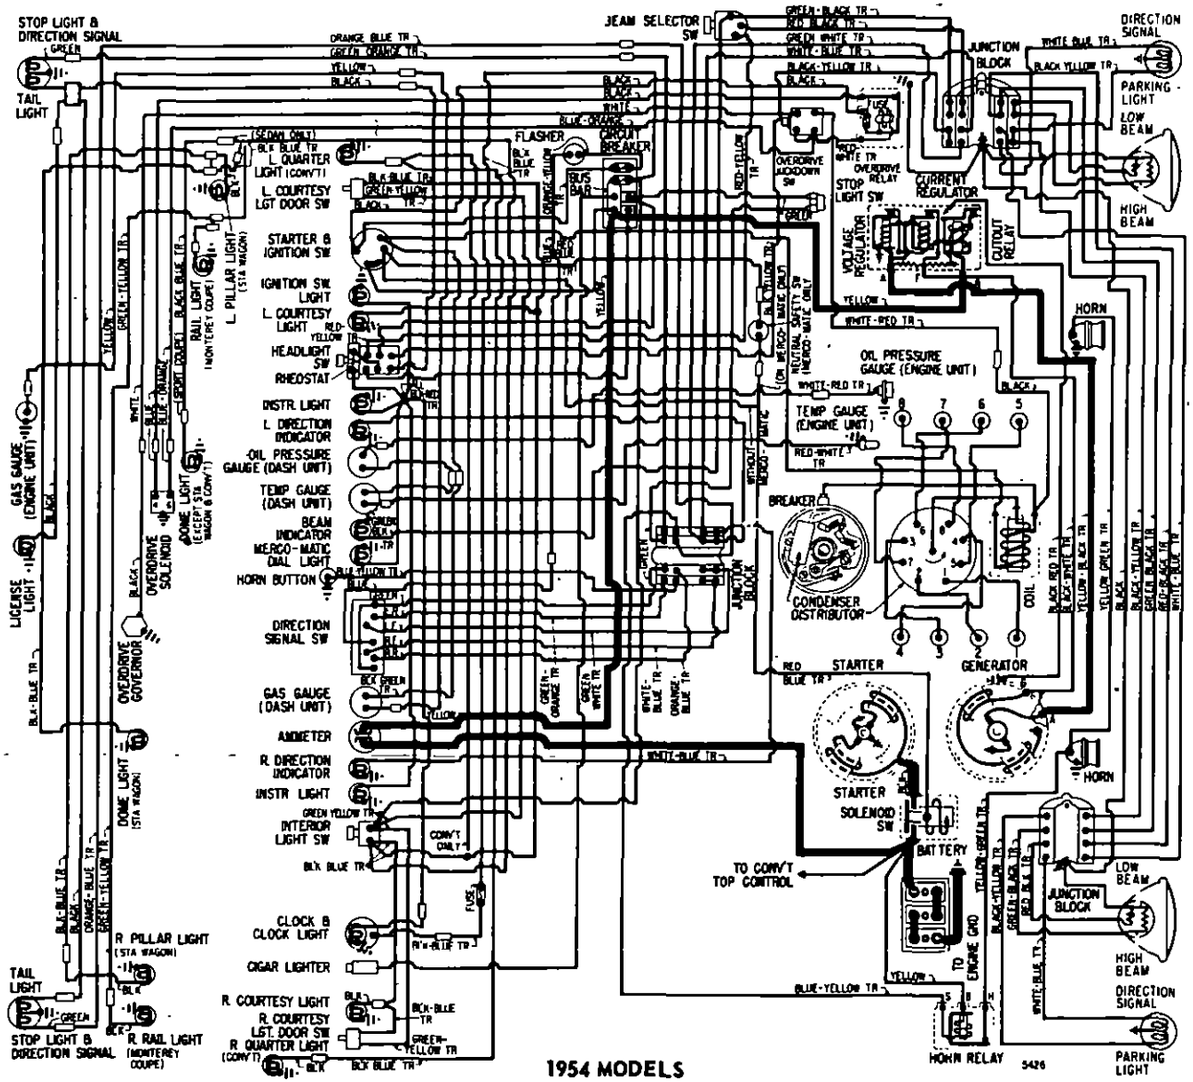
►*FAILURE TO GET FULL THROTTLE (MERC-O-MATIC CARS) CORRECTION: Remove necessary number of seals on accelerator pedal rod to obtain full throttle. NOTE—One seal must be retained to properly seal opening in toe-board.*

►*ENGINE NOT RETURNING TO IDLE SPEED (MERC-O-MATIC CARS) CORRECTION:* Check the following points and correct as necessary. (1) Ignition cable bracket assembly at left rear side of engine near engine ground strap may be interfering with "Z" bar spring support. Correct by bending bracket assembly away from "Z" bar. (2) Adjust carburetor dashpot (see Dashpot following). (3) Change location of accelerator Shaft Retracting Spring by attaching upper end of spring to ball joint and lower end of spring to lowest hole in bracket.

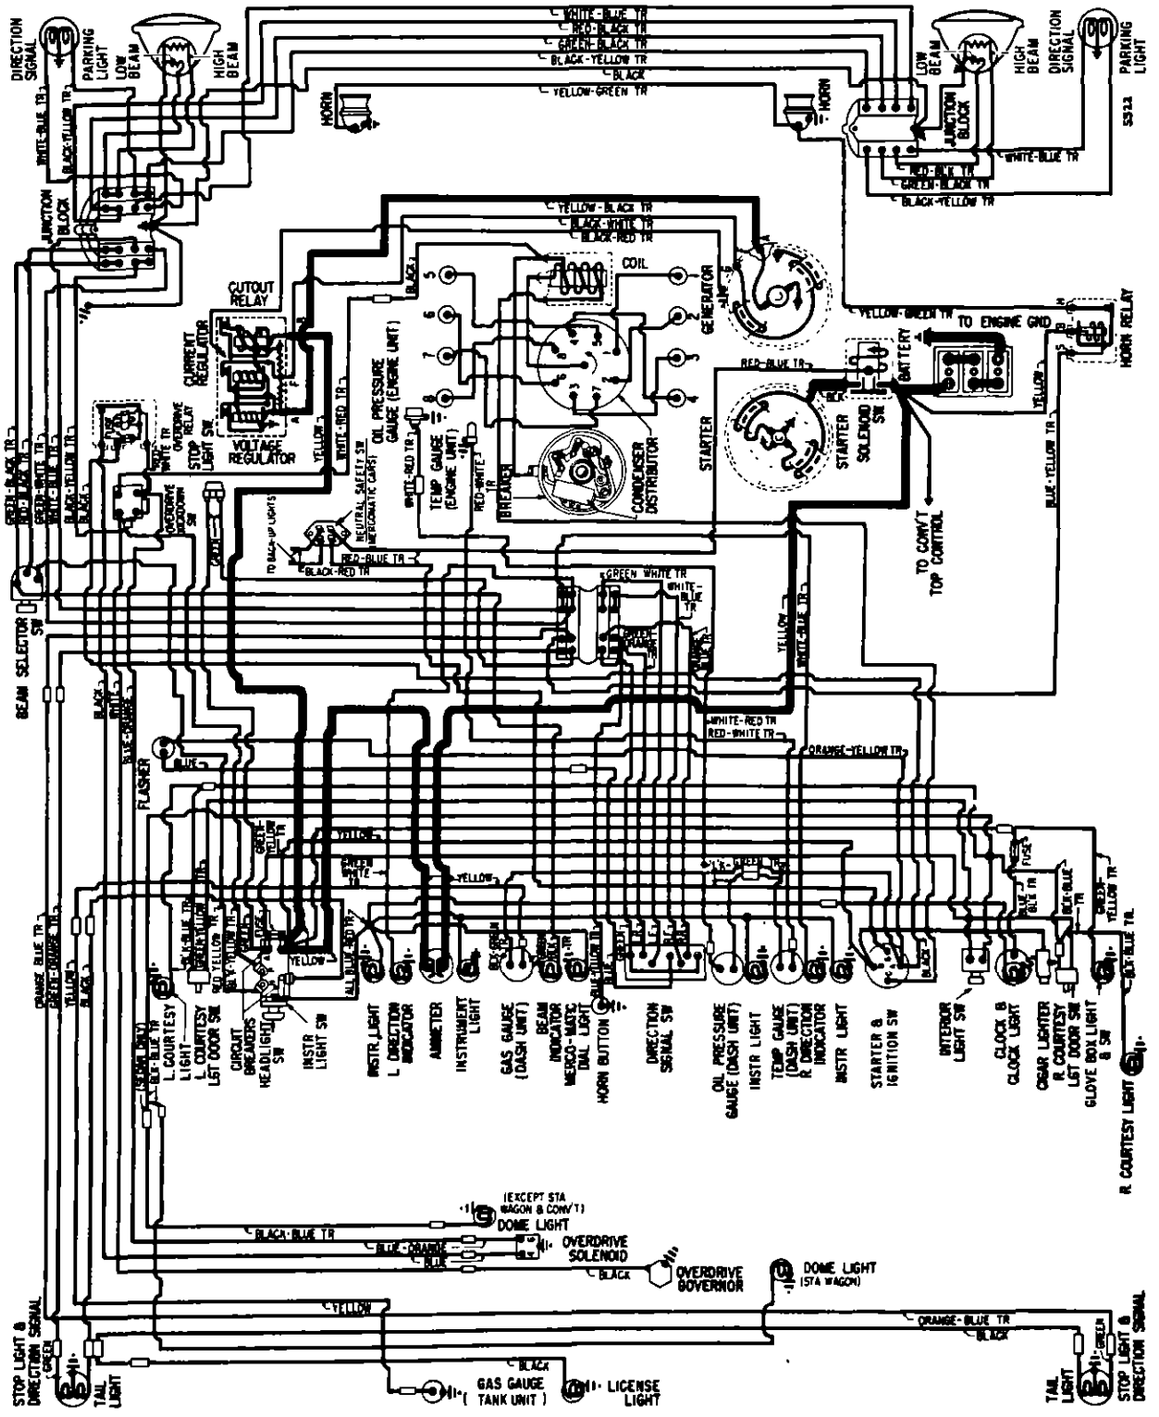
Idle Setting—Exactly 1¼ turns open (set both screws alike).

Idle Speed—With engine at normal operating temperature. 475-500 RPM (Std. & O.D. Trans.). 425-440 RPM (Merc-o-matic) with transmission selector lever in "D" (drive) position.

External Vent Seasonal Adjustment: (See "External Vent Production Change" above). On carburetors *where spring clip is provided on hollow accelerator* pump rod to control vent opening, adjust clip to open or close vent for best operation as follows:



Winter Operation (Temperature below 50°F)—Slide clip down on pump rod so vent is CLOSED.



Summer Operation (Temperature above 50°F)—Slide clip upward on pump rod so that full diameter of vent hole is OPEN.
